A-4-2.1.3.5 For example, the techniques for the use of the monitoring equipment should include monitoring for lighter than air gases in a confined area, heavier than air gases and vapors in a confined area, and heavier than air gases and vapors in an unconfined area.

A-4-2.2.1 For example, the significance of high concentrations of three airborne hazardous materials readings at scenarios relative to the hazards and harmful effects of the hazardous materials on the responders and the general public should be known.

A-4-2.2.4 The selection of scenarios to test the knowledge and ability to identify exposure symptoms should consider the following:

(a) Select materials common to the jurisdiction. This selection can be based on historical local records or any of the lists of materials that are commonly spilled throughout the country (i.e., chlorine, anhydrous ammonia, mineral acids, bases, aliphatic and aromatic solvents).

(b) Select concentrations and formulation of the materials common to the jurisdiction. It is especially important with pesticides to select realistic scenarios since the state of matter, behavior, and exposure routes can vary considerably from technical-grade materials to common-use formulations.

(c) Select weather conditions and release conditions appropriate to the jurisdiction since the behavior and the exposure hazards can vary considerably from summer conditions in the deep south to winter conditions in the north.

A-4-2.3 The condition of the container should be described using one of the following terms:

(a) Undamaged, no product release

(b) Damaged, no product release

(c) Damaged, product release

(d) Undamaged, product release

A-4-2.3.1 See Appendix D for the appropriate reference guides.

A-4-2.3.4 Some of the types of damage that containers can incur include the following:
(a) *Cracks.* A crack is a narrow split or break in the container metal that can penetrate through the metal of the container.

(b) *Scores.* A score is a reduction in the thickness of the container shell. It is an indentation in the container made by a relatively blunt object. A score is characterized by the relocation of the container or weld metal in such a way that the metal is pushed aside along the track of contact with the blunt object.

(c) *Gouges.* A gouge is a reduction in the thickness of the container. It is an indentation in the shell made by a sharp, chisel-like object. A gouge is characterized by the cutting and complete removal of the container or weld metal along the track of contact.

(d) *Dents.* A dent is a deformation of the container metal. It is caused by impact with a relatively blunt object. With a sharp radius, there is the possibility of cracking.

A-4-2.5.2.2

(a) Types:

1. Alpha

2. Beta

3. Gamma

(b) Units of measurement:

1. Activity

2. Quantity gamma

3. Absorbed dose

(c) Protection factors:

1. Half-life

2. Inverse square law

3. Time, distance, and shielding

The radiation absorbed dose (rad) and the roentgen equivalent man (rem) were used for many years to measure the amount and effect of ionizing radiation absorbed by humans. While officially replaced by the gray and the sievert, both rad and rem are still used. The rad equals the energy absorption of 100 ergs per gram of irradiated material (an erg is a unit of work or energy). The rem is the absorbed dose of ionizing radiation that produces the same biological effect as 1 rad of X rays or gamma rays (which are equal). The rem of X rays and gamma rays is therefore equal to the rad; for each type of radiation the number of rads is multiplied by a specific factor to find the number of rems. The millirem, 0.001 rems, is also frequently used; the average radiation dose received by a person in the United States is about 180 millirems per year.

In the SI system (Systeme International d' Unite's, or International System of Units), the gray and the sievert are used to measure radiation absorbed; these units have largely superseded the older rad and rem. The gray (Gy), equal to 100 rads, is now the base unit. It is also expressed as the energy absorption of 1 joule per kilogram of irradiated material. The sievert (Sv) is the absorbed dose of radiation that produces the same biological effect as 1 gray of X rays or gamma rays. The sievert is equal to 100 rems, and has superseded the rem. The becquerel (Bq) measures the radioactive strength of a source, but does not consider effects on tissue. One becquerel is defined as one disintegration (or other nuclear transformation) per second.

Curie

A curie is the standard unit of radioactivity, being the quantity of a radioactive isotope that decays at a rate of 3.7×10^{10} disintegrations per second.

Roentgen

A roentgen is the international unit of the intensity of X rays or gamma rays. It is the quantity of radiation that would produce, in air, ions carrying a positive or negative charge equal to one electrostatic unit in 0.001293 grams of air.

A-4-2.5.3 See A-3-2.4.

A-4-3.3.3.3 Refer to the Chemical Manufacturers Association and Association of American Railroads Hazardous Materials Technical Bulletin *Recommended Terms for Personal Protective Equipment*, issued October 1985. Also refer to NFPA 1991, *Standard on Vapor-Protective Suits for Hazardous Chemical Emergencies;* NFPA 1992, *Standard on Liquid Splash-Protective Suits for Hazardous Chemical Emergencies;* and NFPA 1993, *Standard on Support Function*

Protective Clothing for Hazardous Chemical Operations.

A-4-3.5.4 Safety hazards associated with confined spaces could include the following:

(a) Atmospheric hazards, such as the following:

1. Oxygen-deficient atmosphere
2. Oxygen-enriched atmosphere
3. Flammable/explosive atmosphere
4. Toxic atmosphere

(b) Physical hazards, such as the following:

1. Engulfment hazards
2. Falls/slips
3. Electrical hazards
4. Structural hazards
5. Mechanical hazards

A-4-4.2.2 Emergency procedures for personnel wearing vapor-protective clothing should include procedures for the following:

(a) Loss of air supply

(b) Loss of suit integrity

(c) Loss of verbal communications

(d) Buddy down in hot zone

A-4-4.2.3 Competency for wearing positive pressure self-contained breathing apparatus should have been met as part of Chapter 3.

A-4-4.3.1, A-4-4.3.2 Contact the Chlorine Institute for assistance in obtaining training on the use of the various chlorine kits.

A-4-4.3.7 The safety considerations for product transfer operations should include the following:

(a) Bonding

(b) Grounding

(c) Elimination of ignition sources and shock hazards

A-4.4.3.11 Product removal and transfer considerations should include the following:
(a) Inherent risks associated with such operations

(b) Procedures and safety precautions

(c) Equipment required

A-5-1.3 The following site safety plan considerations are referenced from the *Standard Operating Safety Guides*, EPA, June 1992:

(a) Site description

(b) Entry objectives

(c) On-site organization

(d) On-site control

(e) Hazard evaluation

(f) Personal protective equipment

(g) On-site work plans

(h) Communication procedures

(i) Decontamination procedures

(j) Site safety and health plan

A-5-2.2.3
(a) Types:

1. Alpha

2. Beta

3. Gamma

(b) Units of measurement:

1. Activity

2. Quantity gamma

3. Absorbed dose

(c) Protection factors:

1. Half-life

2. Inverse square law

3. Time, distance, and shielding

A-5-3.4.5.3 Safety precautions should include the following:

(a) Buddy systems

(b) Backup team

(c) Personal protective equipment

A-5-3.4.5.5 See A-4-3.5.4.

A-5-4.2 Criteria/factors should include the following:

(a) Task assignment (based upon strategical and tactical options)

(b) Operational safety

(c) Operational effectiveness

(d) Planning support

(e) Logistical support

(f) Administrative support

A-5-6.1.1 The appropriate steps to transfer command/control of the incident include the following:

(a) Fully brief the incoming command/control person on the details of the incident

(b) Communicate the transfer of command/control to all other interests involved in the incident

A-6-3.1.2 An example of a private sector specialist employee B is a person who regularly loads and unloads tank trucks of the specific chemical involved in the incident as part of their regular job. At a hazardous materials incident, this person would be assigned the task of transferring the contents of the damaged tank truck into another container. The private sector specialist employee B would not be involved with chemicals for which the responder has not been trained. This person would leave the hot or warm zone when this work is completed.

A-6-3.1.3 The following site safety plan considerations are referenced from the *Standard Operating Safety Guides*, EPA, June 1992:

(a) Site description

(b) Entry objectives

(c) On-site organization

(d) On-site control

(e) Hazard evaluation

(f) Personal protective equipment

(g) On-site work plans

(h) Communication procedures

(i) Decontamination procedures

(j) Site safety and health plan

A-6-3.4.1.2 Such factors include heat, cold, working in confined space, working in personal protective equipment, working in a flammable or toxic atmosphere, and pre-existing health conditions.

A-7-4.2 These abilities should include the following:

(a) Task assignment (based upon strategical and tactical options)

(b) Operational safety

(c) Operational effectiveness

(d) Planning support

(e) Information/research

(f) Logistical support

(g) Administrative support

A-8-1.1 These competencies are intended to address even situations when no "hazardous materials branch" is established, such as when only defensive (operational level) activities are being conducted.

If only defensive activities (i.e., at the operational level) are being conducted, the hazardous materials branch safety officer shall be trained to at least the operational level and in addition shall meet the competencies of this chapter.

If the functions and responsibilities of the hazardous materials branch safety officer are performed by the overall incident safety official or on-scene incident commander, that individual shall meet the competencies of this chapter.

A-8-1.2 Under this section, the hazardous materials branch safety officer is given specific responsibilities. It should be understood that even though these duties are to be carried out by the hazardous materials branch safety officer, the incident commander still has overall responsibility for the implementation of these tasks.

A-8-2.1.1 See A-4-2.5.2.2.

A-8-2.1.4 Conditions where protective clothing with thermal protection might be required if entry was made into an area where flammability was a concern can include the following:

(a) Unknown materials involved

(b) Oxygen-enriched atmosphere

(c) Detectable percent of LEL on monitoring instruments

(d) Materials with a wide flammable range present

(e) Reactive materials present

A-8-2.1.5 Conditions under which personnel would not be allowed in the hot zone include the following:

(a) Decontamination procedures not established or in place

(b) Advanced first aid and transportation not available

(c) Flammable atmosphere present

(d) Oxygen-enriched atmosphere of 23.5 percent or greater present

(e) Runaway reaction occurring

(f) Appropriate personal protective clothing not available

(g) No effective action can be taken

(h) Risk outweighs benefit

(i) Personnel not properly trained

(j) Insufficient personnel to perform tasks

A-8-2.1.8 Examples of scenarios that would help prepare emergency responders for situations they might encounter in the field include the following:

(a) Ammonia leaking from a fitting or valve of a railroad tank car

(b) Chlorine leaking from the valve stem of a 150-lb (68-kg) cylinder

(c) Lacquer thinner leaking from a hole in a 55-gal (208-L) drum

(d) Gasoline leaking from a hole in the side of an aluminum tank truck

(e) Carbaryl, a powdered insecticide, found stored in a broken cardboard drum

A-8-2.1.9.4 Such limiting factors include, but are not limited to, operation, calibration, response time, detection range, relative response, sensitivity, selectivity, inherent safety, environmental conditions, and nature of hazard. Also refer to *Standard Operating Safety Guides*, EPA, June 1992.

A-8-3.1 Potential action options are either defensive or offensive in nature. See NFPA 471, *Recommended Practice for Responding to Hazardous Materials Incidents.*

A-8-3.1.1 Safety precautions to observe while mitigating hazards or conditions can include the following:

(a) Elimination of ignition sources

(b) Using monitoring instruments

(c) Stabilizing the container

(d) Establishing emergency evacuation procedures

(e) Ensuring availability of hose lines and foam, when appropriate

(f) Evacuating exposures

(g) Isolating the area

(h) Protecting in place

(i) Wearing proper protective equipment

A-8-3.1.2 Safety precautions to be observed during search and rescue missions at hazardous materials incidents can include the following:

(a) Ensuring availability of appropriate personal protective clothing for all personnel

(b) Using monitoring instruments

(c) Maintaining an escape path

(d) Knowledge of approved hand signals by all personnel

(e) Ensuring availability of communications equipment for each team

(f) Preplanning the search sequence prior to entry

A-8-3.3.1 Benefits of pre-emergency planning include the following:

(a) Identifies and mitigates hazards during the planning process

(b) Familiarizes personnel with facility

(c) Identifies 24-hour responsible parties

(d) Identifies built-in containment systems

(e) Identifies the location of utility and other shutoff/shutdown valves and switches

(f) Identifies location of facility map

(g) Identifies location and quantities of hazardous materials

(h) Identifies vulnerable populations

(i) Identifies facility response capabilities

A-8-3.3.2 Hazards to observe when approaching a hazardous materials incident include the following:

(a) Inhalation hazard

(b) Dermal hazard

(c) Flammable hazard

(d) Reactive hazard

(e) Electrical hazard

(f) Mechanical hazard

A-8-3.3.3 The following are the elements of a site safety plan referenced from the *Standard Operating Safety Guides*, EPA, June 1992:

(a) Site description

(b) Entry objectives

(c) On-site organization

(d) On-site control

(e) Hazard evaluation

(f) Personal protective equipment

(g) On-site work plans

(h) Communication procedures

(i) Decontamination procedures

(j) Site safety and health plan

A-8-3.5.4 Typical action options can include surveying the scene, sampling, monitoring, plugging, and patching.

A-8-3.7.1 The elements of an emergency medical services plan according to NFPA 473, *Standard for Competencies for EMS Personnel Responding to Hazardous Materials Incidents,* include the following:

(a) EMS control activities

(b) EMS component of an incident management system

(c) Medical monitoring of personnel utilizing chemical-protective and high temperature-protective clothing

(d) Triage of hazardous materials victims

(e) Medical treatment for chemically contaminated individuals

(f) Product and exposure information gathering and documentation

A-8-4.4.9 Safety considerations that can minimize secondary contamination include the following:

(a) Control zones are established and enforced

(b) All people and equipment exiting the hot zone are decontaminated

(c) Personnel performing decontamination are properly trained

(d) Personnel performing decontamination are properly protected

See NFPA 473, *Standard for Competencies for EMS Personnel Responding to Hazardous Materials Incidents*.

A-8-4.5.1 Communications systems include in-suit radio communications, hand-held portable radios, air horns, and hand signals.

A-8-5.2.1.1 Examples of such situations or conditions can include, but are not limited to, the following:

(a) Fire or explosion

(b) Container failure

(c) Sudden change in weather conditions

(d) Failure of entry team personal protective clothing and/or equipment

(e) Updated information on identification of hazardous materials(s) involved warranting reassessment of level of protective clothing and equipment being used

A-8-6.2.1 Topics can include, but are not limited to, the following:

(a) The identity of the hazardous materials to which personnel have been or may have been exposed

(b) The signs and symptoms of exposure to the hazardous material(s) involved in the incident

(c) The signs and symptoms of critical incident stress

(d) The duration of a recommended observation period for such signs and symptoms

(e) Procedures to follow in the event of delayed presentation of such signs or symptoms

(f) The name of the individual responsible for post-incident medical contact

(g) Safety and health hazards remaining at the site

A-9-2.1.11 The heat-affected zone is an area in the metal next to the actual weld. This zone is less ductile than either the weld or the metal due to the effect of the welding process. The heat-affected zone is vulnerable to cracks.

A-9-2.1.16 Other methods for determining the amount of liquid include shipping papers, the presence of frost line, the use of touch to feel for the colder liquid level, and the use of heat sensors..

A-9-4.1.9 When bonding and grounding, a ground resistance tester and an ohm meter should be used. The ground resistance tester measures the earth's resistance to a ground rod, and the ohm meter measures the resistance of the connections to ensure electrical continuity. One ground rod might not be enough; more may have to be driven and connected to the first to ensure a good ground. Resistance varies with types of soils.

A-10-2.1.5 See A-9-2.1.16.

A-10-4.1.3 See A-9-4.1.9.

A-11-2.1.9 Methods for determining the amount of liquid include the use of gauges, shipping papers, the presence of frost line, the use of touch or feel for the colder liquid level, and the use of heat sensors.

A-11-2.1.10 See A-9-2.1.11.

A-11-4.1.3, A-11-4.1.7, A-11-4.1.8, A-11-4.1.9 See A-9-4.1.9.

Appendix B Competencies for the Technician with a Flammable Liquids Bulk Storage Specialty

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

B-1 General.

B-1.1 Introduction. Technicians with a flammable liquids bulk storage specialty should meet all requirements of the first responder awareness, operational, and hazardous materials technician levels and the competencies of this Appendix. The technician with a flammable liquids bulk storage specialty also should receive additional training to meet applicable United States Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA), and other appropriate state, local, or provincial occupational health and safety regulatory requirements.

B-1.2 Definition. Technicians with a flammable liquids bulk storage specialty are those persons who, in incidents involving bulk flammable liquid storage tanks, provide support to the hazardous materials technician and other personnel, provide strategical and tactical recommendations to the on-scene incident commander, provide oversight for fire control and product removal operations, and act as a liaison between technicians, fire fighting personnel, and other outside resources. These technicians are expected to use appropriate personal protective clothing and specialized fire, leak, and spill control equipment.

B-1.3 Goal. The goal of this Appendix is to provide the technicians with a flammable liquids bulk storage specialty with the knowledge and skills to perform the following tasks safely. In addition to being competent at the technician levels, the technician with a flammable liquids bulk storage specialty should be able to:

(a) Analyze an incident involving a bulk flammable liquid storage tank to determine the magnitude of the problem by completing the following tasks:

1. Determine the type and extent of damage to the bulk liquid storage tank

2. Predict the likely behavior of the bulk liquid storage tank and its contents in an incident

(b) Plan a response for an incident involving a flammable liquid bulk storage tank within the capabilities and competencies of available personnel, personal protective equipment, and control equipment by completing the following tasks:

1. Determine the response options (offensive, defensive, and nonintervention) for a hazardous materials incident involving flammable liquid bulk storage tanks

2. Ensure that the options are within the capabilities and competencies of available personnel, personal protective equipment, and control equipment

(c) Implement the planned response to a hazardous materials incident involving a flammable liquid bulk storage tank

B-1.4 Mandating of Competencies. This standard does not mandate that hazardous materials response teams performing offensive operations on flammable liquids bulk storage tanks have technicians with a flammable liquids bulk storage specialty. Technicians operating within the bounds of their training as listed in Chapter 4 of this standard are able to intervene in flammable liquids bulk storage incidents. However, if a hazardous materials response team desires to train some or all its technicians to have in-depth knowledge of flammable liquids bulk storage facilities, this Appendix sets out the recommended competencies.

B-2 Competencies - Analyzing the Incident.

B-2.1 Determining the Type and Extent of Damage to the Bulk Storage Tank. Given examples of storage tank incidents, technicians with a flammable liquids bulk storage specialty should describe the type of storage tank, and the type and extent of damage to the tank and its associated piping and fittings. The technician with a flammable liquids bulk storage specialty should be able to:

B-2.1.1 Given examples of various flammable liquid bulk storage operations, identify and describe the procedures for the normal movement and transfer of product(s) into and out of the facility and storage tanks.

Examples should be based upon local or regional facilities and could include marketing terminals, pipeline operations and terminals, refineries, and bulk storage facilities.

B-2.1.2 Given examples of the following atmospheric pressure bulk liquid storage tanks, describe the tank's design and construction features, and types of products commonly found.

(a) Cone roof tank

(b) Open (external) floating roof tank

(c) Open floating roof tank with a geodesic dome external roof

(d) Covered (internal) floating roof tank

According to NFPA 30, *Flammable and Combustible Liquids Code*, atmospheric tanks are defined as storage tanks operating at pressures from atmospheric to 0.5 psig. The floating roof on an open floating roof tank can be a pan roof or a pontoon floating roof, while the floating roof on a covered floating roof tank can be constructed of aluminum, steel or fiberglass, or a pontoon floating roof.

B-2.1.3 Given examples of the following types of low pressure horizontal and vertical bulk liquid storage tanks, describe the tank's uses and design and construction features.

(a) Horizontal tank

(b) Dome roof tank

According to NFPA 30, *Flammable and Combustible Liquids Code*, low pressure tanks are defined as storage tanks operating at pressures from 0.5 psig but not more than 15 psig.

B-2.1.4 Given examples of various atmospheric and low pressure bulk liquid storage tanks, describe the design and purpose of each of the following storage tank components, when present:

(a) Tank shell material of construction

(b) Type of roof and material of construction

(c) Primary and secondary roof seals (as applicable)

(d) Incident venting/pressure relief devices

(e) Tank valves

(f) Tank gauging devices

(g) Tank overfill device

(h) Secondary containment methods (as applicable)

(i) Tank piping and piping supports

(j) Fixed or semi-fixed fire protection system

B-2.1.5 Given three examples of primary and secondary spill confinement measures, describe the design, construction, and incident response considerations associated with each method provided.

B-2.2 Predicting the Likely Behavior of the Bulk Storage Tank and Contents. Technicians with a flammable liquids bulk storage specialty should predict the likely behavior of the tank and its contents. The technician with a flammable liquids bulk storage specialty should be able to:

B-2.2.1 Given examples of different types of bulk flammable liquid storage tank facilities, identify the impact of the following fire and safety features on the behavior of the products during an incident, when present:

(a) Tank spacing

(b) Product spillage and control (impoundment and diking)

(c) Tank venting and flaring systems

(d) Transfer and product movement capabilities

(e) Monitoring and detection systems

(f) Fire protection systems

B-2.2.2 Given a flammable liquid bulk storage tank involved in a fire, identify the factors to be evaluated as part of the risk assessment process, including the following:

(a) Type of storage tank

(b) Product involved

(c) Amount of product within the storage tank

(d) Nature of the incident (e.g., seal fire, tank overfill, full-surface fire, etc.)

(e) Tank spacing and exposures

(f) Fixed or semi-fixed fire protection systems present

B-2.2.3 Given three types of incidents involving flammable liquid bulk storage tanks, describe the likely fire and spill behavior for each incident.

Examples of fire and spill incidents could include tank overfills, seal fires on floating roof tanks, floating roof with a sunk internal roof, tank or piping failures, full surface fire, etc.

B-2.2.4 Describe the causes, hazards, and methods of handling the following conditions as they relate to fires involving flammable liquid bulk storage tanks:

(a) Frothover

(b) Slopover

(c) Boilover

For additional information, see NFPA 30, *Flammable and Combustible Liquids Code* and API 2021, *Guide for Fighting Fires In and Around Flammable and Combustible Atmospheric Petroleum Storage Tanks*.

B-3 Competencies - Planning the Response.

B-3.1 Determining the Response Options. Given an analysis of an incident involving flammable liquid storage tanks, technicians with a flammable liquids bulk storage specialty should determine response options for the storage tank involved. The technician with a flammable liquids bulk storage specialty should be able to:

B-3.1.1 Describe the factors to be evaluated in evaluating and selecting Class B fire fighting foam concentrates for use on flammable liquids.

B-3.1.2 Describe the factors to be considered for the portable application of Class B fire fighting foam concentrates for the following types of incidents:

(a) Flammable liquid spill (no fire)

(b) Flammable liquid spill (with fire)

(c) Flammable liquid storage tank fire

B-3.1.3 Given examples of different types of flammable liquid bulk storage tanks, identify and describe the application, use, and limitations of the types of fixed and semi-fixed fire protection systems that can be used, including the following:

(a) Foam chambers

(b) Catenary systems

(c) Subsurface injection system

(d) Fixed foam monitors

(e) Foam/water sprinkler systems

B-3.1.4 Describe the hazards, safety procedures, and tactical guidelines for handling an accumulated (in-depth) flammable liquid-spill fire.

B-3.1.5 Describe the hazards, safety procedures, and tactical guidelines for handling product/water drainage and runoff problems that can be created at a flammable liquid bulk storage tank fire.

B-3.1.6 Describe the hazards, safety procedures, and tactical guidelines for handling a flammable liquid bulk storage tank with a sunken floating roof.

B-3.1.7 Given a flammable liquid storage tank fire, describe the methods and associated safety considerations for extinguishing the following types of fires by using portable application devices:

(a) Pressure vent fire

(b) Seal fire on an open floating roof tank

(c) Seal fire on an internal floating roof tank

(d) Full-surface fire on an internal floating roof tank

(e) Full-surface fire on an external floating roof tank

(f) Dike fire

(g) Pipeline manifold fire

B-3.1.8 Given the size, dimensions, and products involved for a flammable liquid-spill fire, determine the following:

(a) Appropriate extinguishing agent

(b) Appropriate application method (both portable and fixed system application)

(c) Appropriate application rate and duration

(d) Required amount of Class B foam concentrate and required amount of water

(e) Volume and rate of application of water for cooling exposed tanks

For additional information, see NFPA 11, *Standard for Low-Expansion Foam*.

B-3.1.9 Given the size, dimensions, and product involved for a flammable liquid storage tank fire, determine the following:

(a) Appropriate extinguishing agent

(b) Appropriate application method (both portable and fixed system application)

(c) Appropriate application rate and duration

(d) Required amount of Class B foam concentrate and required amount of water

(e) Volume and rate of application of water for cooling involved and exposed tanks

For additional information, see NFPA 11, *Standard for Low-Expansion Foam*.

B-3.1.10 Given the size, dimensions, and product involved for a fire involving a single flammable liquid bulk storage tank and its dike area, determine the following:

(a) Appropriate extinguishing agent

(b) Appropriate application method (both portable and fixed system application)

(c) Appropriate application rate and duration

(d) Required amount of Class B foam concentrate and required amount of water

(e) Volume and rate of application of water for cooling involved and exposed tanks

For additional information, see NFPA 11, *Standard for Low-Expansion Foam*.

B-3.1.11 Given the size, dimensions, and product involved for multiple flammable liquid storage tanks burning within a common dike area, determine the following:

(a) Appropriate extinguishing agent

(b) Appropriate application method (both portable and fixed system application)

(c) Appropriate application rate and duration

(d) Amount of Class B foam concentrate and water required

(e) Volume and rate of application of water for cooling involved and exposed tanks

For additional information, see NFPA 11, *Standard for Low-Expansion Foam*.

B-4 Competencies - Implementing the Planned Response.

B-4.1 Implementing the Planned Response. Given an analysis of an incident involving flammable liquid storage tanks, technicians with a flammable liquids bulk storage specialty should implement or oversee the implementation of the selected response options safely and effectively. The technician with a flammable liquids bulk storage specialty should be able to:

B-4.1.1 Given a simulated flammable liquid fire, demonstrate the safe and effective methods for extinguishing the following types of fires by using portable application devices:

(a) Valve and/or flange fire

(b) Pump fire (horizontal or vertical)

(c) Pressure vent fire

(d) Large spill fire

(e) Storage tank fire

B-4.1.2 Given a simulated incident involving a three-dimensional flammable liquid fire, demonstrate the safe and effective method for controlling the fire by using portable application devices.

B-4.1.3 Demonstrate bonding and grounding procedures for the transfer of flammable liquids, including the following:

(a) Selection of proper equipment

(b) Sequence of bonding and grounding connections

(c) Proper testing of bonding and grounding connections

B-4.1.4 Given a simulated flammable liquid spill from a bulk storage tank or pipeline, describe the procedures for site safety and fire control during cleanup and removal operations.

Appendix C Competencies for the Technician with a Flammable Gases Bulk Storage Specialty

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

C-1 General.

C-1.1 Introduction. Technicians with a flammable gases bulk storage specialty should meet all requirements of the first responder awareness, operational, and hazardous materials technician levels and the competencies of this Appendix. The technician with a flammable gases bulk storage specialty also should receive additional training to meet applicable United States Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA), and other appropriate state, local, or provincial occupational health and safety regulatory requirements.

C-1.2 Definition. Technicians with a flammable gases bulk storage specialty are those persons who, in incidents involving bulk flammable gas storage tanks, provide support to the hazardous materials technician and other personnel, provide strategical and tactical recommendations to the on-scene incident commander, provide oversight for fire control and product removal operations, and act as a liaison between technicians, fire fighting personnel, and other outside resources. These technicians are expected to use appropriate personal protective clothing and specialized fire, leak, and spill control equipment.

C-1.3 Goal. The goal of this Appendix is to provide the technicians with a flammable gases bulk storage specialty with the knowledge and skills to perform the following tasks safely. In addition to being competent at the technician levels, the technician with a flammable gases bulk storage specialty should be able to:

(a) Analyze an incident involving a bulk flammable gas storage tank to determine the magnitude of the problem by completing the following tasks:

1. Determine the type and extent of damage to the bulk storage tank
2. Predict the likely behavior of the bulk storage tank and its contents in an incident

(b) Plan a response for an incident involving a flammable gas bulk storage tank within the capabilities and competencies of available personnel, personal protective equipment, and control equipment by completing the following tasks:

1. Determine the response options (offensive, defensive, and nonintervention) for a hazardous materials incident involving flammable gas bulk storage tanks

2. Ensure that the options are within the capabilities and competencies of available personnel, personal protective equipment, and control equipment

(c) Implement the planned response to a hazardous materials incident involving a flammable gas bulk storage tank

C-1-4 Mandating of Competencies. This standard does not mandate that hazardous materials response teams performing offensive operations on flammable gas bulk storage tanks have technicians with a flammable gases bulk storage specialty. Technicians operating within the bounds of their training as listed in Chapter 4 of this standard are able to intervene in flammable gas bulk storage incidents. However, if a hazardous materials response team desires to train some or all its technicians to have in-depth knowledge of flammable gas bulk storage facilities, this Appendix sets out the recommended competencies.

C-2 Competencies - Analyzing the Incident.

C-2.1 Determining the Type and Extent of Damage to the Bulk Storage Tank. Given examples of storage tank incidents, technicians with a flammable gases bulk storage specialty should describe the type of storage tank and extent of damage to the tank and its associated piping and fittings. The technician with a flammable gases bulk storage specialty should be able to:

C-2.1.1 Given examples of various flammable gas bulk storage operations, identify and describe the procedures for the normal movement and transfer of product(s) into and out of the facility storage tanks.

Examples should be based upon local or regional facilities and could include marketing terminals, pipeline operations and terminals, refineries, bulk storage facilities, and underground storage caverns.

C-2.1.2 Given examples of the following types of high pressure bulk gas storage tanks, describe the tank's uses and design and construction features.

(a) Horizontal (bullet) tank

(b) Spherical tank

Additional information on the design and construction of high pressure bulk gas storage tanks can be referenced from NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, and API 2510-A, *Fire Protection Considerations for the Design and Operation of Liquefied Petroleum Gas (LPG) Storage Facilities*.

C-2.1.3 Given examples of various high pressure bulk gas storage tanks, point out and explain the design and purpose of each of the following storage tank components and fittings, when present:

(a) Liquid valve and vapor valve

(b) Safety relief valve

(c) Gauging device

(d) Tank piping and piping supports

(e) Fixed or semi-fixed fire protection system

C-2.2 Predicting the Likely Behavior of the Bulk Storage Tank and Contents. Technicians with a flammable gases bulk storage specialty should predict the likely behavior of the tank and its contents. The technician with a flammable gases bulk storage specialty should be able to:

C-2.2.1 Given examples of different types of bulk flammable gas storage tank facilities, identify the impact of the following fire and safety features on the behavior of the products during an incident, when present.

(a) Tank spacing

(b) Product spillage and control (impoundment and diking)

(c) Tank venting and flaring systems

(d) Transfer and product movement capabilities

(e) Monitoring and detection systems

(f) Fire protection systems

C-2.2.2 Given examples of different types of flammable gas bulk storage tanks, identify and describe the application, use, and limitations of the types of fixed and semi-fixed fire protection systems that can be used, including the following:

(a) Water spray systems

(b) Fixed foam monitors

(c) Fixed hydrocarbon monitoring systems

C-2.2.3 Given a flammable gas bulk storage tank and its associated piping, describe the likely breach/release mechanisms and fire scenarios.

C-3 Competencies - Planning the Response.

C-3.1 Determining the Response Options. Given an analysis of an emergency involving flammable gas storage tanks, technicians with a flammable gases bulk storage specialty should determine response options for the storage tank involved. The technician with a flammable gases bulk storage specialty should be able to:

C-3.1.1 Describe the hazards, safety, and tactical considerations required for the following types of flammable gas incidents:

(a) Flammable vapor release (no fire)

(b) Flammable vapor release (with fire)

(c) Liquefied flammable gas release (no fire)

(d) Liquefied flammable gas release (with fire)

C-3.1.2 Given a flammable gas storage tank with a liquid leak from the safety relief valve, describe the hazards, safety, and tactical considerations for controlling this type of leak.

C-3.1.3 Given a flammable gas fire from an elevated structure (e.g., tower or column), describe the hazards, safety, and tactical considerations for controlling this type of leak.

C-3.1.4 Describe the purpose of, potential risks associated with, procedures for, equipment required to implement, and safety precautions for the following product removal techniques:

(a) Transfer of liquids and vapors

(b) Flaring of liquids and vapors

(c) Venting

(d) Hot and cold tapping

C-3.1.5 Describe the effect flaring or venting of gas or liquid has on the pressure in the tank (flammable gas or flammable liquid product).

C-3.1.6 Describe the hazards, safety procedures, and tactical guidelines for handling product/water drainage and runoff problems that can be created at a flammable gas bulk storage facility incident.

C-4 Competencies - Implementing the Planned Response.

C-4.1 Implementing the Planned Response. Given an analysis of an emergency involving flammable gas bulk storage tanks, technicians with a flammable gases bulk storage specialty should implement or oversee the implementation of the selected response options safely and effectively. The technician with a flammable gases bulk storage specialty should be able to:

C-4.1.1 Given a simulated flammable gas incident, demonstrate the safe and effective method for controlling the following types of emergencies by using portable application devices:

(a) Unignited vapor release

(b) Valve and/or flange vapor release (no fire)

(c) Valve and/or flange fire

(d) Pump fire (horizontal or vertical)

C-4.1.2 Given a simulated incident involving the simultaneous release of both flammable liquids and flammable gases, demonstrate the safe and effective method for controlling the following types of emergencies by using portable application devices:

(a) Unignited vapor release

(b) Flange fire

(c) Pump seal fire

C-4.1.3 Demonstrate bonding and grounding procedures for the transfer of flammable gases, including the following:

(a) Selection of proper equipment

(b) Sequence of bonding and grounding connections

(c) Proper testing of bonding and grounding connections

C-4.1.4 Given a simulated flammable gas incident from a bulk storage tank or pipeline, describe the procedures for site safety and fire control during cleanup and removal operations.

Appendix D Referenced Publications

D-1 The following documents or portions thereof are referenced within this standard for informational purposes only and are thus not considered part of the requirements of this standard unless also listed in Chapter 12. The edition indicated here for each reference is the current edition as of the date of the NFPA issuance of this standard.

Standard for Competencies for EMS Personnel Responding to Hazardous Materials Incidents

1997 Edition

This edition of NFPA 473, *Standard for Competencies for EMS Personnel Responding to Hazardous Materials Incidents,* was prepared by the Technical Committee on Hazardous Materials Response Personnel and acted on by the National Fire Protection Association, Inc., at its Fall Meeting held November 18-20, 1996, in Nashville, TN. It was issued by the Standards Council on January 17, 1997, with an effective date of February 7, 1997, and supersedes all previous editions.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

This edition of NFPA 473 was approved as an American National Standard on February 7, 1997.

Origin and Development of NFPA 473

Following the development of NFPA 471 and NFPA 472, the Hazardous Materials Response Personnel Committee undertook the development of this standard relating to the professional competencies of emergency medical personnel who may be required to respond to hazardous materials incidents. The roles and responsibilities of EMS personnel at hazardous materials incidents had not been identified in the majority of emergency response systems. In this 1997 edition, the committee reviewed the document for consistency and clarity of the competencies.

Committee Scope: This Committee shall have primary responsibility for documents on the requirements for the professional competence, training, procedures, and equipment for emergency responders to hazardous materials incidents.

NFPA 473

Standard for Competencies for EMS Personnel Responding to Hazardous Materials Incidents

1997 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates that explanatory material on the paragraph can be found in Appendix A.
Information on referenced publications can be found in Chapter 4 and Appendix F.

Chapter 1 Administration

1-1 Scope.

This standard identifies the levels of competence required of emergency medical services (EMS) personnel who respond to hazardous materials incidents. It specifically covers the requirements for basic life support and advanced life support personnel in the prehospital setting.

1-2* Purpose.

The purpose of this standard is to specify minimum requirements of competence and to enhance the safety and protection of response personnel and all components of the emergency medical services system. It is not the intent of this standard to restrict any jurisdiction from exceeding these minimum requirements. (*See Appendix B.*)

1-3 Definitions.

Advanced Life Support (ALS).

Emergency Medical Technician-Paramedic (EMT-P). An individual who has successfully completed a course of instruction that meets or exceeds the requirements of the U.S. Department of Transportation National Standard EMT-Paramedic Curriculum and who holds an EMT-P certification from the authority having jurisdiction.

Emergency Medical Technician-Intermediate (EMT-I). (This category can include EMT-Cardiac.) An individual who has completed a course of instruction that includes selected modules of the U.S. Department of Transportation National Standard EMT-Paramedic Curriculum and who holds an intermediate level EMT-I or EMT-C certification from the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Basic Life Support (BLS).

*Emergency Medical Technician-Ambulance (EMT-A).** An individual who has completed a specified EMT-A course developed by the U.S. Department of Transportation and who holds an EMT-A certification from the authority having jurisdiction.

*Emergency Care First Responder (ECFR).** An individual who has successfully completed the specified Emergency Care First Responder course developed by the U.S. Department of Transportation and who holds an ECFR certification from the authority having jurisdiction.

Cold Zone. The control zone of a hazardous materials incident that contains the command post and such other support functions as are deemed necessary to control the incident. This zone is also referred to as the clean zone or support zone in other documents.

Competence. The possession of knowledge, skills, and judgment needed to perform indicated objectives satisfactorily.

Components of EMS System. The parts of a comprehensive plan to treat an individual in need of emergency medical care following an illness or injury. These parts include the following:

(a) First responders

(b) Emergency dispatching

(c) EMS agency response

(d) Hospital emergency departments

(e) Specialized care facilities

Confinement. Those procedures taken to keep a material, once released, in a defined or local area.

Contaminant. A hazardous material that physically remains on or in people, animals, the environment, or equipment, thereby creating a continuing risk of direct injury or a risk of exposure.

Control. The procedures, techniques, and methods used in the mitigation of a hazardous materials incident, including containment, extinguishment, and confinement.

Control Zones. Areas at a hazardous materials incident that are designated based on safety and the degree of hazard. Many terms are used to describe the zones involved in a hazardous materials incident. For purposes of this standard, these zones shall be defined as the hot, warm, and cold zones.

Decontamination (Contamination Reduction). The physical and/or chemical process of reducing and preventing the spread of contamination from persons and equipment involved in a hazardous materials incident.

Decontamination Area. The area, usually located within the warm zone, where decontamination takes place.

Demonstrate. To show by actual performance. This performance can be supplemented by simulation, explanation, illustration, or a combination of these.

Describe. To explain verbally or in writing using standard terms recognized in the hazardous materials response community.

Gross Decontamination. The initial phase of the decontamination process during which the amount of surface contaminant is significantly reduced. This phase can include mechanical removal and initial rinsing.

Hazard/Hazardous. Capable of posing an unreasonable risk to health, safety, or the environment; capable of doing harm.

Hazardous Materials.* A substance (solid, liquid, or gas) capable of creating harm to people, property, and the environment.

Class/Division. The general category of hazard assigned to a hazardous material under the DOT regulations. The division is a subdivision of a hazard class.

Class 1 (Explosives)

Division 1.1 Explosives with a mass explosion hazard

Division 1.2 Explosives with a projection hazard

Division 1.3 Explosives with predominantly a fire hazard

Division 1.4 Explosives with no significant blast hazard

Division 1.5 Very insensitive explosives

Division 1.6 Extremely insensitive explosives

Class 2

Division 2.1 Flammable gas

Division 2.2 Nonflammable, nonpoisonous compressed gas

Division 2.3 Poison gas

Division 2.4 Corrosive gas (Canadian designation)

Class 3 (Flammable Liquid)

Division 3.1 Flammable liquids, flashpoint <0°F

Division 3.2 Flammable liquids, flashpoint 0°F and above but <73°F

Division 3.3 Flammable liquids, flashpoint 73°F and up to 141°F

Combustible Liquid

Class 4

Division 4.1 Flammable solid

Division 4.2 Spontaneously combustible material

Division 4.3 Dangerous when wet material

Class 5

Division 5.1 Oxidizer

Division 5.2 Organic peroxide

Class 6

Division 6.1 Poisonous material

Division 6.2 Infectious material

Class 7 (Radioactive material)

Class 8 (Corrosive material)

Class 9 (Miscellaneous hazardous material)

ORM-D material

Hazardous Materials Response Team. The hazardous materials response team is an organized group of trained response personnel, operating under an emergency response plan and appropriate standard operating procedures, who handle and control actual or potential leaks or spills of hazardous materials requiring possible close approach to the material. The team members respond to releases or potential releases of hazardous materials for the purpose of control or stabilization of the incident.

High Temperature-Protective Clothing. Protective clothing designed to protect the wearer from short-term high temperature exposures. This type of clothing is usually of limited use in dealing with chemical commodities.

Hot Zone. The area immediately surrounding a hazardous materials incident, which extends far enough to prevent adverse effects from hazardous materials releases to personnel outside the zone. This zone is also referred to as the exclusion zone or restricted zone in other documents.

Identify. To select or indicate verbally or in writing using standard terms to establish the identity of; the fact of being the same as the one described.

Incident. An emergency involving the release or potential release of a hazardous material, with or without fire.

Incident Commander. The person responsible for all decisions relating to the management of the incident. The incident commander is in charge of the incident site. This term is equivalent to the on-scene incident commander.

Incident Management System. An organized system of roles, responsibilities, and standard operating procedures used to manage emergency operations, as described in NFPA 1561, *Standard on Fire Department Incident Management System*. Such systems are often referred to as “Incident Command Systems.”

Local Area. A geographic area that includes the defined response area and receiving facilities for an EMS agency.

Local Emergency Planning Committee (LEPC). (As mandated by SARA Title III.) Includes elected state and local officials, police, fire, civil defense, public health professionals, environmental, hospital, and transportation officials as well as representatives of facilities, community groups, and the media.

Medical Control. The physician providing direction for patient care activities in the prehospital setting.

Medical Surveillance. The ongoing process of medical evaluation of hazardous materials response team members and public safety personnel who respond to a hazardous materials incident.

Objective. A goal that is achieved through the attainment of a skill, knowledge, or both, that can be observed or measured.

Personal Protective Equipment. The equipment provided to shield or isolate a person from the chemical, physical, and thermal hazards that can be encountered at a hazardous materials incident. Personal protective equipment includes both personal protective clothing and respiratory protection. Adequate personal protective equipment should protect the respiratory system, skin, eyes, face, hands, feet, head, body, and hearing.

Protective Clothing. Equipment designed to protect the wearer from the heat and/or hazardous materials that might contact the skin or eyes. Protective clothing is divided into the following three types:

(a) Chemical-protective clothing

1. Liquid splash-protective clothing

2. Vapor-protective clothing

(b) High temperature-protective clothing

(c) Structural fire fighting protective clothing

Protocol. A series of sequential steps describing the precise patient treatment.

Region. A geographic area that includes the local and neighboring jurisdiction for an EMS agency.

Respiratory Protection. Equipment designed to protect the wearer from the inhalation of contaminants. Respiratory protection is divided into the following three types:

(a) Positive pressure self-contained breathing apparatus

(b) Positive pressure air line respirators

(c) Air purifying respirators

Safely. To perform the objective without injury to self or others, property, or the environment.

Secondary Contamination.* The transfer of contaminants to personnel or equipment outside the hot zone.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Termination. That portion of incident management in which personnel are involved in documenting safety procedures, site operations, hazards faced, and lessons learned from the incident. Termination is divided into three phases: debriefing the incident, post-incident analysis, and critiquing the incident.

Understanding. The process of gaining or developing the meaning of various types of materials or knowledge.

Warm Zone. The area where personnel and equipment decontamination and hot zone support takes place. It includes control points for access corridor and thus assists in reducing the spread of contamination. This is also referred to as the decontamination, contamination reduction, or limited access zone in other documents.

Chapter 2 Competencies for EMS/HM Level I Responders

2-1 General.

2-1.1 Introduction.

All EMS personnel at EMS/HM Level I, in addition to their BLS or ALS certification, shall be trained to meet at least the first responder awareness level as defined in NFPA 472, *Standard for Professional Competence of Responders to Hazardous Materials Incidents*, and all competencies of this chapter.

2-1.2* Definition.

EMS personnel at EMS/HM Level I are those persons who, in the course of their normal duties, might be called on to perform patient care activities in the cold zone at a hazardous materials incident. EMS/HM Level I responders shall provide care only to those individuals who no longer pose a significant risk of secondary contamination.

2-1.3 Goal.

The goal of the competencies at EMS/HM Level I shall be to provide the individual with the knowledge and skills necessary to safely deliver emergency medical care in the cold zone. Therefore the EMS/HM Level I responder shall be able to:

(a) Analyze a hazardous materials emergency to determine what risks are present to the provider and the patient by completing the following tasks:

1. Determine the hazards present to the Level I responder and the patient in a hazardous materials incident

2. Assess the patient to determine the risk of secondary contamination

(b) Plan a response to provide the appropriate level of emergency medical care to persons involved in hazardous materials incidents by completing the following tasks:

1. Describe the role of the Level I responder in a hazardous materials incident

2. Plan a response to provide the appropriate level of emergency medical care in a hazardous materials incident

3. Determine if the personal protective equipment provided is appropriate

4. Determine if the equipment and supplies provided are adequate

(c) Implement the planned response by completing the following tasks:

1. Perform the necessary preparations for receiving the hazardous materials patient and preventing secondary contamination

2. Treat the hazardous materials patient

3. Transport the patient as appropriate

(d) Terminate the incident

2-2 Competencies — Analyzing the Hazardous Materials Incident.

2-2.1

Given an emergency involving hazardous materials, the Level I responder shall determine the hazards to the responder and the patient in that situation. The Level I responder shall be able to:

(a) Assess the nature and severity of the incident (size-up) as they pertain to EMS responsibilities at a hazardous materials incident with evaluation of available resources and a request for any needed assistance

(b) Evaluate the environmental factors as they affect patient care

(c) Identify the information resources available and how to access the following:

1. Poison Control Center

2. Medical control

3. Material safety data sheets

4. Reference guidebooks

5. Hazardous materials data bases

6. Technical information centers (CHEMTREC, NRC, etc.)

7. Technical specialists

8. Agency for Toxic Substances and Disease Registry (ATSDR)

(d) Given a pesticide label, identify and explain the significance of the following:

1. Name of pesticide

2. Signal word

3. EPA registration number

4. Precautionary statement

5. Hazard statement

6. Active ingredient

2-2.2

Given a hazardous materials incident with a patient(s), the Level I responder shall determine the risk of secondary contamination. The Level I responder shall be able to:

(a) Explain the basic toxicological principles relative to assessment and treatment of victims exposed to hazardous materials, including the following:

1. Acute and delayed toxicity

2. Routes of exposure to toxic materials

3. Local and systemic effects

4. Dose response as it relates to risk assessment

5.* Synergistic effects

6. Health hazard as determined by assessing toxicity, exposure, and dose

(b) Describe how the chemical contamination of patients alters the principles of triage in hazardous materials incidents

(c) Explain the need for patient decontamination procedures at hazardous materials incidents

(d) Describe how the potential for secondary contamination determines the extent of patient decontamination required

(e) Describe the way that personnel, personal protective clothing, apparatus, tools, and equipment become contaminated and the importance and limitations of decontamination procedures

(f) Explain the decontamination procedures as defined by the authority having jurisdiction for patients, personnel, personal protective equipment, and apparatus at hazardous materials incidents

2-3 Competencies — Planning the Response.

2-3.1

Given a plan of action by the incident commander, the Level I responder shall describe their role in a hazardous materials incident as identified in the local emergency response plan or organization's standard operating procedures, including the following:

(a) Describe the emergency medical component for the hazardous materials incident response plan as developed by the authority having jurisdiction

(b) State the Level I responder's role within the hazardous materials response plan as developed by the authority having jurisdiction

(c) State the Level I responder's role within the hazardous materials incident management system

2-3.2

Given a hazardous materials incident, the Level I responder shall be able to plan a response to provide the appropriate level of emergency medical care, including the standard operating procedures for the medical management of persons exposed to hazardous materials, as specified by the authority having jurisdiction.

2-3.3

Given the name of the hazardous material and the type, duration, and extent of exposure and decontamination process, the Level I responder shall determine if available personal protective clothing and equipment are appropriate to implement the planned response. The Level I responder shall be able to:

(a) Describe the application, use, and limitations of the following:

1. Street clothing and work uniforms
2. Structural fire fighting protective clothing
3. Respiratory protective equipment
4. Chemical-protective clothing

2-3.4

Given a simulated hazardous materials incident, the Level I responder shall determine if available equipment and supplies are appropriate to implement the planned response. The Level I responder shall be able to describe the equipment and supplies available to the Level I responder for the care and transportation of the hazardous materials incident patient.

2-4 Competencies — Implementing the Planned Response.

2-4.1

Given a plan for providing patient care at a hazardous materials incident, the Level I responder shall be able to perform the preparations necessary to receive the patient for treatment and transport. The Level I responder shall be able to:

(a) List the information that needs to be communicated to the Medical Control/Receiving facility regarding the hazardous materials incident, including the following:

1. Type and nature of the incident
2. Chemical involved and its physical state
3. Number of potential patients

(b) Describe the procedure for preparing the vehicle and equipment for the patient

(c) Demonstrate the proper donning, doffing, usage, and limitations of all personal protective equipment provided to the Level I responder by the authority having jurisdiction for use in their hazardous materials response activities

(d) Describe the concept of patient transfer from the incident site to the decontamination area and then to the treatment area

2-4.2

Given a patient from a hazardous materials incident, the Level I responder shall provide patient care consistent with the planned response and the organization’s standard operating procedures. The Level I responder shall be able to:

(a) Describe how chemical contamination alters the assessment and care of the hazardous materials patient

(b) List the common signs and symptoms and describe the EMS treatment protocols for the following:

1. Corrosives (e.g., acid, alkali)
2. Pulmonary irritants (e.g., ammonia, chlorine)
3. Pesticides (e.g., organophosphates, carbamates)
4. Chemical asphyxiants (e.g., cyanide, carbon monoxide)
5. Hydrocarbon solvents (e.g., xylene, methylene chloride)

(c) Explain the potential risk with invasive procedures for hazardous materials patients

(d) Demonstrate the ability to perform the following EMS functions within the incident management system during incidents involving multiple hazardous materials patients:

1.* EMS control

2. Triage

3. Treatment

4. Disposition and transportation

2-4.3

Given a patient from a hazardous materials incident, the Level I responder shall transport the patient as specified in the local emergency response plan and the organization’s standard operating procedures. The Level I responder shall be able to:

(a) Identify the capabilities of the medical facilities available in the local area to receive hazardous materials patients

(b) Identify the acceptable vehicles available to transport hazardous materials patients from the treatment area to a receiving facility

(c) List the pertinent information that needs to be communicated to the receiving facility, including the following:

1. Estimated time of arrival
2. Age/sex
3. Patient condition/chief complaint

4. Associated injuries

5. Routes, extent, and duration of chemical exposure

6. Pertinent medical history

7. Signs and symptoms

8. Vital signs

9. Treatment, including decontamination and patient response

10. Pertinent chemical characteristics

(d) Describe the actions necessary for the coordinated delivery of hazardous materials incidents patients to a receiving facility

(e) Explain the special hazards associated with air transportation of patients exposed to hazardous materials

2-5 Competencies — Terminating the Incident.

2-5.1

Upon termination of the hazardous materials incident, the Level I responder shall complete the reporting, documentation, and EMS termination activities as required by the local emergency response plan or the organization's standard operating procedures. The Level I responder shall be able to:

(a) List the information to be gathered regarding the exposure of the patient and the EMS provider and describe the proper reporting procedures, including the following:

1. Product information

2. Routes, extent, and duration of exposure

3. Actions taken to limit exposure and contamination

4. Treatment rendered

5. Patient condition and disposition

(b) Identify situations that can necessitate critical incident stress debriefing intervention

(c) Describe the EMS provider's role in the post-incident critique

Chapter 3 Competencies for EMS/HM Level II Responders

3-1 General.

3-1.1 Introduction.

All personnel at EMS/HM Level II shall be certified to the EMT-A level or higher and shall meet all competencies for EMS/HM Level I in addition to all the competencies of this chapter.

3-1.2 Definition.

Personnel at EMS/HM Level II are those persons who, in the course of their normal activities, might be called upon to perform patient care activities in the warm zone at hazardous materials incidents. EMS/HM Level II responder personnel might be required to provide care to those individuals who still pose a significant risk of secondary contamination. In addition, personnel at this level shall be able to coordinate EMS activities at a hazardous materials incident and provide medical support for hazardous materials response personnel.

3-1.3 Goal.

The goal of the competencies at EMS/HM Level II shall be to provide the Level II responder with the knowledge and skills necessary to perform and/or coordinate patient care activities and medical support of hazardous materials response personnel in the warm zone. Therefore the Level II responder shall be able to:

(a) Analyze a hazardous materials incident to determine the magnitude of the problem in terms of outcomes by completing the following tasks:

1. Determine the hazards present to the Level II responder and the patient in a hazardous materials incident

2. Assess the patient to determine the patient care needs and the risk of secondary contamination

(b) Plan a response to provide the appropriate level of emergency medical care to persons involved in hazardous materials incidents and to provide medical support to hazardous materials response personnel by completing the following tasks:

1. Describe the role of the Level II responder in a hazardous materials incident

2. Plan a response to provide the appropriate level of emergency medical care in a hazardous materials incident

3. Determine if the personal protective equipment provided to EMS personnel is appropriate

(c) Implement the planned response by completing the following tasks:

1. Perform the necessary preparations for receiving the patient

2. Perform necessary treatment to the hazardous materials patient

3. Coordinate and manage the EMS component of the hazardous materials incident

4. Perform medical support of hazardous materials incident response personnel

(d) Terminate the incident

3-2 Competencies — Analyzing the Hazardous Materials Incident.

3-2.1

Given an emergency involving hazardous materials, the Level II responder shall determine the hazards to the responders and the patient in that situation. The Level II Responder shall be able to:

(a) Define the following chemical and physical properties and describe their importance in the risk assessment process:

1. Boiling point
2. Flammable (explosive) limits
3. Flash point
4. Ignition temperature
5. Specific gravity
6. Vapor density
7. Vapor pressure
8. Water solubility

(b) Define the following terms:

1. Alpha radiation
2. Beta radiation
3. Gamma radiation

(c) Define the following toxicological terms and explain their use in the risk assessment process:

1. Threshold limit value (TLV-TWA)
2. Lethal concentration and doses ($LD_{50/100}$)
3. Parts per million/billion (ppm/ppb)
4. Immediately dangerous to life and health (IDLH)
5. Permissible exposure limit (PEL)
6. Short-term exposure limit (TLV-STEL)
7. Ceiling level (TLV-C)

(d) Given a specific hazardous material and using the information sources available to the Level II responder, demonstrate extracting appropriate information about the physical characteristics and chemical properties, hazards, and suggested medical response considerations for that material

3-2.2

Given a hazardous materials incident with a patient(s), the Level II responder shall assess the patient and conditions to determine the risk of secondary contamination. The Level II responder shall be able to:

(a) Identify sources of technical information for the performance of patient decontamination

(b) Identify the factors that influence the decision of when and where to treat the patient and the extent of patient care, including the following:

1. Hazardous material toxicity
2. Patient condition

3. Availability of decontamination

3-3 Competencies — Planning the Response.

3-3.1

Given a plan of action by the incident commander, the Level II responder shall describe his or her role in a hazardous materials incident as identified in the local emergency response plan or the organization's standard operating procedures. The Level II responder shall be able to describe the importance of coordination between various agencies at the scene of hazardous materials incidents.

3-3.2

Given a hazardous materials incident, the Level II responder shall plan a response to provide the appropriate level of emergency medical care to persons involved in hazardous materials incidents and to provide medical support to hazardous materials response personnel. The Level II responder shall be able to:

(a) Given a simulated hazardous materials incident, assess the problem and formulate and implement a plan including the following:

1. EMS control activities

2. EMS component of an incident management system

3. Medical monitoring of personnel utilizing chemical-protective and high temperature-protective clothing

4. Triage of hazardous materials victims

5. Medical treatment for chemically contaminated individuals

6. Product and exposure information gathering and documentation

(b) Describe the importance of pre-emergency planning relating to specific sites

(c) Describe the hazards and precautions to be observed when approaching a hazardous materials incident

(d) Describe the considerations associated with the placement, location, and setup of the patient decontamination site

(e) Explain the advantages and limitations of the following techniques of decontamination and how they are or are not applicable to patient decontamination:

1. Absorption

2. Chemical degradation

3. Dilution

4. Isolation

(f) Describe when it would be prudent to pull back from a hazardous materials incident

3-3.3

Given the name of the hazardous material and the type, duration, and extent of exposure, the Level II responder shall determine if the protective clothing and equipment available to EMS personnel is appropriate to implement the planned response. The Level II responder shall be able to:

(a) Identify the advantages and dangers of search and rescue missions at hazardous materials incidents

(b) Identify the advantages and hazards associated with the rescue, extrication, and removal of a victim from a hazardous materials incident

(c) Describe the types, application, use, and limitations of protective clothing used by EMS personnel at hazardous materials incidents

(d) Demonstrate how to interpret a chemical compatibility chart for chemical-protective clothing

3-4 Competencies — Implementing the Planned Response.

3-4.1

Given a plan for providing patient care at a hazardous materials incident, the Level II responder shall perform the preparations necessary to receive the patient for treatment and transport. The Level II responder shall be able to demonstrate the proper donning, doffing, and usage of all personal protective equipment provided to the Level II responder by the authority having jurisdiction.

3-4.2

At the scene of a hazardous materials incident, the Level II responder shall be able to provide or coordinate the patient care. The Level II responder shall be able to:

(a) Given a simulated hazardous materials incident and using local available resources, demonstrate the implementation of the patient decontamination procedure (*see Appendix E*)

(b) Explain the principles of emergency decontamination and its application for critically ill patients

(c) Demonstrate the ability to coordinate patient care activities, including treatment, disposition, and transportation of patients

3-4.3

Given a simulated hazardous materials incident, the Level II responder shall be able to demonstrate the ability to establish and manage the EMS component of an incident management system.

3-4.4

Given a simulated hazardous materials incident, the Level II responder shall perform medical support of hazardous materials incident response personnel. The Level II responder shall be able to:

(a) Explain the components of pre-entry and post-entry assessment, including the following:

1. Vital signs

2. Body weight

3. General health

4. Neurological status

5. Electrocardiographic rhythm strip, if available

(b) Explain the following factors and how they influence heat stress for hazardous materials response personnel:

1. Hydration

2. Physical fitness

3. Environmental factors

4. Activity levels

5. Level of PPE

6. Duration of entry

(c) Explain the medical monitoring protocols and demonstrate medical monitoring procedures for personnel at the scene of a hazardous materials incident

(d) Describe the criteria for site selection of a medical monitoring station

(e) Demonstrate the ability to set up and operate a medical monitoring station

(f) Demonstrate the ability to interpret and analyze data obtained from medical monitoring of hazardous materials response personnel

(g) Given a simulated hazardous materials incident, demonstrate proper documentation of medical monitoring

3-5 Competencies — Terminating the Incident.

3-5.1

Upon termination of the hazardous materials incident, the Level II responder shall complete the reporting, documentation, and EMS termination activities as required by the local emergency response plan or the organization's standard operating procedures. The Level II responder shall be able to:

(a)* Describe the information regarding incident EMS activities that needs to be relayed through the chain of command to the incident commander

(b) Describe the activities required in terminating the EMS component of a hazardous materials incident

(c) Describe the process and demonstrate the ability to conduct the EMS portion of an incident critique

(d) Explain the process of making revisions to EMS operating procedures and response capabilities as a result of information learned

Chapter 4 Referenced Publications

4-1

The following documents or portions thereof are referenced within this standard as mandatory requirements and shall be considered part of the requirements of this standard. The edition indicated for each referenced mandatory document is the current edition as of the date of the NFPA issuance of this standard. Some of these mandatory documents might also be referenced in this standard for specific informational purposes and, therefore, are also listed in Appendix F.

4-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 472, *Standard for Professional Competence of Responders to Hazardous Materials Incidents*, 1997 edition.

NFPA 1561, *Standard on Fire Department Incident Management System*, 1995 edition.

Appendix A Explanatory Material

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-2 The competency requirements for EMS personnel contained herein have been prepared to reduce the numbers of accidents, exposures, and injuries resulting from hazardous materials incidents.

A-1-3 Authority Having Jurisdiction. The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-3 Basic Life Support (BLS). *Emergency Medical Technician-Ambulance (EMT-A)*. This level in some jurisdictions may be recognized as EMT-Basic (EMT-B).

A-1-3 Basic Life Support (BLS). *Emergency Care First Responder (ECFR)*. In Canada, the terminology used is: Emergency Medical Assistant-1 (EMA-1), Emergency Medical Assistant-2 (EMA-2), and Emergency Medical Assistant-3 (EMA-3).

A-1-3 Hazardous Materials. There are many definitions and descriptive names being used for the term hazardous materials, each of which depends on the nature of the problem being addressed.

Unfortunately, there is no one list or definition that covers everything. The United States agencies involved, as well as state and local governments, have different purposes for regulating hazardous materials that, under certain circumstances, pose a risk to the public or the environment.

(a) *Hazardous Materials.* The United States Department of Transportation (DOT) uses the term *hazardous materials*, which covers eight hazard classes, some of which have subcategories called classification, and a ninth class covering other regulated materials (ORM). DOT includes in its regulations hazardous substances and hazardous wastes as an ORM-E, both of which are regulated by the Environmental Protection Agency (EPA), if their inherent properties would not otherwise be covered.

(b) *Hazardous Substances.* EPA uses the term *hazardous substances* for the chemicals that, if released into the environment above a certain amount, must be reported and, depending on the threat to the environment, for which federal assistance in handling the incident can be authorized. A list of the hazardous substances is published in Title 40, *Code of Federal Regulations*, Part 302, Table 302.4.

(c) *Extremely Hazardous Substances.* EPA uses the term *extremely hazardous substances* for chemicals that must be reported to the appropriate authorities if released above the threshold reporting quantity. Each substance has a threshold reporting quantity. The list of extremely hazardous substances is identified in Title III of Superfund Amendments and Reauthorization Act (SARA) of 1986 (Title 40, *Code of Federal Regulations*, Part 355).

(d) *Toxic Chemicals.* EPA uses the term *toxic chemicals* for chemicals whose total emissions or releases must be reported annually by owners and operators of certain facilities that manufacture, process, or otherwise use a listed toxic chemical. The list of toxic chemicals is identified in Title III of SARA.

(e) *Hazardous Wastes.* EPA uses the term *hazardous wastes* for chemicals that are regulated under the Resource, Conservation and Recovery Act (Title 40, *Code of Federal Regulations*, Part 261.33). Hazardous wastes in transportation are regulated by DOT (Title 49, *Code of Federal Regulations*, Parts 170-179).

(f) *Hazardous Chemicals.* The United States Occupational Safety and Health Administration (OSHA) uses the term *hazardous chemicals* to denote any chemical that would be a risk to employees if exposed in the workplace. Hazardous chemicals cover a broader group of chemicals than the other chemical lists.

(g) *Hazardous Substances.* OSHA uses the term *hazardous substances* in Title 29, *Code of Federal Regulations*, Part 1910.120, which resulted from Title I of SARA and covers emergency response. OSHA uses the term differently than EPA. Hazardous substances, as used by OSHA, cover every chemical regulated by both DOT and EPA.

A-1-3 Secondary Contamination. A substance is considered to pose a serious risk of secondary contamination if it is likely to be carried on equipment, clothing, skin, or hair in sufficient quantities to be capable of harming personnel outside of the hot zone.

A-2-1.2 See Appendix D.

A-2-2.2(a)5 As defined in Webster's Dictionary, the word *synergism* means "a cooperative action of discrete agencies such that the total effect is greater than the sum of the effects taken independently." In the context of hazardous materials, it is important to remember that the signs and symptoms of a given chemical are generally standard for that particular chemical. But when two or more chemicals are involved, the resultant signs and symptoms from an exposure may be dramatically different than what the EMS provider anticipates.

A-2-4.2(d)1 EMS control activities at a hazardous materials incident include, but are not limited to, the following:

(a) Identification of EMS needs, including appropriate level of protection for EMS personnel and equipment, resources for patient care, and decontamination of patient and EMS personnel

(b) Securing of resources to meet EMS needs

(c) Assignment of personnel, in the cold zone, to coordinate triage, treatment, disposition, and transport as required

(d) Assignment of appropriately trained personnel to perform medical monitoring and other EMS support functions for hazardous materials response personnel in the cold zone

(e) Assignment of appropriately trained personnel to provide patient care, assist with patient decontamination, and perform any other EMS support functions, as may be required in the warm zone

A-3-5.1(a) The type of information that should be made available to the incident commander would include, but not necessarily be limited to, the following:

(a) Patients

1. Number
2. Condition
3. Disposition

(b) Hazardous materials response personnel

1. Number of personnel screened
2. Adverse reactions noted
3. Personnel transported for further treatment
4. Completed records
5. Recommended medical, physical, and psychological needs for immediate rehabilitation
6. Recommended medical surveillance follow-up

(c) Availability of EMS personnel and equipment

Appendix B Training

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

B-1 General. The Emergency Medical Services (EMS) personnel responding to hazardous materials incidents should be trained and should receive regular continuing education to maintain competency in three areas: emergency medical technology, hazardous materials, and specialized topics approved by the authority having jurisdiction.

B-1.1 EMS Training. Recognized US DOT, state, regional, or local training curricula should constitute the entry level EMS preparation for continuing hazardous materials training. At a hazardous materials incident it is desirable that all EMS BLS provider personnel be trained to the US DOT EMT-A level or equivalent.

B-1.2 Hazardous Materials Training. The foundation for EMS response to a hazardous materials incident should be the competencies described in NFPA 472, *Standard for Professional Competence of Responders to Hazardous Materials Incidents*.

B-1.3 Specialized Training. Following completion of approved EMS training and appropriate level of hazardous materials instruction described in this standard, the authority having jurisdiction should stipulate additional specialized instruction that the EMS personnel responding to hazardous materials incidents must complete.

B-2 Training Plan.

B-2.1 The authority having jurisdiction should develop a formal training plan and provide a program to train EMS personnel to the level being utilized.

B-2.2 A training plan should be developed and contain guidelines for the following functional categories:

(a) Program management

(b) Content development

(c) Instructor competencies

(d) Technical specialist competencies

B-2.3 The training plan should be criteria-based to maintain a consistent quality of curriculum and instruction.

B-2.4 The training plan should specify entry knowledge and skill levels, training, and refresher training for both students and instructors.

B-2.5 The training plan should define evaluation criteria for successful completion of knowledge and skill objectives of the training program.

B-2.6 The training plan should provide for supervised field experience for EMS hazardous materials responder and EMS hazardous materials coordinator training levels.

B-3 Training Program. The training program should be a comprehensive competency-based guideline of the implementation and presentation of the required subject material. As a minimum it should address the areas discussed in this section.

B-3.1 Program Manager.

B-3.1.1 The program manager should have the authority and responsibility for the overall implementation of the program.

B-3.1.2 The program manager should be able to demonstrate knowledge of the following:

(a) The content of NFPA 472, *Standard for Professional Competence of Responders to Hazardous Materials Incidents*; NFPA 471, *Recommended Practice for Responding to Hazardous Materials Incidents;* and this standard

(b) EMS delivery systems

(c) Budgeting and financial planning

(d) Processes used to develop instructional materials

B-3.1.3 The program manager should demonstrate the skill and ability to perform the following tasks:

(a) Coordinate the training program

(b) Evaluate program effectiveness

(c) Identify instructors and technical specialists

B-3.2 Content. The content of the training program should include the competencies of this standard as a minimum.

B-3.3 Evaluation. In recognition of the need for technically sound curricula and instruction to meet the competencies outlined in this standard, careful evaluation of all instructors' training, background, and experience should be made.

B-3.3.1 The authority having jurisdiction should ensure that the training program meets the needs of the local area.

B-3.3.2 The program manager should ensure that the training program meets the needs of the hazardous materials response team and the EMS providers.

B-4 Instruction. The need exists for technically sound curricula and delivery to meet the competencies outlined in this standard.

B-4.1 Instructors. The instructor should

(a) Have mastery of the material he/she presents

(b) Have an understanding of the training program objectives

(c) Have the ability to teach and evaluate

B-4.2 Technical Specialist. The technical specialist is a person who has technical expertise and practical knowledge in a specific area. This category is intended to support training activities by allowing individuals not otherwise qualified at the instructor level to present an essential segment for which they do have expertise.

B-4.3 Final Evaluation. Upon completion of the training program, the student should demonstrate competency in all prescribed content areas. This evaluation should include written and practical testing as specified by the program manager and instructors.

Appendix C Recommended Support Resources

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

C-1 General. Emergency medical service personnel who respond to hazardous materials incidents must operate within a network of support resources. This appendix addresses the general classes of these resources and presents a recommended minimum level of support necessary for adequate emergency medical response.

C-2 Poison Control Centers (PCC).

C-2.1 Goal. In addition to providing support to the general hazardous materials response, the goal of the Poison Control Center is to provide the emergency medical personnel who respond to hazardous materials incidents with medical guidance, information, and advice during incidents involving toxic chemical releases and associated injuries. The PCC should regularly participate in the following activities together with the EMS component of the hazardous materials incident response.

C-2.1.1 Preplanning Assistance. Poison Control Centers should provide preplanning assistance, including the following:

(a) Training

(b) EMS hazardous materials standard operating procedures review

(c) EMS reference materials

C-2.1.2 Technical Advice. Poison Control Centers should have the ability to coordinate decontamination, treatment, and transportation of injured persons. The PCC should be available to the EMS personnel who respond to hazardous materials incidents for emergency consultation around the clock and during the normal working hours for nonemergency consultation. Poison Control Centers should be capable of providing advice regarding the following areas:

(a) Identity of ingredients

(b) Toxicity of substances involved and symptoms and signs of exposure

(c) Recommended level of protective clothing

(d) Potential for secondary contamination

(e) Recommended decontamination procedures

(f) Specific treatment and/or antidotes

C-2.1.3 Data Bases. The PCC should supervise and review the EMS data bases used during hazardous materials incident response.

C-2.1.4 Medical Surveillance. The PCC should provide support for the following:

(a) Surveillance quality assurance program design

(b) Surveillance Q/A program review

(c) Medical follow-up activities

C-3 Chemical Injury Treatment Centers.

C-3.1 Goal. The emergency medical responders to hazardous materials incidents should transfer chemically injured patients to facilities having adequate chemical injury treatment capability. All such facilities should have a minimum level of competency to receive chemically injured patients, including the following provisions.

C-3.1.1 Patient Decontamination Capabilities. Facilities should have the following resources in order to perform patient decontamination:

(a) Decontamination area

(b) Proper ventilation system

(c) Restricted access

(d) Runoff containment

C-3.1.2 Facilities should provide a cadre of trained in-house hazardous materials incident injury treatment personnel.

C-3.1.3 Chemical injury treatment centers should have on hand personal protective clothing for hospital personnel that may treat hazardous materials patients.

C-3.1.4 All treatment centers should have formal hazardous materials incident response procedures directed to EMS providers and hospital personnel.

C-4 Communications. The network of emergency medical response resources to hazardous materials incidents should be linked by an adequate communication system within the incident command post. The following components are suggested as a minimum.

C-4.1 Radiotelephone. All mobile and fixed EMS components should be able to coordinate EMS hazardous materials incident response via at least one dedicated frequency. All fixed facilities shall have r-f emergency power capability for at least one radio channel.

C-4.2 Telephone Service. There should be telephone service within the Medical Section/Division; preferably a cellular telephone.

C-4.3 Computer. All components of the EMS hazardous materials incident response system should have an orientation to and direct or indirect access to computerized chemical data bases, computerized preplans, and computerized operational command and control.

C-4.3.1 Fixed Installation. Computer generated information should be readily available to field and clinical EMS hazardous materials response personnel via at least two of the following:

(a) Verbal transmission

(b) Fax transmission

(c) Modem transmission

C-4.3.2 Mobile. On-scene EMS response personnel should have immediate direct access to a field computerized highly toxic hazardous materials data base and computerized command and control information.

C-4.4 Other Resources. Additional response resources available to hazardous materials incidents include the following:

(a) CHEMTREC (CMA)

(b) ATSDR (HHS)

(c) Private resources

Appendix D Medical Treatment Considerations

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

D-1 The assessment and prehospital care of patients who are involved in hazardous materials incidents, and who are potentially chemically contaminated, should include the following steps:

(a) The safety of the EMS provider should be provided for by securing the scene, ensuring appropriate decontamination of the patient, and protecting against exposure to communicable diseases and hazardous materials.

(b) The patient's airway should be secure and regularly monitored.

(c) The patient's breathing should be monitored and assisted when necessary.

(d) Supplemental oxygen should be administered if the surrounding environment safely permits.

(e) Bleeding should be controlled. This may be accomplished by the application of pressure bandages. Lower extremity bleeding may be controlled through the use of pneumatic anti-shock garments.

(f) When trauma may have involved cervical spine injury, an appropriate stabilization, immobilization collar should be applied.

(g) Cardiopulmonary resuscitation should be performed, if indicated.

(h) In general, avoid all prophylactic invasive procedures unless required by life-threatening conditions. This includes the establishment of intravenous lines.

(i) Direct medical control should be established.

The authority having jurisdiction should ensure that a written prehospital medical standard operating procedures protocol is in place to provide direction to EMS personnel who respond to hazardous materials incidents.

Appendix E Patient Decontamination

This appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

E-1 Patient decontamination, if required, should be carried out in the warm zone by properly trained personnel wearing appropriate chemical-protective clothing and respiratory equipment.

Protocol(s) should be written to address the following:

(a) Determination of the potential for secondary contamination and the necessity for, and extent of, decontamination

(b) Selection of appropriate personal protective equipment to be worn by personnel in the warm zone who are assisting with or performing decontamination

(c) Decontamination of patients when the exposure is to an unidentified gas, liquid, or solid material

(d) Emergency decontamination of patients with critical injuries and illness requiring immediate patient care or transport

Appendix F Referenced Publications

F-1 The following documents or portions thereof are referenced within this standard for informational purposes only and are thus not considered part of the requirements of this standard unless also listed in Chapter 4. The edition indicated here for each reference is the current edition as of the date of the NFPA issuance of this standard.

F-1.1 NFPA Publications. National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 480

1993 Edition

Standard for the Storage, Handling, and Processing of Magnesium Solids and Powders

1993 Edition

This edition of NFPA 480, *Standard for the Storage, Handling, and Processing of Magnesium Solids and Powders*, was prepared by the Technical Committee on Combustible Metals and Metal Dusts and acted on by the National Fire Protection Association, Inc. at its Annual Meeting held May 24-27, 1993, in Orlando, FL. It was issued by the Standards Council on July 23, 1993, with an effective date of August 20, 1993, and supersedes all previous editions.

The 1993 edition of this document has been approved by the American National Standards Institute.

Origin and Development of NFPA 480

This standard was begun in 1946, tentatively adopted in 1950, and adopted by the National Fire Protection Association in May, 1951. Revisions were adopted by the Association in 1952, 1954, 1957, 1959, 1961, and 1967. The 1967 edition was reconfirmed in 1974.

The 1974 edition was completely revised in 1980, primarily to comply with the NFPA *Manual of Style*. Minor technical amendments were made at that time. This complete revision of the 1974 edition was acted on by the Association at its 1981 Fall Meeting and the revision was designated the 1982 edition.

The 1987 edition was a reconfirmation of the 1982 edition. The only changes made were minor editorial improvements and redesignation of the standard as NFPA 480.

For this 1993 edition, the Committee has completely revised the standard to update the requirements for safe handling of magnesium solids and powders as well as updating the fire and dust explosion prevention measures for both. The Committee has incorporated the requirements for safe handling of magnesium powder that were previously found in the 1987 edition of NFPA 651, *Standard for the Manufacture of Aluminum and Magnesium Powder*. The Committee revision has also incorporated editorial and style revisions to comply with the NFPA *Manual of Style* and to assist in making the document more usable, adoptable, and enforceable.

Technical Committee on Combustible Metals and Metal Dusts

Robert W. Nelson, *Chair*
Industrial Risk Insurers, CT
Rep. Industrial Risk Insurers

Richard J. Biehl, Ansul Fire Protection, WI
Rep. Fire Equipment Manufacturers' Assn., Inc.

Martha H. Curtis, NFPA Staff Liaison

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Technical Committee shall have primary responsibility for documents on safeguards against fire and explosion in the manufacturing, processing, handling, and storage of combustible metals, powders, and dusts.

NFPA 480
Standard for the
Storage, Handling, and Processing of
Magnesium Solids and Powders

1993 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 10 and Appendix D.

Chapter 1 General

1-1 Scope.

1-1.1

This standard shall apply to the storage, handling, and processing of magnesium solids at magnesium foundries, processing plants, and commercial storage facilities.

1-1.2

This standard shall also apply to the storage, handling, processing, and manufacture of magnesium powder.

1-1.3

This standard shall not apply to the primary production of magnesium.

1-1.4*

This standard shall not apply to the transportation of magnesium in any form on public highways, waterways, or by air or rail.

1-1.5

The requirements of NFPA 650, *Standard for Pneumatic Conveying Systems for Handling Combustible Materials*, shall not apply to magnesium.

1-2 Purpose.

The purpose of this standard is to minimize the occurrence of and resulting damage from fire and explosion hazards in the storage, handling, processing, and manufacture of magnesium solids and powders.

1-3 Equivalent Protection.

1-3.1

Existing plants, equipment, structures, and installations that do not comply strictly with the requirements of this standard shall be considered to be in compliance if it can be shown that an equivalent level of protection has been provided or that no specific hazard shall be created or continue to exist through noncompliance.

1-3.2

This standard is not intended to prevent the use of systems, methods, or devices that provide equivalent protection from fire and explosion. NFPA 69, *Standard on Explosion Prevention Systems,* shall be referenced where considering the use of optional systems.

1-4 Definitions.

For the purpose of this standard, the terms below shall be defined as follows.

Approved. Acceptable to the "authority having jurisdiction."

NOTE: The National Fire Protection Association does not approve, inspect or certify any installations, procedures, equipment, or materials nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations which is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The "authority having jurisdiction" is the organization, office or individual responsible for "approving" equipment, an installation or a procedure.

NOTE: The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner since jurisdictions and "approval" agencies vary as do their responsibilities. Where public safety is primary, the "authority having jurisdiction" may be a federal, state, local or other regional department or individual such as a fire chief, fire marshal, chief of a fire prevention bureau, labor department, health department, building official, electrical inspector, or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the "authority having jurisdiction." In many circumstances the property owner or his designated agent assumes the role of the "authority having jurisdiction"; at government installations, the commanding officer or departmental official may be the "authority having jurisdiction."

Fire-Resistive. Meeting the requirements for Type I or Type II construction, as described in NFPA 220, *Standard on Types of Building Construction*.

Heavy Casting. Heavy castings are greater than 25 lb (11.3 kg) and have walls with large cross section weights [at least $^1/_4$ in. (6.4 mm)]. Castings less than 25 lb (11.3 kg) shall be considered light castings.

Labeled. Equipment or materials to which has been attached a label, symbol or other identifying mark of an organization acceptable to the "authority having jurisdiction" and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed. Equipment or materials included in a list published by an organization acceptable to the "authority having jurisdiction" and concerned with product evaluation, that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

NOTE: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The "authority having jurisdiction" should utilize the system employed by the listing organization to identify a listed product.

Magnesium. Refers to either pure metal or alloys having the generally recognized properties of magnesium marketed under different trade names and designations.

Magnesium Powder. Refers to magnesium metal in the form of a chip, granule, flake, or finely divided particle. Any such magnesium metal that is less than $^1/_8$ in. (3.2 mm) in two dimensions or less than 0.05 in. (1.3 mm) in single dimension (e.g., magnesium ribbon) shall be considered a powder.

Magnesium Powder Production Plant. Facilities or buildings whose primary product is bulk magnesium powder. Facilities or buildings in which powder is produced incidental to operations shall not be considered a powder production plant.

Noncombustible. In the form used and under the conditions anticipated, will not ignite, burn, support combustion, or release flammable vapors when subjected to fire or heat. (Materials reported as noncombustible, when tested in accordance with ASTM E136, *Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C*, shall be considered noncombustible materials.)

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Swarf. Finely divided metal particles produced by sawing and cutting operations.

Chapter 2 Location and Construction of Magnesium Powder Production Plants

2-1 Location.

2-1.1

Magnesium powder production plants shall be located on a site large enough so that the buildings in which powder is manufactured shall be at least 300 ft (91.5 m) from public roads and from any occupied structure, such as public buildings, dwellings, and business or manufacturing establishments, other than those buildings that are a part of the magnesium powder production plant.

2-1.2

Different production operations shall be located in separate but not adjoining buildings located at least 50 ft (15 m) from each other.

Exception: Two buildings less than 50 ft (15 m) apart shall be permitted if the facing wall of the exposed building shall be capable of resisting a blast pressure of 2.0 psig (13.8 kPa gauge) and shall be nonload-bearing, noncombustible, and without openings.

2-1.3

Separate buildings shall be required where different operations such as but not limited to atomization, grinding, crushing, screening, blending, packaging, or other process are performed.

Exception: More than one operation within the same building shall be permitted if the design provides equivalent protection.

2-2 Security.

2-2.1

This section shall be applied to new and existing facilities. The intent of this section shall be to restrict access to those facilities by the general public and to establish adequate exit facilities for personnel.

2-2.2

The powder production plant shall be surrounded by strong fencing at least 6 ft (1.8 m) high with suitable entrance gates, or otherwise shall be rendered inaccessible.

2-2.3

Security measures taken shall be in accordance with NFPA *101*®, *Life Safety Code*®. (*See 5-9.2.3 of NFPA 101*.)

2-3 Building Construction.

2-3.1

All buildings used for the manufacture, packing, or loading for shipment of magnesium powders shall be single story, without basements, constructed of noncombustible materials throughout, and have nonload-bearing walls. The buildings shall be designed so that all internal surfaces are readily accessible to facilitate cleaning.

Exception: Other construction types shall be permitted if equivalent protection can be demonstrated.

2-3.2

All walls or areas where dust can be produced, which are not of monolithic construction, shall have all masonry joints thoroughly slushed with mortar and troweled smooth so as to leave no interior or exterior voids where magnesium powder can infiltrate and accumulate.

2-3.3

Floors shall be noncombustible hard surface and nonslip, installed with a minimum number of joints in which powder can collect. The requirements of this subsection shall also apply to elevated platforms, balconies, floors, or gratings. (*See Appendix B.*)

2-3.4

Roofs of buildings that house dust-producing operations shall be supported on girders or structural members designed to minimize surfaces on which dust can collect.

2-3.5

Roof decks shall be watertight.

2-4 Doors and Windows.

2-4.1

All exits shall conform with NFPA *101*, *Life Safety Code*.

2-4.2

All doors in fire-rated partitions shall be approved, self-closing fire doors, installed in accordance with NFPA 80, *Standard for Fire Doors and Fire Windows*.

2-4.3*

Windows shall be held in place by friction latches and installed so that they open outward.

2-5* Grounding of Equipment.

All process equipment and all building steel shall be securely grounded by permanent ground wires to prevent accumulation of static electricity.

2-6 Electrical Power.

2-6.1

All electrical equipment and wiring shall be installed in accordance with NFPA 70, *National Electrical Code®*.

2-6.2*

All parts of manufacturing buildings shall be classified.

2-6.3

Buildings shall be provided with emergency lighting systems in accordance with NFPA *101*, *Life Safety Code*. The emergency lighting shall be energized automatically upon loss of electrical power to the buildings.

Exception: Buildings of less than 200 sq ft (19 m^2) not normally occupied shall not be required to have emergency lighting systems.

Chapter 3 Magnesium Mill and Foundry Operations

3-1* Melting and Casting Operations.

3-1.1

Buildings used for the melting and casting of magnesium shall be noncombustible. Melt rooms shall have easy and adequate access to facilitate fire control. Floors around melting operations shall be of hard-burned or vitreous paving block, cast-iron plate, or steel plate, laid in concrete and kept clean and free of moisture.

Exception: Melting and casting shall be permitted in buildings of combustible (Type IV) construction if highly acidic or corrosive conditions are present.

3-1.2

All metal added to melting pots shall be thoroughly dried.

3-1.3

Fuel supply lines to melting pots and preheating installations shall have remote fuel shutoffs and combustion safety controls in accordance with NFPA 86, *Standard for Ovens and Furnaces*, or equivalent.

3-1.4

Furnace settings shall be kept dry and free of iron scale. Safety runoff containers shall be provided for all melting pots and crucibles. Melting pots and crucibles shall be inspected regularly. Pots and crucibles that show evidence of possible failure or that allow molten metal to contact concrete or iron scale shall be discarded.

3-1.5

Ladles, skimmers, and sludge pans shall be thoroughly dried and preheated before contacting molten metal.

3-1.6

Extreme care shall be exercised in pouring magnesium castings to avoid spillage. Permanent molds shall be thoroughly preheated before pouring. Permanent molds shall also be purged with a mixture of sulfur hexafluoride/air/carbon dioxide (SF_6/air/CO_2), argon (Ar), helium (He), or sulfur dioxide gas (SO_2) prior to use and between pourings.

3-1.7

Operators in melting and casting areas shall wear flame-resistant clothing, high foundry shoes, and adequate face protection.

3-2* Heat Treating.

3-2.1

A standard procedure for checking the uniformity of temperatures at various points within heat-treating furnaces shall be established. Furnaces shall be checked prior to use and at regular intervals during use to identify undesirable hot spots.

3-2.2

Furnaces shall be properly and tightly constructed. Gas- or oil-fired furnaces shall be provided with combustion safety controls. (*See NFPA 86, Standard for Ovens and Furnaces*.)

3-2.3

All furnaces shall have two sets of temperature controls operating independently. One shall maintain the desired operating temperature; the other, operating as a high temperature limit control, shall cut off fuel or power to the heat-treating furnace at a temperature slightly above the desired operating temperature.

3-2.4*

Magnesium parts to be put in a heat-treating furnace shall be free of magnesium turnings, chips, and swarf.

3-2.5

Combustible spacers on pallets shall not be used in a heat-treating furnace.

3-2.6

Aluminum parts, sheets, or separators shall not be included in a furnace load of magnesium.

3-2.7

There shall be strict adherence to the heat-treating temperature cycle recommended by the alloy manufacturer.

3-2.8*

Molten salt baths containing nitrates or nitrites shall not be used for heat-treating magnesium alloys.

3-2.9*

Magnesium and aluminum metals shall be segregated and easily identified to avoid the possibility of accidental immersion of magnesium alloys in salt baths used for aluminum.

Chapter 4 Machining and Fabrication of Magnesium

4-1* Machining.

4-1.1

Cutting tools shall not be allowed to ride on the metal without cutting, as frictional heat can ignite any fine metal that is scraped off. For the same reason, the tool shall be backed off as soon as the cut is finished. Cutting tools shall be kept sharp and ground with sufficient rake clearance to minimize rubbing on the end and sides of the tool.

4-1.2*

When drilling deep holes (depth greater than 5 times drill diameter) in magnesium, high-helix drills (45 degrees) shall be used to prevent packing of the chips produced.

4-1.3

Relief on tools used in grooving and parting operations shall be maintained, since the tool tends to rub the sides of the groove as it cuts. Side relief shall be 5 degrees; end relief shall be from 10 degrees to 20 degrees.

4-1.4

If lubrication is needed, as in tapping or extremely fine grooving, a high flash point mineral oil shall be used. Water, water-soluble oils, and oils containing more than 0.2 percent fatty acids shall not be used, as they can generate flammable hydrogen gas.

Exception: Special formulated coolant fluids (water-oil emulsions) that specifically inhibit the formation of hydrogen gas shall be permitted.

4-1.5

Where compressed air is used as a coolant, special precautions shall be taken to keep the air dry.

4-1.6

All machines shall be provided with a pan or tray to catch chips or turnings. The pan or tray shall be installed so that it can be readily withdrawn from the machine in case of fire. It shall be readily accessible for chip removal and for application of extinguishing agent to control a fire.

4-1.6.1 In case of a fire in the chips, the pan or tray shall be immediately withdrawn from the machine, but shall not be picked up or carried away until the fire has been extinguished.

4-2 Dust Collection.

4-2.1

Dust shall be collected by means of suitable hoods or enclosures at each operation. Hoods and enclosures shall be connected either to a dry-type dust collector and blower located outdoors or to a wet-type collector.

4-2.2

Where practical, the dust collection system shall be designed and installed so that the dust is collected upstream of blowers.

4-2.3 Wet Dust Collection.

4-2.3.1 Wet-type collectors shall be permitted to be located indoors.

4-2.3.2 The discharge duct for wet dust collection equipment shall terminate at a safe outside location.

4-2.3.3 The ductwork, dust collector, and fan system shall be designed such that the concentration of magnesium dust in the system is less than 25 percent of the lower flammable limit (LFL) of magnesium.

4-2.3.4 All components of the dust collection system shall be of conductive material.

4-2.3.5 Connecting ducts or suction tubes shall be completely grounded and bonded, with no unnecessary bends. Ducts shall be fabricated and assembled, and shall have a smooth interior and internal lap joints pointing in the direction of airflow. Ducts shall have no unused capped side outlets, pockets, or other dead-end spaces that can allow an accumulation of dust.

4-2.3.6 The power supply to dust-producing machines shall be interlocked with the motor driving the exhaust blower and the liquid-level controller of the liquid precipitation separator in such a way that improper functioning of the dust collection system shall shut down the machine it serves. The interlock system shall function under conditions of belt failure. A time-delay switch or equivalent device shall be provided on the dust-producing machine to prevent starting of its motor drive until the liquid precipitation separator is in complete operation and several air changes have swept out any residual hydrogen.

4-2.4 Liquid Precipitation Collectors.

4-2.4.1* Each dust-producing machine shall be dedicated to the collection of magnesium or magnesium alloy only and have its own dust-separating unit. (*See Figure 4-2.4.2*.)

Exception: With multiunit machines, two dust-producing machines shall be permitted to be served by a single separator. Where multiunit machines are in use, only magnesium shall be processed in each unit.

4-2.4.2 Wet collectors shall be restricted to a dust-loading of no more than 5 gr/cu ft (175 gr/m^3) of inlet air on standard configuration collectors. (*See "Industrial Ventilation: A Manual of Recommended Practice" table on Range of Particle Size, Concentration, and Collector Performance*.)

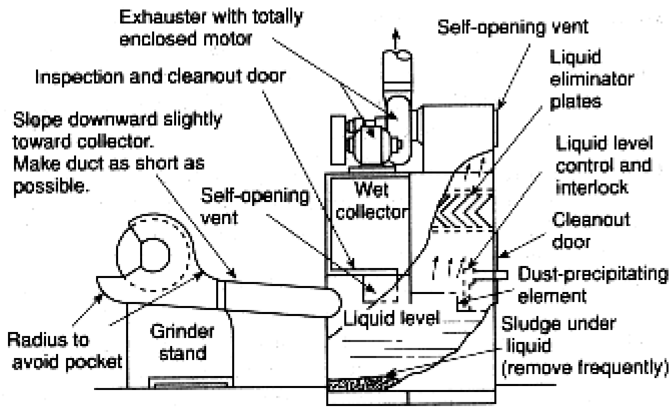

Figure 4-2.4.2 Typical liquid precipitation separation for grinding.

4-2.4.3 Liquid precipitation separators shall be designed such that the hydrogen being generated from the magnesium contacting the water shall be vented at all times.

4-2.4.4 Means of venting to avoid accumulation of hydrogen shall be maintained. Each chamber of the collector shall be vented to dissipate the hydrogen.

4-2.4.5 Sludge level build-up in the sludge tank of the wet collector shall not exceed 5 percent of the tank water capacity as measured by volume. Sludge shall be removed from the collector whenever the collector is to remain inoperative for a period of 24 hours or more.

4-2.4.6 Liquid precipitators shall incorporate the use of positive venting of the sludge tank at all times during shutdown by means of an auxiliary blower that is energized when the main exhaust fan is turned off. The auxiliary fan volume shall not be less than 10 percent of the exhaust fan volume.

4-2.5 Down-Draft Wet Collectors.

4-2.5.1 The number of dust-producing machines shall be limited only by the design of the down-draft bench. All such designed stations shall be individually partitioned from each other. Each down-draft collector shall be used only for the collection of magnesium dust. (*See Figure 4-2.5.1*.)

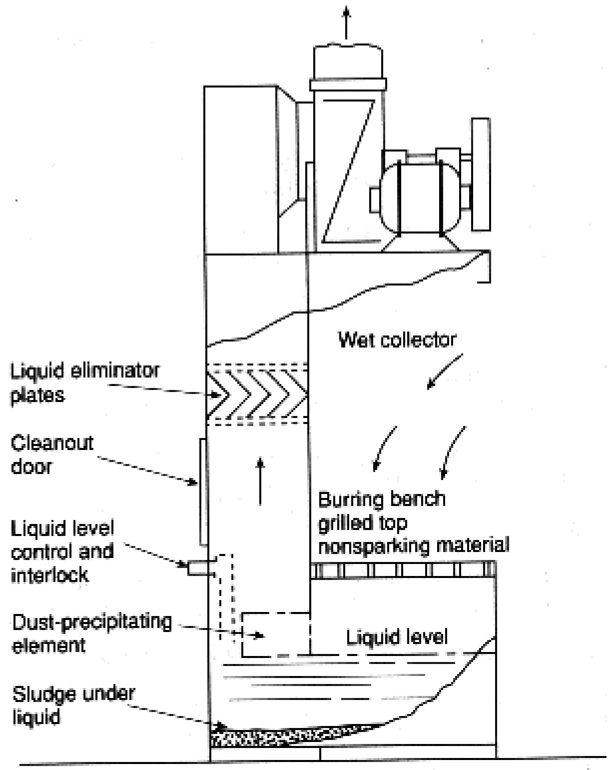

Figure 4-2.5.1 Typical down-draft separator for grinding.

4-2.5.2 The power supply to dust-producing machines shall be interlocked with the motor driving the exhaust blower and the liquid-level controller of the down-draft separator in such a way that improper functioning of the dust collection system will shut down the machine it serves. A time-delay switch or equivalent device shall be provided on the dust-producing machine to prevent starting of its motor drive until the down-draft separator is in complete operation and several air changes have swept out any residual hydrogen.

4-2.5.3 Wet collectors shall be restricted to a dust-loading of no more than 2 gr/cu ft (70 gr/m^3) of inlet air on down-draft bench configuration separators. (*See "Industrial Ventilation: A Manual of Recommended Practice" table on Range of Particle Size, Concentration, and Collector Performance*.)

4-2.5.4 Down-draft bench configuration separators shall maintain no less than 300 ft/min (1.5 m/sec) average work surface capture velocity at each work station. Work surface capture velocity shall be determined as a function of nominal work surface area.

4-2.5.5 Sludge level build-up in the sludge tank of the wet collector shall not exceed 5 percent of the tank water capacity as measured by volume. Sludge shall be removed from the collectors whenever the collector is to remain inoperative for a period of 24 hours or more.

4-2.5.6 Positive venting of the sludge tank shall be maintained at all times by means of an auxiliary blower that is energized when the main exhaust fan is turned off. The auxiliary fan volume shall not be less than 10 percent of the exhaust fan volume.

4-2.5.7 Any chambers that are enclosed shall be vented by natural ventilation.

4-2.6 Dry Dust Collection.

4-2.6.1* Dust shall be collected by means of suitable hoods or enclosures at each operation.

4-2.6.2 Hoods and enclosures shall be connected to a high-efficiency cyclone(s) and blower located outdoors.

4-2.6.3 The cyclone exhaust shall terminate in a safe outside location.

4-2.6.4 All components of a dust collection system shall be made of conductive materials and shall be watertight.

4-2.6.5 The ductwork, cyclone, and fan system shall be designed such that the concentration of magnesium dust in the system is less than 25 percent of the lower flammable limit (LFL).

4-2.6.6 The minimum length of duct from the dust-producing operation(s) to the cyclone shall be 15 ft (4.6 m).

4-2.6.7 The use of media-type collectors shall be prohibited.

4-2.6.8 Explosion venting shall be permitted to be installed on dry-type dust collection systems.

4-2.6.9 Connecting ducts or suction tubes shall be completely grounded and bonded, with no unnecessary bends. Ducts shall be fabricated and assembled, and shall have a smooth interior and internal lap joints pointing in the direction of airflow. Ducts shall have no unused capped side outlets, pockets, or other dead-end spaces that can allow an accumulation of dust.

4-2.6.10 Where practical, the dust collection system shall be designed and installed so that the dust is collected upstream of blowers.

4-2.6.11 Each dust-producing machine shall be equipped with its own dust-separating unit.

Exception: With multiunit machines, two dust-producing machines shall be permitted to be served by a single separator. Where multiunit machines are in use, only magnesium shall be processed in each unit.

4-2.6.12 The power supply to dust-producing machines shall be interlocked with the exhaust blower. The interlock system shall function under conditions of drive belt failure.

4-3 Cleaning.

4-3.1

Systematic cleaning of the entire grinding area, including roof members, pipes, conduits, etc., shall be carried out daily or as often as conditions warrant.

4-3.2

Cleaning shall be done using soft brushes and conductive nonsparking scoops and containers.

4-3.3*

Vacuum cleaners shall not be used unless they are specifically listed for use with magnesium powder or dusts.

4-4 Electrical Equipment.

4-4.1*

Electrical equipment and wiring methods associated with dust-producing machines, including those used in connection with dust collection equipment, shall be approved for Class II, Group E atmospheres and shall be installed in accordance with Article 502 of NFPA 70, *National Electrical Code*.

4-4.2

All electrical equipment shall be inspected and cleaned periodically.

4-4.3

Where flashlights or storage battery-operated lanterns are used, they shall be listed for classified locations.

4-5* Grounding of Equipment.

All equipment shall be securely grounded by permanent ground wires to prevent accumulation of static electricity.

4-6 Safety Precautions.

4-6.1

Operator clothing shall be flame-retardant, easily removable, and shall be kept clean and free from dust. Clothing shall be smooth, allowing dust to be brushed off readily. Clothing shall have no pockets or cuffs. Woolen, silk, or fuzzy outer clothing and shoes with exposed steel parts shall be prohibited.

4-6.2

Machinery and equipment described in Section 5-2 shall not be used for processing other metals until the entire grinder and dust-collecting system are thoroughly cleaned. The grinding wheel or belt shall be replaced prior to work on other metals.

4-6.3

No open flames, electric or gas cutting or welding, or other spark-producing operations shall be permitted in the section of the building where magnesium dust is produced or handled while dust-producing equipment is in operation. Where this type of work is done in such areas, all machinery in the area shall be shut down, and the area shall be thoroughly cleaned to remove all accumulations of magnesium dust. All internal sections of grinding equipment, ducts, and dust collectors shall be completely free of moist or dry magnesium dust, and any hydrogen shall be flushed out.

4-6.4*

Wheels used for grinding magnesium castings shall be relocated for dressing.

Exception: If it is not feasible to move the grinding wheels to a safer location for dressing, the hoods shall be thoroughly cleaned or removed entirely before dressing operations are started, and all deposits of dust on and around the wheel shall be removed before, during, and after dressing.

4-6.5

Nonsparking tools shall be used where making repairs or adjustments around grinding wheels, hoods, or collector units where magnesium dust is present.

4-6.6

Dust collection equipment shall not have filters or other obstructions that will allow accumulation of magnesium dust.

4-7 Drawing, Spinning, and Stamping.

4-7.1

Reliable means to prevent overheating shall be provided where heating magnesium for drawing or spinning.

4-7.2

Clippings and trimmings shall be collected at frequent intervals and placed in clean, dry steel or other noncombustible containers. Fine particles shall be handled according to the requirements of Chapter 5.

Chapter 5 Magnesium Powder — Machinery and Operations

5-1 General Precautions.

5-1.1

In powder handling or manufacturing buildings and in the operation of dust-conveying systems, every precaution shall be taken to avoid the production of sparks from static electricity, electrical faults, friction, or impact (e.g., iron or steel articles on stones, on each other, or on concrete).

5-1.2

Water leakage within or into any building where it can contact magnesium powder shall be prevented to avoid possible spontaneous heating and hydrogen generation.

5-1.3

Electrical heating of any resistance element or load to a high temperature in an area containing a dust hazard shall be prohibited.

5-1.4*

Serious local friction heating of bearings in any machine located in an area containing a dust hazard shall be prevented.

5-2 Requirements for Machinery.

5-2.1

All dust-producing machines and conveyors shall be constructed so that escape of dust is minimized.

5-2.2*

All machinery shall be bonded and grounded to minimize accumulation of static electric charge. This requirement shall be applicable to stamp mortars, mills, fans, and conveyors in all areas where dust is produced or handled. Static conductive belts shall be used on belt-driven equipment.

5-2.3*

Grounded and bonded bearings, properly sealed against dust, shall be used.

5-2.4

Internal machine clearances shall be maintained to prevent internal rubbing or jamming.

5-2.5

High-strength permanent magnetic separators, pneumatic separators, or screens shall be installed ahead of mills, stamps, or pulverizers wherever there is any possibility that tramp metal or other foreign objects can be introduced into the manufacturing operations.

5-3 Start-Up Operations.

All the machine processing contact areas shall be thoroughly cleaned and free from water before being charged with metal and placed into operation.

5-4 Charging and Discharging.

5-4.1

All magnesium powder containers not used for shipping into or out of the plant shall be made of metal.

5-4.2

Where charging magnesium powders to (or discharging from) machines, the containers shall be bonded to the equipment and grounded by a suitable grounding conductor.

5-5 Packaging and Storage.

Magnesium powder shall be stored in steel drums or other closed conductive containers. The containers shall be tightly sealed and stored in a dry location until ready for shipment or repacking.

Chapter 6 In-Plant Conveying of Magnesium Powder

6-1 Containers.

6-1.1

Transfer of powders in-plant shall be done in suitable conductive containers, as described in Chapter 5. Special attention shall be necessary to ensure the magnesium powder is not exposed to moisture.

6-1.2

Containers approved by the U.S. Department of Transportation (DOT) for shipment of magnesium powders shall be used where magnesium powder is transported on pallets by industrial trucks. (*See NFPA 505, Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Maintenance, and Operation*.)

6-1.3

All wheeled containers, hand trucks, and lift trucks shall be grounded.

6-2 Pneumatic Conveying.

6-2.1

If the conveying gas is air, the magnesium dust-to-air ratio throughout the conveying system shall be held safely below the lower flammable limit (LFL) of the magnesium dust at normal operating conditions. (*See Section 4-2 and Appendix B.*)

6-2.2*

If an inert gas such as argon or helium is used, it shall have an oxygen concentration appropriate to the inerting gas and the particle size of the magnesium dust. Recycling of inert gas shall be permitted. (*See NFPA 69, Standard on Explosion Prevention Systems.*)

6-2.3

The conveying gas shall have a dew point such that no free moisture can condense or accumulate at any point in the system.

6-2.4

A minimum conveying velocity of 3500 ft/min (1068 m/min) shall be maintained throughout the conveying system to prevent the accumulation of dust at any point and to pick up any dust or powder that can drop out during an unscheduled system stoppage. Higher conveying velocities are more desirable and increase safety.

6-3 Ductwork for Conveying Systems.

6-3.1*

Explosion vents, openings protected by antiflashback swing valves, or rupture diaphragms shall be provided on ductwork. Relief shall be to a safe location. The guidelines in NFPA 68, *Guide for Venting of Deflagrations*, do not apply to ductwork for conveying systems for magnesium powder.

6-3.2

Wherever damage to other property or injury to personnel can result from the rupture of the ductwork, and where explosion relief vents cannot provide sufficient pressure relief, the ductwork shall be designed to withstand a sudden internal pressure of 125 psi (862 kPa). (*See NFPA 69, Standard on Explosion Prevention Systems.*)

6-3.2.1 If a portion of the ductwork is so located that no damage to property or injury to personnel can result from its bursting, that portion shall be permitted to be of light construction so as to intentionally fail, thereby acting as an auxiliary explosion vent for the system.

6-3.3

Conveyor ducts shall be fabricated of conductive material. Nonconductive duct liners shall not be used.

6-3.4*

Ducts shall be electrically bonded and grounded to minimize accumulation of static charge.

6-3.5

Where the conveying duct is exposed to weather or moisture, it shall be moisturetight.

6-4 Fan Construction and Arrangement.

6-4.1*

Blades and housings of fans used to move air or inert gas in conveying ducts shall be constructed of conductive material.

6-4.2

Personnel shall not be permitted within 50 ft (15 m) of the fan while it is operating. No maintenance shall be performed on the fan until it is shut down.

Exception: If personnel must approach the fan while it is operating, such as for a pressure test, it shall be done under the direct supervision of a competent technical person and with the knowledge and approval of operating management.

6-4.3

Fans shall be located outside of all manufacturing buildings wherever practical.

6-4.4

Fans shall be electrically interlocked with dust-producing machinery so that the machines shut down if the fan stops.

6-5 Dust Collectors.

6-5.1

High-efficiency cyclone magnesium dust collectors shall be located in and exhausted to a safe outside location, and shall be provided with suitable barricades or other means for protection of personnel and facilities.

6-5.2

Ductwork shall comply with the provisions of Section 6-3.

6-5.3*

The entire dust collection system, including the dust collector, shall be constructed of conductive material and shall be completely bonded and grounded to minimize accumulation of static electric charge.

Chapter 7 Prevention of Dust Accumulations

7-1 General.

7-1.1

Dust shall not be permitted to accumulate. Spills shall be removed at once, using conductive, nonsparking scoops and soft brooms or brushes having natural fiber bristles. Compressed-air blowdown shall not be permitted.

7-1.2

The use of water for cleaning shall not be allowed in manufacturing areas unless the following requirements are met.

(a) It has been determined by competent technical personnel that the use of high-pressure water will be the safest and most effective method of cleaning.

(b) Operating management has full knowledge of and has granted approval for its use.

(c) Adequate ventilation, either natural or forced, is available to maintain the hydrogen concentrations safely below the lower flammable limit (LFL).

(d) Complete drainage of all water and powder to a safe, remote area is available.

(e) The area has been cleaned to remove all loose accumulations of powder.

7-2 Cleaning Frequency.

7-2.1*

Operating personnel and supervisors shall exercise great care to prevent the accumulation of excessive dust on any portions of buildings or machinery not regularly cleaned during daily operations.

7-2.2

Regular periodic cleaning, with all machinery idle and power off, shall be performed as frequently as conditions warrant.

Chapter 8 Storage of Magnesium Solids

8-1* Storage of Pigs, Ingots, and Billets.

8-1.1

The size of piles shall be limited. Minimum aisle widths shall be based on the height of the pile as per 8-1.2.4. The pile height shall not exceed 20 ft (6.1 m).

8-1.2 Yard (Outdoor) Storage.

8-1.2.1 Magnesium ingots shall be carefully piled on firm and generally level areas to prevent tilting or toppling. Storage areas and yard pavements shall be well drained. The storage area shall be kept free of grass, weeds, and accumulations of combustible materials.

8-1.2.2 Combustible flooring or supports shall not be used under piles of ingots.

8-1.2.3 The quantity of magnesium stored in any pile shall be kept to a minimum. In no case shall the amount exceed 1,000,000 lb (453,600 kg).

8-1.2.4 Aisle widths shall be not less than one-half the height of the piles, but in no case shall they be less than 10 ft (3 m).

8-1.2.5 Readily combustible material shall not be stored within a distance of 25 ft (7.6 m) from any pile of magnesium ingots.

8-1.2.6 An open space, equal to the height of the piles plus 10 ft (3 m), shall be provided between the stored magnesium ingots and adjoining property lines where combustible material or buildings are exposed or where the adjacent occupancy can provide fire exposure to the magnesium.

8-1.2.7 No cutting, welding, or burning shall be permitted without operating management approval.

8-1.3 Indoor Storage.

8-1.3.1 Storage shall be in buildings of noncombustible construction.

Exception: Other construction types shall be permitted if equivalent protection can be demonstrated.

8-1.3.2* Floors shall be of noncombustible construction and shall be well drained to prevent accumulations of water in puddles.

8-1.3.3 Supports used under piles of magnesium ingots shall be noncombustible. There shall be no idle pallet storage.

8-1.3.4 The quantity of magnesium ingots stored in any one pile shall be kept to a minimum, but in no case shall the amount exceed 500,000 lb (226,800 kg).

8-1.3.5 Aisle widths shall comply with 8-1.2.4.

8-2* Storage of Heavy Castings.

8-2.1

Buildings used for the storage of heavy magnesium castings shall be of noncombustible construction.

Exception: Storage shall be permitted in buildings of combustible construction if the buildings are fully protected by an automatic sprinkler system.

8-2.2*

Floors shall be of noncombustible construction and shall be well drained to prevent accumulations of water in puddles.

8-2.3

All magnesium castings shall be inspected prior to storage to see that they are clean and free of chips or fine particles of magnesium.

8-2.4

The size of storage piles of heavy magnesium castings, either in cartons or crates or free of any packing material, shall be limited to 1250 cu ft (36 m^3). Aisles shall be maintained to permit inspection and effective use of fire protection equipment.

8-2.5

Aisle widths shall be not less than one-half the height of the piles.

8-2.6*

Automatic sprinkler protection shall be permitted to be installed in magnesium storage buildings where combustible cartons, crates, or other packing materials are present.

8-3 Storage of Light Castings.

8-3.1

Light magnesium castings shall be stored in noncombustible buildings and shall be segregated from other storage.

Exception: Storage of light castings shall be permitted in buildings of combustible construction *if the buildings are fully protected by an automatic sprinkler system. (See 8-3.4.)*

8-3.2

Piles of stored light magnesium castings, either in cartons or crates or without packing, shall be limited in size to 1000 cu ft (28 m^3). Light castings shall be segregated from other combustible materials and kept away from flames or sources of heat capable of causing ignition.

8-3.3

Aisle widths shall not be less than one-half the height of the piles.

8-3.4*

Automatic sprinkler protection shall be permitted to be installed in magnesium storage buildings where combustible cartons, crates, or packing materials are present.

8-4 Storage in Mills, Warehouses, and Processing Plants.

8-4.1

Buildings shall be of noncombustible construction.

Exception: Storage shall be permitted in buildings of combustible construction if the buildings are fully protected by an automatic sprinkler system.

8-4.2

Magnesium shall not be stored in or over a basement or similar subgrade space.

8-4.3

Stocks of magnesium shall be stored separately from other combustible materials.

8-4.4*

Automatic sprinkler protection shall be permitted to be installed in magnesium storage buildings where combustible cartons, crates, or packing materials are present.

8-5 Storage in Racks or Bins.

8-5.1

Racks shall be permitted to be extended along walls in optional lengths. Aisle spaces in front of racks shall be equal to the height of the racks. All aisle spaces shall be kept clear.

8-5.2

Combustible rubbish, spare crates, and separators shall not be permitted to accumulate within the rack space. Separators and metal sheets shall not be stacked on edge, and leaned against racks, as they will prevent heat from a small fire from activating automatic sprinklers and act as shields against sprinkler discharge.

8-6 Storage of Scrap Magnesium.

8-6.1

This section shall apply to the storage of scrap magnesium in the form of chips, turnings, swarf, or other fine particles.

8-6.2

Buildings shall be of noncombustible construction.

Exception: Other construction types shall be permitted if equivalent protection can be demonstrated.

8-6.3

Dry magnesium scraps shall be kept well separated from other combustible materials. Scraps shall be kept in covered steel or other noncombustible containers and shall be kept in such manner or locations that they will not become wet. Outside storage of magnesium fines shall be permitted if such storage is separated from buildings or personnel and great care is exercised to avoid the fines from becoming wet.

8-6.4*

Wet magnesium scrap (chips, fines, swarf, or sludge) shall be kept under water in a covered and vented steel container in an outside location. Sources of ignition shall be kept away from the drum vent and top. Containers shall not be stacked.

8-6.5*

Storage in quantities greater than 50 cu ft (1.4 m^3) (six 55-gal drums) shall be kept separate from other occupancies by fire-resistive construction without window openings or by an open space of at least 50 ft (15 m). Such buildings shall have explosion vents.

8-6.6

The use of automatic sprinklers in scrap magnesium storage buildings or areas shall be prohibited.

8-6.7

Suitable fire extinguishment materials shall be readily available in these locations.

8-7* Storage of Solid Magnesium Scrap.

8-7.1

Solid magnesium scrap, such as clippings and castings, shall be stored in noncombustible bins or containers pending salvage.

8-7.2

Oily rags, packing materials, and similar combustibles shall not be permitted in storage bins or areas storing solid magnesium scrap.

8-7.3*

Solid scrap shall be treated in accordance with Section 8-6 or 8-7.

8-8 Storage of Magnesium Powder.

8-8.1

Buildings used to store magnesium powder shall be of noncombustible single-story construction.

8-8.2

The use of automatic sprinklers in such buildings shall be strictly prohibited.

8-8.3

Magnesium powder shall be kept well separated from other combustible or reactive metals.

8-8.4

Magnesium powder shall be stored in steel drums or other closed containers. The containers shall be kept tightly sealed and stored in dry locations.

8-8.5

As necessary, magnesium powder storage areas shall be checked for water leakage.

8-8.6

Areas that routinely are used for the storage of magnesium powder shall be considered Class II, Group E, in accordance with NFPA 70, *National Electrical Code*.

8-8.7

Suitable fire extinguishment material shall be readily available in these locations.

8-8.8

Where magnesium powder in drums is stacked for storage, the maximum height shall not exceed 18 ft (5.5 m). Stacked storage shall be done in such a manner so as to ensure stability. Under no circumstances shall containers be permitted to topple over. The safest manner of storage is achieved using no stacking.

8-9 Storage of Finished Products.

8-9.1

This section shall apply to the storage of magnesium, in warehouses, wholesale facilities, and retail outlets, in the form of finished parts in which magnesium makes up the major portion of the articles on a volumetric basis.

8-9.2

Storage in quantities greater than 50 cu ft (1.4 m^3) shall be separated from storage of other materials that are either combustible or in combustible containers by aisles with a minimum width equal to the height of the piles of magnesium products.

8-9.3

Magnesium products stored in quantities greater than 1000 cu ft (28 m^3) shall be separated into piles each not larger than 1000 cu ft (28 m^3), with the minimum aisle width equal to the height of the piles.

8-9.4 *

Where storage in quantities greater than 1000 cu ft (28 m^3) is contained in a building of combustible construction, or the magnesium products are packed in combustible crates or cartons, or there is other combustible storage within 30 ft (9 m) of the magnesium, the storage area shall be protected by automatic sprinklers.

Chapter 9 Fire Fighting Procedures

9-1 General Precautions.

9-1.1

Magnesium is a flammable solid that once ignited shall be best extinguished by smothering (i.e., excluding oxygen). Burning magnesium responds poorly to several types of extinguishing agents used for other types of materials. Use of inappropriate agents can result in accelerating the fire or in causing an explosion (due to hydrogen). Under no circumstances shall the use of water, halogenated agents (halon), carbon dioxide, foam, or nitrogen be permitted.

Exception: A few individual burning chips of magnesium shall be permitted to be extinguished by dropping them into a bucket of water.

9-1.2

Magnesium solids and heavy magnesium castings normally do not ignite until reaching the melting point of magnesium. Extreme caution shall be taken to avoid molten magnesium contacting water, as an explosion will occur.

9-1.3*

The use of pressurized extinguishing agents shall not be permitted on a magnesium powder or chip fire, unless applied carefully so as not to disturb or spread the magnesium powder. This shall be performed only by trained personnel. This is due to the danger of spreading the burning powder or chips or creating a dust cloud. The bulk dry extinguishing agents shall be provided in areas where chips and powders are produced or used. The bulk dry extinguishing agents shall be kept dry (i.e., free of moisture). Application of wet extinguishing agents accelerates a magnesium fire and could result in an explosion.

9-1.4

The use of automatic sprinklers shall not be permitted in areas where molten magnesium is produced or handled, in areas where heat-treating furnaces are located, or in areas where magnesium chips or powders are produced or handled.

9-2 Reignition Conditions.

Extreme care shall be exercised even after a magnesium fire appears to be out. Reignition can occur due to high temperatures of the magnesium beneath the extinguishing agent, especially if the magnesium or the extinguishing agent covering the magnesium is disturbed. This allows air to reignite the magnesium.

9-3 Automatic Sprinkler Protection.

Automatic sprinkler protection shall only be permitted in storage areas for heavy or light magnesium castings in accordance with Sections 8-2, 8-3, and A-8-7.

9-4 Emergency Procedures.

Employees shall be instructed and trained in fighting magnesium fires using the permissible techniques appropriate for the various physical forms of magnesium. Employees shall be instructed in emergency procedures to be followed in the event of a fire.

9-5 Fire Fighting Organization.

Any fire fighting organizations that respond to an emergency shall be trained in the hazards involved in fighting a magnesium fire.

9-6 Employee Instruction.

9-6.1

All employees shall be carefully and thoroughly instructed by their supervisors regarding the hazards of their working environment and their behavior and procedures in case of fire or explosion.

9-6.2

All employees shall be shown the location of electrical switches and alarms, first-aid equipment, safety equipment, and fire extinguishing equipment.

9-6.3

The hazards posed by causing dust clouds and the danger of applying liquids onto an incipient fire shall be explained.

9-6.4

Strict discipline and scrupulous housekeeping shall be maintained at all times.

9-6.5

Attention shall be given to employee training and organizational planning to ensure safe and proper evacuation of the area.

9-7 Periodic Inspection.

9-7.1

A thorough systematic inspection shall be made at regular intervals not to exceed 1 month.

9-7.2

At least two or more competent persons shall conduct each inspection, and their findings and recommendations shall be permanently recorded in the plant's principal office.

9-7.3

The inspection shall include the following:

(a) General safety precautions

(b) Fire fighting equipment

(c) First-aid equipment

(d) Housekeeping

(e) Electrical and mechanical equipment

(f) Procedures.

9-7.4

Indicating and recording instruments and alarm devices shall be checked daily and the results recorded. Instruments shall be calibrated every 6 months.

Chapter 10 Referenced Publications

10-1

The following documents or portions thereof are referenced within this document and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

10-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 69, *Standard on Explosion Prevention Systems*, 1992 edition.

NFPA 70, *National Electrical Code*, 1993 edition.

NFPA 80, *Standard for Fire Doors and Fire Windows*, 1992 edition.

NFPA 86, *Standard for Ovens and Furnaces*, 1990 edition.

NFPA *101*, *Life Safety Code*, 1991 edition.

NFPA 220, *Standard on Types of Building Construction*, 1992 edition.

NFPA 505, *Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Maintenance, and Operation*, 1992 edition.

NFPA 650, *Standard for Pneumatic Conveying Systems for Handling Combustible Materials*, 1990 edition.

10-1.2 ASTM Publication.

American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

ASTM E136, *Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C*, 1992 edition.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

A-1-1.4 Transportation Regulations.

Regulations for the domestic shipment of dangerous goods (magnesium powder is so classified) are issued by the U.S. Department of Transportation (49 CFR, Parts 100-199), which has specific responsibility for promulgating the regulations. These regulations are updated and published yearly by the DOT. International shipments are regulated by the United Nations, International Air Transport Association, International Maritime Organization, and other national agencies. Attention is directed to activity now underway to consolidate the regulations under auspices of the United Nations.

A-2-4.3

See NFPA 68, *Guide for Venting of Deflagrations*.

A-2-5

See NFPA 77, *Recommended Practice on Static Electricity*.

A-2-6.2

See NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*.

A-3-1

Chips, turnings, powders, or swarf that is being preheated or charged to melting pots will autoignite at temperatures below that of the solid metal. Solids should be free of these smaller particles, as they can ignite and, in turn, ignite the solids. There should be no depression directly beneath the magnesium storage area where water can accumulate or flow during a fire.

A-3-2

Extreme care should be taken when heat treating aluminum containing magnesium alloys since aluminum additions form a eutectic alloy with considerably lower melting and autoignition temperatures. Failure to identify the alloy can result in heat-treating furnace fires.

A-3-2.4

To further retard ignition of magnesium, mixtures of sulfur dioxide (SO_2), sulfur hexafluoride with carbon dioxide (SF_6/CO_2), helium (He), and argon (Ar) with air is recommended in heat-treating furnaces operating above 750°F (399°C).

A-3-2.8

Special salt fluxes can be safely used for dip-brazing of magnesium.

A-3-2.9

Magnesium and aluminum form a eutectic alloy with considerably lower melting temperatures and autoignition temperatures than either parent metal.

A-4-1

Flashing of chips during machining should be minimized by any of the following methods:

(a) Keep surface speed below 300 ft/min (1.5 m/sec) or above 2200 ft/min (11 m/sec).

(b) Increase feed rate from 0.0008 in. to 0.010 in. (0.02 mm to 0.25 mm) per revolution.

(c) Control relative humidity in the machining area to 45 percent or lower at 70°F (21°C) room temperature.

(d) Apply a coolant.

A-4-1.2

Use of high-helix drills prevents frictional heat and possible flash fires in fines. High-helix drills are also recommended for drilling deep holes through composite or sandwich sections.

A-4-2.4.1 Interaction between magnesium and aluminum alloy fines (if the aluminum contains more than $^1/_2$ to 1 percent copper) in wet collector sludge can lead to hydrogen evolution and heat generation greatly exceeding that produced by magnesium fines alone. See NFPA 65, *Standard for the Processing and Finishing of Aluminum*.

A-4-2.6.1 The maximum concentration of less than 100 mesh magnesium dust should never exceed 0.03 oz per cu ft (0.03 g/L) (air), which is the lower flammable limit (LFL).

Minimum explosive concentrations for magnesium dust in air are published in RI 6516, “Explosibility of Metal Powders.” Although the metal dust-air suspension normally can be held below the lower flammable limit (LFL) in the conveying system, the suspension can pass through the flammable range in the collector at the end of the system.

A-4-3.3

Standard commercial industrial vacuum cleaners should not be used, as they are not safe for use with magnesium.

A-4-4.1

See NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, for guidance on classified areas for Class II materials.

A-4-5

See NFPA 77, *Recommended Practice on Static Electricity*.

A-4-6.4

Special precautions are necessary to prevent ignitions while dressing the wheels used for grinding magnesium castings. Hot metal thrown off by the dressing tool can ignite dust or magnesium deposits in the hood or duct.

A-5-1.4

Temperature-sensing elements connected to alarms or machine stop switches can be employed for locations where overheating of bearings or other elements may be anticipated.

A-5-2.2

See NFPA 77, *Recommended Practice on Static Electricity*.

A-5-2.3

Bearings located outside of the volume containing magnesium dust are preferred. Bearings within the volume containing magnesium dust are potential sources of ignition in the event of a failure. Bearings should be located outside the volume containing magnesium dust.

A-6-2.2

Completely inert gas cannot be used as an inerting medium, since the magnesium powder would eventually, at some point in the process, be exposed to the atmosphere, at which time the unreacted surfaces would be oxidized; enough heat would be produced to initiate either a fire or an explosion. To provide maximum safety, a means for the controlled oxidation of newly exposed surfaces is provided by regulating the oxygen concentration in the inert gas. The mixture serves to control the rate of oxidation, while materially reducing the fire and explosion hazard.

A-6-3.1

See NFPA 68, *Guide for Venting of Deflagrations*.

A-6-3.4

See NFPA 77, *Recommended Practice on Static Electricity*.

A-6-4.1

Wherever practical, the design should not allow the transported dust or powder to pass through the fan before entering the final collector. Where practical, fans should be located outside of all manufacturing buildings.

A-6-5.3

See NFPA 77, *Recommended Practice on Static Electricity*.

A-7-2.1

See NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*.

A-8-1

Industrial buildings or separate storage areas in which magnesium parts are being stored in quantities greater than 500 lb (227 kg), or where these magnesium parts are the primary hazard, should be labeled in accordance with NFPA 704, *Standard System for the Identification of the Fire Hazards of Materials*. This serves as a warning to fire fighters of the potential risk in the event of an emergency.

A-8-1.3.2 Storage of magnesium ingots should be on the first or ground floor. Basements or depressions below the magnesium storage area into which water or molten metal can flow should be avoided.

A-8-2

Fines that come in contact with water, water-soluble oils, and oils containing more than 0.2 percent fatty acids can generate flammable hydrogen gas. Fines that come in contact with animal or vegetable oils may ignite spontaneously.

A-8-2.2

Storage of magnesium castings should be on the first or ground floor. Basements or depressions below the magnesium cast storage area into which water or molten metal can flow should be avoided.

A-8-2.6

Sprinkler systems are of vital importance in heavy magnesium casting areas that also contain significant amounts of ordinary combustibles, as sprinkler operation can prevent the magnesium from becoming involved in the fire.

A-8-3.4

A slow-burning fire in nearby combustible material can develop enough heat to ignite thin-section magnesium, producing a well-involved magnesium fire before automatic sprinklers operate. Special importance, therefore, should be attached to prompt fire detection and alarm service, design of a fast-operating automatic sprinkler system, and avoidance of obstructions to sprinkler discharge. See NFPA 13, *Standard for the Installation of Sprinkler Systems*.

A-8-4.4

A slow-burning fire in nearby combustible material can develop enough heat to ignite thin-section magnesium, producing a well-involved magnesium fire before automatic sprinklers operate. Special importance, therefore, should be attached to prompt fire detection and alarm service, design of a fast-operating automatic sprinkler system, and avoidance of obstructions to sprinkler discharge. See NFPA 13, *Standard for the Installation of Sprinkler Systems*.

A-8-6.4

The wet magnesium should be checked frequently to ensure that it remains totally immersed during storage.

A-8-6.5

For design information, see NFPA 68, *Guide for Venting of Deflagrations*.

A-8-7

The danger of ignition of this solid scrap is very low, provided it is not stored with combustible materials. However, automatic sprinkler protection is recommended.

A-8-7.3

Scrap magnesium is usually received by secondary smelters in truck or carload quantities. Solid scrap may be shipped loose, but chips and turnings are packed in covered steel drums. Since storage is in the open, incipient fires can be readily detected and extinguished.

A-8-9.4

A slow-burning fire in nearby combustible material can develop enough heat to ignite thin-section magnesium, producing a well-involved magnesium fire before automatic sprinklers operate. Special importance, therefore, should be attached to prompt fire detection and alarm service, design of a fast-operating automatic sprinkler system, and avoidance of obstructions to sprinkler discharge. See NFPA 13, *Standard for the Installation of Sprinkler Systems*.

A-9-1.3

Recommended extinguishing agents for magnesium are approved Class D agents, gases (SO_2, SF_6/CO_2, Ar, He), and nonreactive granular material or powders. In cases involving molten magnesium burning, dry magnesium foundry flux can be used as an extinguishing agent. The flux melts or crusts over the hot metal, excluding air from the burning metal. Magnesium foundry flux has been shown to be an effective extinguishing agent. Protective gas mixtures are useful only if the magnesium vessel is closed.

Appendix B Supplementary Information on Magnesium

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

B-1 Properties.

Magnesium, a silvery white metal with an atomic weight of 24.32 and specific gravity of 1.74, is one of the lightest known structural metals. The melting point of magnesium is 1202°F (650°C). The ignition temperature is generally considered to be close to the melting point, but ignition of magnesium in certain forms can occur at temperatures below the melting point. Magnesium ribbon, fine magnesium shavings, and magnesium powders can be ignited under certain conditions at temperatures of about 950°F (510°C), and a very finely divided magnesium powder has been ignited at temperatures below 900°F (482°C).

Commercially pure magnesium contains traces of aluminum, copper, iron, manganese, nickel, and silicon, but these contaminants in typical analyses generally total less than 0.2 percent. Metal marketed under different trade names and commonly referred to as magnesium might be one of a large number of different alloys containing different percentages of magnesium, aluminum, zinc, and manganese. Some of these alloys can have ignition temperatures considerably lower than that determined for pure magnesium. In some cases, the melting point of certain alloys can be as low as 800°F (427°C) and can ignite if held at this lower temperature for some time.

B-2 Radioactive Alloys.

A few magnesium alloys are produced that contain thorium. Thorium, which is a low-level radioactive material, is used in these alloys up to a nominal concentration of 3 percent.

The natural decay or "daughter" products of thorium are locked in the alloy until such time as the metal is melted, burned, or chemically disintegrated. Under fire conditions, these decay products exist within visible fumes and are diluted as the visible fumes dissipate. These elements can be inhaled with possible irradiation of lung tissue and deposition in bone structure. Maximum permissible airborne concentrations of such radioactive materials have been established by the Nuclear Regulatory Commission and are based on continuous exposure for a normal 40-hour work week.

B-3 Spot Tests for Magnesium.

In the construction or assembly of certain machinery or equipment, magnesium or one of its alloys having similar properties might be used for a few of the component parts, and where finished or painted products are being stored or handled it can be difficult to determine the percentage of magnesium. Investigation has shown that silver nitrate or acetic acid (vinegar) can be used to distinguish between parts composed of magnesium and those composed of aluminum. The portion of metal to be tested is first cleaned of grease, dirt, oxide, etc., using sandpaper or steel wool. After the test area has been prepared, a drop of acetic acid is placed on it. If hydrogen bubbles develop, the piece tested is magnesium.

B-3.1 Silver Nitrate Test.

The test solution is prepared by dissolving about 5 g of silver nitrate ($AgNO_3$) in 1 L of distilled water. The application of this solution immediately produces a black coloration on magnesium or magnesium alloy. (This coloration is essentially reduced silver.) No coloration is noted on aluminum and its alloys, or most other metals. Zinc and cadmium exhibit a similar black coloration but are much heavier.

B-4 Combustibility and Explosibility.

The ignitability potential of magnesium depends to a large extent upon the size and shape of the material as well as the size and intensity of the source of ignition. Where magnesium exists in the form of ribbon, shavings, or chips with thin, feather-like edges, or as grinding dust, a spark can be sufficient to start the material burning. Heavier pieces such as ingots and thick wall castings are difficult to ignite because heat is conducted away rapidly from the source of ignition. If the entire piece of metal is raised to the ignition temperature [about 1200°F (649°C) for pure magnesium and many of the alloys], self-sustained burning will occur.

The combustibility of magnesium, the ineffectiveness of ordinary types of extinguishing agents on magnesium fires, and the fact that, under certain conditions, the application of some of these agents intensifies burning and can release hydrogen to form an explosive gas-air mixture, all combine to create serious fire and explosion hazards.

Magnesium, in its solid form, melts as it burns and can form puddles of molten magnesium that, in the presence of sufficient moisture, can pose explosion hazards similar to those associated with other molten metals.

B-5 General.

B-5.1

Electrically conductive flooring is often employed in magnesium powder plants, although it is recognized that it is difficult to maintain the conductivity of the floor over a period of time using currently available materials.

B-5.2

The surface of a conductive floor provides a path of moderate electrical conductivity between all persons and portable equipment making contact with the floor, thus preventing the accumulation of dangerous electrostatic charges.

B-5.3

The maximum resistance of a conductive floor is usually less than 1,000,000 ohms, as measured between two electrodes placed 3 ft (0.3 m) apart at any two points on the floor. The minimum resistance is usually greater than 25,000 ohms, as measured between a ground connection and an electrode placed at any location on the floor. This minimum resistance value provides protection for personnel against electrical shocks. Resistance values should be checked at regular intervals.

B-6 Testing for Minimum and Maximum Resistance.

The following equipment and procedures are accepted practice.

B-6.1

Each electrode weighs 5 lb (2.2 kg) and has a dry, flat, circular contact area 2.5 in. (63.5 mm) in diameter. The electrode consists of a surface of aluminum foil 0.0005 in. to 0.001 in. (0.013 mm to 0.025 mm) thick, backed by a layer of rubber 0.25 in. (6.4 mm) thick, and measuring 40 to 60 durometer hardness, as determined by a shore-type durometer or equivalent. (*See ASTM D2240, Standard Test Method for Rubber Property — Durometer Hardness*.)

B-6.2

Resistance should be measured with a suitably calibrated ohmmeter that can operate on a nominal open circuit output voltage of 500 volts dc and a short-circuit current of 2.5 milliamperes to 10 milliamperes.

B-6.3

Measurements should be made at five or more locations in each room and the results averaged.

B-6.4

To comply with the maximum resistance limit, the average of all measurements should be less than 1,000,000 ohms.

B-6.5

To comply with the minimum resistance limit, no individual measurement should be less than 10,000 ohms, and the average of not fewer than five measurements should be greater than 25,000 ohms.

B-6.6

Where resistance to ground is measured, two measurements are customarily made at each location, with the test leads interchanged at the instruments between the two measurements. The average of the two measurements is taken as the resistance to ground at that location. Measurements are customarily taken with the electrode or electrodes more than 3 ft (0.9 m) from any ground connection or grounded object resting on the floor.[1]

[1]If resistance changes appreciably over time during a measurement, the value observed after the voltage has been applied for about 5 minutes should be considered the measured value.

B-7 Building Construction.

While noncombustible construction is preferred for buildings occupied by magnesium melting and processing operations, limited-combustible and combustible construction can be permitted in appropriate circumstances.

B-7.1

Moisture and foreign material are dangerous where molten metal is present. Such moisture can result from outdoor storage or from collection of condensate during indoor storage.

B-7.2

Flash fires in fine dust can result in serious injury. While the chance of a flash fire igniting castings is remote, a fire in accumulated dust can be intense enough to cause ignition of castings.

B-7.3

Fire can occur in furnaces or ovens where magnesium is being heat-treated if there is lack of proper temperature control or if the surface of the metal is not free of dust or fine particles of metal. Failure to provide for proper circulation of the heated air in the furnace can result in overheating or higher temperatures in certain zones than those indicated by the thermocouples that operate the temperature control devices.

B-7.3.1 Direct contact between aluminum and magnesium at heat-treating temperatures promotes diffusion and alloying of one metal with the other, resulting in the formation of low-melting, ignitable alloys.

B-7.3.2 Certain commonly used mixtures of molten nitrates and nitrites can react explosively with the magnesium alloys immersed in them.

B-8

Machining magnesium includes sawing, turning, chipping, drilling, routing, reaming, tapping, milling, and shaping. Magnesium can usually be machined at the maximum speeds obtainable on modern machine tools. The low power required allows heavy depths of cut and high rates of feed, which are consistent with good workmanship. The resulting chips are thick and relatively massive; they seldom ignite due to their relatively large heat capacity.

B-9

Magnesium pigs, ingots, and billets are not easily ignited, but they burn if exposed to fire of sufficient intensity.

B-9.1

Heavy castings [25 lb (11.3 kg) or greater] having walls with large cross sections [at least $^1/_4$ in. (6.4 mm)] can be ignited after some delay where in contact with burning magnesium chips or where exposed to fires in ordinary combustible materials.

B-10

Prime (commercially pure) magnesium chips and fines are commonly used in Grignard and other chemical reactions. These chips are generally free of contaminants and are not subject to spontaneous ignition. Where such chips are produced, shipped, and stored for chemical and metallurgical process purposes, the conditions of handling and storage are such that a fire is unlikely.

While water should not be applied to a large chip fire, automatic sprinklers are valuable in confining or extinguishing an incipient fire in packaging and in small amounts of chips, provided detection and discharge are rapid.

B-11

While the flame temperature of burning magnesium is about 7200°F (3983°C), the heat of combustion is only about half that of common petroleum products. Thus, fire fighting personnel can approach a fire closely during extinguishment, if care is exercised.

B-11.1

Fires in magnesium should be extinguished using a Class D extinguishing agent or a dry inert granular material.

B-11.2

Magnesium fires are more easily extinguished if attacked with the proper extinguishing agents during the early stages of the fire. Certain extinguishing agents accelerate a magnesium fire. These agents include foam, carbon dioxide, halogenated agents, and dry chemical agents containing mono- or diammonium phosphate. Also, the use of water on a magnesium chip or powder fire should be avoided. It is very difficult to extinguish a massive fire in magnesium powder. The major problem involves control of fires in the incipient stage.

The fire area should not be re-entered until all combustion has stopped and the material has cooled to ambient temperature.

B-11.3

Reignition can occur due to high localized heat or spontaneous heating. To avoid reignition, the residual material should be immediately smothered.

B-11.4

It is recommended that a practice fire drill be conducted once each year to familiarize local fire department personnel with the proper method of fighting Class D fires.

B-12

Provisions should be made to automatically cut off electrical power and lighting circuits in manufacturing buildings when one or more safety-sensing devices are activated by high pressure, low airflow, abnormal oxygen content, excessive vibration, or other pertinent factors that are being monitored. Alternatively, these sensing devices should be arranged to sound an alarm in those locations where prompt corrective action can be taken.

B-13

Temperature-sensing elements connected to alarms or machine stop switches should be employed for locations where overheating of bearings or other elements might be anticipated.

B-14

Open bin storage is not desirable. Storage bins for powders should be sealed and purged with inert gas prior to filling.

Appendix C Explosibility of Magnesium Dust

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

Definition.

Deflagration: An explosion in which the rate of propagation of the flame front into the unreacted medium occurs at less than sonic speed. If the shock wave propagates at a rate greater than the speed of sound, it becomes a detonation.

C-1 Explosions in Magnesium/Air Dust Mixtures.

Magnesium dust is a potentially hazardous material when suspended in air. The finer the dust particle size, the more easily it disperses, the longer it takes to settle, and the easier it is to ignite.

In order for a magnesium/air dust cloud to experience a deflagration (explosion), two conditions are necessary:

(a) An ignitable concentration of dust in air;

(b) An ignition source of sufficient strength to ignite the combustible air/dust mixture.

Research conducted by the U.S. Bureau of Mines and others over many years has established values for these parameters. In using these data for the design of industrial equipment and systems, it should be kept in mind that other factors such as metal purity, particle size distribution, moisture, ambient pressure and temperature, and turbulence all affect the exact conditions for initiating explosions in such dust clouds.

A summary of the best available information for unalloyed magnesium dust in air is listed in Table C-1. Attention is directed to the fact that the data shown are for 200 mesh (less than 74 microns) in small unvented containers. These conditions are not truly representative of magnesium powder manufacture but provide useful guidelines for avoiding accidents. For this reason, an additional safety factor should be used where applying this information to industrial-scale operations. A safety factor of 2-3 is suggested.

Table C-1 Explosion Characteristics of Unalloyed Magnesium Dust in Air [200 Mesh (74 microns)]

Explosibility Index*	10
Ignition Sensitivity†	3.0
Explosion Severity††	7.4
Maximum Explosion Pressure (psig)	115

	(793 kPa gauge)
Maximum Rate of Pressure Rise (psi/sec)	15,000 (103,410 kPa/sec)
Ignition Temperature Cloud (°C)	560°C
Minimum Cloud Ignition Energy	
Joules (watt-seconds)	0.04
Minimum Explosion Concentration (oz/cu ft)	0.03
Limiting Oxygen % for Spark Ignition	-§
(K_{St} values for specific particle sizes)	

* Explosibility Index = ignition sensitivity × explosion severity

† Ignition Sensitivity =

$$\frac{\text{[Ignition temp} \times \text{min energy} \times \text{min conc. (LEL)] Pittsburgh coal dust}}{\text{[Ignition temp} \times \text{min energy} \times \text{min conc.] Sample dust}}$$

†† Explosion Severity =

$$\frac{\text{[Max exp. pressure} \times \text{max rate of pressure rise] Pittsburgh coal dust}}{\text{[Max exp. pressure} \times \text{max rate of pressure rise] Sample dust}}$$

§Burns in carbon dioxide, nitrogen, and halons.

Magnesium dust explosions are characterized by very rapid rates of pressure rise to a maximum pressure of approximately 115 psig (793 kPa gauge). Limited industrial loss experience indicates the use of venting and explosion suppression techniques can be impractical for large-size vessels. As a consequence, the avoidance of conditions that can lead to explosions is of particular importance with fine magnesium powders.

It has been determined that the presence of some coarse particles, greater than 100 mesh (150 microns) in size, in magnesium dust has little effect on the initiation of explosions in such dust clouds. For this reason, the particle size distribution of the powders in air systems should be known, and equipment designs and safe operating procedures should be based on the expected concentration of less than 100 mesh (less than 149 microns) powder in these systems. In the absence of this information, the total amount of powder should be used. While this can limit production rates, it provides an additional factor of safety where dealing with undocumented powders.

From a practical standpoint, a combination of explosion containment with other techniques might be the only other way to avoid personal injury and property damage in manufacturing operations unless oxygen reduction by dilution with argon or helium is employed. This containment technique, together with the avoidance of conditions that can lead to dust explosions, represents the best way of avoiding catastrophic accidents in magnesium dust handling equipment and systems.

Dust clouds can be ignited by flames, arcs, high-temperature surfaces, and static and friction sparks, etc. The destructive effect of magnesium dust explosions can be greater than that of some vapor and gas explosions because of the comparatively high rate at which the pressure rises in some dust explosions. This results in longer impulse-loading on personnel and structures than that resulting from a gas explosion and is the factor that causes a dust explosion to be more destructive. Attention is directed to the fact that a 0.5 psig (3.5 kPa gauge) overpressure will cause an 8-in. (20-cm) concrete block wall to fail. It is obvious that this overpressure is reached extremely rapidly where the rate pressure rise is 15,000 psi/sec (103,410 kPa/sec) and the maximum pressure reached is 115 psig (793 kPa gauge).

In pneumatic conveying systems, proper selection of fan or blower capacity can be used to maintain a powder concentration below the LFL of 0.03 oz/cu ft (0.03 g/L) shown in Table C-1. If the quantity of powder to be transported is predetermined, the fan can be selected to provide enough conveying air to keep the dust concentration below the ignitable level. Care should be taken, however, to maintain sufficient superficial air velocity [over 3500 ft/sec (1068 m/min)] in the duct system to avoid saltation in horizontal lines and drop-out in vertical lines.

While the complete design of a "safe" system is beyond the scope of this appendix, a simplified example serves to illustrate the above point. For instance, to transport 10 lb/min (4.5 kg/min) of fine [less than 100 mesh (less than 149 microns)] magnesium powder introduced uniformly into an air-conveying system while maintaining a dust concentration below the 0.03 oz/cu ft (0.03 g/L) flammability level, the airflow is calculated as follows:

$$\text{Air Needed} = \frac{10\ \text{lb/min} \times 16\ \text{oz}}{0.03\ \text{oz/cu ft}} = 5333.3\ \text{CFM}$$

For a 14-in. diameter round duct, the superficial air velocity from the following equation is 4994 ft/min, neglecting density effects.

$$Q = AV$$

where Q = quantity of airflow

A = cross-sectional area

V = velocity

$$Q = \frac{5333.3}{1.068} = 4994 \text{ ft/min}$$

NOTE: These calculations do not take into account the effects of temperature, altitude, and humidity on the airflow. The result indicates that to maintain a nonignitable dust concentration, the amount of air needed per pound of powder $\left[\frac{(5333.3 \text{ CFM})}{10 \text{ lb}} \times 0.075 = 40 \text{ lb}\right]$ is quite large.

The standard density of dry air is taken at 0.075 lb/cu ft.

Therefore, highly diluted phase-conveying is necessary for safe operation. With the added recommended safety factor of 2 to 3, this ratio becomes much greater. Observing these guidelines provides a simple starting point for the design of a reasonably safe system for air-conveying fine magnesium powder.

In air-separating cyclones, the dust concentration can be assumed to approximate the concentration in the conveying lines less an allowance of 10 percent for air-lock leakage, etc. Nearly all of the conveying air entering a cyclone leaves through the vent, and there are no semistagnant air spaces except for the small volumes of the dust trap and dip-leg.[1] As a consequence, the concentration of magnesium fines [less than 100 mesh (less than 149 microns)] in the air in a properly designed cyclone separator does not exceed the lower flammability limit in such units where the recommended safety factor and other considerations referred to previously are used as guidelines.

[1]Attention is directed to the difference between this situation and a grain silo, where a large amount of dust is discharged by gravity from the separator into semistagnant air in a large cylindrical tank or silo, which allows the dust concentration to materially increase.

With regard to the presence of ignition sources of sufficient strength to ignite a dust cloud, if the lower flammability level of 0.03 oz/cu ft (0.03 g/L) is exceeded, it should be noted that the 40 millijoules (MJ) energy required to ignite such a dust cloud is nearly 20 to 50 times greater than that required to ignite flammable gas or vapor mixtures. Such strong ignition sources do not generally exist in magnesium powder plants that operate with lightning protection and electrically bonded and grounded equipment to minimize static electricity, and that have strong magnetic separators to remove tramp metals from process streams, where all the above safety equipment and arrangements are regularly inspected and maintained.

C-2 Chemical Process to Render Magnesium Fines Noncombustible.

Metallic magnesium fines generated in the production of structural magnesium parts or other products often have no commercial value and can present a fire hazard. They should be disposed of regularly. These fines might be the wet fines from a dust collector system, partially converted to an inactive state by having been collected in water, or chips from a machining operation.

Chips and turnings may be wet, dry, or oil-soaked, and, frequently, they are contaminated. Fines vary in size from the dust generated in a sanding or buffing operation to a much larger particle produced by sawing, drilling, or turning. Prior to disposing of any fines, a secondary processor/melter should be contacted to assess the recycled value of the by-product.

In seeking a means of disposal for magnesium fines, other than by burning, the most obvious solution is to immerse them in water. Magnesium fines can be rendered partially inactive by reacting them with water to form hydrogen and noncombustible magnesium hydroxide. Film formation on the magnesium, however, normally slows the process beyond practical limits; however, once substantially reduced to magnesium hydroxide, the residual sludge does not burn and can be disposed of like any other inert material. It has been found that partially inactivated magnesium fines containing approximately 10 percent metallic magnesium do not burn.

Magnesium sludge can more effectively be rendered chemically inactive and noncombustible by reacting it with a 5 percent solution of ferrous chloride ($FeCl_2•2H_2O$). The reaction takes place with the evolution of hydrogen at such a rate that the magnesium fines are changed in less than 24 hours to a concentration of magnesium hydroxide that the residue cannot burn. Since hydrogen is generated by the reaction, the process should be carried out in an open container placed outside in a location where natural air movement will prevent the accumulation of explosive concentrations of hydrogen in air. Open flames and smoking should be prohibited in the immediate vicinity of the process. The amount of $FeCl_2•2H_2O$ commonly employed in the decomposition is approximately 0.6 lb (0.3 kg) for each pound of magnesium fines (dry weight). The amount of water in the fines should be considered in determining the weight of the magnesium fines. Exact concentrations should be determined on the basis of the type of fines being handled. The cycle can be repeated easily in the same container until the amount of brown, damp residue is such that the container should be cleaned out. To be certain of complete reaction, a sample of the residue should be heated with a Bunsen burner or oxyacetylene torch to determine if it can be ignited. While the method is simple, it should be operated under strict technical supervision to avoid disposal of partially reacted magnesium.

The main constituent of the residual sludge is magnesium hydroxide [$Mg(OH)_2$], which indicates that the iron salt functions not as a reagent that is consumed in the reaction, but rather as a catalyst that simply promotes the reaction with water to form magnesium hydroxide and hydrogen gas. Considerable heat is generated in the early stages of the reaction, especially if the particles are finely divided and clean. During this stage, considerable hydrogen is released and foaming can occur. Small amounts of hydrogen continue to evolve until no metallic magnesium is present.

It should be remembered that this is a chemical reaction and the results obtained depend on several factors. It has been mentioned that freshly formed, finely divided particles react quite quickly, so that considerable heat, hydrogen evolution, and foaming can occur. In case of excessive foaming, the reaction should be slowed down, or a defoamer can be added. If the fines have been under water in a collector system for some time, less metallic magnesium is present, and the reaction is slower. Particles coated with oil or tar pose special problems, and the use of a detergent might be advisable. If the reaction is carried out in a container that has little surface area and limited excess water, the heat of reaction might be sufficient to ignite the hydrogen. Hydrogen is less liable to be trapped in a shallow container, and a larger surface area provides better heat dissipation.

It is recommended that the details of the process be worked out by technically competent personnel. The daily operation can be performed on a routine basis under technical supervision. If excessive heating is a problem, more water can be added. It has been found that a weaker solution will frequently render the material noncombustible in the desired length of time with less initial heating. The reaction vessel can be mild steel. In one case, a tank constructed of $^1/_4$-in. (6.4-mm) thick mild steel, in almost constant use, lasted 10 years before leaking.

Ferric chloride ($FeCl_3$) in dilute amounts can be used in place of ferrous chloride ($FeCl_2$) to produce the same results. The initial rate of reaction is faster when using ferric chloride; however, this can be controlled by adding more water or initially adding the magnesium fines slowly. Solutions of $FeCl_3$ in water as low as 1 percent dilute have been used to render certain types of magnesium fines noncombustible within 24 hours.

$FeCl_3$ is available in crystalline form ($FeCl_3•6H_2O$) or the anhydrous form (98 percent $FeCl_3$). Either can be used, but the anhydrous form should be handled like an acid because of the hazard posed by chemical burns to the skin and eyes. In figuring the required amounts of either $FeCl_2$ or $FeCl_3$, the water produced by crystallization should be considered in determining the strength of the solution.

Several companies have used either $FeCl_2$ or $FeCl_3$ to render magnesium fines noncombustible. The general experience supports the original work done on a laboratory scale. The following two examples provide information of interest.

Case 1

Material Treated: Fines from wire brushing sheet collected in a wet dust collector or fine shavings from a milling operation.

Tank Size: 8 ft (2.4 m) wide × 20 ft (6.1 m) long × 27 in. (69 cm) deep.

Amount of Fines Treated: Amount of fines in water solution varies considerably from batch to batch. Several hundred pounds have been treated at a time.

Amount of Chemical Added: 25 lb (11.4 kg) of $FeCl_2•6H_2O$ or 15 lb (6.8 kg) of anhydrous $FeCl_3$ (98 percent $FeCl_3$) per 100 gal (379 l) of liquid in the tank. $FeCl_2•2H_2O$ is added as a powder; $FeCl_3•6H_2O$ is added in cake form; the 98 percent $FeCl_3$ is a powder and is made up as a water solution and pumped into the tank.

Result: Little heat evolution, low foaming, and a noncombustible sludge within 24 hours.

NOTE: The reaction is carried on outside, and a steam coil is used to warm the solution in the winter. The residue is checked with a propane torch to determine combustibility. Adequate protection from chemical burns is provided where using anhydrous $FeCl_3$ (98 percent).

Case 2

Material Treated: Fines generated by sanding of magnesium die castings that have been collected in a wet dust collector.

Tank Size: 5 ft (1.5 m) wide × 8 ft (2.4 m) long × $3^1/_2$ ft (1 m) deep (steel dumpster box).

Amount of Fines Treated: Approximately 60 lb (27 kg) magnesium fines in a 55-gal (208-l) drum filled with fines and water. To this is added approximately 92 gal (348 l) of water that results in a liquid depth of 5 in. (12.7 cm) in the tank.

Amount of Chemical Used: 44 lb (20 kg) of 98 percent $FeCl_3$ added with an aluminum hand scoop.

Result: Some heat evolution, foaming, and a noncombustible sludge within 24 hours.

NOTE: If too much ferric chloride is used at once, the reaction is quite violent. Where 100 lb (45.4 kg) of magnesium fines were treated, the foam overflowed the tank. Each lot is tested for combustibility with a propane torch. The operator is protected against chemical burns while adding the $FeCl_3$ to the solution.

The following generalizations taken from the experience of users provides further information of interest.

(a) The magnesium fines can be added to the solution or the solution added to the fines. Additional fines can be added to a previous batch containing inactivated sludge. Experience indicates the time needed to complete each reaction and the amount of either $FeCl_2$ or $FeCl_3$ that needs to be added with each increment of fines.

(b) The ratio of $FeCl_2$ or $FeCl_3$ to magnesium content is subject to alteration based on a number of conditions, but the reaction takes place over a broad range of concentrations. The amount required should be determined for the fines being treated and the time allowed for reaction. The recommendation is to use 0.6 lb (0.3 kg) of $FeCl_2$•$2H_2O$ for each pound of magnesium fines (dry weight). The upper limit on concentration used has been 5 percent, but in many cases a lower concentration has been satisfactory and has produced less initial heat and foaming.

(c) Personnel handling anhydrous ferric chloride or ferric chloride solutions should wear overalls, rubber aprons, rubber gloves, and chemical goggles.

(d) Moist fines should not be flushed through long lines because they can build up a layer of semimoist material in the pipe. Inert sludge does not create a fire hazard under these same conditions.

(e) Heating with a steam line has been used to speed up the reaction process, especially in winter and after the initial rapid reaction stage is over.

(f) Foaming can be decreased by the use of defoaming agents. A greater quantity of water limits the heating and slows down the formation of foam.

(g) Longer reaction times might be needed to inactivate larger particles or those that are covered with oil or tars.

(h) For the purpose of estimating metal content, a cu ft (m^3) of material taken from a wet dust collector should be assumed to contain approximately 30 lb (13.6 kg) of metallic dust and 6 gal

(23 L) of water. Approximate weights used for dry fines are 50 lb per cu ft (800 kg/m^3) of sawdust and 15 lb per cu ft (240 kg/m^3) of rotary filings.

(i) Particular care should be taken in adding the initial $^1/_4$ lb to $^1/_2$ lb (0.11 kg to 0.22 kg) of magnesium fines per pound of $FeCl_2$ or $FeCl_3$ content of the solution. During this period, the reaction rate can be very rapid with fine powders (60 to 80 percent completion in 5 minutes), due to the initial acidity of the iron chloride salts. Beyond this point, however, the reaction rate moderates to a stable 4 to 5 percent of completion every 5 minutes (50 to 60 percent per hour).

(j) If magnesium and aluminum fines are mixed, the magnesium still reacts with the ferrous chloride or ferric chloride solution.

(k) Partially deactivated fines containing 10 percent metallic magnesium do not support combustion.

(l) After reaction is complete, the inert residue should be disposed of as waste or fill material.

Although this method has been widely used in the past, current environmental regulations should be met; therefore, a review with local authorities should be conducted to ensure compliance with all local, state, and federal requirements.

NFPA 481

1995 Edition

Standard for the Production, Processing, Handling, and Storage of Titanium

1995 Edition

This edition of NFPA 481, *Standard for the Production, Processing, Handling, and Storage of Titanium*, was prepared by the Technical Committee on Combustible Metals and Metal Dusts and acted on by the National Fire Protection Association, Inc., at its Annual Meeting held May 22-25, 1995, in Denver, CO. It was issued by the Standards Council on July 21, 1995, with an effective date of August 11, 1995, and supersedes all previous editions.

This edition of NFPA 481 was approved as an American National Standard on August 11, 1995.

Origin and Development of NFPA 481

This standard was initiated in 1955, tentatively adopted in 1957 and, with certain amendments, was adopted by the National Fire Protection Association in May, 1958. Amendments were adopted in 1959 and 1961.

A complete revision of the 1961 edition was adopted in 1972. Amendments to the 1972 edition were adopted in 1974.

In 1980, the 1974 edition was completely revised primarily to comply with the NFPA Manual of Style. Minor technical corrections were also made at this time. The completely revised edition was adopted by the Association at its 1981 Fall Meeting, and the revision was designated the 1982 edition.

The 1987 edition was a reconfirmation of the 1982 edition.

For this 1995 edition, the Committee has completely revised the standard to update the fire and dust explosion prevention measures and the requirements for safe handling of titanium solids and powders. The Committee revision has also incorporated editorial and style revisions to comply with the NFPA Manual of Style and to assist in making the document more usable, adoptable, and enforceable.

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on safeguards against fire and explosion in the manufacturing, processing, handling, and storage of combustible metals, powders, and dusts.

NFPA 481
Standard for the
Production, Processing, Handling, and Storage of Titanium

1995 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 9 and Appendix C.

Chapter 1 General

1-1 Scope.

1-1.1

This standard shall apply to the production, processing, handling, and storage of titanium.

1-1.2

This standard shall also apply to finished parts and those materials, including scrap, that exhibit the burning characteristics of titanium.

1-1.3

This standard shall not apply to the transportation of titanium in any form on public highways and waterways, or by air or rail.

1-1.4

This standard shall not apply to those laboratories handling hazardous chemicals as defined in NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

1-2* Purpose.

The purpose of this standard shall be to provide requirements addressing the fire and explosion hazards of titanium and titanium alloys and to outline requirements for fire prevention and protection.

1-3 Equivalency.

Nothing in this standard shall be intended to prevent the use of systems, methods, or devices of equivalent or superior quality, strength, fire resistance, effectiveness, durability, and safety over those prescribed by this standard, provided technical documentation is made available to the authority having jurisdiction to demonstrate equivalency and the system, method, or device is approved for the intended purpose.

1-4 Applicability.

The provisions of this document shall be considered necessary to provide a reasonable level of protection from loss of life and property from fire and explosion. They reflect situations and the state-of-the-art prevalent at the time the standard was issued. Unless otherwise noted, it shall not be intended that the provisions of this document be applied to facilities, equipment, structures, or installations that were existing or approved for construction or installation prior to the effective date of the document, except in those cases where it is determined by the authority having jurisdiction that the existing situation involves a distinct hazard to life or adjacent property.

1-5 Definitions.

For the purpose of this standard, the following terms shall have the meanings given below.

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed.* Equipment or materials included in a list published by an organization acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

Media Collector. Refers to either a bag house or a filter-type cartridge collector used for collecting dust.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Titanium. Refers to either pure metal or alloys having the generally recognized properties of titanium metal, including the fire or explosion characteristics of titanium in its various forms.

Titanium Chips.* Particles produced from a cutting, machining, or grinding operation that are not oxidized and that are not diluted by noncombustible materials.

Titanium Dust.* Any finely divided titanium material 420 microns or smaller in diameter (material passing U.S. No. 40 Standard Sieve) that presents a fire or explosion hazard when dispersed and ignited in air.

Titanium Fines. Titanium particles typically 20 mesh and below that can be ignited in a static layer.

Titanium Powder.* See Titanium Dust and Titanium Fines.

Titanium Sponge.* Titanium metal after it has been won from the ore but before it is melted into ingot.

Titanium Swarf. Particles produced from a cutting, machining, or grinding operation that causes partial oxidation of the parent material or dilution by other inert materials.

Chapter 2 Sponge Production

2-1 Plant Construction.

2-1.1*

Buildings housing reduction furnaces, boring and crushing facilities, and magnesium refining operations shall be constructed of noncombustible materials. Consideration shall be given to the provision of explosion venting in accordance with current accepted practices.

2-1.2

Building exits shall comply with NFPA *101®*, *Life Safety Code®*.

2-1.3*

Floors in reduction, boring, and crushing buildings shall be made of noncombustible materials, such as concrete, brick, or steel plates.

2-1.4

Magnesium refining and casting operations shall be protected from rain, and all possibilities of water spillage shall be avoided.

2-2 Processing Equipment.

2-2.1

Reactor vessels shall be air-cooled.

Exception: Magnesium reduction-sealed vessels shall be permitted to be water-cooled and designed to prevent water from entering the reaction vessel.

2-2.2

Furnaces shall be kept dry and free of iron scale and metal spillage.

2-2.3

Fuel supply lines to gas-fired furnaces shall have an emergency shutoff valve located within easy access outside of the building that contains the reduction furnaces.

NOTE: For information on emergency gas shutoff valves, see NFPA 54, *National Fuel Gas Code*.

2-2.4

All electrically operated or controlled processing equipment shall be installed in accordance with NFPA 70, *National Electrical Code®*.

2-3 Storage of Raw Materials.

2-3.1

Magnesium ingots for use in the Kroll process shall be stored in accordance with NFPA 480, *Standard for the Storage, Handling, and Processing of Magnesium Solids and Powders*.

2-3.2*

Chlorine shall be handled and stored in accordance with accepted industry practice.

2-3.3*

Bulk containers of liquid titanium tetrachloride ($TiCl_4$) shall be stored in a well-ventilated place located away from areas of acute fire hazard. Containers shall be plainly identified and tightly sealed until used.

2-4 Dust Collection.

2-4.1

Dust resulting from the crushing of titanium sponge shall be safely managed to minimize the risk of fires and explosions.

2-4.2

Media collectors shall not be used for the collection of titanium sponge fines.

2-4.3

Dry collectors shall be emptied before or when 80 percent of the storage capacity of the collector is attained. The maximum volume of titanium fines collected before emptying shall not exceed 5 gal (19 L).

2-4.4*

Dust collectors for Kroll-distilled material shall be located outside buildings and shall be provided with explosion vents.

2-4.5*

Fans that handle combustible dust and air mixtures shall be constructed of nonsparking materials and shall be constructed in accordance with NFPA 91, *Standard for Exhaust Systems for Air Conveying of Materials*.

2-5* Personnel Safety Precautions.

Personnel involved in reduction furnace tapping, removal of molten magnesium chloride, and magnesium refining and casting shall wear tight-fitting, above-the-ankle shoes, flame-retardant clothing, heat-resistant gloves, and face shields.

2-6 Sponge Storage.

2-6.1

Titanium sponge shall be stored in closed metal containers with a maximum capacity that are capable of being moved by available equipment.

2-6.2

Titanium storage areas shall be kept free of combustible materials, well-ventilated, equipped with required fire protection equipment, and plainly marked with No Smoking signs.

2-6.3

Where drums are used, storage shall be limited to one-drum tiers per pallet, and no more than four pallet loads high. Stacked storage shall be positioned in such a manner as to ensure stability.

2-6.4

Aisles shall be provided for maneuverability of material-handling equipment, accessibility, and to facilitate fire-fighting operations.

Chapter 3* Titanium Melting

3-1 Explosion Prevention.

3-1.1

The water supply to crucibles shall be monitored continuously by a system that automatically interrupts power to the furnace upon a drop in water pressure or flow. In addition, an emergency source of cooling water shall be provided and shall be actuated automatically by flow interlock in the event of interruption of the primary cooling water.

3-1.2

The use of a magnetic field to deflect the electric arc away from the crucible wall shall be considered.

3-1.3

Water-cooled furnaces shall be located in a protective concrete vault, or the crucible and its water jacket shall be isolated to protect personnel and to minimize damage if an explosion occurs.

3-1.4*

The upper chamber of the furnace shall be provided with a pressure-relieving device, such as a rupture disc, to aid in safely relieving pressure if water enters the furnace. Means shall be provided to prevent influx of air through the pressure-relief port. The release pressure of the rupture disc shall be 20 psig (138 kPa gauge) maximum. Large low-pressure ports shall not be used.

3-1.5

A clearance shall be maintained at all times between the electrode and the crucible wall to minimize arcing to the crucible wall.

3-1.6

The furnace shall be equipped with a device that continuously senses pressure within the furnace. The device shall automatically interrupt power to the melting heat source in the event of an expected sudden rise in pressure.

3-1.7

The furnace shall be equipped with:

(a) Water flow, temperature, and pressure sensors on all cooling systems;

(b) Arc voltage and melting power recorders;

(c) Electrode position indicators;

(d) Furnace pressure sensors and recorders; and

(e) Set point alarms on all systems to warn of abnormal conditions.

3-2* Casting.

3-2.1*

The water supply to crucibles shall be monitored continuously by a system that automatically interrupts power to the melting heat source upon a drop in water pressure or flow. In addition, an emergency source of cooling water shall be provided and shall be actuated automatically by flow interlock in the event of interruption of the primary cooling water.

3-2.2

Molds for titanium casting shall be made of material that is compatible with molten titanium. Molds shall be dried thoroughly and stored carefully to prevent accumulation of moisture in the molds.

3-2.3

The casting chamber shall be cooled or shall be sufficiently massive, or both, to accommodate a spill, since mold breaks are inevitable.

3-2.4

Control consoles for water-cooled melting and casting operations shall be located remote from melting areas and outside of furnace vaults.

3-2.5*

Residue from casting furnaces shall be placed in steel boxes and moved outside the building.

Chapter 4* Mill Operations

4-1 Fire Prevention.

4-1.1

Tanks in which flammable or combustible solvents are used for degreasing shall comply with NFPA 30, *Flammable and Combustible Liquids Code*.

4-1.2*

Sawing, grinding, and cutting equipment shall be grounded.

4-1.3

All titanium chips shall be collected in closed-top metal containers and removed daily, as a minimum, to a safe storage or disposal area.

4-1.4

Forge presses, heavy grinders, and other milling equipment operated by hydraulic systems shall use a less hazardous hydraulic oil with a flash point greater than 200°F (93°C) if oil leaks are anticipated.

4-1.5

Nonflammable coolants shall be used for wet grinding, cutting, or sawing operations. The coolant shall be filtered on a continuous basis and the collected solids shall not be permitted to accumulate in quantities greater than 5 gal (19 L) and shall be moved to a safe storage or disposal area.

4-1.6

Flammable and combustible liquids coatings applied to ingots or billets shall meet the requirements of NFPA 34, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*.

4-1.7

Oily crushed lathe turnings, raw turnings, and swarf shall be collected in closed-top metal containers and removed daily, as a minimum, to a safe storage or disposal area.

4-1.8

Furnaces or other heating equipment used for heating titanium shall be free of iron scale or residue that could react exothermically with the metal being heated.

Chapter 5 Machining and Fabrication

5-1* Machining Operations.

Cutting tools shall be of proper design and shall be kept sharp for satisfactory work with titanium.

5-2 Welding.

5-2.1

All welding of titanium shall be carried out under an inert atmosphere, such as helium, argon, or under vacuum.

5-2.2

Electric arc or gas torch welding shall not be permitted in any room where titanium powder is produced, handled, packaged, or stored until all powder has been removed and all equipment washed thoroughly.

5-3 Titanium Dust Collection.

5-3.1

Titanium dust shall be collected by means of hoods or enclosures at each dust-producing operation. The hoods or enclosures shall be connected to liquid precipitation separators, and the suction unit shall be installed so that the dust is converted to sludge without contact, in the dry state, with any high-speed moving parts. [*See Figures A-5-3.1(a) through (e).*]

5-3.2

Connecting ducts or suction tubes between points of collection and separators shall be completely bonded and grounded. Ducts and tubes shall be as short as possible, with no unnecessary bends. Ducts shall be fabricated and installed in accordance with NFPA 91, *Standard for Exhaust Systems for Air Conveying of Materials*.

5-3.3

Titanium dust-producing equipment shall be connected to dust-separating equipment. Multiple pieces of titanium dust-producing equipment shall be permitted to be connected to a single titanium dust-separating unit. An evaluation shall be made to determine if multiple pieces of dust-producing equipment can be safely served by a single dust-separating unit.

5-3.4*

If the titanium dust-separating unit is to be used for other materials, it shall be thoroughly cleaned of all incompatible materials prior to and after its use.

5-3.5

The power supply to the dust-producing equipment shall be interlocked with the airflow from the exhaust blower and the liquid level controller of the separator so that improper functioning of the dust collection system will shut down the equipment it serves. A time delay switch or equivalent device shall be provided on the dust-producing equipment to prevent starting of its motor drive until the separator is in complete operation.

5-3.6 Housekeeping.

5-3.6.1 Systematic cleaning of the entire building containing dust-producing equipment, including roof members, pipes, conduits, etc., shall be conducted as conditions warrant. Cleaning methods shall be limited to those methods that minimize the probability of having a fire or explosion, as determined by a person knowledgeable in the properties of titanium dust.

5-3.6.2 Due to the inherent hazards associated with the use of fixed vacuum-cleaning systems for finely divided titanium dust, special engineering considerations shall be given to the design, installation, maintenance, and use of such systems.

5-3.7

Sludge from dust separators and vacuum-cleaning system precipitators shall be removed daily as a minimum. Covered, vented steel containers shall be used to transport collected sludge to a safe storage area or for disposal. Sludge shall be disposed of in accordance with federal, state, and local regulations.

5-4 Compressed Air Fittings.

To prevent potential explosions caused by inadvertently using high-pressure compressed air in place of low-pressure inert gas, fittings used on compressed air and inert gas line outlets shall not be interchangeable.

Chapter 6* Scrap Storage

6-1 Storage.

6-1.1

Open storage of sheet, plate, forgings, or massive pieces of scrap presents no fire risk and shall be permitted.

6-1.2

Open storage of sponge, chips, fines, and dust that are readily ignitable shall be isolated and segregated from other combustible materials and titanium scrap to prevent propagation of a fire.

Exception: Storage of materials in closed noncombustible containers shall not be subject to the requirements of 6-1.2.

Chapter 7* Titanium Powder Production and Use

7-1 Drying and Storage of Titanium Powder.

7-1.1

Wetted powder shall be dried at a temperature not exceeding 230°F (110°C).

7-1.2*

Drying rooms shall be of Type I construction, as defined by NFPA 220, *Standard on Types of Building Construction*. They shall be segregated as far as possible from other operations. Explosion venting for drying rooms shall be considered.

7-1.3

Titanium powder shall be stored in sealed containers in well-ventilated areas, and shall be kept free of combustibles. The containers shall be protected from damage.

7-2 Titanium Powder Handling.

7-2.1

Special care shall be taken to prevent spills or dispersions that produce dust clouds.

7-2.2

Special temperature controls shall be required on sintering furnaces that handle titanium parts that are fabricated from powder. Powder or dust shall not be permitted to accumulate in the furnace or near the heating elements. Furnaces shall be provided with inert atmospheres.

7-2.3*

To minimize the risk of fire or explosion hazards in the handling of dry titanium powders, the equipment and processes shall be designed by people knowledgeable in the hazards of titanium powders.

7-2.4 Electrical Installations.

All titanium powder production, drying, and packing areas shall be evaluated for fire and explosion hazards associated with the operation and shall be provided with approved electrical equipment for the hazardous location present, which shall be installed in accordance with the requirements of NFPA 70, *National Electrical Code*.

7-3 Personnel Safety Precautions.

Personnel handling dry titanium powder shall wear nonsparking shoes and noncombustible or flame-retardant clothing without pockets, cuffs, laps, or pleats in which powder can accumulate.

Chapter 8 Fire Prevention and Fire Protection

8-1 Fire Prevention.

The provisions of Chapter 8 shall apply to all titanium production process, handling, and storage operations.

8-1.1

Buildings shall comply with the applicable provisions of NFPA *101*, *Life Safety Code*.

8-1.2

Sponge discharged from dryers shall be collected in containers that have no larger than a 4000-lb (1814-kg) capacity. The collection area shall be well-ventilated and free from other combustible material.

8-1.3

Hot work permits shall be required in designated areas that contain exposed titanium fines, dust, or sponge where hot work is conducted. All hot work areas that require a permit shall be thoroughly cleaned of titanium fines, dust, or sponge before hot work is performed.

NOTE: For information on cutting and welding practices, see NFPA 51B, *Standard for Fire Prevention in Use of Cutting and Welding Processes*.

8-1.4*

All containers used to receive molten metal, molten magnesium, molten magnesium chloride, or liquid sodium shall be cleaned and dried thoroughly before using. All pieces of magnesium metal shall be clean and dry when charged to reactors.

8-1.5

Good housekeeping practices shall be maintained. Supplies shall be stored in an orderly manner with properly maintained aisles to permit regular inspection and segregation of incompatible materials. Supplies of materials in titanium processing areas shall be limited to amounts necessary for normal operation.

8-1.6

Ordinary combustible materials, such as paper, wood, cartons, and packing material, shall not be stored or permitted to accumulate in titanium processing areas unless necessary for the process, and then only in designated areas.

8-1.7

Regular, periodic cleaning of titanium dust and fines from buildings and machinery shall be carried out as frequently as conditions warrant. Dust and fines shall be removed to a safe storage or disposal area. Consideration shall be given to the potential ignition sources associated with the operation of equipment during the cleaning operation.

8-1.8

Regular inspections shall be conducted to detect the accumulation of excessive titanium dust, chips, or fines on any portions of buildings or machinery not regularly cleaned in daily operations. Records shall be kept of these inspections.

8-1.9

Combustible materials shall not be discarded in containers used for the collection of dust, swarf, or turnings.

8-1.10

Oil spills shall be cleaned up immediately.

8-1.11

Smoking shall be permitted only in designated areas. No smoking areas shall be posted with No Smoking signs.

8-1.12*

Boring, crushing, and drying equipment shall be properly electrically bonded and grounded to prevent accumulation of static electricity.

8-1.13

All electrical equipment and wiring in titanium production, processing, handling, and storage facilities shall comply with NFPA 70, *National Electrical Code*.

8-1.14

Nonsparking tools and utensils shall be used in handling titanium powder.

8-1.15*

All metal objects or equipment used in titanium operations shall be properly electrically bonded and grounded to prevent accumulations of static electricity.

8-1.16

Where titanium is collected or stored in containers, material-handling equipment with sufficient capability to remove any container from the immediate area in the case of an emergency shall be readily available.

8-1.17

Areas used for torch-cutting of massive pieces of scrap shall be kept free of combustible materials.

8-2* Fire Protection.

8-2.1*

Buildings or portions of buildings of noncombustible construction used principally for titanium storage or handling shall not be permitted to be equipped with automatic sprinkler protection.

Exception: Sprinkler systems installed in accordance with NFPA 13, Standard for the Installation of Sprinkler Systems, shall be permitted in areas where combustibles other than titanium create a more severe hazard than the titanium and where acceptable to an authority having jurisdiction who is knowledgeable of the hazards associated with titanium.

8-2.2

If required by the authority having jurisdiction, automatic sprinkler protection, installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall be provided for offices, repair shops, and warehouses not used for the storage of titanium sponge, fines, or chips.

8-2.3* Portable Fire Extinguishers.

8-2.3.1 Portable fire extinguishers shall be provided in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*. Water-based or CO_2 extinguishers shall not be provided in areas containing titanium sponge, fines, or chips.

8-2.3.2 If portable extinguishers are to be used on metal fires, they shall be approved for use on Class D fires.

8-2.4*

Dry sodium chloride, or other dry chemicals or compounds suitable for extinguishment or containment of titanium fires, shall be permitted to be substituted for Class D fire extinguishers. These alternative agents shall be stored in a manner that ensures the agent's effectiveness.

Shovels or scoops shall be kept readily available adjacent to the containers. All extinguishing agent storage areas shall be clearly identified.

8-2.5

Titanium fines shall be segregated by storage in noncombustible drums or tote bins. Drums or tote bins of burning materials shall be moved away from processing equipment and out of buildings as rapidly as possible.

8-2.6*

When a fire occurs in processing equipment, material feed to the equipment shall be stopped. The equipment shall be kept in operation, unless continued operation will spread the fire.

Chapter 9 Referenced Publications

9-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

9-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 10, *Standard for Portable Fire Extinguishers*, 1994 edition.

NFPA 13, *Standard for the Installation of Sprinkler Systems*, 1994 edition.

NFPA 30, *Flammable and Combustible Liquids Code*, 1993 edition.

NFPA 34, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*, 1995 edition.

NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*, 1991 edition.

NFPA 70, *National Electrical Code*, 1996 edition.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-2

See Appendix B for supplementary information on titanium.

A-1-5 Approved.

The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-5 Authority Having Jurisdiction.

The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-5 Listed.

The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-5 Titanium Chips.

Titanium chips vary in ease of ignition and rapidity of burning, depending on size and geometry. A light, fluffy chip ignites easily and burns vigorously while a heavy, compact chip ignites with difficulty and burns quite slowly.

A-1-5 Titanium Dust.

See NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, or NFPA 497M, *Manual for Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, for information on explosibility parameters of combustible dusts.

A-1-5 Titanium Powder.

See NFPA 497B, *Recommended Practice for Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, or NFPA 497M, *Manual for Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, for information on explosibility parameters of combustible dusts.

A-1-5 Titanium Sponge.

Titanium sponge can contain dust and fines that can become airborne when the material is handled. If present in sufficient quantity, the dust and fines can cause increased fire risk.

A-2-1.1

NFPA 68, *Guide for Venting of Deflagrations*, contains information on the subject of explosion venting.

A-2-1.3

Floors should be slightly crowned to prevent accumulation of water in the vicinity of reduction furnaces.

A-2-3.2

For information on guidelines for handling and storing chlorine, see *The Chlorine Manual* (*see C-1.2.4*).

A-2-3.3

Titanium tetrachloride in contact with moist air or water hydrolyzes to form hydrogen chloride gas and hydrochloric acid. Hydrogen chloride is toxic and highly irritating to the respiratory tract. If not immediately removed, titanium tetrachloride in contact with the eyes or skin will result in a double burn, one caused by the acid, the other caused by the heat of reaction. Any skin that is contacted by titanium tetrachloride should be wiped immediately and then flushed with a large amount of water. Eyes splashed with titanium tetrachloride also should be flushed with copious amounts of water.

A-2-4.4

A high-efficiency cyclone-type collector presents less hazard than a bag- or media-type collector and, except for extremely fine powders, usually operates with fairly high collection efficiency. Where cyclones are used, the exhaust fan discharges to atmosphere away from other operations. It should be recognized that there are some instances in which a centrifugal-type collector might be followed by a fabric or bag- or media-type collector or by a scrubber-type collector where particulate emissions are kept at a low level. The hazards of each collector should be recognized and protected against. In each instance, the fan is the last element downstream in the system. Because of the extreme hazard involved with a bag- or media-type collector, consideration should be given to a multiple-series cyclone with a liquid final stage.

Industry experience has clearly demonstrated that an eventual explosion can be expected where a bag- or media-type collector is used to collect titanium fines. Seldom, if ever, can the source of ignition be positively identified. In those unusual instances where it becomes necessary to collect very small fines for a specific commercial product, it is customary for the producer to employ a bag- or media-type collector. Since this presents a strong explosion potential, the bag- or media-type collector should be located a safe distance from buildings and personnel.

If a bag- or media-type collector is used, the shaking system or dust removal system can be such as to minimize sparking due to frictional contact or impact. Pneumatic or pulse-type shaking is more desirable because no mechanical moving parts are involved in the dusty atmosphere. If the bags are provided with grounding wires, they can be positively grounded through a low-resistance path to ground. Where bags are used, it is customary that the baghouse be protected by an alarm that indicates excessive pressure drop across the bags. An excess air temperature alarm is also frequently used. A bag- or media-type collector is customarily located at least 50 ft (15 m) from any other building or operation. It is not customary to permit personnel to be within 50 ft (15 m) of the collector during operation or when shaking bags. Explosion vents are usually built into the system, as described in NFPA 68, *Guide for Venting of Deflagrations*. Care is customarily exercised in locating the vents because of the possibility of blast damage to personnel or adjacent structures.

A-2-4.5

Information on spark-resistant fans and blowers can be found in AMCA Standards Handbook 99-0410-86, *Classification for Spark-Resistant Construction*, 1986.

A-2-5

Molten magnesium and molten magnesium chloride present an extremely dangerous fire and fume hazard, in addition to an explosion hazard, if in contact with water or residual moisture.

A-3

Unlike other metals, which can be melted, cast, or molded without unusual complications, titanium, because of its strong affinity for oxygen, hydrogen, and nitrogen and its tendency to become contaminated, is melted in special water or NaK-cooled copper crucibles under a vacuum or with an inert gas blanket of argon or helium. During the early years of the titanium industry, melting was done with a nonconsumable electrode, usually carbon.

The consumable electrode process using direct current electricity was developed to meet quality and process requirements. Nonconsumable copper electrode furnaces are now being used to process scrap.

During the 1950s, several titanium melting furnace explosions occurred when water inadvertently entered the melting crucibles during the melting operation. Three distinct types of explosions were evident: steam explosions produced by water contacting molten metal; chemical reaction between the molten metal and water; and explosion of free hydrogen generated by the chemical reaction. Also, if air entered the crucible at the same time, an air-hydrogen explosion would sometimes occur. All three types of explosions could occur in the same incident. The explosion hazard is present with any crucible that is water-cooled.

The use of liquid metal NaK (sodium-potassium alloy) as a crucible coolant has been developed for both laboratory and commercial installations. While the danger of furnace explosion due to leakage into the melt zone is reduced, the handling of NaK has its own inherent hazards. The reaction between NaK and water is violent.

A-3-1.4

The explosion that can occur due to the rapid phase transformation of water trapped below molten material takes place over a time span of approximately 10^{-5} to 10^{-4} seconds. This is faster than a condensed phase detonation. The required pressure-relief device would not be effective in safely relieving the rapid pressure build-up caused by the rapid phase transformation. It should be noted that the required pressure-relieving device is intended to safely relieve only much slower increases in pressure, such as might occur from small incursions of water onto the top of the molten metal.

A-3-2

The general process for shape-casting of titanium is the “skull-casting” process, where the material to be cast is melted as a consumable electrode in a tilting crucible. The power applied is normally somewhat higher than typical for ingot melting in order to develop a deep pool of molten metal. At the appropriate time in the melting cycle, the electrode is withdrawn and the casting poured. Vacuum or inert gas is provided to protect the metal from atmospheric contamination. The furnace crucible is made of copper and has water or NaK cooling. Due to the high power levels used, seams in the crucible should not be exposed to the electric arc or the molten metal.

A-3-2.1

Such ingots contain internal stresses that can cause them to shatter, even up to several days after being wetted.

A-3-2.5

Personnel entering furnace shells to conduct inspections or repair work should first make certain that any inert gas has been purged from the shell and that all pyrophoric residue has been removed. These residues might be combustible or pyrophoric and caution should be exercised.

A-4

Forging remains the most popular method of forming titanium because it is generally simpler and less costly than other forming processes. Gas or electric furnaces with accurate heat control are used to heat the metal into the proper forging range, which can vary from 1600°F to 2300°F (871°C to 1260°C). The rate of heat-up and final temperature must often be controlled precisely to achieve specific metallurgical and physical properties. Slabs, billets, and bar stock are produced by forging.

Large rounds of titanium are produced by lathe turning or by grinding forges. A considerable amount of titanium strip, coil, and duct, down to foil thickness, is produced from slabs on both continuous and hand mills. Wide sheets and plates of various thicknesses are produced on hand mills or plate-rolling mills. Temperature control during rolling is important. Shearing and straightening operations are necessary to trim sheets and plates to size, to straighten or flatten plates, or to straighten forged bar stock or extrusions. Titanium wire is produced from coils of rolled bar by drawing operations. Fastener stock is produced from coils of wire. Titanium tubing is produced by inert gas seam welding of rolled narrow strip. Heavy wall seamless tubing is produced by extrusion.

Special types of grinding operations are performed in mills. Swing grinders are used to spot grind ingots, slabs, billets, and bar stock. Centerless grinders are used to finish round bar and fastener stock. Strip in coil form is ground continuously and sheets are individually ground.

Cold saws and abrasive cut-off saws are used to cut billet and bar stock to length. Swarf, or finely divided metal particles, is produced by all sawing and grinding operations.

A-4-1.2

See NFPA 77, *Recommended Practice on Static Electricity*.

A-5-1

Improperly designed or dulled tools can produce high temperatures at the interface, causing ignition at the turnings, if an adequate coolant flow is not used.

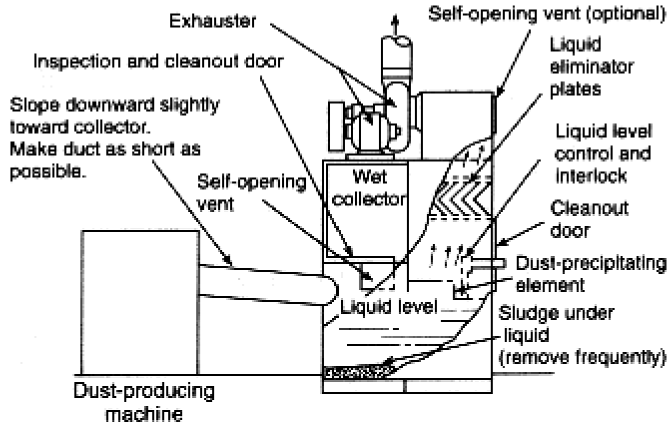

Figure A-5-3.1(a) Typical liquid precipitation separator for fixed dust-producing equipment.

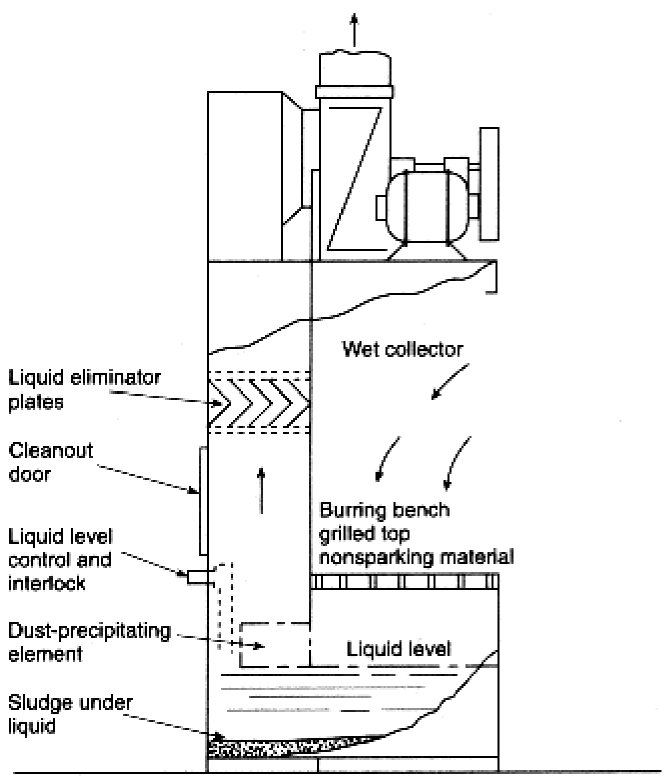

Figure A-5-3.1(b) Typical liquid precipitation separator for portable dust-producing equipment.

NOTE: These drawings are schematic and are intended only to indicate some of the features that are incorporated into the design of a separator. The volume of all dust-laden airspace is as small as possible.

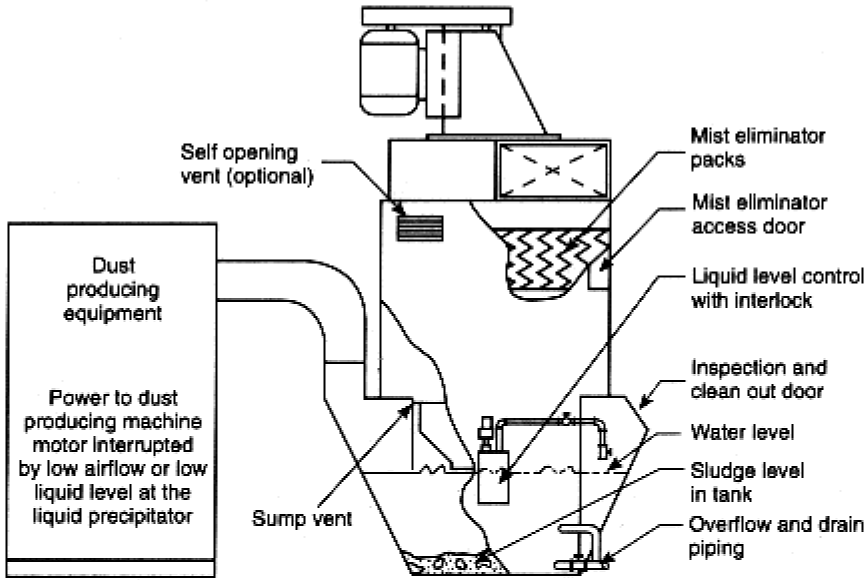

Figure A-5-3.1(c) Typical liquid precipitation separator for fixed dust-producing equipment.

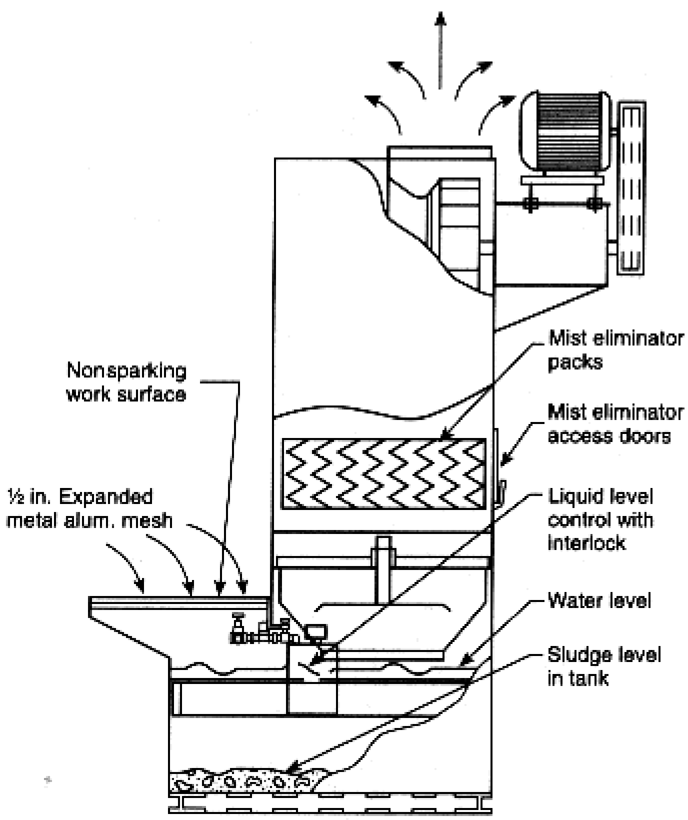

Figure A-5-3.1(d) Typical liquid precipitation separator for portable dust-producing equipment.

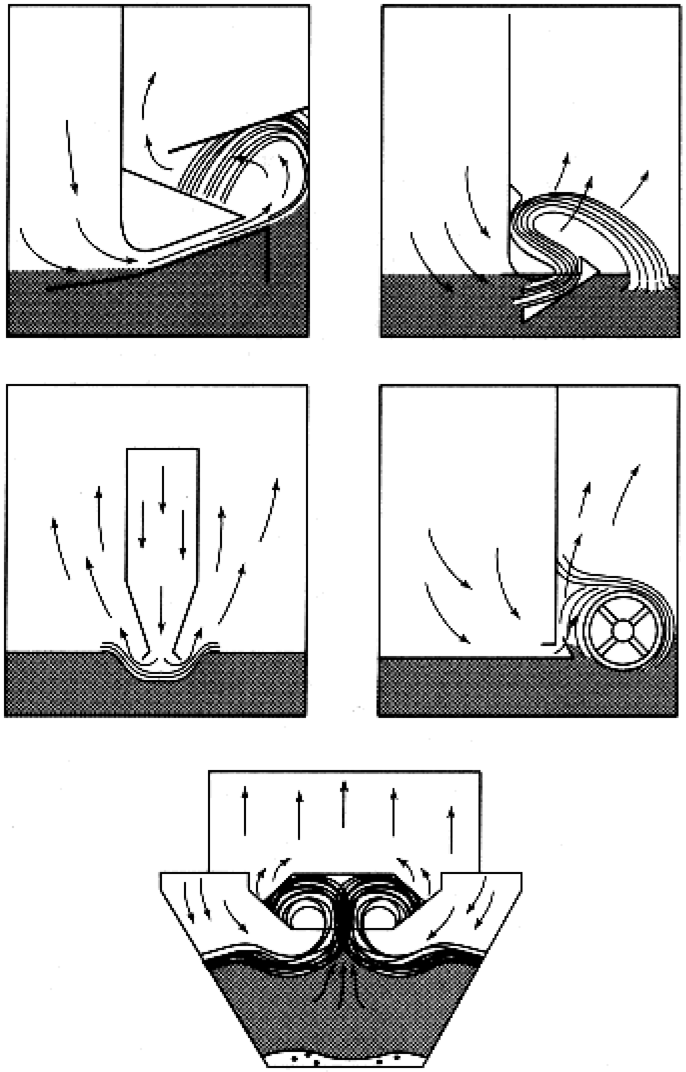

Figure A-5-3.1(e) Diagram of five methods of precipitating dust used in precipitators such as those shown in Figures A-5-3.1(a), (b), (c), and (d).

A-5-3.4

For example, iron oxide dusts are known to be incompatible with titanium due to the potential for an exothermic reaction. The dust-separating unit should be cleaned unless it has been determined that the materials exhibit no incompatibility.

A-6

Generation of titanium scrap from the sponge and melting processes through milling and fabrication is an inherent part of the titanium business. Scrap sponge, including some fines, is generated in the reduction, boring, crushing, leaching, and blending operations due to contamination and spills. Solid pieces of scrap titanium result in the melting process due to air or water contamination or due to malfunctions that cause interrupted melts.

During milling and fabrication, solid pieces of scrap result from forge, welding, and fabrication shops. Other scrap includes lathe turnings and clippings.

Before recycling, lathe turnings and clippings are usually crushed and degreased with a water-soluble detergent. Solid scrap is more difficult to handle. In one process, large pieces are torch-cut, then tumbled to remove slag, after which they are descaled in a basic chemical solution, washed in a sulfuric acid bath, and water-rinsed. Hydrogenation and crushing completes the preparation for recycling. Another method of handling fairly large chunks of titanium scrap is to weld them to the sides of consumable electrodes prior to melting.

A more recent development is the nonconsumable electrode furnace for melting scrap into ingot form. Equipped with a continuous feed through a vacuum interlock, these furnaces are capable of handling scrap pieces of baseball size.

A-7

Not all methods of producing metal powder are applicable to titanium. Reduction of titanium hydride and some forms of milling generally are used to produce the limited amounts of powder now required commercially. To reduce oxidation and possible ignition hazards, milling can be performed underwater or in an inert atmosphere of helium or argon. Some powders are given a very light copper coating during the manufacturing process.

Like many other metal powders, titanium is capable of forming explosive mixtures in air. The ignition temperatures of dust clouds, under laboratory test conditions, range from 330°C to 590°C (626°F to 1094°F). The minimum explosive concentration is 0.045 oz/ft^3 (0.045 kg/m^3). Maximum pressure produced in explosions in a closed bomb at a concentration of 0.5 oz/ft^3 (0.5 kg/m^3) ranged from 46 psi to 81 psi (317 kPa to 558 kPa). The average rate of pressure rise in these tests ranged from 250 psi/sec to 4300 psi/sec (1724 kPa/sec to 29 650 kPa/sec); the maximum rate of pressure rise ranged from 550 psi/sec to 10,000 psi/sec (3792 kPa/sec to over 68 950 kPa/sec). The minimum energy of electrical condenser discharge sparks required for ignition of a dust cloud was 10 millijoules; for a dust layer, the minimum value was 8 microjoules. Some samples of titanium powder were ignited by electric sparks in pure carbon dioxide, as well as in air. In some cases, titanium at elevated temperatures was found to react in nitrogen as well as in carbon dioxide. Titanium powder is considered a flammable solid. (See NFPA 491M, *Manual of Hazardous Chemical Reactions*.)

A-7-1.2

For information on designing explosion venting, see NFPA 68, *Guide for Venting of Deflagrations*.

A-7-2.3

The handling of dry titanium powder presents a fire and explosion hazard. The hazard increases as the size of the titanium particles decreases. The equipment and processes should be designed with consideration for the need to minimize the damage to property and risk to life resulting from fires and explosions involving titanium powders. Design considerations should include the use of deflagration venting, proper dust collection systems, inerting, or a combination of these methods. The inert gas used should be determined by test to be appropriate for the titanium powder being handled. Titanium powder can react exothermically in pure carbon dioxide atmospheres and in pure nitrogen atmospheres.

Tests have shown that the maximum oxygen concentrations allowed for different inert gases to prevent explosions are:

Carbon Dioxide	0 percent oxygen
Nitrogen	6 percent oxygen
Argon	4 percent oxygen
Helium	8 percent oxygen

This data was obtained from U.S. Bureau of Mines, Report of Investigations 3722, *Inflammability and Explosibility of Metal Powders*.

A-8-1.4

Molten magnesium and molten magnesium chloride present an extremely dangerous fire and fume hazard, in addition to an explosion hazard, if contacted with water or residual moisture.

A-8-1.12

See NFPA 77, *Recommended Practice on Static Electricity*.

A-8-1.15

See NFPA 77, *Recommended Practice on Static Electricity*.

A-8-2

The principal intent in fighting titanium fires is isolation and containment, rather than extinguishment. Water and other liquids have proven ineffective in extinguishing titanium sponge fires. Streams of water intensify the fire by feeding oxygen to it. There is also the possibility of causing a steam or hydrogen explosion, particularly if large amounts of sponge are involved. The great affinity of high-temperature titanium for oxygen will free a considerable amount of hydrogen, which can reach explosive concentrations in confined spaces. Entrapment of water under any burning or hot metal can result in a steam explosion.

A-8-2.1

Automatic sprinkler protection should not be recommended for blending and melting buildings.

A-8-2.3

Water-based extinguishers suitable for use on Class A fires should only be used on fires in ordinary combustibles. Extinguishers suitable for Class B fires are recommended for fires in oil, grease, and most flammable liquids. Extinguishers suitable for Class C fires should be used for fires in electrical equipment.

A-8-2.4

Experience has shown that dry sodium chloride is one of the most effective chemicals for containing fires involving titanium sponge or fines. Fire-fighting salts should be checked periodically to ensure that they have not become caked from moisture. Another effective chemical is a nonmetallic flux compound consisting of potassium chloride, magnesium chloride, and calcium fluoride. Commercial dry powder fire extinguishers or agents approved for use on combustible metals are also effective. Covering the fire completely reduces the accessible oxygen supply, thereby slowing the burning rate so that eventual extinguishment is reached.

A-8-2.6

Keeping the equipment in operation until all burning material is removed can reduce damage to the equipment. Small amounts of burning materials can be handled with a shovel to facilitate removal.

Appendix B Supplementary Information on Titanium

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

B-1 Commercial Production.

Commercial production of titanium began in 1948 in a plant whose capacity was less than 20 tons (18,140 kg) per year. By 1951, the fulfillment of the needs of the military had brought about tremendous strides in the titanium industry. Large-scale commercial production had become a reality.

Titanium-bearing ores are plentiful and widely scattered throughout the world, including the United States, the principal ores being rutile and ilmenite. At present, rutile is the more desirable of the two for recovery of titanium. However, it is the ore in shortest supply, coming primarily from deposits in Australia, South Africa, and Sierra Leone.

It is generally recognized that, in time, the greatest tonnage of titanium might be processed from ilmenite ore. Ilmenite mines in the United States are located at Tahawas, NY; Highland, Starke, and Green Cove Springs, FL; and Manchester, NJ.

Titanium sponge is currently produced in the United States, Japan, England, and among countries in the former Soviet Union. Three basic processes have been developed for commercial refining of titanium from rutile ore. The most widely used processes employ magnesium or sodium to reduce titanium tetrachloride. An electrolytic process has been proven to be practical, and development of a commercial version is underway.

Titanium ingot is produced by arc-melting a consumable electrode of compacted sponge, or sponge and alloy, into a cooled copper mold under a low vacuum or an inert atmosphere.

B-2 Properties.

Titanium is a silver-gray light metal, about 60 percent heavier than aluminum, but only 56 percent as heavy as alloy steel. Its atomic weight is 47.90, specific gravity is 4.5, and melting point is 3140°F (1727°C). Titanium-based alloys are stronger than aluminum alloys and most alloy steels and have excellent ductility. They are superior to all the usual engineering metals and alloys in strength-weight ratio. Their fatigue resistance (ability to resist repeated flexures) is above that of heat-treated alloy steels and far greater than those of nonferrous metals. Titanium alloys are harder than aluminum and almost as hard as the high alloy steels. Surface hardness comparable to nitrided steel is obtainable.

Titanium is highly corrosion-resistant, being greatly superior to aluminum, considerably better than many specialty steels, and unique, compared to commonly available metals, in its immunity to saltwater and marine atmospheres. It is the only known structural metal that is highly resistant to simultaneous exposure to seawater and air. However, it is subject to stress corrosion cracking in methanol containing less than 0.8 percent water. Also, crevice corrosion can be expected in chlorine systems.

Titanium-based alloys can be subject to cracking during hot-forming operations if they are in contact with halide salts. Manufacturers' recommendations should be sought if applications are considered where high strength alloys are expected to come in contact with halide salts at temperatures above 500°F (260°C).

Impact resistance (capacity to withstand shock) of titanium is superior to that of aluminum; some titanium alloys approach heat-treated steel in impact resistance. Titanium alloys commonly lose strength above 1000°F (540°C) and can become embrittled after extended exposure to air at temperatures above 800°F (430°C).

Normal compositions of some widely used titanium alloys are:

Titanium 90 percent, Aluminum 6 percent, Vanadium 4 percent;

Titanium 92.5 percent, Aluminum 5 percent, Tin 2.5 percent;

Titanium 90 percent, Aluminum 8 percent, Molybdenum 1 percent, Vanadium 1 percent;

Titanium 86 percent, Aluminum 6 percent, Vanadium 6 percent, Tin 2 percent;

Titanium 92 percent, Manganese 8 percent.

Titanium presents some fire hazards during production of the raw sponge, melting of the sponge, casting, machining that produces fine turnings or chips, powder production and handling, and disposal of scrap containing chips or fines. However, because of its high temperature resistance properties in solid form, titanium sheet is extensively used for fire walls in jet aircraft and spacecraft.

In molten form, titanium either dissolves or is contaminated by every known refractory.

Slight contaminations apparently have little effect on the flammable characteristics of chips, turnings, or powder produced in machining operations, but might have an important bearing on ignition and explosion hazards associated with acid or salt baths.

Titanium combines readily with oxygen, nitrogen, and hydrogen at temperatures considerably below its melting point. Freshly exposed surfaces tend to form an adherent oxide coating quickly. This oxide coating is evidenced by discoloration that will dissolve as temperature increases. Excessive oxidation can cause embrittlement.

B-3 Tests for Titanium.

Two relatively simple methods are used to distinguish titanium from other metals.

(a) *Spark Test.* Distinctive sparks are thrown off when a piece of titanium is held against a grinding wheel. The white lines traced by the flying sparks end with a burst that produces several brilliant white rays or branches.

(b) *Glass Test.* The softer grades of titanium and titanium alloys are able to wet glass and can be identified by rubbing a moistened piece of the metal on a piece of glass. If the metal is relatively soft titanium, it will leave distinctive gray-white marks on the glass.

A portable metal spectroscope will better serve the purpose when attempting to identify titanium scrap by grade.

B-4 Applications.

While titanium has many uses, production is still largely consumed by commercial and military aircraft applications for use in jet engines, aircraft frames, and outer skin covering on subsonic and supersonic aircraft. Titanium is also being used in space vehicles and communications satellites. Other military uses include armor plate, electrical components, pontoons, cables, structural braces, fire walls, personnel helmets, and protective vests.

Titanium's virtually complete immunity to atmospheric and saltwater corrosion and to such agents as wet chlorine, nitric acid, and most oxidizing chemicals makes it attractive for chemical process applications such as heat exchangers, dryers, mixers, and other equipment.

Specially prepared, very finely divided titanium powders find limited application in powder metallurgy and other relatively small-scale uses.

B-5 Combustibility and Explosibility.

In tests conducted by the U.S. Bureau of Mines with titanium powders of less than 200 mesh, ignition of dust clouds in air was obtained at temperatures from 630°F to 1090°F (330°C to 590°C). Ignition of dust layers occurred at temperatures from 720°F to 950°F (380°C to 510°C). In some cases, dust clouds ignited at lower temperatures than static layers of the same dust. (See U.S. Bureau of Mines Report of Investigations 3722 and 4835, listed in Appendix C.) Titanium fines, nominally under 48 mesh, a by-product of sponge production and handling, and coarser particles, such as swarf from sawing and grinding operations, can be ignited by a spark.

Tests conducted by Underwriters Laboratories Inc. showed that dry ductile titanium in the form of thin chips and fine turnings could be ignited with a match. Normal size machine chips and turnings ignited and burned when heated in the flame of a Bunsen or blast burner. When ignited, titanium sponge or coarse turnings burn slowly with the release of a large quantity of heat, although a sponge fire can spread rather rapidly immediately after ignition.

Heavy castings or ingots of titanium can give some indication of burning when being cut with an oxyacetylene torch, but when enough surface is available to permit radiation cooling below the ignition temperature, burning ceases when the torch is removed.

Titanium can burn in atmospheres other than air. For example, one titanium powder sample, which ignited in air as a cloud at 900°F (480°C) and as a layer at 880°F (470°C), also ignited as a layer in pure carbon dioxide at 1260°F (680°C). At red heat, about 1300°F (704°C), titanium will decompose steam to free hydrogen and oxygen. Above 1470°F (801°C), titanium burns readily and vigorously in atmospheres of pure nitrogen.

Titanium will burn in the presence of dry chlorine or oxygen at room temperature. In oxygen, the combustion is not spontaneous and only occurs with oxygen concentration above 35 percent at pressures over 350 psig (2410 kPa gauge) when a fresh surface is created. The actual hazard in air is much less than that for aluminum.

B-6 Special Hazards.

In spite of titanium's superior resistance to corrosion, as discussed in Section B-2, titanium can react vigorously or even explosively with some hazardous materials. For example, extreme care should be taken when using titanium metal or powder in red fuming nitric acid. While no problems have been reported with normal nitric acid, explosions have occurred in laboratory tests involving titanium and red fuming nitric acid. These incidents have never been completely explained, although it is believed that the strength of the acid is a controlling factor and that some pyrophoric material is produced, which, when disturbed, releases enough heat to permit rapid oxidation of the metal. Potentially hazardous reactions between titanium and various chemicals are listed in NFPA 491M, *Manual of Hazardous Chemical Reactions*.

Low melting eutectics can form when titanium or its alloys are in contact with metals such as iron, nickel, or copper at high temperatures. Phase diagrams for titanium, such as those in the *ASM International Handbook*, Chapter on Metals Properties, should be consulted in such potential situations.

Titanium engages in thermite-type reactions with iron oxides.

Caution should be exercised in introducing titanium into process environments not previously investigated, since titanium can react and, in some cases, become pyrophoric.

B-7 Spontaneous Combustion.

Spontaneous ignition has occurred in fine, water-soluble, oil-coated titanium chips and swarf. Such fires, while probably due mostly to the presence of oil and certain contaminants, are very difficult to control and special precautions should be taken to have all fine scrap and oil-covered material removed from the plant and stored where any possible fire can be segregated and prevented from exposing other combustible material. Dry titanium fines collected in cyclones have, on occasion, ignited spontaneously when allowed to drop freely through the air. Also, sump fines will often ignite when they are dried.

During the early stages of the development of the titanium industry, thin titanium sheets were reported to have ignited spontaneously as they were removed from a sodium hydride descaling bath. However, the use of a potassium hydride solution in recent years has eliminated this problem.

Like any other metal in the high temperature molten state, titanium can cause a violently destructive explosion if water is present in any mold, pit, or depression into which the molten metal is poured or spilled. Under such circumstances, severe damage can be caused by steam pressure, an exothermic chemical reaction, or a low order hydrogen-air explosion.

In the 1950s, several violent explosions occurred in consumable electrode furnaces when water entered the furnace because of a crucible failure. The failures resulted from loss of cooling water flow and severe arc-through. A committee of industry representatives then prepared a set of general recommendations on design of melting furnaces to improve process safety. Their recommendations, given consideration in this standard, have been published by the Defense Metals Information Center of Battelle Memorial Institute. (*See Appendix C.*)

B-8 Process Description.

Current titanium production processes involve reduction of titanium tetrachloride to titanium metal. The titanium tetrachloride ($TiCl_4$) is made from rutile ore (approximately 95 percent titanium dioxide) by high temperature reaction with chlorine in the presence of a reducing agent, usually carbon. There are two basic commercially used processes for reduction of titanium: the Kroll-Bureau of Mines process, which uses magnesium as the reducing agent, and the sodium process, which uses liquid sodium as the reducing agent. Pilot plant work to develop a commercial electrolytic process is underway. The resulting product of all of the processes is referred to as titanium sponge.

In the Kroll-Bureau of Mines process, purified titanium tetrachloride is fed into a steel reaction chamber containing molten magnesium. The reduction takes place under an inert gas blanket of argon or helium and at temperatures between 1290°F (700°C) and 1650°F (900°C). The products of the reduction are magnesium chloride and titanium sponge, so called because of the spongy appearance of the titanium. The magnesium chloride is drawn off in the molten state for recycling or for reprocessing to magnesium and chlorine. After cooling, the sponge mass is bored from the reactor vessel and crushed in a "dry room." Any residual magnesium or magnesium chloride is removed by acid leaching or vacuum distilling. A modified version of the Kroll process involves vacuum distillation in the reaction vessel before removal of the sponge, thus eliminating the dry room. A detailed description of the Kroll process and equipment is contained in the Bureau of Mines' Report of Investigations No. 4879. Another description by Powell appears in American Institute of Chemical Engineers (AICHE) *Chemical Engineering Progress*, November, 1954. (*See Appendix C*.)

In the sodium reduction process, liquefied sodium is used as the reducing agent. In this process, the reaction vessel is heated to approximately 1830°F (1000°C) and no withdrawal of by-product during the reduction cycle is required. After completion of the reduction cycle, the reactor contains a solid mixture of titanium sponge and sodium chloride (called "spalt"). After the cooling cycle, this solid mixture is usually bored from the reaction vessel. A dry room is not required. The spalt is vacuum dried after removal from the reaction vessel. The sodium reduction process is described by Forbath in *Chemical Engineering*, March, 1958.

In the electrolytic process being developed, titanium tetrachloride is fed into a cell containing a molten salt bath (usually sodium chloride), where it is reduced to crystalline metal by fused salt electrolysis. The crystalline mass must be crushed, leached, and dried after removal from the cell. Although this process is commercially feasible, it has not yet been used significantly.

The titanium sponge fire risk is affected by the process used. The sodium reduction process and the electrolytic process produce a sponge that is less apt to be pyrophoric than magnesium-reduced sponge. The fines resulting from the crushing operation of these two processes, likewise, tend to be less pyrophoric.

Formal Interpretation

NFPA 481

Titanium

1995 Edition

Reference : Section 5-3
F.I. 87-1

Question: Is it the intent of the Committee that the requirements of Chapter 5, Machining & Fabrication; notably Section 5-3, Titanium Dust Collection; be applied to commercially pure titanium as well as the titanium alloys enumerated in Appendix B, Section B-2, Properties?

Answer: Yes.

Issue Edition: 1987
Reference: Section 5-6
Issue Date: July 17, 1991
Effective Date: August 6, 1991

NFPA 482

1996 Edition

Standard for the Production, Processing, Handling, and Storage of Zirconium

1996 Edition

This edition of NFPA 482, *Standard for the Production, Processing, Handling, and Storage of Zirconium*, was prepared by the Technical Committee on Combustible Metals and Metal Dusts and acted on by the National Fire Protection Association, Inc., at its Annual Meeting held May 20-23, 1996, in Boston, MA. It was issued by the Standards Council on July 18, 1996, with an effective date of August 9, 1996, and supersedes all previous editions.

This edition of NFPA 482 was approved as an American National Standard on July 26, 1996.

Origin and Development of NFPA 482

NFPA 482 was originally developed as a manual under the designation NFPA 482M, *Zirconium*. NFPA 482M was prepared by the Committee on Combustible Metals and officially adopted by the NFPA in 1959. It was amended in 1961, and the 1961 edition was reconfirmed in 1974.

In reviewing the 1974 edition, the Committee on Combustible Metals determined that NFPA 482M could be rewritten as a standard. Thus, where appropriate, all recommendations were expressed as requirements. Supplementary information was relocated to the appendices. The text was also rearranged to comply with the NFPA *Manual of Style*. This major rewrite resulted in the 1982 edition.

The 1987 edition was a reconfirmation of the 1982 edition.

For the 1996 edition, the committee has completely revised the standard to update the fire and dust explosion prevention measures and the requirements for safe handling of zirconium solids and powders. The committee revision has also incorporated editorial and style revisions to comply with the NFPA *Manual of Style* and to assist in making the document more usable and adoptable.

Committee Scope: This Committee shall have primary responsibility for documents on safeguards against fire and explosion in the manufacturing, processing, handling, and storage of combustible metals, powders, and dusts.

NFPA 482
Standard for the
Production, Processing, Handling, and
Storage of Zirconium

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 9 and Appendix C.

Chapter 1 General

1-1 Scope.

1-1.1*

This standard shall apply to the production, processing, handling, and storage of zirconium.

1-1.2

This standard also shall apply to finished parts and those materials, including scrap, that exhibit the burning characteristics of zirconium.

1-1.3

This standard shall not apply to the transportation of zirconium in any form on public highways and waterways, or by air or rail.

1-1.4

This standard shall not apply to those laboratories handling hazardous chemicals as defined in NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

1-2* Purpose.

The purpose of this standard is to provide requirements addressing the fire and explosion hazards of zirconium and zirconium alloys in all forms and to outline requirements for fire prevention and protection.

1-3 Equivalency.

Nothing in this standard is intended to prevent the use of systems, methods, or devices that are equivalent or superior in quality, strength, fire resistance, effectiveness, durability, and safety to those prescribed by this standard, provided technical documentation is made available to the authority having jurisdiction that demonstrates equivalency and the system, method, or device is approved for the intended purpose.

1-4 Applicability.

The provisions of this document shall be considered necessary to provide a reasonable level of protection from loss of life and property from fire and explosion. They reflect situations and the state of the art prevalent at the time the standard was issued. Unless otherwise noted, it is not intended that the provisions of this document be applied to facilities, equipment, structures, or installations that existed or were approved for construction or installation prior to the effective date of the document, except in those cases where it is determined by the authority having jurisdiction that the existing situation involves a distinct hazard to life or adjacent property.

1-5 Definitions.

For the purpose of this standard, the following terms shall be defined as follows:

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed.* Equipment, materials, or services included in a list published by an organization acceptable to the authority having jurisdiction and concerned with evaluation of products or services that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services and whose listing states either that the equipment, material, or service meets identified standards or has been tested and found suitable for a specified purpose.

Media Collector. A bag house or a filter-type cartridge collector used for collecting dust.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Zirconium. Pure metal or alloys having the generally recognized properties of zirconium metal, including the fire or explosion characteristics of zirconium in its various forms.

Zirconium Chips.* Particles produced from a cutting, machining, or grinding operation that are not oxidized and that are not diluted by noncombustible materials.

Zirconium Dust.* Any finely divided zirconium material 420 microns or smaller in diameter (material passing through a U.S. No. 40 standard sieve) that presents a fire or explosion hazard when dispersed and ignited in air.

Zirconium Fines. Zirconium particles that typically are 20 mesh and below that can be ignited in a static layer.

Zirconium Powder.* See Zirconium Dust and Zirconium Fines.

Zirconium Sponge.* Zirconium metal after it has been won from the ore but before it is melted.

Zirconium Swarf. Particles produced from a cutting, machining, or grinding operation that causes partial oxidation of the parent material or dilution by other inert materials.

Chapter 2 Sponge Production

2-1 Magnesium Operations.

All magnesium storage, handling, and processing operations in zirconium sponge production operations shall be in accordance with the requirements of NFPA 480, *Standard for the Storage, Handling, and Processing of Magnesium Solids and Powders*.

2-2 Plant Construction.

2-2.1*

Buildings housing reduction furnaces, boring and crushing facilities, and magnesium refining operations shall be constructed of noncombustible materials. Consideration shall be given to the provision of deflagration venting in accordance with current accepted practices.

2-2.2

Building exits shall comply with NFPA *101*®, *Life Safety Code*®.

2-2.3*

Floors in reduction, boring, and crushing facilities shall be made of noncombustible materials, such as concrete, brick, or steel plate.

2-2.4

Fittings used on compressed air and inert gas line outlets shall not be interchangeable to prevent potential explosions caused by inadvertently using compressed air in place of low pressure inert gas.

2-3 Processing Equipment.

2-3.1

Chlorinators and reduction vessels shall be designed and maintained to prevent water from entering the reaction chamber.

2-3.2

Furnaces shall be kept dry and free of iron scale and other foreign material.

2-3.3

Fuel supply lines to gas-fired furnaces or other gas-fired equipment shall be installed and maintained in accordance with NFPA 54, *National Fuel Gas Code*.

2-3.4*

Furnaces shall comply with NFPA 86C, *Standard for Industrial Furnaces Using a Special Processing Atmosphere*, and NFPA 86D, *Standard for Industrial Furnaces Using Vacuum as an Atmosphere*.

2-3.5

All electrically operated or controlled processing equipment shall be installed in accordance with NFPA 70, *National Electrical Code*®.

2-3.6

Back-up methods or systems shall be provided to allow for the safe and orderly shutdown of critical processes in the case of primary system failure.

2-4 Storage of Raw Materials.

2-4.1*

Chlorine shall be handled and stored in accordance with accepted industry practice.

2-4.2

Storage and handling of flammable and combustible liquids shall be in accordance with NFPA 30, *Flammable and Combustible Liquids Code*.

2-4.3*

Bulk containers of zirconium tetrachloride ($ZrCl_4$) and silicon tetrachloride ($SiCl_4$) shall be stored in a well-ventilated area located away from areas of acute hazard. Containers shall be identified plainly and tightly sealed until used.

2-5 Dust Collection.

2-5.1

Dust resulting from the crushing of zirconium sponge shall be managed safely to minimize the risk of fires and explosions.

2-5.2

Media collectors shall not be used for the collection of zirconium sponge fines.

2-5.3

Nonmedia based dry collectors shall be emptied before, or when, 80 percent of the storage capacity is attained. The maximum volume of zirconium fines collected before emptying shall not exceed 5 gal (19 L).

2-5.4*

Dust collectors for Kroll-distilled material shall be located outside buildings and shall be provided with deflagration vents.

2-5.5*

Fans that handle combustible dust and air mixtures shall be constructed of nonsparking materials and shall be constructed in accordance with NFPA 91, *Standard for Exhaust Systems for Air Conveying of Materials*.

2-6* Personnel Safety Precautions.

Personnel involved in reduction furnace tapping, removal of molten magnesium chloride, and magnesium refining and casting shall wear tight-fitting, above-the-ankle shoes, flame-retardant clothing, heat-resistant gloves, and face shields.

2-7 Sponge Storage.

2-7.1*

Dry zirconium sponge shall be stored in closed metal containers with a maximum capacity that is capable of being moved by available equipment. Wet zirconium sponge shall be stored in nonsealing, covered, metal containers with a maximum capacity that is capable of being moved by available equipment.

2-7.2

Zirconium storage areas shall be kept free of combustible materials, well-ventilated, equipped with the required fire protection equipment, and plainly marked with "no smoking" signs.

2-7.3

Where drums are used, storage shall be limited to one-drum tiers per pallet with a height of no more than four pallet loads. Stacked storage shall be arranged to ensure stability.

2-7.4

Aisles shall be provided for maneuverability of material-handling equipment, for accessibility, and to facilitate fire-fighting operations.

Chapter 3* Zirconium Melting

3-1 Explosion Prevention.

3-1.1

The water supply to crucibles shall be continuously monitored by a system that automatically interrupts power to the furnace upon a drop in water pressure or flow. In addition, an emergency source of cooling water shall be provided and shall be actuated automatically by flow interlock in the event of interruption of the primary cooling water.

3-1.2

Water-cooled furnaces shall have the crucible and its water jacket located in a protective noncombustible enclosure that provides a means of isolation to protect personnel and to minimize damage if an explosion occurs.

3-1.3*

The upper chamber of the furnace shall be provided with a pressure-relieving device to aid in safely relieving pressure if water enters the furnace. The release pressure of the pressure-relieving device shall be a maximum of 20 psig (138 kPa gauge).

3-1.4*

A clearance shall be maintained at all times between the electrode and the crucible wall to minimize arcing to the crucible wall.

3-1.5

The furnace shall be equipped with a device that continuously senses pressure within the furnace. The device shall automatically interrupt power to the melting heat source in the event of an unexpected sudden rise in pressure.

3-1.6

The furnace shall be equipped with the following:

(a) Water flow, temperature, and pressure sensors on all cooling systems;

(b) Arc voltage and melting power recorders;

(c) Electrode position indicators;

(d) Furnace pressure sensors and recorders; and

(e) Set point alarms on all systems to warn of abnormal conditions.

3-2* Casting.

3-2.1

The water supply to crucibles shall be monitored continuously by a system that automatically interrupts power to the melting heat source upon a drop in water pressure or flow. In addition, an emergency source of cooling water shall be provided and shall be actuated automatically by flow interlock in the event of interruption of the primary cooling water.

3-2.2

Molds for zirconium casting shall be made of material that is compatible with molten zirconium. Molds shall be dried thoroughly and stored carefully to prevent accumulation of moisture in the molds.

3-2.3

Since mold breaks are inevitable, the casting chamber shall be cooled or shall be large enough to serve as a heat sink, or both, in order to provide the protection necessary in the event of a spill.

3-2.4

Control consoles for water-cooled melting and casting operations shall be located remote from melting areas and outside of furnace enclosures.

3-2.5*

Residue from casting furnaces shall be placed in steel boxes and moved outside the building.

Chapter 4* Mill Operations

4-1 Fire Prevention.

4-1.1

Flammable or combustible liquids shall be handled in accordance with NFPA 30, *Flammable and Combustible Liquids Code*.

4-1.2*

All electrically-driven equipment used for sawing, cutting, or grinding operations shall be grounded in accordance with NFPA 70, *National Electrical Code*.

4-1.3

Zirconium chips shall be collected in covered metal containers and removed daily, as a minimum, to a safe storage or disposal area.

4-1.4

Forge presses, heavy grinders, and other milling equipment operated by hydraulic systems shall use a less hazardous hydraulic oil with a flash point greater than 200°F (93°C).

4-1.5

Nonflammable coolants shall be used for wet grinding, cutting, or sawing operations. The coolant shall be filtered on a continuous basis, and the collected solids shall not be permitted to accumulate in quantities greater than 5 gal (19 L) and shall be moved to a safe storage or disposal area.

4-1.6

Flammable or combustible liquid coatings applied to zirconium shall be used in accordance with the requirements of NFPA 34, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*.

4-1.7

Oily crushed lathe turnings, raw turnings, and chips shall be collected in covered metal containers and removed daily, as a minimum, to a safe storage or disposal area.

4-1.8

Furnaces or other heating equipment used for heating zirconium shall be free of iron scale or residue that could react exothermically with the metal being heated.

Chapter 5 Machining and Fabrication

5-1* Machining Operations.

5-1.1

Cutting tools shall be of proper design and shall be kept sharp for satisfactory work with zirconium.

5-1.2

Nonflammable coolants or lubricants shall be used to minimize heat generated by the cutting operation.

5-2 Welding.

5-2.1

All welding of zirconium shall be carried out under a helium or argon atmosphere, or under vacuum.

5-2.2*

Hot work such as electric arc or gas torch welding shall not be permitted in areas where zirconium powder or chips are produced, handled, packaged, or stored until all exposed chips or powder have been removed and exposed equipment has been cleaned thoroughly.

5-3 Zirconium Dust Collection.

5-3.1*

Zirconium dust shall be collected by means of hoods or enclosures at each dust-producing operation. The hoods or enclosures shall be connected to liquid precipitation separators, and the suction unit shall be installed so that the dust is converted to sludge without making contact, in the dry state, with any high-speed moving parts. [*See Figures A-5-3.1(a) through (e)*.]

5-3.2

Connecting ducts or suction tubes between points of collection and separators shall be completely bonded and grounded. Ducts and tubes shall be as short as practicable, with no unnecessary bends. Ducts shall be fabricated and installed in accordance with NFPA 91, *Standard for Exhaust Systems for Air Conveying of Materials*.

5-3.3

Zirconium dust-producing equipment shall be connected to dust-separating equipment. Multiple pieces of zirconium dust-producing equipment shall be permitted to be connected to a single zirconium dust-separating unit. An evaluation shall be made to determine if multiple pieces of dust-producing equipment can be safely served by a single dust-separating unit.

5-3.4*

If the zirconium dust-separating unit is to be used for other materials, it shall be thoroughly cleaned of all incompatible materials prior to and after its use.

5-3.5

The power supply to the dust-producing equipment shall be interlocked with the airflow from the exhaust blower and the liquid-level controller of the separator so that improper functioning of the dust collection system shuts down the equipment it serves. A time-delay switch or equivalent device shall be provided on the dust-producing equipment to prevent starting of its motor drive until the separator is in complete operation and several air changes have swept out any residual hydrogen.

5-3.6 Housekeeping (Dust).

5-3.6.1 Systematic cleaning of the entire building containing dust-producing equipment, including roof members, pipes, conduits, and other components, shall be conducted as conditions warrant. Cleaning methods shall be limited to those methods that minimize the probability of fire or explosion, as determined by a person knowledgeable in the properties of zirconium dust.

5-3.6.2 Due to the inherent hazards associated with the use of vacuum-cleaning systems for finely divided zirconium dust, special engineering considerations shall be given to the design, installation, maintenance, and use of such systems.

5-3.7*

Sludge from dust separators and vacuum-cleaning system precipitators shall be removed daily, as a minimum, and shall be kept thoroughly wet. Nonsealing, covered, metal containers shall be used to transport collected sludge to a safe storage area or for disposal. Sludge shall be disposed of in accordance with federal, state, and local regulations.

Chapter 6* Scrap Storage

6-1 Storage.

6-1.1

Open storage of sheet, plate, forgings, or massive pieces of scrap shall be permitted.

6-1.2

Storage of sponge, chips, fines, and dust that are readily ignitible shall be isolated and segregated from other combustible materials and zirconium scrap to prevent propagation of a fire.

Chapter 7* Zirconium Powder Production and Use

7-1 Drying and Storage of Zirconium Powder.

7-1.1*

Wetted powder shall be dried at a temperature not exceeding 230°F (110°C).

7-1.2*

Drying rooms shall be of Type I construction, as defined by NFPA 220, *Standard on Types of Building Construction*. They shall be segregated as far as practicable from other operations. Deflagration venting for drying rooms shall be considered.

7-1.3

Zirconium powder shall be stored in sealed containers in well-ventilated areas and shall be kept segregated from other combustibles. The containers shall be protected from damage.

7-2 Zirconium Powder Handling.

7-2.1

Special care shall be taken to prevent spills or dispersions that produce dust clouds.

7-2.2*

Sintering furnaces that handle zirconium parts that are fabricated from powder shall be installed and operated in accordance with NFPA 86C, *Standard for Industrial Furnaces Using a Special Processing Atmosphere*. Powder or dust shall not be permitted to accumulate in the furnace or near the heating elements. Furnaces shall be operated with inert atmospheres of helium or argon or under vacuum.

7-2.3

To minimize the risk of fire or explosion hazard in the handling of zirconium powders, the equipment and processes shall be designed by people knowledgeable in the hazards of zirconium powders.

7-2.4 Electrical Installations.

All zirconium powder production, drying, and packing areas shall be evaluated for fire and explosion hazards associated with the operation and shall be provided with approved electrical equipment suitable for the hazardous location. The electrical equipment shall be installed in accordance with the requirements of NFPA 70, *National Electrical Code*.

7-3 Personnel Safety Precautions.

Personnel handling zirconium powder shall wear nonsparking shoes and noncombustible or flame-retardant clothing that is designed to minimize the accumulation of zirconium powder.

7-4 Housekeeping Practices.

Good housekeeping practices shall be followed so that accumulations of powder are minimized. Special attention shall be paid to powder accumulations in crevices and joints between walls and floors.

Chapter 8 Fire Prevention and Fire Protection

8-1 Fire Prevention.

The provisions of Chapter 8 shall apply to all zirconium production processes, handling, and storage operations.

8-1.1

Buildings shall comply with the applicable provisions of NFPA *101*, *Life Safety Code*.

8-1.2

Sponge discharged from dryers shall be collected in containers with a maximum capacity of 4000 lb (1814 kg). The collection area shall be well-ventilated and free from other combustible materials.

8-1.3*

Hot work permits shall be required in designated areas that contain exposed zirconium chips, powder, or sponge. All hot work areas that require a permit shall be thoroughly cleaned of zirconium chips, powder, or sponge before hot work is performed.

8-1.4*

All containers used to receive molten metal, molten magnesium, molten magnesium chloride, or liquid sodium shall be cleaned and dried thoroughly before use. All pieces of magnesium metal shall be clean and dry where charged to reduction furnaces.

8-1.5

Good housekeeping practices shall be maintained. Supplies shall be stored in an orderly manner with properly maintained aisles to allow routine inspection and segregation of incompatible materials. Supplies of materials in zirconium processing areas shall be limited to those amounts necessary for normal operation.

8-1.6

Ordinary combustible materials, such as paper, wood, cartons, and packing material, shall not be stored or allowed to accumulate in zirconium processing areas.

Exception: This requirement shall not apply where ordinary combustible materials are necessary for the process and are stored in designated areas.

8-1.7*

Periodic cleaning of zirconium sponge, chips, or powder from buildings and machinery shall be carried out as frequently as conditions warrant. Sponge, chips, or powder shall be removed to a safe storage or disposal area.

8-1.8

Periodic inspections shall be conducted, as frequently as conditions warrant, to detect the accumulation of excessive zirconium sponge, chips, or powder on any portions of buildings or machinery not regularly cleaned during daily operations. Records of these inspections shall be kept.

8-1.9*

Ordinary combustible materials shall not be discarded in containers used for the collection of sponge, chips, or powder.

Exception: Floor sweepings from zirconium operations shall be permitted to contain small amounts of ordinary combustible materials.

8-1.10

Areas in which flammable and combustible liquids are used shall be in accordance with the requirements of NFPA 30, *Flammable and Combustible Liquids Code*.

8-1.11

Smoking shall not be permitted in areas where ignitible zirconium sponge, chips, or powder is present. Such areas shall be posted with "no smoking" signs.

Exception: Where smoking is prohibited throughout the entire plant, the use of signage shall be at the discretion of the facility management.

8-1.12

All electrical equipment and wiring in zirconium production, processing, handling, and storage facilities shall comply with NFPA 70, *National Electrical Code*.

8-1.13

Where using tools and utensils in areas handling zirconium powder, consideration shall be given to the risks associated with generating impact sparks and static electricity.

8-1.14*

Processing equipment used in zirconium operations shall be electrically bonded and grounded properly in order to prevent accumulations of static electricity.

8-1.15

Where zirconium is collected or stored in containers, material-handling equipment with sufficient capability to remove any container from the immediate area in the case of an emergency shall be readily available.

8-1.16

Areas used for torch-cutting of massive pieces of scrap shall be kept free of combustible materials.

8-2* General Fire Protection.

8-2.1

A fire protection plan shall be provided for all areas where zirconium is processed, handled, used, and stored.

8-2.2*

Buildings or portions of buildings of noncombustible construction principally used for zirconium storage or handling shall not be permitted to be equipped with automatic sprinkler protection.

Exception: Sprinkler systems installed in accordance with NFPA 13, Standard for the Installation of Sprinkler Systems, shall be permitted in areas where combustibles other than zirconium create a more severe hazard than the zirconium and where acceptable to an authority having jurisdiction who is knowledgeable of the hazards associated with zirconium.

8-2.3

If required by the authority having jurisdiction, automatic sprinkler protection, installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, shall be provided for offices, repair shops, and warehouses not used for the storage of zirconium sponge, powder, or chips.

8-2.4

As an alternative, a specially engineered fire protection system specifically designed to be compatible with the hazards present in the zirconium operation area shall be permitted to be installed in areas where combustible loading is essential to the process operation.

8-3 Extinguishing Agents and Application Techniques.

8-3.1

Only listed or approved Class D extinguishing agents or those tested and shown to be effective for extinguishing zirconium fires shall be permitted. A supply of extinguishing agent for manual application shall be kept within easy reach of personnel while they are working with zirconium. The quantity of extinguishing agents shall be sufficient to contain anticipated fires.

8-3.2

Agents intended for manual application shall be kept in identified containers. Container lids shall be secured in place to prevent agent contamination and to keep the agent free of moisture. Where large quantities of agent are expected to be needed, a clean, dry shovel shall be provided with the container. Where small amounts are needed, a hand scoop shall be provided with each container.

8-3.3

Portable or wheeled extinguishers approved for use on zirconium fires shall be permitted and shall be distributed in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*.

8-3.4*

Portable fire extinguishers shall be provided in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*. Water-based or CO_2 extinguishers shall not be provided in areas containing zirconium sponge, chips, or powder.

Exception: CO_2 extinguishers shall be permitted in areas containing zirconium for use on electrical fires. Such CO_2 extinguishers shall be clearly marked "not for use on zirconium fires."

8-3.5

The following agents shall not be used as extinguishing agents on a zirconium fire because of adverse reaction:

(a) Water;

(b) Gaseous-based foams;

(c) Halon; and

(d) Carbon dioxide.

8-3.6

An ABC dry chemical extinguisher and a B:C dry chemical extinguisher shall not be used as a zirconium fire extinguishing agent, but shall be permitted to be used on other classes of fires in the area where zirconium is present.

8-3.7*

Dry sodium chloride, or other dry chemicals or compounds suitable for extinguishment or containment of zirconium fires, shall be permitted to be substituted for Class D fire extinguishers. These alternative agents shall be stored in a manner that ensures the agent's effectiveness. Shovels or scoops shall be kept readily available adjacent to the containers. All extinguishing agent storage areas shall be clearly identified.

8-3.8

Zirconium fines shall be segregated by storage in noncombustible drums.

8-3.9*

Where a fire occurs in processing equipment, material feed to the equipment shall be stopped. When feed is stopped, the equipment shall be kept in operation.

Exception: Where continued operation of equipment would cause the spread of fire, it shall be stopped.

Chapter 9 Referenced Publications

9-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

9-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 10, *Standard for Portable Fire Extinguishers*, 1994 edition.

NFPA 13, *Standard for the Installation of Sprinkler Systems*, 1996 edition.

NFPA 30, *Flammable and Combustible Liquids Code*, 1996 edition.

NFPA 34, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*, 1995 edition.

NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*, 1996 edition.

NFPA 54, *National Fuel Gas Code*, 1996 edition.

NFPA 70, *National Electrical Code*, 1996 edition.

NFPA 86C, *Standard for Industrial Furnaces Using a Special Processing Atmosphere*, 1995 edition.

NFPA 86D, *Standard for Industrial Furnaces Using Vacuum as an Atmosphere*, 1995 edition.

NFPA 91, *Standard for Exhaust Systems for Air Conveying of Materials*, 1995 edition.

NFPA *101*, *Life Safety Code*, 1994 edition.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-1.1 See Appendix B for supplementary information on zirconium.

A-1-2 See Appendix B for supplementary information on zirconium.

A-1-5 Approved. The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-5 Authority Having Jurisdiction. The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-5 Listed. The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-5 Zirconium Chips. Zirconium chips vary in ease of ignition and rapidity of burning, depending on their size and geometry. A light, fluffy chip ignites easily and burns vigorously while a heavy, compact chip ignites with difficulty and burns quite slowly.

A-1-5 Zirconium Dust. See NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, or NFPA 497M, *Manual for Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, for information on the explosibility parameters of combustible dusts.

A-1-5 Zirconium Powder. See NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, or NFPA 497M, *Manual for Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, for information on the explosibility parameters of combustible dusts.

A-1-5 Zirconium Sponge. Zirconium sponge can contain dust and fines that can become airborne when the material is handled. If present in sufficient quantity, the dust and fines can cause increased fire risk.

A-2-2.1 NFPA 68, *Guide for Venting of Deflagrations*, contains information on the subject of deflagration venting.

A-2-2.3 Floors should be slightly crowned or drained to prevent the accumulation of water in the vicinity of reduction furnaces.

A-2-3.4 For additional information on ovens and furnaces, see NFPA 86, *Standard for Ovens and Furnaces*.

A-2-4.1 For information on guidelines for handling and storing chlorine, see *The Chlorine Manual*.

A-2-4.3 Zirconium tetrachloride in contact with moist air or water hydrolyzes to form hydrogen chloride gas and hydrochloric acid. Hydrogen chloride is toxic and highly irritating to the respiratory tract. If not immediately removed, zirconium tetrachloride in contact with the eyes or skin results in a double burn, one caused by the acid, the other caused by the heat of reaction. Any skin that comes in contact with zirconium tetrachloride should be wiped immediately and then flushed with a large amount of water. Eyes splashed with zirconium tetrachloride also should be flushed with copious amounts of water.

A-2-5.4 A high-efficiency cyclone-type collector presents less hazard than a bag-type or media-type collector and, except where collecting extremely fine powders, usually operates with fairly high collection efficiency. Where cyclones are used, the exhaust fan discharges to the atmosphere away from other operations. It should be recognized that there are some instances in which a centrifugal-type collector might be followed by a fabric or bag-type or media-type collector or by a scrubber-type collector where particulate emissions are kept at a low level. The hazards of each collector should be recognized and appropriate protection provided. In each instance, the fan is the last element downstream in the system. Because of the extreme hazard involved with a bag-type or media-type collector, consideration should be given to a multiple-series cyclone with a liquid final stage.

Industry experience has clearly demonstrated that an explosion ultimately can be expected where a bag-type or media-type collector is used to collect zirconium fines. Seldom, if ever, can the source of ignition be positively identified. In those unusual instances where it becomes necessary to collect very small fines for a specific commercial product, it is customary for the producer to employ a bag-type or media-type collector. Since this presents a strong explosion potential, the bag-type or media-type collector should be located a safe distance from buildings and personnel.

If a bag-type or media-type collector is used, the shaking system or dust removal system can be such that it minimizes sparking due to frictional contact or impact. Pneumatic or pulse-type shaking is recommended, because no mechanical moving parts are involved in the dusty atmosphere. If the bags are provided with grounding wires, they can be positively grounded through a low-resistance path-to-ground. Where bags are used, the baghouse should be protected by an alarm that indicates excessive pressure drop across the bags. An excess air temperature alarm also is frequently used. A bag-type or media-type collector should be located at least 50 ft (15 m) from any other building or operation. Personnel should not be permitted to be within 50 ft (15 m) of the collector during operation or when shaking bags. Deflagration vents usually are built into the system, in accordance with NFPA 68, *Guide for Venting of Deflagrations*. Care should be exercised in locating the vents because of the possibility of blast damage to personnel or adjacent structures.

A-2-5.5 Information on spark-resistant fans and blowers can be found in AMCA Standards Handbook 99-0410-86, *Classification for Spark-Resistant Construction*.

A-2-6 Molten magnesium and molten magnesium chloride present an extremely dangerous fire and fume hazard, in addition to an explosion hazard, where they come into contact with water or residual moisture.

A-2-7.1 Wet zirconium sponge has the potential to generate hydrogen gas. Sealed covers have the potential to confine hazardous accumulations of hydrogen within the container.

A-3 Unlike other metals, which can be melted, cast, or molded without unusual complications, zirconium, because of its strong affinity for oxygen, hydrogen, and nitrogen and its tendency to become contaminated, is melted in special water or NaK (sodium-potassium alloy)-cooled copper crucibles under a vacuum or with an inert gas blanket of argon or helium. During the early years of the zirconium industry, melting was done with a nonconsumable electrode, usually carbon.

The consumable electrode process using direct current electricity was developed to meet quality and process specifications.

During the 1950s, several zirconium melting furnace explosions occurred when water inadvertently entered the melting crucibles during the melting operation. Three distinct types of explosions were evident: steam explosions produced by water contacting molten metal; chemical reaction between the molten metal and water; and explosion of free hydrogen generated by the chemical reaction. Also, if air entered the crucible at the same time, an air-hydrogen explosion would sometimes occur. All three types of explosions could occur in a single incident. The explosion hazard is present with any crucible or electrode that is water-cooled.

The use of liquid metal NaK as a crucible coolant has been developed for both laboratory and commercial installations. While the danger of furnace explosion due to leakage into the melt zone is reduced, the handling of NaK has its own inherent hazards. The reaction between NaK and water is violent.

A-3-1.3 The explosion that can occur due to the rapid phase transformation and dissociation reaction of water in contact with molten material takes place over a time span of approximately 10^{-5} seconds to 10^{-4} seconds. This is faster than a condensed phase detonation. The required pressure-relieving device is not effective in safely relieving the rapid pressure build-up caused by the rapid phase transformation. It should be noted that the required pressure-relieving device is intended to relieve safely only much slower increases in pressure, such as might occur from small incursions of water onto the top of the molten metal. Following a breech in the vacuum system, air enters the furnace, which could create a secondary explosion due to the presence of hydrogen generated by the molten metal/water reaction.

A-3-1.4 The use of a magnetic field to deflect the electric arc away from the crucible wall should be considered.

A-3-2 The general process for shape casting of zirconium is the "skull-casting" process, where the material to be cast is melted as a consumable electrode in a tilting crucible. The power applied is normally somewhat higher than typical for ingot melting in order to develop a deep pool of molten metal. At the appropriate time in the melting cycle, the electrode is withdrawn and the casting is poured. A vacuum or inert gas is provided to protect the metal from atmospheric contamination. The furnace crucible is made of copper and uses water or NaK for cooling. Due to the high power levels used, seams in the crucible should not be exposed to the electric arc or the molten metal.

A-3-2.5 Personnel entering furnace shells to conduct inspections or repair work should first make certain that any inert gas has been purged from the shell (*see Title 29, Code of Federal Regulations, Part 1910.146*, *"Permit Required Confined Spaces*"). All combustible or pyrophoric residues should be removed or deactivated. Residues from casting furnaces are known to be combustible or pyrophoric and caution should be exercised.

A-4 Forging remains the most popular method of forming zirconium because it is generally simpler and less costly than other forming processes. Gas or electric furnaces with accurate heat control are used to heat the metal into the proper forging range, which can vary from 1600°F to 2300°F (871°C to 1260°C). The rate of heat-up and final temperature often should be controlled precisely to achieve specific metallurgical and physical properties. Slabs, billets, and bar stock are produced by forging.

Large rounds of zirconium are produced by lathe turning or by grinding forges. A considerable amount of zirconium strip, coil, and sheet in thicknesses as thin as those of foil is produced from slabs on both continuous mills and hand mills. Wide sheets and plates of various thicknesses are produced on hand mills or plate rolling mills. Temperature control during rolling is important. Shearing and straightening operations are necessary to trim sheets and plates to size, to straighten or flatten plates, or to straighten forged bar stock or extrusions. Zirconium wire is produced from coils of rolled bar by drawing operations. Fastener stock is produced from coils of wire. Zirconium tubing is produced by inert gas seam welding of rolled narrow strip. Heavy-wall seamless tubing is produced by extrusion.

Special types of grinding operations are performed in mills. Swing grinders are used to spot-grind ingots, slabs, billets, and bar stock. Centerless grinders are used to finish round bar and fastener stock. Strip in coil form is ground continuously and sheets are individually ground.

Cold saws and abrasive cut-off saws are used to cut billet and bar stock to length. Swarf, or finely divided metal particles, is produced by all sawing and grinding operations.

A-4-1.2 See NFPA 77, *Recommended Practice on Static Electricity,* in operations where static electricity presents a hazard.

A-5-1 If a sufficient coolant flow is not used, improperly designed or dull tools can produce high temperatures at the interface, causing ignition of the turnings.

A-5-2.2 Cleaning methodologies should consider the hazards of creating airborne dusts and the dangers associated with the use of vacuum cleaners.

A-5-3.1 See Figures A-5-3.1(a) through (e) for typical dust collector drawings.

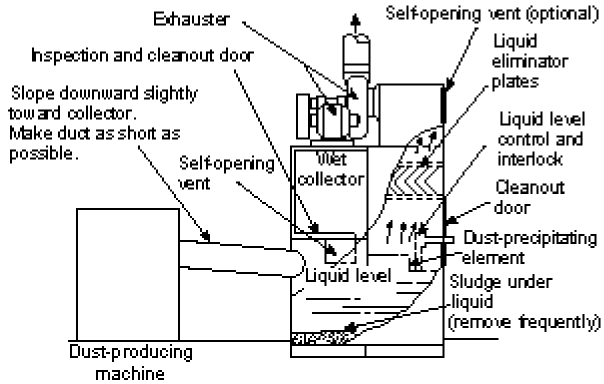

Figure A-5-3.1(a) Typical liquid precipitation separator for fixed dust-producing equipment.

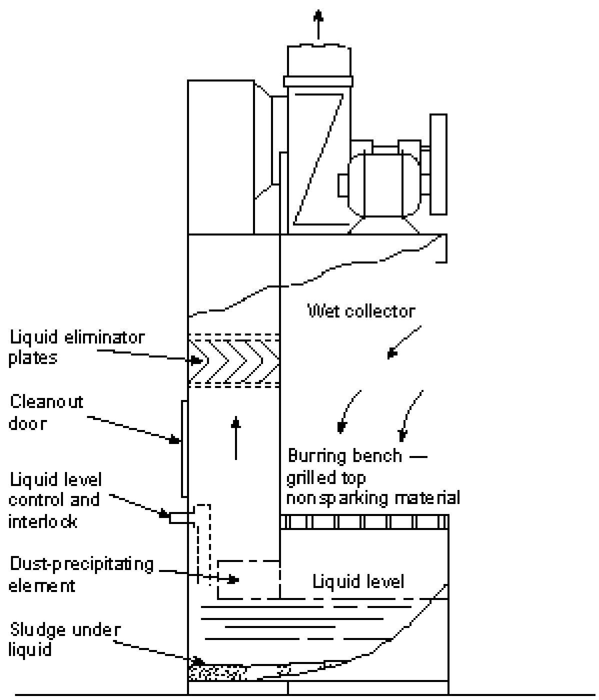

Figure A-5-3.1(b) Typical liquid precipitation separator for portable dust-producing equipment.

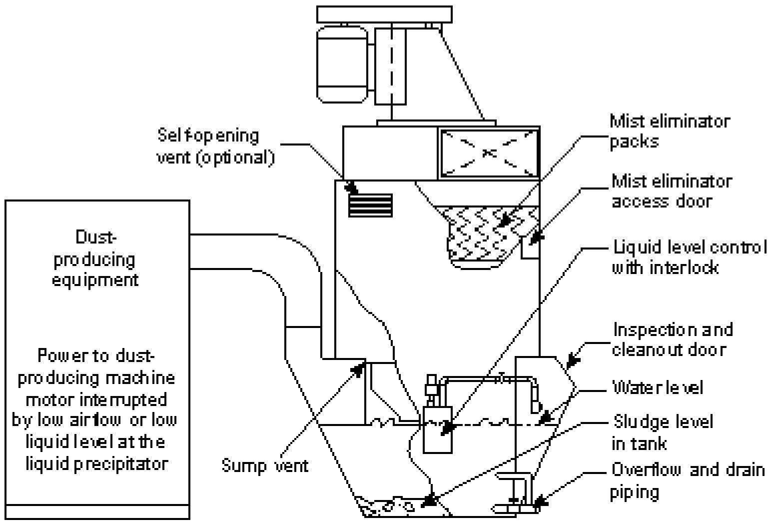

Figure A-5-3.1(c) Typical liquid precipitation separator for fixed dust-producing equipment.

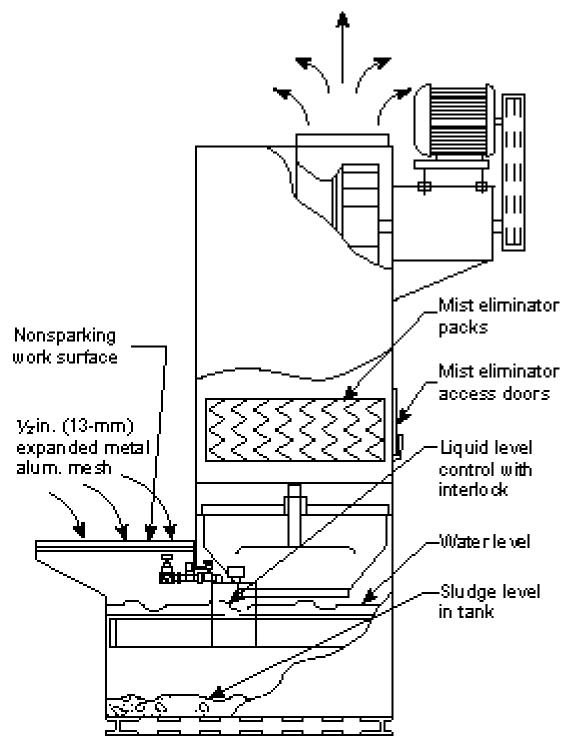

Figure A-5-3.1(d) Typical liquid precipitation separator for portable dust-producing equipment.

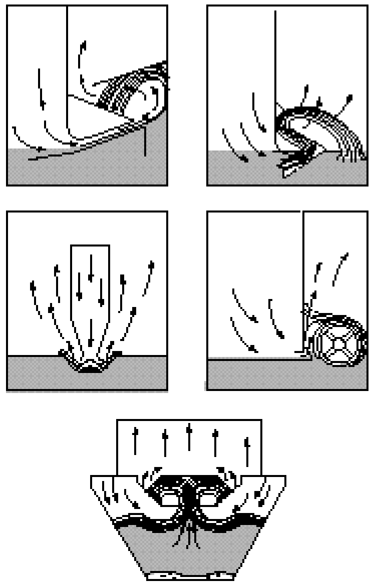

Figure A-5-3.1(e) Diagram of five methods of precipitating dust used in precipitators such as those shown in Figures A-5-3.1(a), (b), (c), and (d).

NOTE: These drawings are schematic and are intended only to illustrate some of the features that are incorporated into the design of a separator. The volume of all dust-laden air space is as small as possible.

A-5-3.4 For example, iron-oxide dusts are known to be incompatible with zirconium due to the potential for an exothermic reaction. The dust-separating unit should be cleaned, unless it has been determined that the materials exhibit no incompatibility.

A-5-3.7 Wet zirconium sludge has the potential to generate hydrogen gas. Sealed covers have the potential to confine hazardous accumulations of hydrogen within the container.

A-6 Generation of zirconium scrap from the sponge and melting processes through milling and fabrication is an inherent part of the zirconium business. Scrap sponge, including some fines, is generated in the reduction, boring, crushing, leaching, and blending operations due to contamination and spills. Solid pieces of scrap zirconium result in the melting process due to air or water contamination or due to malfunctions that cause interrupted melts.

During milling and fabrication, solid pieces of scrap result from forging, welding, and fabrication shops. Other scrap includes lathe turnings and clippings.

Before recycling, lathe turnings and chips are usually crushed, chopped, degreased, and compacted with a water-soluble detergent. Solid scrap is more difficult to handle. A method of handling fairly large chunks of zirconium scrap is to weld them to the sides of consumable electrodes prior to melting.

A more recent development is the nonconsumable electrode furnace for melting scrap into ingot form. Equipped with a continuous feed through a vacuum interlock, these furnaces are capable of handling scrap pieces of baseball size.

A-7 Not all methods of producing metal powder are applicable to zirconium. Reduction of zirconium hydride and some forms of milling are generally used to produce the limited amounts of powder now needed commercially. To reduce oxidation and possible ignition hazards, milling can be performed under water or in an inert atmosphere of helium or argon. Some powders are given a very light copper coating during the manufacturing process.

Like many other metal powders, zirconium is capable of forming explosive mixtures in air. The ignition temperatures of dust clouds, under laboratory test conditions, range from 626°F to 1094°F (330°C to 590°C). The minimum explosive concentration is 0.045 oz/ft^3 (45.1 g/m^3). The maximum pressure produced in explosions in a closed bomb at a concentration of 0.5 oz/ft^3 (500 g/m^3) ranged from 46 psi to 81 psi (317 kPa to 558 kPa). The average rate of pressure rise in these tests ranged from 250 psi/sec to 4300 psi/sec (1724 kPa/s to 29,670 kPa/s); the maximum rate of pressure rise ranged from 550 psi/sec to 10,000 psi/sec (3792 kPa/s to over 69,000 kPa/s). The minimum energy of electrical condenser discharge sparks necessary for ignition of a dust cloud was 10 millijoules; for a dust layer, the minimum value was 8 microjoules. Some samples of zirconium powder were ignited by electric sparks in pure carbon dioxide, as well as in air. In some cases, zirconium at elevated temperatures was found to react in nitrogen as well as in carbon dioxide. Zirconium powder is considered a flammable solid.

A-7-1.1 Experience has shown that the tendency for autoignition increases with decreasing particle size of the powder. In particular, in the range of 40 microns and below, the particles exhibit pyrophoric tendencies. This tendency is exacerbated in the presence of moisture.

A-7-1.2 For information on designing deflagration venting, see NFPA 68, *Guide for Venting of Deflagrations*.

A-7-2.2 The equipment and processes should be designed with consideration for the need to minimize the damage to property and risk to life resulting from fires and explosions involving zirconium powders. Design considerations should include the use of deflagration venting, proper dust collection systems, inerting, or a combination of these. The inert gas used should be determined by test to be appropriate for the zirconium powder being handled. Zirconium powder can react exothermically in pure carbon dioxide atmospheres and in pure nitrogen atmospheres.

Tests have shown that, to prevent explosions, the limiting oxygen concentrations for the inert gases argon and helium are 4.0 percent and 5.0 percent, respectively. (*See NFPA 69, Standard on Explosion Prevention Systems, for further information on limiting oxygen concentrations for safe handling of metal powders*.)

This data was obtained from U.S. Bureau of Mines, Report of Investigations 3722, *Inflammability and Explosibility of Metal Powders*, Report of Investigations 4835, *Explosive Characteristics of Titanium, Zirconium, Thorium, Uranium, and Their Hydrides*, and Report of Investigations 6516, *Explosibility of Metal Powders*.

A-8-1.3 For information on cutting and welding practices, see NFPA 51B, *Standard for Fire Prevention in Use of Cutting and Welding Processes*.

A-8-1.4 Molten magnesium and molten magnesium chloride present an extremely dangerous fire and fume hazard, in addition to an explosion hazard, where they come into contact with water or residual moisture.

A-8-1.7 Consideration should be given to the potential ignition sources associated with the operation of cleaning and processing equipment during the cleaning operation.

A-8-1.9 Special attention should be given to the segregation of ordinary trash and the routine collection of sponge, chips, and powder from floor sweepings as a function of housekeeping.

A-8-1.14 For information on static electricity, see NFPA 77, *Recommended Practice on Static Electricity.*

A-8-2 The objectives in fighting zirconium fires are isolation and containment, rather than extinguishment. Water and other liquids have proven ineffective in extinguishing zirconium fires. Streams of water intensify the fire by feeding it oxygen. There is also the possibility of causing a steam or hydrogen explosion, particularly if large amounts of zirconium are involved. The great affinity of high-temperature zirconium for oxygen frees a considerable amount of hydrogen, which can reach explosive concentrations in confined spaces. Entrapment of water under any burning or hot metal can result in a steam explosion.

Because of their unique nature, zirconium fires demand a comprehensive fire protection plan wherever zirconium is processed, handled, used, or stored. This plan should include specific actions in the event of a zirconium fire and should be coordinated with the local facility management, responding fire fighters, and medical personnel.

This plan should recognize the extreme hazards associated with zirconium-water reactions that might occur with sprinkler water. Specific attention should be given to an evacuation plan for personnel in the event of any release of water.

Properly trained personnel who work with zirconium know its hazards. Such personnel are best equipped to extinguish a zirconium fire in its incipient stage. Training should include sufficient information to determine if extinguishment can be accomplished safely and effectively.

A-8-2.2 Automatic sprinkler protection should not be used in buildings used for blending and melting.

A-8-3.4 Water-based extinguishers approved for use on Class A fires should be used only on fires involving ordinary combustibles. Extinguishers approved for Class B fires should be used for fires involving oil, grease, and most flammable liquids. Extinguishers approved for Class C fires should be used for fires involving electrical equipment.

A-8-3.7 Experience has shown that dry sodium chloride is one of the most effective chemicals for containing zirconium sponge or fines fires. Fire-fighting salts should be checked periodically to ensure that they have not become caked from moisture. Another effective chemical is a nonmetallic flux compound consisting of potassium chloride, magnesium chloride, and calcium fluoride. Commercial dry powder fire extinguishers or agents approved for use on combustible metals also are effective. Covering the fire completely reduces the accessible oxygen supply, thereby slowing the burning rate so that eventual extinguishment is achieved.

A-8-3.9 Keeping the equipment in operation until all burning material is removed can reduce damage to the equipment. Small amounts of burning materials can be handled with a shovel to facilitate removal.

Appendix B Supplementary Information on Zirconium

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

B-1 History. Klaproth first reported the discovery of the element zirconium in 1789 during his analysis of the precious stone called jargon. Other chemists confirmed his discovery and, in 1797, Vauquelin reported on some of its properties and detailed its preparation. At that time, it was called zirconia. Berzelius first isolated the impure metal in 1824, but it was not until 1925 that the ductile metal was produced by van Arkel and deBoer, using their hot-wire reduction process.

A commercial-scale production process for making ductile zirconium was developed at the U.S. Bureau of Mines Laboratories where Dr. Wilhelm Kroll served as consultant and advisor for the process that bears his name.

B-2 Properties.

B-2.1 Zirconium is a silvery-gray metal having a close-packed hexagonal crystal structure at room temperature. At 1584°F (862°C), the crystal structure changes to a body-centered cubic structure. Both structures are very ductile, and the metal is easily machined, rolled, and extruded using conventional equipment and methods.

B-2.2 Some of the chemical and physical properties of zirconium are shown in Table B-2.2:

Table B-2.2 Physical Properties of Zirconium

Atomic number	40
Atomic weight	91.22
Atomic radius	1.60 angstrom units
Specific gravity	6.5
Melting point	3360°F (1850°C)
Boiling point	6475°F (3580°C)
Electronegativity	1.6
Valence	+4 (in most chemical reactions)

B-2.3 Zirconium has a very low capture cross section for thermal neutrons (0.18 barns). Its principal alloys have outstanding resistance to corrosion in water and steam at high temperatures. These properties make zirconium desirable as a cladding material for fuel elements in water-cooled nuclear power reactors. However, it becomes embrittled and loses strength on long-term exposure to air at temperatures above 1004°F (540°C).

B-3 Combustibility and Explosibility.

B-3.1 In laboratory tests, a dust cloud of fine particles of zirconium with an average particle diameter of 3.3 microns ignited spontaneously at 68°F (20°C). Powder having an average particle diameter of 17.9 microns would not ignite under similar circumstances until heated to 662°F (350°C). Similar clouds in carbon dioxide had to be heated to 1020°F (550°C) for ignition to occur. In atmospheres of air and helium, at least 5 percent oxygen had to be present to obtain spark ignition of zirconium dust clouds.

B-3.2 Layers of zirconium powder on hot surfaces ignited at 374°F (190°C) in air; at 1148°F (620°C) in carbon dioxide; and at 1454°F (790°C) in nitrogen.

B-3.3 The minimum explosive concentration for zirconium dust in air was found to be 0.04 oz/ft^3 (40.5 g/m^3). At concentrations of 1.0 oz/ft^3 (1000 g/m^3), the maximum explosion pressure was 76 psig to 78 psig (524 kPa gauge to 538 kPa gauge), and the maximum rate of pressure rise ranged from 9500 psi/sec to 10,000 psi/sec (65,500 kPa/s to 69,000 kPa/s). For further information, see U.S. Bureau of Mines Reports of Investigations 3722, *Inflammability and Explosibility of Metal Powders*, and Report of Investigations 4835, *Explosive Characteristics of Titanium, Zirconium, Thorium, Uranium, and Their Hydrides*.

B-4 Hazards.

B-4.1 Zirconium and its alloys do not present a serious risk where handled in most forms in which they are ultimately used (e.g., tubes, bars, and sheets). However, finely divided chips, turnings, or powder can be easily, sometimes spontaneously, ignited and can burn very rapidly. Although other potential hazards exist during melting, those that have resulted in the most serious and lethal accidents have been associated with the handling of zirconium powders, finely divided scrap, and so-called black reaction residues. For this reason, special precautions should be observed during handling or disposal of these materials.

Several companies have reported that fires have occurred while zirconium bars, plates, and other shapes were being chopped. A number of fires have occurred where hot or burning chips fell into accumulations of moist fines on or under lathes or milling machines. The most violent reactions have occurred where burning chips fell into drums or deep containers partially filled with moist turnings or scrap.

B-4.2 In the molten state, zirconium either dissolves or is contaminated by every known refractory. Slight contamination apparently has little effect on the flammable characteristics of chips, turnings, or powder produced in machining operations. However, such contamination should be avoided because of its effect during acid treatment, in salt baths, or during exposure in nuclear reactors.

B-4.3 At temperatures considerably below its melting point, zirconium or zirconium sponge readily combines with oxygen, nitrogen, carbon dioxide, hydrogen, and water vapor. Surface discoloration can indicate contamination. Contaminated sponge can present an increased combustion hazard.

B-5 Special Hazards.

B-5.1 A cloud of zirconium dust in air presents a serious flash fire hazard, as well as a potential explosion hazard. Accumulations of static dust on horizontal and vertical surfaces (e.g., beams, walls, ledges, ductwork) present the potential for a more serious dust explosion, since such static dust is likely to be thrown into suspension by the disturbance created by the ignition of a dust cloud in the same area. Therefore, the importance of preventing and controlling any dispersions of zirconium dust or powder warrants special emphasis. The provision of inert atmospheres in equipment and storage containers and the use of special cleaning equipment are two methods that aid in preventing explosions. Any dust deposits produced accidentally should be cleaned up promptly and the affected area washed down. All collected dust should be kept in small containers [1 gal (3.8 L) maximum] under water until disposal. Good housekeeping and prevention of ignition sources in areas where zirconium powder is handled are essential.

B-5.2 The burning rate of zirconium chips and turnings increases where water or water-soluble oils are present as a surface coating. The burning rate also increases with increasing pile depth, degree of confinement, and increasing void space in the pile. Chips and turnings less than 0.003 in. (0.08 mm) thick are particularly susceptible to rapid burning. Where all other factors are equal, partially wet material ignites more easily and burns more rapidly than dry material.

B-5.3 Small amounts of water tend to increase the risk of explosion. Additional heat is liberated on formation of the hydrated oxide, thereby increasing the chance of an explosion. Scrap that is fully immersed in water generally does not overheat because the water provides a substantial heat sink. However, with tight-packed, very finely divided zirconium, some risk might still be present.

B-5.4 Explosions can occur while immersing specimens of uranium alloys of 1 percent to 50 percent zirconium in nitric acid or while subsequently handling the clean, dry surface after nitric acid pickling. The formation of such explosive surface coatings can be mitigated by providing fluoride ions in the pickling bath. The fluoride should be in the form of 30 grams of ammonium fluoride per liter of 50 percent nitric acid/50 percent water solution.

B-5.5 There are incipient hazards associated with collected zirconium particulate where it is mixed with ordinary combustibles during cleanup or where it is mixed with laundry. Depending on the particular problems generated, management techniques should be developed to mitigate any hazards to the general public. Any and all zirconium wastes generated should be disposed of in accordance with all federal, state, and local regulations.

B-5.6 In the case of certain common metals, such as nickel and iron, zirconium can form eutectic mixtures that exhibit melting points much lower than the individual metals and can result in unexpected meltdown. The condition can be exacerbated by one or more of the materials being in a finely divided form.

B-6 Molten Metal and Water.

B-6.1 As with any other molten metal, a violently destructive explosion can occur if water is present in any mold, pit, or depression into which molten zirconium is poured or spilled. The damage might be the result of a steam explosion, an exothermic chemical reaction, a low-order hydrogen/air explosion, or a combination of these.

B-6.2 Several violent explosions have occurred in titanium melting furnaces using consumable electrodes. The explosions occurred when cooling water accidentally entered the furnace. These explosions are of interest to the zirconium production industry because of the chemical and physical similarities between titanium and zirconium and the fact that the same types of furnaces are used for both metals. These accidents resulted in the formation of a committee of industry representatives that prepared general guidelines for the design of titanium and zirconium melting furnaces. Their recommendations have been published by the Defense Metals Information Center of Battelle Memorial Institute and have been considered in the development of this standard.

B-7 Pickling of Zirconium. Several mineral acids are used in the production of zirconium sponge and mill shapes, including hydrochloric, nitric, sulfuric, and hydrofluoric acids. The acids are used to pickle the surfaces of zirconium ingots, to clean reaction vessels and copper crucibles, and to pickle and clean mill shapes of zirconium and its alloys. Care should be exercised to prevent overheating acid baths during pickling operations to prevent explosions. Acid supplies should be stored remote from production facilities.

B-8 Tests for Zirconium.

B-8.1 Several tests can be used in the identification of zirconium and its alloys. It is important that other metals are separated from zirconium alloys if the zirconium is to be recycled.

B-8.1.1 Spark Test. Titanium, zirconium, and hafnium produce a very brilliant spark when held against a grinding wheel. The white lines traced by the flying sparks end with bursts that produce several brilliant white rays or branches.

B-8.1.2 Glass Test. The softer grades of zirconium, titanium, and hafnium can be identified by rubbing a moistened piece of the metal on a piece of glass. The metal leaves distinctive gray-white marks on the glass.

B-8.1.3 Density Test. Titanium, zirconium, and hafnium can be separated by density measurement. Their densities are 4.54 g/cm^3, 6.50 g/cm^3, and 13.3 g/cm^3, respectively.

B-8.1.4 Spectroscope. The use of a portable metal spectroscope is best for identifying and separating zirconium alloys.

B-9 Zirconium Alloys.

B-9.1 The following nuclear grade zirconium alloys are available:

UNS R60001	99.5 percent Zr; 0.05 percent max. Fe and Cr; 0.005 percent max. H_2; 0.025 percent max. N_2; 0.05 percent max. C; 0.02 percent max. Hf.
UNS R60802	1.2 percent to 1.7 percent Sn; 0.07 percent to 0.2 percent Fe; 0.05 percent to 0.15 percent Cr; 0.03 to 0.08 percent Ni; balance percent Zr.
UNS R60804	1.2 percent to 1.7 percent Sn; 0.18 percent to 0.24 percent Fe; 0.07 percent to 0.13 percent Cr; balance, Zr.
UNS R60901	96 percent Zr; 3 percent Nb; 1 percent Sn.

B-9.2 Non-nuclear grades of the alloys specified in B-9.1 are available and contain up to 4.5

percent hafnium. (*See Table B-9.2.*)

Table B-9.2 Nuclear and Non-nuclear Zirconium Alloy Grades

Nuclear Grade	Non-nuclear Grade
R60001	701
R60802	702
R60804	704
R60901	705 (tentative)

B-10 Applications.

B-10.1 One of the major uses of zirconium alloys is in the nuclear field where it is used for the cladding of fuel elements of water-cooled power reactors.

B-10.2 Zirconium alloys are used for chemical process equipment and chemistry laboratory equipment. They also are used as filament material for photo flashbulbs.

B-10.3 In zirconium processing and production plants, zirconium is used for critical parts where corrosion resistance and minimal contamination are of extreme importance. Some typical applications include raffinate storage vessels, venturi scrubbers, pollution control piping and ducts, fan housings and blades, heat exchanger shells and tubes, and other equipment exposed to chloride attack.

B-10.4 Zirconium is an efficient gettering agent for removing hydrogen, oxygen, nitrogen, and carbon dioxide from vacuum tubes. Where alloyed with titanium at a ratio of 66 percent Zr to 34 percent Ti, zirconium gettering efficiency is increased.

B-10.5 In powder form, zirconium is used as an ingredient in lighter flints and in the pyrotechnic component of safety flares.

B-10.6 Zirconium sheet is formed into special crucibles used for sodium peroxide fusions conducted in analytical chemistry laboratories.

B-11 Production.

B-11.1 Zircon-bearing sand is found throughout the world, including the United States. The most abundant mineral containing zirconium is zircon; the second is baddeleyite (ZrO_2). Only zircon is used currently for the production of zirconium.

B-11.2 The element hafnium is associated with zirconium in each of the two ores. In zircon, it is present in the ratio of one part hafnium to 49 parts zirconium. Most of this hafnium is removed by liquid-liquid extraction in glass columns before the zirconium can be used for nuclear grade alloys.

B-11.3 The production of zirconium begins with the manufacture of zirconium tetrachloride ($ZrCl_4$) by high-temperature reaction with chlorine (Cl_2) in the presence of a reducing agent, usually carbon. The zirconium tetrachloride is made into zirconium sponge by means of the Kroll process.

B-11.4 In the Kroll process, zirconium tetrachloride vapor is fed to a steel reaction chamber containing molten magnesium. The reduction is carried out under an inert atmosphere of dry argon or helium at 1292°F to 1652°F (700°C to 900°C), with magnesium chloride formed as a by-product. Any residual magnesium chloride or magnesium is vacuum-distilled from the reaction chamber, leaving behind a porous form of zirconium called "sponge."

The reactor is cooled to 122°F (50°C) and the sponge treated with air for a short period to reduce the possibility of igniting the sponge. The reactor then is evacuated, backfilled with inert gas, and cooled to 68°F (20°C). The sponge then is removed, crushed, and sized.

B-11.5 An electrolytic process for producing zirconium is currently under development. In this process, zirconium tetrachloride is fed to a fused salt bath containing sodium chloride and other materials. The zirconium produced is a crystalline form of the metal that then is crushed and leached.

B-11.6 Zirconium ingot is produced by arc-melting a consumable electrode of compacted sponge (or sponge and alloy) in a cooled copper crucible. The molten metal is protected by a vacuum or an inert atmosphere.

NFPA 485

1994 Edition

Standard for the Storage, Handling, Processing, and Use of Lithium Metal

1994 Edition

This edition of NFPA 485, *Standard for the Storage, Handling, Processing, and Use of Lithium Metal*, was prepared by the Technical Committee on Combustible Metals and Metal Dusts and acted on by the National Fire Protection Association, Inc., at its Annual Meeting held May 16-18, 1994, in San Francisco, CA. It was issued by the Standards Council on July 14, 1994, with an effective date of August 5, 1994.

The 1994 edition of this document has been approved by the American National Standards Institute.

Origin and Development of NFPA 485

The Committee on Combustible Metals and Metal Dusts began its work on developing a proposed standard on lithium at a Committee meeting in December 1990. The Committee reviewed drafts of the proposed standard and continued to revise the draft standard at Committee meetings held in June 1991, October 1991, March 1992, November 1992, March 1993, and November 1993.

The standard was submitted and adopted at the 1994 Annual Meeting in San Francisco, CA, May 16-18, 1994. The 1994 edition is the first edition of this standard.

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on safeguards against fire and explosion in the manufacturing, processing, handling, and storage of combustible metals, powders, and dusts.

NFPA 485

Standard for the

Storage, Handling, Processing,

and Use of Lithium Metal

1994 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 8 and Appendix B.

Chapter 1 General

1-1 Scope.

1-1.1

This standard shall apply to the storage, handling, processing, and use of solid or molten lithium.

1-1.2*

This standard shall also apply to finished parts and those materials, including scrap, that exhibit the burning characteristics of lithium as specified by the manufacturer.

1-1.3

This standard shall not apply to the primary production of lithium solid.

1-1.4

This standard shall not apply to the transportation of lithium.

1-1.5

This standard shall not apply to those laboratories handling hazardous chemicals as defined in NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*.

1-1.6*

This standard shall not apply to finely divided solid forms of dry lithium or finely divided lithium dispersed in a flammable liquid.

1-2 Applicability.

Unless otherwise noted, it is not intended that the provisions of this document be applied to facilities, equipment, structures, or installations that were existing or approved for construction or installation prior to the effective date of the document, except in those cases where it is determined by the authority having jurisdiction that the existing situation involves a distinct hazard to life or adjacent property.

1-3 Purpose.

The purpose of this standard shall be to call attention to the fire and explosion hazard in the storage, handling, processing, and use of lithium; to emphasize the measures to be taken to reduce such hazards; and to minimize the frequency and severity of lithium-related fire and explosion incidents. The requirements of this standard are based on conclusions drawn from available reports and data on lithium fire tests and actual fire experience.

1-4 Equivalency.

Nothing in this standard is intended to prevent the use of systems, methods, or devices of equivalent or superior quality, strength, fire resistance, effectiveness, durability, and safety over those prescribed by this standard, provided technical documentation is made available to the authority having jurisdiction to demonstrate equivalency and the system, method, or device is approved for the intended purpose.

1-5 Definitions.

For the purpose of this standard, the following terms shall have the meanings given below.

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Handling. Any activity, including processing, that can expose the metal's surface to air or any other substance capable of reacting with the metal under the conditions of the exposure.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed.* Equipment or materials included in a list published by an organization acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

Lithium. Either pure metal or alloys having the generally recognized properties of lithium metal, including the burning characteristics of lithium.

Noncombustible. In the form used and under the conditions anticipated, will not ignite, burn, support combustion, or release flammable vapors when subjected to fire or heat. (Materials reported as noncombustible, where tested in accordance with ASTM E136, *Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C*, are considered noncombustible materials.)

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Chapter 2 General Precautions

2-1* Special Considerations.

Lithium shall be kept away from sources of moisture.

2-2* Handling, Processing, and Storage Areas for Lithium.

Lithium shall be handled, processed, and stored only in areas specifically suitable for the special hazards of lithium.

2-3* Lithium Fire Residue.

2-3.1*

Lithium fire residues shall be protected to prevent adverse reactions and to prevent the formation of reactive or unstable compounds.

2-3.2

Lithium fire residues shall be disposed of in accordance with federal, state, and local regulations.

2-4 Fire Inspection Frequency.

Containers of lithium fire residue shall be inspected monthly by individuals who are familiar with lithium hazards and able to recognize potential problems associated with these containers.

Chapter 3 Building Construction

3-1 General.

3-1.1

This chapter applies to buildings or portions of buildings that are dedicated to the handling or storage of solid or molten lithium.

3-1.2

Buildings dedicated to the storage, handling, processing, or use of lithium shall be constructed of noncombustible materials.

Exception: Other construction types shall be permitted if equivalent protection can be demonstrated.

3-1.3

Buildings shall comply with applicable provisions of NFPA *101®*, *Life Safety Code®*.

3-1.4*

Roof decks shall be watertight.

3-1.5

Walls and ceilings shall be constructed with noncombustible insulation tested in accordance with ASTM E136, *Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C*.

3-1.6*

All floors or elevated platforms shall be sealed against the penetration of lithium. In areas where molten lithium is handled, wall-to-floor connections shall be constructed with the minimum number of joints.

3-1.7

Floor drains shall not be permitted.

3-1.8

Where molten lithium is handled, dispensed, or stored, the handling area shall be provided with a steel-lined containment. The containment shall provide for a volume of 110 percent of the maximum amount of material that is contained or could be spilled in the area. In areas where molten lithium is handled, wall-to-floor connections shall be sealed against the penetration of molten lithium.

3-1.9

All electrical equipment and wiring shall comply with NFPA 70, *National Electrical Code®*.

3-2 Separation from Water.

3-2.1

Water pipes or pipes that can contain water under normal use (e.g., domestic water, roof drains, waste pipes, etc.) shall not be permitted in areas containing lithium. Sprinkler piping shall not be permitted to pass through lithium areas for which sprinkler systems have been deemed inappropriate.

Exception: Sprinkler system piping as allowed by the Exception to 6-1.2 shall be permitted.

3-2.2

Portions of buildings shall be separated by watertight walls, ceilings, and door systems from adjacent areas not handling or storing lithium where water can be present. The floor shall be sloped away from the entrance to these areas, or other means shall be taken to prevent water from entering.

Chapter 4 Handling or Processing of Solid or Molten Lithium

4-1 General Precautions.

4-1.1

Lithium metal shall be handled only by trained personnel who are knowledgeable of the hazards associated with lithium.

4-1.2

The number of persons in lithium-handling areas during operations shall be limited to those necessary for the operation.

4-1.3

Access to lithium-handling areas by unauthorized personnel shall not be permitted.

4-1.4

Lithium shall not be handled in the presence of incompatible materials. (*See also A-5-1.3*.)

4-1.5

Primary storage of ordinary combustible materials and flammable and combustible liquids shall be prohibited in lithium-processing areas.

4-1.6

No open flames or electric or gas cutting, welding, or other spark-producing operations equipment shall be permitted in the section of the building where lithium is present unless approved hot work procedures are followed by qualified personnel. (See NFPA 51B, *Standard for Fire Prevention in Use of Cutting and Welding Processes*.)

4-1.7*

Only lithium for immediate use shall be present in handling areas. Lithium handling or processing areas shall not be used for primary storage of lithium.

4-2 Solid Lithium Handling.

4-2.1

Solid lithium shall be protected from moisture during handling by water-free mineral oil or by the use of dry air, argon, helium, or other appropriate methods.

4-2.2*

Only the amount of lithium needed for an individual task or procedure shall be removed from containers. Surplus lithium shall be returned to the shipping container and resealed as soon as possible.

4-3 Molten Lithium Handling.

4-3.1

Molten lithium shall be contained in closed systems that prevent its contact with air or reactive materials.

Exception: As required for the process.

4-3.2

Molten lithium piping systems shall be designed in conformance with ANSI B31.3, *Chemical Plant and Petroleum Refinery Piping*. All pump seals and flange gaskets shall be made of compatible materials.

4-3.3

Molten lithium systems shall overflow or relieve to secondary containments designed to handle 110 percent of the largest expected failure and shall be provided with the means to prevent contact with incompatible materials.

4-3.4

Molten lithium shall be handled in a detached building or in portions of a building separated from other exposures by barrier walls so any fire shall be permitted to be dealt with as a lithium fire.

Chapter 5 Storage of Solid or Molten Lithium

5-1 General Precautions.

5-1.1*

Lithium shall be permitted to be stored in sealed Department of Transportation (DOT) or Hazardous Materials Regulations (HM 181) approved shipping containers or in clean, moisture-free, sealed metal containers dedicated for the storage of lithium.

5-1.2

Lithium shall not be stored in containers previously used for the storage of incompatible materials.

5-1.3*

Lithium shall not be stored in an area with incompatible materials.

5-1.4

Lithium containers shall not be stored outside.

Exception: Lithium fire residues shall be permitted to be stored outside where placed in a double-steel, overpack drum and inspected daily.

5-2 Solid Lithium Storage.

5-2.1

Solid lithium shall be stored only on the ground floor. There shall be no basement or depression below the lithium storage area into which water or molten metal shall be permitted to flow or fall during a fire.

5-2.2

The solid lithium storage area shall be isolated from other areas so that water cannot enter by spray or drainage from automatic sprinkler systems or any other water source.

5-2.3 Container Storage Arrangement.

5-2.3.1 Containers shall be stored individually or on pallets in an arrangement that allows visual inspection for container integrity.

5-2.3.2 Containers on pallets shall be permitted to be stored in racks not more than 15 ft (4.5 m) high.

5-2.3.3 Containers on pallets not in racks shall not be stacked more than two high.

5-2.3.4 Aisle widths shall not be less than one-half the height of the piles.

5-2.3.5 Idle pallet storage shall not be permitted in solid lithium storage areas.

5-3 Molten Lithium Storage.

Molten lithium storage shall be in closed systems and in separate buildings or portions of buildings designed by competent designers solely for that purpose.

Chapter 6 Fire Protection

6-1* General Precautions.

6-1.1

A fire protection plan shall be provided for all areas where lithium is processed, handled, used, and stored.

6-1.2*

Buildings or portions of buildings dedicated to lithium storage or handling shall not be permitted to be equipped with automatic sprinkler protection.

Exception: Sprinkler systems installed in accordance with NFPA 13, Standard for the Installation of Sprinkler Systems, shall be permitted in areas where combustibles other than lithium create a more severe fire hazard than the lithium and where acceptable to an authority having jurisdiction who is knowledgeable of the hazards associated with lithium.

6-1.3

As an alternative, a specially engineered fire protection system specifically designed to be compatible with the hazards present in the lithium operation area shall be permitted to be installed in areas where combustible loading is essential to the process operation.

NOTE: If dry chemical extinguishing systems are used, see NFPA 17, *Standard for Dry Chemical Extinguishing Systems*.

6-2 Extinguishing Agents and Application Techniques.

6-2.1*

Only listed, Class D, extinguishing agents or those tested and shown to be effective for extinguishing lithium fires shall be permitted. A supply of extinguishing agent for manual application shall be kept within easy reach of personnel while working with lithium. The amount of extinguishing agent to be provided shall follow the listing agency's or manufacturer's recommendation.

6-2.2

Agents intended for manual application shall be kept in original labeled factory containers. Container lids shall be kept in place to prevent agent contamination and to keep agent moisture free. Where large quantities of agent are expected to be needed, a clean dry shovel shall be provided with the container. Where small amounts are needed, a hand scoop shall be provided with each container.

6-2.3*

Portable or wheeled extinguishers listed for use on lithium fires shall be permitted and shall be distributed in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*.

6-2.4*

The following agents shall not be used as extinguishing agents on a lithium fire because of adverse reaction.

(a) Water,

(b) Gaseous-based foams,

(c) Halon, and

(d) Carbon dioxide.

6-2.5*

An ABC dry chemical and a B:C dry chemical extinguisher shall not be used as a lithium fire extinguishing agent, but shall be permitted to be used on other classes of fires in the area where lithium is present.

6-2.6*

Fire extinguishing agent expellant gases shall be compatible with lithium.

6-3 Personal Protective Equipment for Fire Fighting.

6-3.1*

Proper protective clothing, respiratory protection, and adequate eye protection shall be used by all responding fire-fighting personnel assigned to a lithium fire. (See NFPA 1500, *Standard on Fire Department Occupational Safety and Health Program*.)

6-3.2*

Additional eye protection shall be worn by personnel wearing SCBA protection to protect against the higher degree of emitted light during a lithium fire. Visual protection equivalent to a No. 6 welding lens shall be used.

6-4 Protective Equipment for Facility Personnel Performing Incipient Stage Lithium Fire Fighting.

6-4.1

If incipient lithium fires are to be fought, personal protective equipment shall be worn. Personal protective equipment shall include face shields, head protection, gloves, external clothing, and respiratory protection.

6-4.1.1* Personnel who attempt to fight a lithium fire in its incipient stage shall, as a minimum, wear full face shields.

6-4.1.2 Head protection shall consist of hard hats.

6-4.1.3 Gloves shall conform with 7-2.3.

6-4.1.4 If provided, external clothing shall conform with 7-2.5.

6-4.1.5 Respiratory protection suitable for the hazards of lithium shall be provided.

6-4.2

If incipient lithium fires are to be fought, personal protective equipment shall be readily accessible and maintained in good condition in all areas where lithium is handled.

6-4.3

A minimum of two sets of personal protective equipment shall be provided if incipient lithium fires are to be fought.

6-5 Lithium Fire-Fighting Procedures.

6-5.1*

While fighting a lithium fire, every effort shall be made to avoid splattering the burning lithium.

6-5.2*

Once the fire is extinguished and a crust is formed, the crust shall not be disturbed until the residues have cooled to room temperature.

Chapter 7 Personal Protective Equipment for Molten and Solid Handling Operations

7-1* Personal Protective Equipment for Solid Lithium Handling.

7-1.1

While handling solid lithium, eye protection shall be worn.

7-1.2

Gloves shall be worn while handling solid lithium. Gloves shall have tight-fitting cuffs and shall be made of a material suitable for protection from caustic hazards.

7-1.3

Clothing worn while handling solid lithium shall have no exposed pockets or cuffs that could trap and carry lithium residues.

7-2* Personal Protective Equipment for Handling Molten Lithium.

7-2.1

Personal protective equipment shall be worn and shall be compatible with the hazards of molten lithium.

7-2.2

While handling molten lithium, safety glasses and full-face protection shall be worn, i.e., face shields.

7-2.3

Gloves shall be worn and shall be loose-fitting, easily removable, and compatible with the hazards of molten lithium.

7-2.4

All clothing shall be loose-fitting, easily removable, flame-resistant, and compatible with the hazards of molten lithium.

7-2.5*

An external clothing layer shall be worn for protection from splash. The external clothing layer shall be impervious to body moisture.

7-2.6

Protective footwear shall be appropriate for the hazards of molten lithium.

Chapter 8 Referenced Publications

8-1

The following documents or portions thereof are referenced within this document and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

8-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

ANSI B31.3, *Chemical Plant and Petroleum Refinery Piping*, 1993 edition.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-1.2

Products or materials that have the characteristics of lithium should have a material safety data sheet (MSDS) that describes these burning characteristics. Refer to A-6-1, A-6-5.1, and A-6-5.2 for a general explanation of these characteristics, and consult with the manufacturer or technical personnel knowledgeable of the hazards associated with lithium.

A-1-1.6

Finely divided dry lithium and finely divided lithium dispersed in a flammable liquid can exhibit pyrophoric properties and, therefore, do not act as combustible metals, as covered by this standard.

A-1-5 Definitions.

Approved. The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

Listed. The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-2-1

Lithium reacts with moisture from any available source, such as concrete, the atmosphere, and human skin. The degree and speed of the reaction varies with conditions; therefore, the best approach is to take precautions to keep moisture away from lithium.

A-2-2

Small facilities isolated from other facilities under the same ownership are ideal for handling and processing lithium. In the event of an uncontrolled lithium emergency, property damage would be considerably less.

A-2-3

Lithium fire residue products can include metallic lithium, lithium nitride, lithium oxide, or lithium hydroxide, which can absorb moisture.

A-2-3.1

Once a lithium fire is extinguished, lithium is usually still present in sufficient quantity to create adverse reactions and exhibit the burning characteristics of lithium. Lithium fire residues can include other reactive components. These residues can react with each other and cause re-ignition. Containers of residues can be purged with argon gas or the residues can be coated with water-free mineral oil to reduce the potential for reaction.

A-3-1.4

The requirement for watertight roof decks is an effort to ensure that buildings are designed and maintained to minimize possible leaks from weather conditions. Special care should be given to maintain these roofs, especially in climates where heavy amounts of snow are expected.

A-3-1.6

Nonslip surfaces should be provided due to the potential presence of mineral oil on the floor. Gratings should be used only where containment provisions have been provided below the area or where access can be restricted below the area.

A-4-1.7

When evaluating the amounts needed for immediate use, the risks and fire exposures should be evaluated with other processing requirements.

A-4-2.2

Solid lithium is supplied in a variety of forms, e.g., ingots and ribbon, which are often individually protected in small cans or airtight foil pouches. If individual containers are not supplied and the containers are opened, lithium is exposed to surrounding air, causing slow reactions to take place. It is for this reason that once the container is opened, only that amount of lithium intended to be used should be removed.

A-5-1.1

Lithium is shipped from lithium manufacturers in DOT or HM 181-approved containers that should continue to act as storage containers. Containers should be sealed to remain airtight, with lithium coated with mineral oil or packed under an argon cover. Containers used to store lithium under mineral oil for long-term storage (over three months) should be inverted to redistribute the mineral oil covering the lithium. Containers packed under an argon cover should be regularly checked to verify the integrity of the container seal. When lithium is returned to any shipping container, the protective method used by the manufacturer should be duplicated.

A-5-1.3

Lithium is known to be incompatible with the following materials: inorganic and organic acids; Halon 1211; Halon 2402; carbon tetrachloride; 1,1,1 trichloroethane; oxidizers such as nitric acid, chromic acid, phosphoric acid, or hypochlorous acid; and reducing acids such as sulfuric, hydrochloric, and sulfamic acid. Oxalic acid, phenol and organic acid mixtures, or compounds such as paint strippers or metal cleaners are also reactive and should not be stored in the vicinity of lithium. Refer to NFPA 491M, *Manual of Hazardous Chemical Reactions*.

A-6-1

Lithium fires, being quite unique in nature, require a comprehensive fire protection plan where lithium is processed, handled, used, or stored. This plan should include specific actions in the event of a lithium fire and should be coordinated with the local facility management, responding fire fighters, and medical personnel.

This plan should pay special attention to the extreme hazards associated with lithium-water reactions that might occur with sprinkler water. Specific attention should be paid to an evacuation plan for personnel in the event of any release of water.

The particulate fumes given off by burning lithium are very corrosive; therefore, nonessential personnel in the vicinity should be evacuated to a safe distance, with special attention given to shifting winds. Where frequent lithium fires can affect local environmental quality conditions, an exhaust treatment system should be provided.

Properly trained personnel who work with lithium know its hazards. Such personnel will have the greatest chance to extinguish a lithium fire in its incipient stage. Training should include sufficient information to determine if extinguishment can be safely and effectively accomplished.

Lithium at room temperature in the presence of incompatible materials can reach the melting point and reach the autoignition temperature.

The degree of reaction and the amount of time to produce these effects vary with conditions surrounding the fire; temperature of the exposed lithium being the major factor. At low temperatures or temperatures within a few degrees of lithium's melting point, the reaction is slower with reduced intensity. At higher temperatures, the reaction is accelerated and more intense.

When fighting a lithium fire, it is very important that fire fighters be aware of the dangers of burning lithium. When molten lithium reacts with materials such as water or flammable or combustible liquids or gases, molten lithium can be ejected for a considerable distance. The severity of lithium reactions varies with a multitude of conditions.

Lithium in contact with moisture and air forms lithium hydroxide and lithium oxide, which will cause caustic burns without adequate personal protective equipment.

A-6-1.2

The reaction of lithium, especially burning lithium, with water is extremely hazardous. Where combustible loading in areas used for lithium processing is determined by the authority having jurisdiction to require sprinkler protection, consideration should be given to the installation of preaction sprinkler systems to reduce the opportunity for accidental discharge.

A-6-2.1

Several agents, e.g., graphite-based agents and lith-x, have been successfully tested on lithium fires and found to be successful with varying results. These agents all form a crust of varying durability over the fuel, but due to molten lithium's fluid properties, lithium tends to seek any weak spot in this crust and develop "burn-throughs." Copper powder formed the most durable crust of all these effective fire-fighting agents.

Low density agents were found to be difficult to apply in windy conditions, resulting in decreased extinguisher effective range, reduced visibility, and larger amounts of agent needed.

Testing indicates that the amount of agent needed depends on several factors. Small-scale lithium fires require the use of an acceptable ratio of extinguishing agents. Larger fires can require dramatically larger ratios. The acceptable ratio varies, depending on the agent selected.

Lithium, with its low density, will float on solid or liquid. Extinguishing agents will tend to sink in molten lithium; therefore, as depth of fuel increases, the amount of agent needed will increase. Extended testing and evaluation of lithium fires indicates the amount of agent needed is not based on weight of agent per weight of fuel, but should be based on depth and surface area of involved fuel per weight of agent.

The lower the temperature of the lithium, the less heat will be required to be drawn from the lithium to reduce reactions, therefore reducing the amount of agent needed.

A-6-2.3

In cases where the weight of the lithium hazard is small and well defined, portable or wheeled extinguishers should be distributed so that at least one is located within 75 ft (22.7 m) of the hazard and additional extinguishers can be readily available.

The reasoning for recommending wheeled extinguishers where large amounts of lithium are found is based on the following:

(a) One or two individuals can deliver large amounts of agent in a relatively short period of time.

(b) Being highly mobile, wheeled extinguishers can be situated to provide a more complete coverage of any facility.

(c) Wheeled units protecting other areas that might not be affected in the emergency can be brought to the scene.

A-6-2.4

The following extinguishing agents should not be used as lithium fire extinguishing agents:

(a) The application of water in any form on lithium releases considerable amounts of hydrogen gas, steam, and heat and is not recommended on lithium.

Tests have demonstrated that the effect of water on lithium fires is the formation of hydrogen gas. In some cases, hydrogen will burn and intensify the fire; in other cases, hydrogen results in rapid heat rise with an explosive-like effect.

The amount of hydrogen gas present in the vicinity of any lithium reaction is directly proportional to the degree of further reaction. If the environment surrounding the fire is such that the hydrogen gas is driven off or its concentration is reduced to a level below its lower explosive limit, the reaction is less in intensity.

(b) Past testing of the application of aqueous film-forming foam (AFFF) on burning lithium resulted in extreme reactions.

(c) Halon should not be used as a lithium fire extinguishing agent.

Halon, when applied to a lithium fire, exhibits an immediate reaction. One effect is that the reaction will track the agent stream putting the fire fighter in increased danger.

(d) The application of CO_2 produces minimal reactions, yet the force of this agent can greatly spread burning lithium. Therefore, CO_2 is not recommended as a lithium fire extinguishing agent.

A-6-2.5

Dry chemical agents should not be used on a lithium fire. Testing indicated that a B:C dry chemical was not an effective lithium fire-fighting agent although it exhibited the least amount of adverse reaction with lithium.

A-6-2.6

Many common extinguishing agents and extinguisher expelling gases, when exposed to burning lithium, exhibit high reactivity. The degree of reactivity depends on a wide range of variables, e.g., temperature of the fire and other chemical compounds reacting with the lithium. For example, nitrogen commonly used to expel dry powder agent does not exhibit a high degree of reactivity until the temperature of the fire increases.

Testing has indicated that carbon dioxide and nitrogen, commonly used as extinguisher expellant gases, are reactive to lithium at higher temperatures. Argon gas, being nonreactive to lithium, can be used successfully as a substitute.

If lithium is involved in a multiclass fire and agents that are reactive to lithium, e.g., water, AFFF, and halon, are used, expect and prepare for the effects of the reaction. Use unmanned delivery techniques and use whatever physical protection is available.

A-6-3.1

Burning lithium will burn through material used in the construction of most fire fighter protective clothing. Some features (e.g., heavy quilted lining and aluminized outer shell) can reduce this risk. It is recognized that SCBA face piece eye protection worn by fire fighters is adequate protection with the exception of the intense light given off by burning lithium.

A-6-3.2

Specific testing has indicated that white light levels emitted from burning lithium exceed recommended levels. Extended lithium fire experience has shown that this intense light can cause serious damage to unprotected eyes.

A clip-on adapter over an SCBA face piece with a shaded glass lens equivalent to a No. 6 welding lens has been used very successfully to reduce such hazards. A darker lens tends to obstruct fire fighters view to an unacceptable degree.

A-6-4.1.1 Full face shields, preferably shaded shields, should be made readily available in areas where lithium fires are likely to occur. These shields will provide adequate protection against small incipient-stage lithium fires.

A-6-5.1

One of the greatest dangers to fire fighters is the splattering effect of burning lithium. Molten lithium is very fluid and easily spread; therefore, extreme care needs to be taken when applying fire-fighting agent. The force used to deliver agent from an extinguisher can easily spread lithium particles; therefore, delivery technique is very important. Should direct agent application become hazardous, indirect application techniques should be used. Deflecting agent off another object or directing the agent stream above the hazard and letting the agent fall by gravity can be effective.

A-6-5.2

Forming a crust over burning lithium reduces the available oxygen and eliminates exothermic reactions. Extinguishing agent should first be applied to the white-hot burning areas, then evenly applied to the mass, controlling the flow to form an oxygen-depleting crust. Since lithium tends to flow easily through any weak spots, agents should be applied evenly to construct a continuous crust. If lithium surfaces, additional agent should be applied to strengthen the crust.

Actual crust formation is created by the ability of some powdered agents to absorb heat from the lithium. In the case of copper powder, a lithium-copper alloy is formed as heat is absorbed from the lithium. Once the crust is formed, the temperature of the lithium decreases and exothermic reactions are reduced. Extreme care should be taken to ensure the crust is not disturbed or broken until the temperature of the lithium is decreased to the point where resolidification occurs.

A-7-1

Lithium in contact with moisture forms lithium hydroxide and lithium oxide, which will cause caustic burns. Lithium in contact with human skin will react with body moisture and cause thermal and caustic burns.

A-7-2

Hazards involved with handling molten lithium are significantly greater than those of handling solid lithium due to enhanced reactivity, heat of reaction, and elevated temperatures.

A-7-2.5

Fire risk is significantly reduced when the outer clothing layer is kept dry.

NFPA 490

1993 Edition

Code for the Storage of Ammonium Nitrate

1993 Edition

This edition of NFPA 490, *Code for the Storage of Ammonium Nitrate*, was prepared by the Technical Committee on Hazardous Chemicals and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 16-18, 1992, in Dallas, TX. It was issued by the Standards Council on January 15, 1993, with an effective date of February 12, 1993, and supersedes all previous editions.

The 1993 edition of this document has been approved by the American National Standards Institute.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

Origin and Development of NFPA 490

NFPA 490 was developed by the Technical Committee on Storage, Handling, and Transportation of Hazardous Chemicals and was tentatively adopted by the Association in 1963. It was further amended and again tentatively adopted in 1964. After further revision, it was officially adopted in 1965. Amendments to NFPA 490 were adopted in 1967, 1969, and 1970. A complete revision was adopted in 1975 and several minor amendments were adopted in 1980 and 1985.

The 1993 edition of NFPA 490 incorporates amendments to the document to enhance its enforceability by revising nonmandatory language provisions and conformance with the NFPA *Manual of Style*.

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: To develop and maintain current codes for classes of hazardous chemicals and codes for specific chemicals when these are warranted by virtue of widespread distribution or special hazards.

NFPA 490

Code for the Storage of Ammonium Nitrate

1993 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 8 and Appendix D.

Foreword

Ammonium nitrate[1] is a compound containing nitrogen, hydrogen, and oxygen (NH_4NO_3) and is commercially produced by reacting nitric acid with ammonia, evaporating the resultant solution of ammonium nitrate to make a concentrated ammonium nitrate melt, which is then spray granulated in a prilling tower or pelletized or flaked by some other means.

For interstate shipments, the Department of Transportation of the United States classifies ammonium nitrate as an oxidizing material, as it does some other fertilizer products such as sodium nitrate, potassium nitrate, and calcium nitrate. Such oxidizing materials can yield oxygen upon decomposition under fire conditions and will, therefore, under proper conditions of mixing, vigorously support combustion if involved in a fire with combustible materials. Ammonium nitrate is capable of undergoing detonation with about half the blast effect of explosives, if heated under confinement that permits high pressure build-up, or if subjected to strong shocks, such as those from an explosive. The sensitivity of ammonium nitrate to detonation increases at elevated temperatures.

Industrial use of ammonium nitrate extends to its use as an ingredient in blasting agents. When a carbonaceous or organic substance such as fuel (or diesel) oil, nut hulls, or carbon black is added and admixed with ammonium nitrate, the mixture may become a blasting agent. A blasting agent is defined as being any material or mixture, consisting of a fuel and oxidizer, intended for blasting, not otherwise classed as an explosive and in which none of the ingredients is classified as an explosive, provided that the finished product, as mixed and packaged for use or shipment, cannot be detonated by means of a No. 8 test blasting cap when unconfined. (*See NFPA 495, Explosive Materials Code.*)

Recent test data on ammonium nitrate are included in the U.S. Bureau of Mines Report of Investigations 6746, *Sympathetic Detonation of Ammonium Nitrate and Ammonium Nitrate Fuel Oil*; Report of Investigations 6903, *Further Studies of Sympathetic Detonation*; and Report of Investigations 6773, *Explosion Hazards of Ammonium Nitrate Under Fire Exposure*. On the basis of these reports a Table of Distances of Ammonium Nitrate and Blasting Agents from Explosives or Blasting Agents has been developed. The table is included in Appendix C of *NFPA 495*, *Explosive Materials Code*.

While blasting agents should not be confused with fertilizer products, extreme care should be taken to ensure that stored ammonium nitrate does not become sensitized by intimate mixing with carbonaceous, organic, or combustible material.

Mixed fertilizers containing less than 60 percent ammonium nitrate are not covered by this code.

With proper precautions against fire and explosion, ammonium nitrate can be stored safely at the plant, in distributors' warehouses, or on the farm.

[1]The term is used in this publication refers only to solid forms of ammonium nitrate.

Chapter 1 Scope and Definitions

1-1 Scope.

1-1.1

This code shall apply to the storage of ammonium nitrate in the form of crystals, flakes, grains, or prills including fertilizer grade (as defined by *Definitions and Test Procedures for Ammonium Nitrate Fertilizer*), dynamite grade, nitrous oxide grade [as defined by *Standard for Ammonium Nitrate (Nitrous Oxide Grade)*], technical grade, and other mixtures containing 60 percent or more by weight of ammonium nitrate.

1-1.2

It shall not apply to the transportation of ammonium nitrate.

1-1.3

It shall not apply to storage under the jurisdiction of and in compliance with the regulations of the United States Coast Guard.

1-1.4

This code shall not apply to ammonium nitrate-based blasting agents. (*See NFPA 495, Explosive Materials Code.*)

1-1.5

The storage of ammonium nitrate and ammonium nitrate mixtures that are more sensitive than allowed by the *Definitions and Test Procedures for Ammonium Nitrate Fertilizer* shall not be permitted by this code except on the specific approval of the authority having jurisdiction.

1-1.6

Nothing in this code shall apply to the production of ammonium nitrate or to the storage of ammonium nitrate on the premises of the producing plant, provided that no distinct undue hazard to the public is created.

1-2 Purpose.

The purpose of this code is to provide for the safe storage of fertilizer grade ammonium nitrate.

1-3 Definitions.

Approved. Acceptable to the “authority having jurisdiction.”

NOTE: The National Fire Protection Association does not approve, inspect or certify any installations, procedures, equipment, or materials nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations which is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The “authority having jurisdiction” is the organization, office or individual responsible for “approving” equipment, an installation or a procedure.

NOTE: The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner since jurisdictions and “approval” agencies vary as do their responsibilities. Where public safety is primary, the “authority having jurisdiction” may be a federal, state, local or other regional department or individual such as a fire chief, fire marshal, chief of a fire prevention bureau, labor department, health department, building official, electrical inspector, or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the “authority having jurisdiction.” In many circumstances the property owner or his designated agent assumes the role of the “authority having jurisdiction”; at government installations, the commanding officer or departmental official may be the “authority having jurisdiction.”

Labeled. Equipment or materials to which has been attached a label, symbol or other identifying mark of an organization acceptable to the “authority having jurisdiction” and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed. Equipment or materials included in a list published by an organization acceptable to the “authority having jurisdiction” and concerned with product evaluation, that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

NOTE: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The “authority having jurisdiction” should utilize the system employed by the listing organization to identify a listed product.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Chapter 2 General Provisions

2-1 Application.

This code shall apply to all persons, firms, corporations, co-partnerships, and associations storing, having, or keeping ammonium nitrate and to the owner or lessee of any building, premises, or structure in which ammonium nitrate is stored in quantities of 1,000 lb (454 kg) or more.

2-2 Restricted Locations.

2-2.1

A permit shall be required from the authority having jurisdiction for the storage of 1,000 lb (454 kg) or more of ammonium nitrate.

2-2.2

Not more than 60 tons (54.4 metric tons) of ammonium nitrate shall be stored unless the location and storage facility have been approved.

2-2.3

Storage locations shall be subject to approval by the authority having jurisdiction with respect to nearness of residential occupancies, places of public assembly, schools, hospitals, railroads, and public highways. Limitations on storable quantities shall be considered with regard to proximity of these exposures and congested commercial or industrial districts.

2-2.4*

Approval of large quantity storage shall be subject to due consideration of the fire and explosion hazards, including exposure to toxic vapors from burning or decomposing ammonium nitrate.

2-3 Structures.

2-3.1

Storage buildings shall not have basements unless the basements are open on at least one side. Storage buildings shall not be over one story in height, unless approved for such use.

2-3.2

Storage buildings shall have adequate ventilation or be of a construction that will be self-ventilating in the event of fire.

2-3.3

The wall on the exposed side of a storage building within 50 ft (15.2 m) of a combustible building, forest, piles of combustible materials, and similar exposure hazards shall be of Type I construction, as described in NFPA 220, *Standard on Types of Building Construction*. In lieu of the Type I wall, other equivalent means of exposure protection such as a free standing wall shall be permitted to be used. The roof coverings shall be Class C or better. (*See NFPA 203, Guideline on Roof Coverings and Roof Deck Constructions*.)

2-3.4

All flooring in storage and handling areas shall be of noncombustible material or protected against impregnation by ammonium nitrate and shall be without open drains, traps, tunnels, pits, or pockets into which any molten ammonium nitrate could flow and be confined in the event of fire.

2-3.5

The continued use of an existing storage building or structure not in strict conformity with this code shall be approved by the authority having jurisdiction in cases where such continued use will not constitute a hazard to life or adjoining property.

2-3.6

Buildings and structures shall be dry and free from water seepage through the roof, walls, and floors.

Chapter 3 Storage of Ammonium Nitrate in Bags, Drums, or Other Containers

3-1 Containers.

3-1.1

Bags and containers used for ammonium nitrate shall comply with the specifications and standards established by the U.S. Department of Transportation.

3-1.2

Containers used on the premises in the actual manufacturing or processing need not comply with provisions of 3-1.1.

3-2 Piles.

3-2.1

Containers of ammonium nitrate shall not be accepted for storage when the temperature of the ammonium nitrate exceeds 130°F (54.4°C).

3-2.2

Bags of ammonium nitrate shall not be stored within 30 in. (76 cm) of the storage building walls and partitions.

3-2.3

The height of piles shall not exceed 20 ft (6.1 m). The width of piles shall not exceed 20 ft (6.1 m) nor the length 50 ft (15.2 m) except that, where the building is of noncombustible construction or is protected by automatic sprinklers, the length of piles shall not be limited. In no case shall the ammonium nitrate be stacked closer than 36 in. (0.9 m) below the roof or supporting and spreader beams overhead.

3-2.4

Aisles shall be provided to separate piles by a clear space of not less than 3 ft (0.9 m) in width. At least one service or main aisle in the storage area shall be not less than 4 ft (1.2 m) in width.

3-2.5

The requirements for pile sizes and aisles, as set forth in 3-2.3 and 3-2.4, shall be permitted to be waived by the authority having jurisdiction where storage facilities are located in remote areas.

Chapter 4 Storage of Bulk Ammonium Nitrate

4-1 Structures.

4-1.1

Warehouses shall have adequate ventilation or be capable of adequate ventilation in case of fire.

4-1.2

Unless constructed of noncombustible material or unless adequate facilities for fighting a roof fire are available, bulk storage structures shall not exceed a height of 40 ft (12.2 m).

4-2 Compartments.

4-2.1

Bins shall be clean and free of materials that can contaminate ammonium nitrate.

4-2.2*

Due to the corrosive and reactive properties of ammonium nitrate, and to avoid contamination, galvanized iron, copper, lead, and zinc shall not be used in bin construction unless suitably protected. Aluminum bins, and wooden bins protected against impregnation by ammonium nitrate, are permissible.

4-2.3

The warehouse shall be permitted to be subdivided into any desired number of ammonium nitrate storage compartments or bins. The partitions dividing the ammonium nitrate storage from the storage of other products that would contaminate the ammonium nitrate shall be of tight construction.

4-2.4

The ammonium nitrate storage bins or piles shall be clearly identified by signs reading “AMMONIUM NITRATE” with letters at least 2 in. (5 cm) high.

4-3 Piles.

4-3.1

Piles or bins shall be so sized and arranged that all material in the pile is moved out periodically in order to minimize possible caking of the stored ammonium nitrate.

4-3.2*

Height or depth of piles shall be limited by the pressure-setting tendency of the product. However, in no case shall the ammonium nitrate be piled higher at any point than 36 in. (0.9 m) below the roof or supporting and spreader beams overhead.

4-3.3

Ammonium nitrate shall not be accepted for storage when the temperature of the product exceeds 130°F (54.4°C).

4-3.4

Dynamite, other explosives, and blasting agents shall not be used to break up or loosen caked ammonium nitrate.

Chapter 5 Contaminants

5-1 Separation.

5-1.1

Ammonium nitrate shall be in a separate building or shall be separated by approved fire partitions of not less than 1 hour fire endurance from storage of organic chemicals, acids or other corrosive materials, materials that can require blasting during processing or handling, compressed flammable gases, flammable and combustible materials, or other contaminating substances including *but not limited to* animal fats, baled cotton, baled rags, baled scrap paper, bleaching powder, burlap or cotton bags, caustic soda, coal, coke, charcoal, cork, camphor, excelsior, fibers of any kind, fish oils, fish meal, foam rubber, hay, lubricating oil, linseed oil, or other oxidizable or drying oils, naphthalene, oakum, oiled clothing, oiled paper, oiled textiles, paint, straw, sawdust, wood shavings, or vegetable oil. Walls referred to in this section need extend only to the underside of the roof.

5-1.2

In lieu of separation walls, ammonium nitrate shall be permitted to be separated from the materials referred to in 5-1.1 by a space of at least 30 ft (9.1 m) or more as required by the authority having jurisdiction and sills or curbs shall be provided to prevent mixing during fire conditions.

5-1.3

Flammable liquids such as gasoline, kerosene, solvents, and light fuel oils shall not be stored on the premises except where such storage conforms to NFPA 30, *Flammable and Combustible Liquids Code*, and where walls and sills or curbs are provided in accordance with 5-1.1 or 5-1.2.

5-1.4

LP-Gas shall not be stored on the premises except where such storage conforms to NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

5-2 Prohibited Articles.

5-2.1

Sulfur and finely divided metals shall not be stored in the same building with ammonium nitrate except where such storage conforms to NFPA 495, *Explosive Materials Code*.

5-2.2

Explosives and blasting agents shall not be stored in the same building with ammonium nitrate except on the premises of makers, distributors, and user-compounders of explosives or blasting agents.

5-2.2.1 Where explosives or blasting agents are stored in separate buildings, other than on the premises of makers, distributors, and user-compounders of explosives or blasting agents, they shall be separated from the ammonium nitrate by the distances or barricades specified in the *Table of Recommended Separation Distances of Ammonium Nitrate and Blasting Agents from Explosives or Blasting Agents*, found in NFPA 495, *Explosive Materials Code.*

5-2.2.2 Storage or operations on the premises of makers, distributors, and user-compounders of explosives or blasting agents shall be in conformity with NFPA 495, *Explosive Materials Code*.

Chapter 6 General Precautions

6-1 Electrical Installations.

6-1.1

Electrical installations shall conform to the requirements of NFPA 70, *National Electrical Code,*® for ordinary locations. They shall be designed to minimize damage from corrosion.

6-1.2

Electric lamps shall be located or guarded so as to preclude contact with bags or other combustible materials.

6-2 Housekeeping.

6-2.1

Good housekeeping shall be maintained.

6-2.2

If contents of broken bags are uncontaminated, they shall be permitted to be salvaged by placing the damaged bag inside a clean, new slipover bag and closing securely. Other spilled materials and discarded containers shall be promptly gathered and disposed of in a safe manner.

6-3 Sources of Ignition.

Open flames and smoking shall be prohibited in storage buildings, and this is not meant to include heating units approved by the authority having jurisdiction.

6-4 Signs.

All points of entry to commercial warehouses in which ammonium nitrate is stored shall be properly identified with durable signs meeting the following specifications:

(a) Signs shall have background and letters in contrasting colors.

(b) Signs shall be worded “AMMONIUM NITRATE,” with letters at least 2 in. (5 cm) high.

6-5 Vehicles and Lift Trucks.

6-5.1

Internal combustion motor vehicles, lift trucks, and cargo conveyors shall not be permitted to remain unattended in a building where ammonium nitrate is stored unless parked in an area that will prevent the spreading of a fire in the event of a vehicle fire.

6-5.2*

Fork trucks, tractors, platform lift trucks, and other specialized industrial trucks used within the warehouse shall be maintained so that fuels or hydraulic fluids do not contaminate the ammonium nitrate.

6-6* Handling Equipment.

Hollow spaces shall be avoided in nitrate handling equipment where nitrate could collect and be confined under sufficiently high pressure to become a source of explosion in the event of fire.

6-7 Lightning.

In areas where lightning storms are prevalent, lightning protection shall be provided. (*See NFPA 780, Lightning Protection Code.*)

6-8 Control of Access.

Provisions shall be made to prevent unauthorized personnel from entering the ammonium nitrate storage area.

Chapter 7 Fire Protection

7-1 Automatic Sprinklers.

7-1.1

Unless the storage of a greater quantity is approved by the authority having jurisdiction, not more than 2,500 tons (2,268 metric tons) of bagged ammonium nitrate shall be stored in a building or structure not equipped with an automatic sprinkler system.

7-1.2

When determining whether greater quantities shall be permitted without sprinkler protection, the authority having jurisdiction shall take into consideration exposure of the storage building to built-up areas and possible presence of contaminants in the storage building.

7-1.3

Sprinkler protection shall be permitted to be required for the storage of less than 2,500 tons (2,268 metric tons) of ammonium nitrate where location of the building or the presence of other stored materials can present a special hazard.

7-1.4

Sprinkler systems shall be of approved type and installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

7-2 Extinguishing Devices.

7-2.1

Suitable fire control devices such as small hose or portable extinguishers shall be provided throughout the warehouse and in the loading and unloading areas. (*See NFPA 10, Standard for Portable Fire Extinguishers, and NFPA 14, Standard for the Installation of Standpipe and Hose Systems.*)

7-2.2

Water supplies and fire hydrants shall be available in accordance with recognized good practices and as required by the authority having jurisdiction. (*See NFPA 24, Standard for the Installation of Private Fire Service Mains and Their Appurtenances.*)

7-2.3

The requirements for automatic sprinklers, water supplies, and fire hydrants set forth in 7-1.4 and 7-2.2 shall be permitted to be waived by the authority having jurisdiction where storage facilities are located in remote areas.

Chapter 8 Referenced Publications

8-1

The following documents or portions thereof are referenced within this code and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

8-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 13, *Standard for the Installation of Sprinkler Systems*, 1991 edition

NFPA 30, *Flammable and Combustible Liquids Code*, 1990 edition

NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, 1992 edition

NFPA 70, *National Electrical Code*, 1993 edition

NFPA 203, *Guideline on Roof Coverings and Roof Deck Constructions*, 1992 edition

NFPA 220, *Standard on Types of Building Construction*, 1992 edition

NFPA 495, *Explosive Materials Code*, 1992 edition

8-1.2 Other Publications.

Definitions and Test Procedures for Ammonium Nitrate Fertilizer, Washington, DC, Fertilizer Institute, 1984

Standard for Ammonium Nitrate (Nitrous Oxide Grade), Arlington, VA, Compressed Gas Assn.

Appendix A Explanatory Notes

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

A-2-2.4

Ammonium nitrate is capable of undergoing detonation with the blast effect of about half the quantity of explosives, if heated under confinement that permits high pressure build-up or if subjected to strong shocks, such as those from an explosive. The sensitivity of ammonium nitrate to detonation is increased by elevated temperatures or by contamination. (*See Chapter 5.*)

A-4-2.2

Steel or wood can be protected by special coatings such as sodium silicate, or epoxy coatings, or polyvinyl chloride coatings.

A-4-3.2

Pressure setting is a factor affected by humidity and temperature in the storage space and by pellet quality. Temperature cycles through 90°F (32°C) and high atmospheric humidity are undesirable for storage in depth.

A-6-5.2

It is recommended that electric or LP-Gas powered trucks be employed rather than gasoline or diesel to reduce the potential for contamination to ammonium nitrate.

A-6-6

Examples of hollow spaces include hollow conveyor rollers and hollow screw conveyor shafts.

Appendix B Suggested Fire Fighting Procedure

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

B-1

Should a fire break out in an area where ammonium nitrate is stored, it is important that the mass be kept cool and the burning be promptly extinguished. Apply large volumes of water as quickly as possible. If fires reach massive and uncontrollable proportions, fire fighting personnel should evacuate the area and withdraw to a safe place.

B-2

Provide as much ventilation as possible to the fire area. Rapid dissipation of both the products of decomposition and the heat of reaction is very important.

B-3

Approach the fire from upwind as the vapors from burning ammonium nitrate are very toxic. Self-contained breathing apparatus of types approved by the U.S. Bureau of Mines should be used to protect personnel against gases.

B-4

After extinguishment of the fire, the loose and contaminated unsalvageable ammonium nitrate should be buried or dumped in water, where permissible. Any residue that cannot be removed by sweeping should be washed away with hoses. Flushing and scrubbing of all areas should be very thorough to ensure the dissolving of all residue. Wet empty bags should be removed, permitted to dry out, and then burned out of doors.

Appendix C Suggested Provisions for Municipal Legal Regulations

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

NOTE: Where this code is used as the basis for municipal legal regulations, the following provisions are suggested as an aid to enforcement.

C-1 Title.

This ordinance shall be known as "an ordinance regulating the storage, having, and keeping of ammonium nitrate in the City of...," and shall be permitted to be referred to as "The Ammonium Nitrate Storage Ordinance."

NOTE: The title should conform with local law and practice.

C-2 Definitions.

C-2.1

Chief. The Chief of the Fire Department or his or her authorized representative is hereby designated as "the authority having jurisdiction" wherever that expression appears in the ordinance.

C-2.2 Jurisdiction.

"Jurisdiction" wherever used in this ordinance shall mean the City of...

C-2.3 Permit.

The term "Permit," wherever used in this ordinance, shall mean the written authority of the .... issued pursuant to this ordinance to store, have, or keep pure, fertilizer, or other grades of ammonium nitrate and mixtures containing 60 percent or more by weight of ammonium nitrate and that are classified as oxidizing materials (usually by the Department of Transportation) by the authority having jurisdiction.

C-3 Application.

This ordinance shall apply to all persons, firms, corporations, co-partnerships, governmental agencies except federal, and associations storing, having, or keeping ammonium nitrate and to the owner or lessee of any building or premises in or on which ammonium nitrate is stored or kept.

C-4 Permitted Locations.

C-4.1

The storage of ammonium nitrate in quantities of 1,000 lb (454 kg) or more is prohibited within the following limits:

NOTE: These limits are to be specified according to local zoning ordinances. They should include all residential, mercantile, and other congested districts.

C-4.2

No permit shall be issued until approval has been given for the proposed storage location with respect to nearness to places of public assembly, schools, hospitals and churches, and adequacy of water supply for fire control.

C-5 Retroactivity.

The chief may issue a permit for the continued use of an existing warehouse, storage facility, handling equipment, building, and structure for the storage of ammonium nitrate that is not in strict compliance with the terms of this ordinance in cases in which continued use will not constitute a distinct hazard to life or adjoining property. In cases where such permit is denied, the chief shall notify the applicant and specify the reasons for denial in writing.

C-6 Permits.

C-6.1

A permit issued pursuant to this ordinance shall be obtained from the chief to store, have, or keep, in quantities of 1,000 lb (454 kg) or more, pure, fertilizer, and other grades of ammonium nitrate, and mixtures containing 60 percent or more by weight of ammonium nitrate and that are classified as oxidizing materials (usually by the Department of Transportation) by the authority having jurisdiction.

C-6.2

Permits shall not be transferable.

C-6.3

Each permit granted by the chief shall be valid for such period as may be specified but not to exceed one year, shall be a revocable license, and shall expire when revoked.

C-7 Inspection and Approval.

C-7.1

Application for a permit to use or operate facilities for the storage, having, or keeping of ammonium nitrate as herein required shall be made in writing to the chief. The chief shall then cause to be made an inspection of the premises and equipment proposed to be used. If they are found to be in compliance with this ordinance, a statement to that effect shall be noted on the application and the application signed by the person making the inspection. The chief shall thereupon issue a permit as applied for.

C-7.2

The chief may at any reasonable time inspect premises, buildings, installations, or equipment for the storage and handling of ammonium nitrate. If a violation of this ordinance is found to exist, the chief shall file with the owner, occupant, or operator a notice citing the violation and ordering its correction. If such order is not complied with, the chief may suspend the permit issued for such facility.

C-7.3

In the event that an inspection reveals a violation of this ordinance serious enough in the chief's opinion to constitute a clear and present danger to the public safety, the chief shall take whatever measures are necessary to correct, abate, or remove the hazard or condition.

C-8 Modification.

The chief shall have the power to grant exemption from application of the ordinance upon request in writing to do so when such request shows that the enforcement of the ordinance will cause unnecessary hardship to the petitioner, provided that said request shall not be granted where the requested use will constitute a distinct hazard to life or adjoining property. The particulars of such exemptions when granted shall be entered upon the permit issued. A copy thereof shall be retained by the chief.

C-9 Appeals.

C-9.1

An owner, lessee, agent, operator, or occupant aggrieved by any order issued pursuant to this ordinance may file an appeal to the City Council within ten days from the service of such an order, and the City Council shall fix a time and place not less than five days nor more than ten days thereafter when and where such appeal may be heard by it. Such appeal shall stay the execution of such order until it has been heard and reviewed, vacated, or confirmed. Nothing in this section shall be construed as preventing the chief from taking any action indicated by Section B-7-3 of this ordinance.

NOTE: This section should conform to local law and practice with respect to terminology and designation of agency to hear appeals.

C-9.2

The City Council shall at such hearing affirm, modify, revoke, or vacate such order. Unless revoked or vacated, such order shall then be complied with.

C-9.3

Nothing therein contained shall be deemed to deny the right of any person, firm, corporation, co-partnership, or voluntary association to appeal from an order or decision of the City Council to a court of competent jurisdiction. Such appeal shall stay the execution of such order until it has been heard and reviewed, vacated, or confirmed.

C-10 Penalties.

Any person who shall violate any of the provisions of this ordinance or fail to comply therewith, or who shall violate or fail to comply with any order made thereunder, or who shall build in violation of any detailed statement of specifications or plans submitted and approved thereunder, or any certificate or permit issued thereunder, and from which no appeal has been taken, or who shall fail to comply with such an order as affirmed or modified by the City Council or by a court of competent jurisdiction, within the time fixed herein shall severally for each and every violation and non-compliance, respectively, be guilty of a misdemeanor, punishable by a fine of not less than $..................... or by imprisonment for not less than............... days nor more than............ days or by both such fine and imprisonment. The imposition of one penalty for any violation shall not excuse the violation or permit it to continue; and all such persons shall be required to correct or remedy such violations or defects within a reasonable time; and when not otherwise specified, each ten days that prohibited conditions are maintained shall constitute a separate offense. The application of the foregoing penalty shall not be held to prevent the enforced removal of prohibited conditions.

C-11 Repeal of Conflicting Ordinances.

All former ordinances or parts thereof conflicting with the provisions of this ordinance are hereby repealed.

C-12 Severability.

The City Council hereby declares that, should any section, paragraph, sentence, or word of this ordinance be declared, for any reason, to be invalid, it is the intent of said City Council that it would have passed all other portions of this ordinance independent of the elimination herefrom of any such portion as may be declared invalid.

C-13 Effective Date.

This ordinance shall take effect upon .... of ....

NFPA 491M

1991 Edition

Manual of Hazardous Chemical Reactions

1991 Edition

This edition of NFPA 491M, *Manual of Hazardous Chemical Reactions*, was prepared by the Technical Committee on Hazardous Chemical Reactions and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 12-14, 1990 in Miami, FL. It was issued by the Standards Council on January 11, 1991, with an effective date of February 8, 1991, and supersedes all previous editions.

The 1991 edition of this document has been approved by the American National Standards

Institute.

Origin and Development of NFPA 491M

This manual was prepared by the Technical Committee on Hazardous Chemical Reactions. It has been approved for publication by the Technical Committee on Hazardous Chemical Reactions. This 1991 edition is a reconfirmation of the 1986 edition, originally published in 1975, and includes over 3500 entries of hazardous or potentially hazardous chemical reactions. As further information on hazardous reactions is accumulated, the Committee plans to publish revised editions. Those who know of references to reactions not included or who have personal knowledge of hazardous reactions are requested to send the information to the Committee Secretary, using the tear sheets at the end of the manual.

Technical Committee on Hazardous Chemical Reactions

Foreword

This manual had its beginnings in an extensive literature survey conducted by the late George W. Jones of the U.S. Bureau of Mines. For many years, Mr. Jones served as a member of the National Fire Protection Association Committee on Chemicals and Explosives and as Chairman of the closely allied American Chemical Society Committee on Hazardous Chemicals and Explosives. His untimely death prevented him from putting the compilation into final form. Subsequently, the Sectional Committee on Hazardous Chemical Reactions reviewed his compilation and arranged the format published as the first edition in 1964. The 1966 edition incorporated the remainder of Mr. Jones' compilation plus corrections and contributions from readers of the first edition and gleanings from recent literature. With more than 300 additional reactions from technical literature and individual contributions added in 1968, another 350 added in 1971, and approximately 1,200 added in 1975, this edition contains approximately 3,550 documented reactions.

The purpose of the manual is to bring to chemists and other users of chemicals a compilation of recorded experience with chemical reactions that have potential for danger. Thus, the abstracts presented here range from reactions that produce incandescence or flame at moderate or slightly elevated temperatures to those that produce explosions or detonations. In presenting the compilation at this time, the Committee fully recognizes certain inadequacies and possible inaccuracies but hopes the manual's shortcomings will not seriously impair its usefulness. Since some of the information was obtained from very old references, its validity may be questioned; many of the reported hazardous reactions may have been due to impurities or contaminants in the materials involved. At the same time, the user should be cautioned that the absence of a reaction from this listing in no way implies that combinations of materials may be mixed with impunity with or without heating. Similarly, the comments that may be appended to particular reactions regarding their violence should be tempered by consideration of quantities involved, temperatures, confinement, and many other factors.

For convenience many potentially hazardous reaction mixtures have been brought together into groups. For example, the reactions of mixtures of inorganic perchlorates with many fuels can be quite violent. This association of different reactants in the same group should not be taken, however, as an indication that all such related compounds will react with equal rates or ease with a given fuel, that the violence will be equivalent in every case, or that potential contaminants, such as moisture, will have the same effect. The reader is warned that trace quantities of contaminants acting as catalysts may have a profound effect on the course and rate of the reaction. Unless there is unusual reactivity with air, oxygen, or water, the usual combustion reactions involving these oxidants have not been included for all possible fuel substances. Finally, any mixture of oxidizing and reducing agents should be suspected of being able to undergo a hazardous reaction.

Organization of this Manual

In this alphabetic tabulation, the reactions are presented in the following format:

PRIMARY ENTRY

Secondary Entries	Remarks and literature references.

Thus, the entry

ALUMINUM

Sodium Carbonate	When sodium carbonate was applied to redhot aluminum, an explosion occurred.Price and Baker, *Chem. & Met. Eng.* **29:** 878 (1923).

means that aluminum and sodium carbonate react under the conditions stated and that the reference can be consulted for possible additional information. At the end of the manual, the full titles of the abbreviated names of references are listed.

This same reaction will also appear alphabetically under “sodium carbonate” as a cross-entry in bold-faced capital letters on the left margin as follows:

SODIUM CARBONATE

Aluminum	See ALUMINUM plus Sodium Carbonate.

The reactant under which the specific remarks are made (the Primary Entry) is chosen under an arbitrary system of priorities. Generally, the primary entry was selected from the higher on the following list:

CHEMICAL	*EXAMPLE*
Metallic Elements	Magnesium
Other Elements	Bromine
Classes of Compounds	Nitrates
Uncommon Compounds	Cesium Acetylene Carbide
Specific Compounds of a Class	Ammonium Nitrate
Common Acids	Nitric Acid
Common Bases	Sodium Hydroxide
Common Organic Compounds	Ethyl Alcohol
Nonchemical Names	Organic Matter

Additional guides for finding reactions in the manual are listed below:

1. When two chemical compounds are of equal importance, the first in alphabetic listing has usually received priority as the primary entry.

2. Most of the secondary entries appear also as primary cross-entries; exceptions are air, water, common chemical names like alcohol and ether, and trivial or common names like caustic soda or wood. For these common substances, refer to the other reactant or to the specific chemical name. Since so many reactions concern charcoal, this material is a primary entry.

3. For some common organic chemicals, popular names were used in preference to scientific nomenclature; for example, methyl bromide, rather than monobromomethane.

4. A chemical name is used in preference to its creator’s name, thus, permonosulfuric acid, rather than Caro’s acid.

5. A few proprietary names appear in preference to the relatively unknown chemical identification of the compound, e.g., Teflon® instead of polytetrafluoroethylene.

6. If no hazardous reaction is listed for a particular pair of chemicals, the reader should look up possible reactions between chemicals with similar properties. For example, if no reaction is given between cesium and hydrochloric acid, see sodium and hydrochloric acid. The violence of

the reaction between the similar chemicals may not be the same, but the combination should be regarded as suspect.

7. The manual does not list explosive fuel-air mixtures, but does list pyrophoric or hypergolic (self-igniting) mixtures.

8. The manual also lists a number of individual chemicals that explode or detonate spontaneously or in response to impact or heat. In such cases the chemical is listed as the primary entry, under which is printed the term, “self-reactive.”

9. A number of entries by “families” of chemicals, e.g., nitrates, sulfates, aldehydes, ethers, are included to facilitate the search for reactions. Frequently, these entries cross-refer to reactions of individual chemicals of the family.

10. Isomeric designations such as “iso” and “n” do not affect the alphabetic arrangement of chemical names in this manual.

REFERENCES

An effort has been made to furnish references complete enough to lead the reader to the source of information. At the end of the manual, the full titles are listed for the abbreviated names of references that accompany the reactions. If a statement about a reaction might disclose proprietary information, the source is protected by the reference, “Confidential information furnished to NFPA.”

INFORMATION ON ERRORS AND OMISSIONS WELCOMED

The Technical Committee on Hazardous Chemical Reactions will welcome comments on and criticisms of the present compilation. If a reader can cite more up-to-date references or experiences concerning any of the listed reactions, the information also will be welcomed. Similarly, the Committee would very much appreciate receiving brief details of incidents involving hazardous chemical reactions not yet included in the manual, so that these can be compiled and included in a later revision. Such material should be transmitted to Guy R. Colonna, Secretary, Committee on Chemicals and Explosives, National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101. Tear-out pages for forwarding new material are at the back of the manual.

NFPA 491M

Manual of Hazardous Chemical Reactions

1991 Edition

ACETALDEHYDE CH_3CHO

Acetic Acid	Acetaldehyde was put in drums previously pickled with acetic acid. The acid caused the acetaldehyde to polymerize, and the drums became hot and vented. *MCA Case History* **1764** (1971).
Acid Anhydrides	Condensation reaction of acetaldehyde with acid

	anhydrides, alcohols, ketones, and phenols can be violent.
	Chem. Safety Data Sheet **SD-43** (1952).
Air	Acetaldehyde oxidizes readily in air to unstable peroxides that may explode spontaneously.
	Chem. Safety Data Sheet **SD-43** (1952).
Alcohols	See ACETALDEHYDE plus Acid Anhydrides.
	Chem. Safety Data Sheet **SD-43** (1952).
Ammonia (Anhydrous)	Reaction of anhydrous ammonia, hydrogen cyanide, or hydrogen sulfide can be violent.
	Chem. Safety Data Sheet **SD-43** (1952).
Bromine	See BROMINE plus Acetaldehyde.
Chlorine	See CHLORINE plus Acetaldehyde.
Fluorine	See BROMINE plus Acetaldehyde.
Hydrogen Cyanide	See ACETALDEHYDE plus Ammonia (Anhydrous).
Hydrogen Sulfide	See ACETALDEHYDE plus Ammonia (Anhydrous).
Iodine	See BROMINE plus Acetaldehyde.
Ketones	See ACETALDEHYDE plus Acid Anhydrides.
Phenols	See ACETALDEHYDE plus Acid Anhydrides.
Phosphorus Isocyanate	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.
Sodium Hydroxide	A violent polymerization of acetaldehyde results from reactions with alkaline materials such as sodium hydroxide.
	Doyle (1966).

ACETIC ACID CH_3COOH

Acetaldehyde	See ACETALDEHYDE plus Acetic Acid.
2-Aminoethanol	Mixing acetic acid and 2-aminoethanol in a closed container caused the temperature and pressure to increas e.
	Flynn and Rossow (1970). See Note under complete reference.

Ammonium Nitrate	See AMMONIUM NITRATE plus Acetic Acid.
Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Acetic Acid.
Chlorosulfonic Acid	Mixing glacial acetic acid and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Chromic Acid	See CHROMIC ANHYDRIDE plus Acetic Acid.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Acetic
and Acetic Anhydride	Acid and Acetic Anhydride.
Diallyl Methyl	See DIALLYL METHYL CARBINOL plus
Carbinol and Ozone	Ozone and Acetic Acid.
Ethylene Diamine	Mixing acetic acid and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethyleneimine	Mixing glacial acetic acid and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Acetic Acid.
Nitric Acid	See NITRIC ACID plus Acetic Acid.
Nitric Acid and	See NITRIC ACID plus Acetone and Acetic
Acetone	Acid.
Oleum	Mixing glacial acetic acid and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Perchloric Acid	See PERCHLORIC ACID plus Acetic Acid.
Permanganates	See PERMANGANATES plus Acetic Acid.

Phosphorus Isocyanate	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.
Phosphorus Trichloride	See PHOSPHORUS TRICHLORIDE plus Acetic Acid.
Potassium Hydroxide	Potassium hydroxide residue in a catalyst pot reacted violently when acetic acid was added. *MCA Case History* **920** (1963).
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Acetic Acid.
Sodium Peroxide	See SODIUM PEROXIDE plus Acetic Acid.
n-Xylene	During the production of terephthalic acid, n-xylene is oxidized in the presence of acetic acid. During these processes, detonating mixtures may be produced. Addition of a small amount of water may largely eliminate the risk of explosion. B.I. Sraer, *Himiceskaja promyslennost* **46** (10): 27-30 (1970).

ACETIC ANHYDRIDE $CH_3COOCOCH_3$

2-Aminoethanol	Mixing acetic anhydride and 2-aminoethanol in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Aniline	See ANILINE plus Acetic Anhydride.
Boric Acid	See BORIC ACID plus Acetic Anhydride.
Chlorosulfonic Acid	Mixing acetic anhydride and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Chromic Acid	See CHROMIC ANHYDRIDE plus Acetic Anhydride.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Acetic Anhydride.
Chromic Anhydride and Acetic Acid	See CHROMIC ANHYDRIDE plus Acetic Anhydride and Acetic Acid.

Ethylene Diamine	Mixing acetic anhydride and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethyleneimine	Mixing acetic anhydride and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Glycerol	A violent reaction occurs between these reactants in the presence of phosphorus oxychloride as a catalyst.
	Hexagon Alpha Chi Sigma **40** (Oct. 1949).
Hydrochloric Acid	Mixing acetic anhydride and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing acetic anhydride and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Acetic Acid.
Nitric Acid	Mixing acetic anhydride and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
	See NITRIC ACID plus Acetic Anhydride.
	See NITRIC ACID plus Acetic Acid.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Acetic Anhydride.
Oleum	Mixing acetic anhydride and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

Perchloric Acid	See PERCHLORIC ACID plus Acetic Acid.
	See PERCHLORIC ACID plus Acetic Anhydride.
Permanganates	See PERMANGANATES plus Acetic Acid.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Acetic Anhydride.
Sodium Peroxide	See SODIUM PEROXIDE plus Acetic Acid.
Sulfuric Acid	Mixing acetic anhydride and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Water	The mixing of acetic anhydride with water can be dangerously explosive, especially when mineral acids are present.
	Chem. Eng. News **25:** 3458.

ACETONE CH_3COCH_3

Chloroform	A mixture of acetone and chloroform in a residue bottle exploded. Since addition of chloroform to acetone in the presence of a base will result in a highly exothermic reaction, it is thought that a base may have been in the bottle.
	MCA Case History **1661** (1970).
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Acetone.
Chromyl Chloride	See CHROMYL CHLORIDE plus Acetone.
Hexachloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Organic Matter.
Nitric Acid and Acetic Acid	See NITRIC ACID plus Acetone and Acetic Acid.
Nitric Acid and Sulfuric Acid	See NITRIC ACID plus Acetone and Sulfuric Acid.

Nitrosyl Chloride	See NITROSYL CHLORIDE plus Acetone.
Nitrosyl Perchlorate	See NITROSYL PERCHLORATE plus Acetone.
Nitryl Perchlorate	See NITRYL PERCHLORATE plus Benzene.
Permonosulfuric Acid	See PERMONOSULFURIC ACID plus Acetone.
Potassium Tert.-Butoxide	Ignition occurs when potassium t-butoxide reacts with the following: acetone, ethyl methyl ketone, methyl isobutyl ketone, methanol, ethanol, n-propanol, isopropanol, ethyl acetate, n-butyl acetate, n-propyl formate, acetic acid, sulfuric acid, methylene chloride, chloroform, carbon tetrachloride, epichlorohydrin, dimethyl carbonate, and diethyl sulfate.
	MCA Case History **1948** (1973).
Sodium Hypobromite	An explosion occurred during an attempt to prepare bromoform from acetone by the haloform reaction.
	Chem. Eng. News **9:** 229 (1931).
Sulfuric Acid and Potassium	Acetone ignited when it was accidentally
Dichromate	splashed into a sulfuric acid-dichromate solution.
	Wischmeyer (1969).
Thiodiglycol and	See THIODIGLYCOL plus Hydrogen Peroxide
Hydrogen Peroxide	and Acetone.
Trichloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.

ACETONE CYANHYDRIN

(See a-HYDROXYISOBUTYRONITRILE)

ACETONITRILE CH_3CN

Chlorosulfonic Acid	Mixing acetonitrile and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

Erbium Perchlorate	In the preparation of anhydrous erbium perchlorate an acetonitrile extraction was made. During the final stages of the procedure a glossy material was formed that exploded when scratched with a spatula. It was concluded that acetonitrile was trapped in the glossy erbium perchlorate and that this material was shock-sensitive as are many organic-containing perchlorates.
	J. Chem. Edu. **50** (6): A336-7 (1973).
Oleum	Mixing acetonitrile and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sulfuric Acid	Mixing acetonitrile and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

ACETYL BROMIDE CH_3COBr

Alcohols	Acetyl bromide reacts violently with alcohols or water.
	Merck Index **7th Ed.** (1960).
Water	See ACETYL BROMIDE plus Alcohols.

ACETYL CHLORIDE CH_3COCl

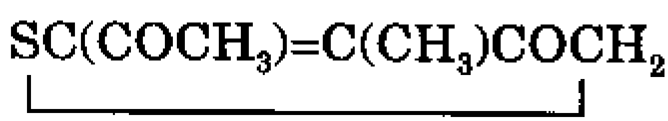
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
Ethyl Alcohol	Acetyl chloride reacts violently with ethyl alcohol or water.
	Rose (1961).
Water	Acetyl chloride reacts violently with water.
	Haz. Chem. Data (1966).

ACETYLENE $CH\equiv CH$

Brass	See COPPER plus Acetylene.

Bromine	See BROMINE plus Acetylene.
Cesium Hydride	See CESIUM HYDRIDE plus Acetylene.
Chlorine	See CHLORINE plus Acetylene.
Cobalt	See COBALT plus Acetylene.
Copper	See COPPER plus Acetylene.
Copper Salts	See COPPER SALTS plus Acetylene.
Cuprous Acetylide	See CUPROUS ACETYLIDE plus Acetylene.
Fluorine	See FLUORINE plus Acetylene.
Iodine	See IODINE plus Acetylene.
Mercuric Nitrate	See MERCURIC NITRATE plus Acetylene.
Mercury	See MERCURY plus Acetylene.
Mercury Salts	See MERCURY SALTS plus Acetylene.
Nitric Acid	See NITRIC ACID plus Acetylene.
Potassium	See POTASSIUM plus Acetylene.
Rubidium Hydride	See RUBIDIUM HYDRIDE plus Acetylene.
Silver	See SILVER plus Acetylene.
Silver Salts	See MERCURY SALTS plus Acetylene.
	See also SILVER NITRATE plus Acetylene and Ammonium Hydroxide.
Sodium Hydride	See SODIUM HYDRIDE plus Acetylene.

2-ACETYL-3-METHYLTHIOPHEN-4-ONE



(self-reactive) — A vacuum distillation of 2-acetyl-3-methylthiophen-4-one was being performed on a laboratory bench when suddenly

	there was an explosion.
	MCA Guide for Safety, Appendix 3 (1972).

ACETYL NITRATE CH_3COONO_2

(self-reactive)	Acetyl nitrate has been reported to explode during vacuum distillation; also, when touched by a glass rod.
	J. P. Wilaut, *Chem. Zentr.* **112**(I):384 (1943).
	Pichet and Khotinsky, *Berichte* **40**:1164 (1907).

ACETYL PEROXIDE

(See DIACETYL PEROXIDE)

ACID ANHYDRIDES

(See specific Anhydride)

Acetaldehyde	See ACETALDEHYDE plus Acid Anhydrides.

ACIDS

(See also specific acid)

Acrolein	See ACROLEIN plus Sulfur Dioxide.
Benzyl Alcohol	Benzyl alcohol containing acidic constituents and dissolved iron was found to polymerize with a rapid temperature increase when heated in excess of 100¡C. Amines, pyridene, and alkali hydroxides act as inhibitors and prevent polymerization.
	Chem. Abst. **77**:7816w (1972).
Lithium Aluminum	See LITHIUM ALUMINUM HYDRIDE
Hydride	plus Water.
Nickel Nitride	See NICKEL NITRIDE plus Acids.
Sodium Ozonate	See SODIUM OZONATE plus Acids.

Thorium Phosphide	See THORIUM PHOSPHIDE plus Acids.
Tri-iso-Butyl Aluminum	See TRI-iso-BUTYL ALUMINUM plus Acids.

ACROLEIN CH_2=CHCHO

Acids	See ACROLEIN plus Sulfur Dioxide.
Alkalis	See ACROLEIN plus Sulfur Dioxide.
Amines	See ACROLEIN plus Sulfur Dioxide.
	See SODIUM HYDROXIDE plus Acrolein.
2-Aminoethanol	Mixing acrolein and 2-aminoethanol in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ammonia	See SODIUM HYDROXIDE plus Acrolein.
Ammonium Hydroxide	Mixing acrolein and 28% ammonium hydroxide in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Chlorosulfonic Acid	Mixing acrolein and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	Mixing acrolein and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethyleneimine	Mixing acrolein and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydroxides	See SODIUM HYDROXIDE plus Acrolein.

Nitric Acid	Mixing acrolein and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing acrolein and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Potassium Hydroxide	See SODIUM HYDROXIDE plus Acrolein.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Acrolein.
Sulfur Dioxide	Acrolein polymerizes with release of heat on contact with minor amounts of acids (including sulfur dioxide), alkalis, volatile amines, salts, thiourea, oxidants (air) and on exposure to light and heat. *BCISC* **44**:174 (1973).
Sulfuric Acid	Mixing acrolein and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Thiourea	See ACROLEIN plus Sulfur Dioxide.

ACRYLIC ACID $H_2C{=}CHCOOH$

2-Aminoethanol	Mixing acrylic acid and 2-aminoethanol in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Ammonium Hydroxide	Mixing acrylic acid and 28% ammonium hydroxide in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Chlorosulfonic Acid	Mixing acrylic acid and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.

	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	Mixing acrylic acid and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethyleneimine	Mixing acrylic acid and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing acrylic acid and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

ACRYLONITRILE CH_2=CHCN

Acids (Strong)	See ACRYLONITRILE plus Sulfuric Acid and Water.
2-Aminoethanol	Mixing acrylonitrile and 2-aminoethanol in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Bromine	See BROMINE plus Acrylonitrile.
Chlorosulfonic Acid	Mixing acrylonitrile and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	Mixing acrylonitrile and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Acrylonitrile and 70% Nitric Acid detonates at 90¡ C.
	Flynn and Rossow (1970). See Note under complete

	reference.
Oleum	Mixing acrylonitrile and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Potassium Hydroxide	See SODIUM HYDROXIDE plus Acrylonitrile.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Acrylonitrile.
Sulfuric Acid	A mixture with concentrated sulfuric acid must be kept well chilled; otherwise, a vigorous exothermic reaction occurs. *Chem. Safety Data Sheet* **SD-31:** 8 (1949). A vigorous reaction between acrylonitrile and strong acids occurs with hydroquinone and powdered copper as catalysts. In the preparation of acrylic acid from these ingredients, using concentrated sulfuric acid, an eruption will occur in the flask, due to a strong exothermic reaction, unless the ingredients are kept well chilled. F. J. Kaszuba, *Chem. Eng. News* **30:** 824 (1952). Mixing acrylonitrile and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
1,2,3,4-Tetrahydrocarbazole	See 1,2,3,4-TETRAHYDROCARBAZOLE plus Acrylonitrile.

ACRYLONITRILE-BUTADIENE COPOLYMER

$[-CH_2CH=CHCH_2CH_2CH(CN)-]n$

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

ACYL HALIDES

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.

ACYL HYPOFLUORITES

(self-reactive)	See PERFLUOROPROPIONYL FLUORIDE plus Fluorine.

AIR

(See other reactant)

AIR (LIQUID)

Charcoal	Explosions have occurred when liquid air contacts organic matter. A cracked tube of activated charcoal immersed in liquid air exploded violently.
	J. Taylor, *J. Sci. Instr.* **5:** 24 (1928).
Diethyl Ether	See DIETHYL ETHER plus Air (Liquid).
Hydrocarbons	Almost any reducing agent and all hydrocarbons can form explosive mixtures with liquid air.
	Chem. Eng. News **27:** 2612 (1949).

ALCOHOLS

Acetaldehyde	See ACETALDEHYDE plus Acid Anhydrides.
Barium Perchlorate	See BARIUM PERCHLORATE plus Alcohols.
Chlorine	See ALCOHOLS plus Hypochlorous Acid.
Diethyl Aluminum Bromide	See DIETHYL ALUMINUM BROMIDE plus Air.
Ethylene Oxide	See ETHYLENE OXIDE plus Alcohols.
Hexamethylene Diiosocyanate	See ALCOHOLS plus Isocyanates.
Hydrogen Peroxide and Sulfuric Acid	Mixtures of alcohols with concentrated sulfuric acid and strong hydrogen peroxide can cause explosions. Examples: An explosion will occur if dimethylbenzylcarbinol is added to 90% hydrogen peroxide

	and then acidified with concentrated sulfuric acid. Mixtures of ethyl alcohol with concentrated hydrogen peroxide form powerful explosives. Mixtures of hydrogen peroxide and 1-phenyl-2-methyl propyl alcohol tend to explode if acidified with 70% sulfuric acid.
	Chem. Eng. News **45** (43): 73 (1967). *J. Org. Chem.* **28:** 1893 (1963).
Hypochlorous Acid	Alkyl hypochlorites are violently explosive. They are readily obtained by reacting hypochlorous acid and alcohols either in aqueous solution or in mixed water-carbon tetrachloride solutions. Obviously CHLORINE plus Alcohols would similarly produce alkyl hypochlorites. They decompose in the cold and explode on exposure to sunlight or heat. Tertiary hypochlorites are less unstable than secondary or primary hypochlorites.
	Whitmore, 157 (1937). *Mellor*, **Supp. II, Part I:** 560 (1956).
Isocyanates	Base-catalyzed reactions of isocyanates such as hexamethylene diisocyanate with alcohols should generally be carried out in inert solvents. Such reactions in the absence of solvents often occur with explosive violence.
	Wischmeyer (1969).
Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus Water.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Alcohols.
Perchloric Acid	See PERCHLORIC ACID plus Alcohols.
Permonosulfuric Acid	See PERMONOSULFURIC ACID plus Alcohols.
Tri-iso-Butyl Aluminum	See TRI-iso-BUTYL ALUMINUM plus Acids.

ALDEHYDES

(See specific aldehyde plus other reactant)

ALKALI CARBONATES

Silicon	See SILICON plus Alkali Carbonates.

ALKALI HYDROXIDES

Zirconium	See ZIRCONIUM plus Alkali Hydroxides.

ALKALI METAL CHROMATES

Zirconium	See ZIRCONIUM plus Alkali Metal Salts.

ALKALI METAL DICHROMATES

Zirconium	See ZIRCONIUM plus Alkali Metal Salts.

ALKALI METAL MOLYBDATES

Zirconium	See ZIRCONIUM plus Alkali Metal Salts.

ALKALI METALS

Boron Trifluoride	Boron trifluoride reacts with incandescence when heated with alkali metals or alkaline earth metals, except magnesium.
	Merck Index, p. 163 (1960).
Hydrazine and	See HYDRAZINE plus Alkali Metals and
Ammonia	Ammonia.
Maleic Anhydride	Maleic anhydride decomposes explosively in the presence of alkali metals.
	Chem. Safety Data Sheet **SD-88** (1962).
	Chem. Haz. Info. Series **C-71** (1960).

ALKALI METAL SULFATES

Zirconium	See ZIRCONIUM plus Alkali Metal Salts.

ALKALI METAL TUNGSTATES

Zirconium	See ZIRCONIUM plus Alkali Metal Salts.

ALKALINE EARTH METALS

Boron Trifluoride	See ALKALI METALS plus Boron Trifluoride.

ALKENES

Fluorine	See FLUORINE plus Alkenes.

ALKYL AZIDES

(self-reactive)	Low molecular weight alkyl azides and diazido alkanes are considered to be particularly dangerous in the absence of suitable precautions. Introduction of more than one azide group into the molecule increases its instability. *Chem. Eng. News* **42** (31): 6 (1964).

ALKYL BENZENES

Fluorine	See FLUORINE plus Alkyl Benzenes.

ALKYLISOTHIOUREA SALTS

Chlorine	See CHLORINE plus Alkylisothiourea Salts.

ALKYLPHOSPHINES

Chlorine	See CHLORINE plus Alkylphosphines.

ALLENE $H_2C{=}C{=}CH_2$

(self-reactive)	Pure allene can decompose explosively at two atmospheres. *Rutledge*, p. 13 (1968).

ALLYL ALCOHOL CH_2=CHCH$_2$OH

Carbon Tetrachloride	A reaction between allyl alcohol and carbon tetrachloride produces trichlorobutylene epoxide (oxide) and dichlorobutylene epoxide (oxide), a mixture which during distillation proved to be unstable and detonated in the still. *Doyle* (1969).
Chlorosulfonic Acid	Mixing allyl alcohol and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Diallyl Phosphite and Phosphorus Trichloride	See DIALLYL PHOSPHITE plus Allyl Alcohol and Phosphorus Trichloride.
Nitric Acid	Mixing allyl alcohol and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing allyl alcohol and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Sodium Hydroxide	As a benzene extract of allyl benzenesulfonate was prepared from allyl alcohol and benzene sulfonyl chloride in the presence of aqueous sodium hydroxide, under vacuum distillation two fractions came off, then the temperature rose to 135¡C, when the residue darkened and exploded. W.T. Dye, and G.E. Ham, *Chem. Eng. News* **28:**3452 (1950). This reaction was almost certainly a caustic-catalyzed

	polymerization of allyl alcohol.
	Doyle (1966).
Sulfuric Acid	Mixing allyl alcohol and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Tri-n-Bromomelamine	These compounds exploded fifteen minutes after mixing at room temperature.
	Chem. Eng. News **30:**1916 (1952).

ALLYL BENZENESULFONATE $CH_2{=}CHCH_2OSO_2C_6H_5$

(self-reactive)	During distillation of crude allyl benzenesulfonate, from which the benzene solvent had been removed, two fractions came off — the first at 86-92¡C and the second at 92-135¡C — then the remaining residue darkened, thickened, and exploded probably owing to uncontrolled polymerization.
	Chem. Eng. News **28:**3452 (1950).

ALLYL CHLORIDE $CH_2{=}CHCH_2Cl$

Aluminum Chloride	See SULFURIC ACID plus Allyl Chloride.
Benzene and Diethyl Aluminum Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Benzene and Ethyl Aluminum Dichloride	It has been found that allyl chloride or other alkyl halides will react vigorously with benzene or toluene, even at minus 70¡C, in the presence of ethyl aluminum dichloride or ethyl aluminum sesquichloride. Explosions have been reported.
	Wischmeyer (1970).
Benzene and Ethyl Aluminum Sesquichloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Chlorosulfonic Acid	Mixing allyl chloride and chlorosulfonic acid in a closed

	container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	Mixing allyl chloride and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethyleneimine	Mixing allyl chloride and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ferric Chloride	See SULFURIC ACID plus Allyl Chloride.
Lewis-Type Catalysts	See SULFURIC ACID plus Allyl Chloride.
Nitric Acid	Mixing allyl chloride and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing allyl chloride and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Allyl Chloride.
Sulfuric Acid	Mixing allyl chloride and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
	See SULFURIC ACID plus Allyl Chloride.
Toluene and Diethyl Aluminum Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Toluene and Ethyl Aluminum Dichloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.

Toluene and Ethyl Aluminum Sesquichloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Ziegler-Type Catalysts	See SULFURIC ACID plus Allyl Chloride.

ALLYLDIMETHYLARSINE $CH_2CHCH_2AS(CH_3)_2$

Air	Dimethylallylarsine ignites in air and on filter paper.
	Ellern, pp. 24, 25 (1968).

ALUMINUM Al

Ammonium Nitrate	A mixture of aluminum powder and ammonium nitrate can be used as an explosive. A number of explosions in which ammonium nitrate and aluminum are mixed with carbon, hydrocarbons, with or without oxidizing agents, have occurred.
	Mellor **5:** 219 (1946-1947).
Ammonium Persulfate	A mixture of aluminum powder with ammonium persulfate powder and water may cause an explosion.
	Pieters, p. 30 (1957).
Antimony Trichloride	See ALUMINUM plus Phosphorus Trichloride.
Arsenic Trichloride	See ALUMINUM plus Phosphorus Trichloride.
Barium Bromate	See ALUMINUM plus Bromates.
Barium Chlorate	See ALUMINUM plus Bromates.
Barium Iodate	See ALUMINUM plus Bromates.
Barium Sulfate	See ALUMINUM plus Sulfates.
Bismuth Trioxide	When bismuth trioxide is heated with powdered aluminum, the reduction occurs with explosive violence.
	Mellor **9:** 649 (1946-1947). *Ellern*, pp. 244, 280 (1968).
Bromates	A combination of finely divided aluminum with finely divided bromates (also chlorates or iodates) of barium, calcium, magnesium, potassium, sodium, or zinc can be

	exploded by heat, percussion, and sometimes, light friction.
	Mellor **2:** 310 (1946-1947).
Bromine	Bromine vapor reacts with warm aluminum foil with brilliant incandescence. The reaction is vigorous, even at 15¡C.
	Chem. News **121:** 178 (1920).
	Mellor **1:** 135 (1946-1947).
	Mellor **5:** 209 (1946-1947).
Calcium Bromate	See ALUMINUM plus Bromates.
Calcium Chlorate	See ALUMINUM plus Bromates.
Calcium Iodate	See ALUMINUM plus Bromates.
Calcium Sulfate	See ALUMINUM plus Sulfates.
Carbon Disulfide	Powdered aluminum burns in the vapor of carbon disulfide, sulfur dioxide, sulfur dichloride, nitrous oxide, nitric oxide, or nitrogen peroxide.
	Mellor **5:** 209-212 (1946-1947).
Carbon Tetrachloride	A bomb containing powdered aluminum and carbon tetrachloride exploded violently when heated to 153¡C.
	C.C. Clogston, *UL Bull. Research* **34** (1945).
	A mixture of powdered aluminum and carbon tetrachloride in a ball mill exploded.
	Chem. Eng. News **32:** 258 (1954).
	Impact sensitivity tests have shown that mixtures of carbon tetrachloride and aluminum will detonate.
	ASESB Pot. Incid. **39** (1968).
Chlorates	See ALUMINUM plus Bromates.
Chlorinated Hydrocarbons	When hot vapors contact powdered aluminum, an explosion results.
	Tech. Ind. Fire & Expl. Hazards **2:** 26 (1947).
Chlorine	Aluminum powder burns in chlorine, even at 20¡C.

Mellor **2:** 92; **5:** 209 (1946-1947).

Chlorine Trifluoride

In the presence of carbon, the combination of chlorine trifluoride with aluminum, copper, lead, magnesium, silver, tin or zinc results in a violent reaction.

Mellor **2, Supp. 1:** (1956).

See also CHLORINE TRIFLUORIDE plus Elements.

Chlorofluorohydrocarbons

It has been experimentally determined that mixtures of powdered aluminum with monofluorotrichloroethane or with trifluorotrichloroethane will flash or spark on heavy impact.

ASESB Pot. Incid. **39** (1968).

See also ALUMINUM plus Dichlorodifluoromethane.

Chloroform

Chloroform, methyl chloride, and carbon tetrachloride, and mixtures of these chemicals explode when in contact with aluminum powder or magnesium powder.

C.C. Clogston, *UL Bull. Research* **34:**5 (1945).

Chromic Anhydride

A violent reaction or flaming is likely in the reaction of chromic anhydride and aluminum powder.

Mellor **11:**237 (1946-1947).

Copper Oxide

A strong explosion occurred when aluminum was heated with copper oxide. With lead oxide, the crucible was broken to pieces and the doors of the furnace were blown off.

Mellor **5:**217-19 (1946-1947). *Ellern*, pp. 244, 280 (1968).

Diborane

Diborane reacts spontaneously with aluminum and lithium to form hydrides that ignite in air.

Haz. Chem. Data (1966).

Dichlorodifluoromethane

Destruction of the impellers in a centrifugal compressor occurred when abrasion exposed and heated fresh aluminum surfaces. These surfaces and dichlorodifluoromethane joined in a self-sustaining reaction with sufficient heat generation to melt and react much of the aluminum impeller material. Similar results were obtained in large test compressors using monochlorodifluoromethane. Follow-up laboratory test

	reactions between aluminum and (a) 1,1,2-trichloro-1,2,2-trifluoroethane; (b) monofluorotrichloromethane; (c) 1,2-dichloro-1,1,2,2-tetrafluoroethane; (d) dichlorodifluoromethane; (e) monobromotrifluoromethane; (f) monochlorodifluoromethane; (g) tetrafluoromethane established that vigorous reactions and heat outputs occurred in all cases. The vigor of the reactions and heat outputs increased in the given order, and were dependent on the combined effects of vapor pressure and degree of fluorination.
	B. J. Eiseman, Jr., *ASHRAE Journal* **5:**63 (1963). C.C. Clogston, *UL Bull. Research* **34** (1945). *Chem. Eng. News* **39** (27):44 (1961);**39** (32): 4 (1961).
1,2-Dichloro-1,1,2,2-tetrafluoroethane	See ALUMINUM plus Dichlorodifluoromethane.
Ethylene Dichloride, Propylene Dichloride, and Orthodichlorobenzene	Orthodichlorobenzene had been mixed with ethylene dichloride and propylene dichloride. This mixture dissolved the oxide coating from the aluminum containing vessel. Subsequent reaction between the aluminum vessel and the chlorinated olefins caused rupture of the vessel.
	Doyle (1966).
Fluorine	See FLUORINE plus Metals.
Fluorochloro-lubricants	An explosive reaction occurs with fluorochloro oils or greases in contact with fresh aluminum surfaces under high loads. Examples cited: a spinning aluminum rod under pressure on an aluminum surface; a freshly bored aluminum cylinder under pressure from an aluminum piston; threading an aluminum rod into a dural tube with a fluorochloro oil as a lubricant.
	Laccabue (1958).
Iodates	See ALUMINUM plus Bromates.
Iodine	Aluminum powder and iodine in close contact will ignite spontaneously.
	Ellern, p. 46 (1968).

Iodine Monochloride	Aluminum foil, after continued contact with iodine monochloride, ignites spontaneously and burns with a bluish-white flame.
	Mellor **2:** 119 (1946-1947).
Iron Oxide	The reaction of powdered aluminum and iron oxide, usually started by burning magnesium, proceeds vigorously, with evolution of intense heat. The mixture is known as "thermite."
	Mellor **5:** 217-19 (1946-1947).
	The reaction can be initiated by impact between an aluminum object and a rusty surface.
	Morse (1966). *Abbey* (1964). *Health & Safety Inf.* **161** (1963).
Lead Oxides	The reduction of lead oxide by aluminum is violent. See also ALUMINUM plus Copper Oxide.
	Mellor **7:** 658 (1946-1947). *Ellern*, pp. 244, 280 (1968).
Magnesium and Potassium Perchlorate	There have been three industrial explosions involving a photoflash composition containing potassium perchlorate with aluminum and magnesium powders.
	ACS **146:** 210. *BM Info. Circ.* **7349** (1945).
Magnesium Bromate	See ALUMINUM plus Bromates.
Magnesium Chlorate	See ALUMINUM plus Bromates.
Magnesium Iodate	See ALUMINUM plus Bromates.
Manganese and Air	See MANGANESE plus Aluminum and Air.
Methyl Bromide	Methyl bromide in a steel tank reacted with an aluminum tube (part of a level gage) producing methyl aluminum bromide. When the latter was subsequently exposed to air, enough heat was produced to ignite the methyl bromide-compressed air mixture above the liquid level. The ensuing explosion shattered the tank.
	Chem. Eng. Progr. **58** (8): 46-9 (1962).
Methyl Chloride	Methyl chloride in the presence of a small amount of

	aluminum chloride will attack powdered aluminum, forming spontaneously flammable (in air) aluminum trimethyl.
	C. C. Clogston, *UL Bull. Research* **34** (1945).
	See also ALUMINUM plus Chlorinated Hydrocarbons.
Monobromotrifluoromethane	See ALUMINUM plus Dichlorodifluoromethane.
Monochlorotrifluoromethane	See ALUMINUM plus Dichlorodifluoromethane.
Monofluorotrichloromethane	See ALUMINUM plus Dichlorodifluoromethane.
Niobium Oxide	A mixture of aluminum, niobium oxide and
and Sulfur	sulfur caused a serious fire.
	Poole (1971).
Nitrate-Nitrite and	Aluminum and aluminum alloys contaminated
Organic Matter	with organic matter are likely to explode in nitrate-nitrite salt baths.
	Pieters, p. 30 (1957).
Nitrates	Two explosions occurred in mixtures containing aluminum dust, nitrates, water, sulfur, and vegetable glues.
	Chem. Eng. News **32:** 258 (1954).
Nitric Oxide	See ALUMINUM plus Carbon Disulfide.
Nitrogen Peroxide	See ALUMINUM plus Carbon Disulfide.
Nitrosyl Chloride	Aluminum is attacked by nitrosyl chloride when cold.
	Mellor **5:** 212 (1946-1947).
Nitrous Oxide	See ALUMINUM plus Carbon Disulfide.
Oxygen	Flash bulbs containing aluminum foil plus oxygen, when ignited, cause similar bulbs up to 8 inches away to be ignited by radiated heat.
	W. Zimmerman, *Naturwissenschaften* **18:** 857 (1930).
	Liquid oxygen gives a detonable mixture when combined with powdered aluminum.
	Kirschenbaum (1956).

	A lecturer was demonstrating the ignition of powdered aluminum mixed with liquid oxygen when the mixture exploded. Seventeen persons were injured. This experiment, which is described in several places as a lecture demonstration, has been carried out successfully hundreds of times but there have been a few explosions when the conditions were just right.
	Chem. Eng. News **35**(25): 90 (June 17, 1957).
Palladium	If an aluminum sheath surrounding a palladium core of about .0025-inch diameter is heated to the melting point of aluminum, 600¡C, an alloying reaction takes place with production of a brilliant flash and a temperature of 2,800¡C.
	Tricon (1965). *Woodcock* (1967). *U.S. Pat. Gaz.,* p. 224 (Nov. 3, 1959). *Ellern,* p. 279 (1968).
Performic Acid	Powdered aluminum decomposes performic acid violently.
	Berichte **48:**1139 (1915).
Phosgene	See ALUMINUM plus Phosphorus Trichloride.
Phosphorus Trichloride	Powdered aluminum burns in the vapor of phosphorus trichloride, antimony trichloride, arsenic trichloride, and phosgene.
	Mellor **5:**214 (1946-1947).
Potassium Bromate	See ALUMINUM plus Bromates.
Potassium Chlorate	See ALUMINUM plus Bromates.
Potassium Iodate	See ALUMINUM plus Bromates.
Potassium Sulfate	See ALUMINUM plus Sulfates.
Propylene Dichloride	An aluminum transfer line failed completely after only a few hours' service in refined propylene dichloride under hot weather conditions. Following this failure, a time sequence study illustrated the nature and rapidity with which this reaction may occur.
	Chem. Abst. **52:**7986h (1958). *Corrosion* **14:** 186t-190t (1958).
Silicon and Lead Oxide	See SILICON plus Aluminum and Lead Oxide.
Silver Chloride	A reaction between silver chloride and aluminum, once

	started, proceeds with explosive violence.
	Mellor **3:**402 (1946-1947).
Sodium Bromate	See ALUMINUM plus Bromates.
Sodium Carbide	See MERCURY plus Sodium Carbide.
Sodium Carbonate	When sodium carbonate was applied to red-hot aluminum, an explosion occurred.
	Price and Baker, *Chem. & Met. Eng.* **29:**878 (1923).
Sodium Chlorate	See ALUMINUM plus Bromates.
Sodium Hydroxide	A 25 per cent sodium hydroxide solution was filtered into a tank trailer thought to be made of mild steel. By the time it was discovered that the tank was made of aluminum, copious volumes of hydrogen were already boiling off.
	MCA Case History **1115** (1965).
	Aluminum reacts vigorously in sodium hydroxide.
	Mellor **5:**207 (1946-1947).
Sodium Iodate	See ALUMINUM plus Bromates.
Sodium Peroxide	A mixture of sodium peroxide and aluminum powder reacts with incandescence. The mixture explodes when heated to redness. When the mixture is exposed to moist air, spontaneous ignition occurs.
	Mellor **2:**490; **5:**217 (1946-1947).
Sodium Peroxide and	When carbon dioxide gas is passed over a
Carbon Dioxide	mixture of powdered aluminum and sodium peroxide, the mixture explodes.
	Mellor **2:**490 (1946-1947).
Sodium Sulfate	See ALUMINUM plus Sulfates.
Sulfates	Violent explosions occur when potassium sulfate and sodium sulfate are melted with aluminum.
	Chem. Eng. News **32:** 258 (1954).
	The reduction of barium sulfate and of calcium sulfate by aluminum is attended by violent explosions.

	Mellor **5:**217-19 (1946-1947).
Sulfur Dichloride	See ALUMINUM plus Carbon Disulfide.
Sulfur Dioxide	See ALUMINUM plus Carbon Disulfide.
Tetrafluoromethane	See ALUMINUM plus Dichlorodifluoromethane.
Trichloroethylene	In the presence of dilute hydrochloric acid (0.1-0.2%) aluminum and trichloroethylene formed aluminum chloride, which catalyzed polymerization of the trichloroethylene with a very high release of heat. Under this condition subsequent oxidation of aluminum fines caused an explosion.
	J. van Hints, *Veiligheid* **28:**121-23 (1952).
	Fire and Accident Prev. (Dec. 22, 1953).
1,1,2-Trichloro-1,2,2-trifluoroethane	See ALUMINUM plus Dichlorodifluoromethane.
Zinc Bromate	See ALUMINUM plus Bromates.
Zinc Chlorate	See ALUMINUM plus Bromates.
Zinc Iodate	See ALUMINUM plus Bromates.
Zinc Peroxide	Zinc peroxide explodes when heated to about 212¡C; and when mixed with aluminum powder or zinc powder, it burns with a dazzling light.
	Mellor **4:**530 (1946-1947).

ALUMINUM AMINOBOROHYDRIDES

Air	Oily aluminum borohydrides are spontaneously flammable in air and are attacked by water.
	A. B. Burg and C. L. Randolph, Jr., *J. Am. Chem. Soc.* **73:**953 (1951).
Water	See ALUMINUM AMINOBOROHYDRIDES plus Air.

ALUMINUM BOROHYDRIDE

(See ALUMINUM TETRAHYDROBORATE)

ALUMINUM BROMIDE $AlBr_3$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ALUMINUM CARBIDE Al_4C_3

Lead Peroxide	Aluminum carbide reduces lead peroxide with incandescence.
	Mellor **5:**872 (1946-1947).
Potassium Permanganate	Aluminum carbide reduces potassium permanganate with incandescence.
	Mellor **5:**872 (1946-1947).

ALUMINUM CHLORIDE $AlCl_3$

(self-reactive)	After long storage of aluminum chloride in closed containers, an explosion often occurs when the container is opened.
	Chem. Abst. **41:**6723d (1947).
Allyl Chloride	See SULFURIC ACID plus Allyl Chloride.
Ethylene	Ethylene in the presence of aluminum chloride may undergo a violent reaction.
	Waterman, *J. Inst. Pet.* **33:**254 (1947).
Ethylene Oxide	See ETHYLENE OXIDE plus Aluminum Oxide.
	See ETHYLENE OXIDE plus Acids and Bases.
Nitrobenzene and Phenol	Aluminum chloride added to nitrobenzene containing about 5% phenol caused a violent explosion.
	Chem. Eng. News **31:**4915 (1953).
Nitromethane and Organic Matter	Mixtures of nitromethane and aluminum chloride may explode when organic matter is present.

	Chem. Eng. News **26:**2257 (1948).
Oxygen Difluoride	See OXYGEN DIFLUORIDE plus Aluminum Chloride.
Perchloryl Fluoride and Benzene	See PERCHLORYL FLUORIDE plus Benzene and Aluminum Chloride.
Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.
Water	When water was added to sublimed anhydrous aluminum chloride, a very vigorous reaction with a release of much heat and toxic hydrogen chloride resulted.
	Scott (1966).
	This salt dissolves in water with hissing and much heat.
	Mellor **5:**314 (1946-1947).

ALUMINUM FLUORIDE Alf$_3$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ALUMINUM HYDRIDE AlH_3

Air	Aluminum hydride will burn violently in air.
	Lab. Govt. Chemist (1965).
Dimethyl Ether	Occasional explosions involving these materials have been traced to carbon dioxide impurity in the ether.
	J. Am. Chem. Soc. **70:**877 (1948).
Oxygen	See OXYGEN plus Aluminum Hydride.

ALUMINUM HYDROXIDE $Al(OH)_3$

Bismuth	See BISMUTH plus Aluminum Hydroxide.

ALUMINUM HYPOPHOSPHITE Al $(PH_2O_2)_3$

Air	Aluminum hypophosphite releases spontaneously flammable phosphine at about 220¡C. *Mellor* **8, Supp. 3:**623 (1971).

ALUMINUM OXIDE Al_2O_3

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Ethylene Oxide	See ETHYLENE OXIDE plus Aluminum Oxide. See ETHYLENE OXIDE plus Acids and Bases.

ALUMINUM PHOSPHIDE AlP

Water	Aluminum phosphide yields phosphine on reaction with water. Phosphine is spontaneously flammable in air. *Merck Index,* pp. 46, 823 (1968).

ALUMINUM SESQUIBROMIDE DIALUMINUM

(See TRIBROMOTRIETHOXYDIALUMINUM)

ALUMINUM TETRAAZIDOBORATE $Al[B(N_3)_4]_3$

(self-reactive)	This compound is very explosive on shock. *Mellor* **8, Supp. 2:** 2 (1967).

ALUMINUM TETRAHYDROBORATE $Al(BH_4)_3$

Air	Oily liquid aluminum borohydrides are spontaneously flammable in air; the reaction is violent with air containing moisture. *Gaylord,* p. 8 (1956). *Pease,* p. 1 (1950). H.I. Schlesinger et al., *J. Am. Chem. Soc.* **75:**210-211 (1953).

Oxygen	See OXYGEN plus Aluminum Borohydride.
Water	Aluminum borohydride will flame when in contact with water.
	Ellern, p. 45 (1968).

ALUMINUM TRIETHYL

(See TRIETHYL ALUMINUM)

ALUMINUM TRIMETHYL

(See TRIMETHYL ALUMINUM)

ALUMINUM TRIPHENYL $(C_6H_5)_3Al$

(See TRIPHENYL ALUMINUM)

ALUMINUM TRIPROPYL

(See TRIPROPYL ALUMINUM)

AMINE PERCHOLORATES

(self-reactive)	There are a large number of amine perchlorates that ignite or explode at temperatures above 215¡C.
	J. Chem. Soc. **115:** 1006-10 (1909).
	Analyst **80:** 4-15 (1955). *ACS* **146:** 211.

AMINES RNH_2

Acrolein	See ACROLEIN plus Sulfur Dioxide.
	See SODIUM HYDROXIDE plus Acrolein.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Amines.
Maleic Anhydride	See SODIUM HYDROXIDE plus Maleic Anhydride.

Nitrosyl Perchlorate	See NITROSYL PERCHLORATE plus Amines.

Tri-iso-Butyl Aluminum	See TRI-iso-BUTYL ALUMINUM plus Acids.

2-AMINOETHANOL $NH_2CH_2CH_2OH$

Acetic Acid	See ACETIC ACID plus 2-Aminoethanol.
Acetic Anhydride	See ACETIC ANHYDRIDE plus 2-Aminoethanol.
Acrolein	See ACROLEIN plus 2-Aminoethanol.
Acrylic Acid	See ACRYLIC ACID plus 2-Aminoethanol.
Acrylonitrile	See ACRYLONITRILE plus 2-Aminoethanol.
Chlorosulfonic Acid	Mixing 2-aminoethanol and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Epichlorohydrin	Mixing 2-aminoethanol and epichlorohydrin in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Hydrochloric Acid	Mixing 2-aminoethanol and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing 2-aminoethanol and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Mesityl Oxide	See MESITYL OXIDE plus 2-Aminoethanol.
Nitric Acid	Mixing 2-aminoethanol and 70% nitric acid in a closed

	container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing 2-aminoethanol and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Propiolactone	Mixing 2-aminoethanol and propiolactone
(BETA-)	(BETA-) in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sulfuric Acid	Mixing 2-aminoethanol and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Vinyl Acetate	Mixing 2-aminoethanol and vinyl acetate in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

AMINOGUANIDINE NITRATE $CH_6N_4 \bullet HNO_3$

(self-reactive)	Aminoguanidine nitrate in water solution exploded violently while being evaporated to dryness in vacuo on the steam bath. H. Koopman, *Chem. Weekblad* **53:** 97, 98 (1957).

2-AMINOTHIAZOLE $(SCHCHNC)NH_2$

(self-reactive)	2-Aminothiazole ignited in a tray dryer and was entirely consumed. Stability tests show that 2-aminothiazole will ignite spontaneously in 3 1/2 hours at 100¡C.
	MCA Case History **1587** (1969).

AMMONIA (ANHYDROUS) NH_3

Acetaldehyde	See ACETALDEHYDE plus Ammonia (Anhydrous).

AMMONIUM CARBONATE $(NH_4)_2CO_2$

Sodium Hypochlorite	See SODIUM HYPOCHLORITE plus Ammonium Acetate.

AMMONIUM CHLORATE NH_4ClO_3

(self-reactive)	The solid is an explosive compound. Solutions may decompose violently if much solid phase is present. *Mellor* **2, Supp. 1:** 591 (1956).

AMMONIUM CHLORIDE NH_4Cl

Ammonium Nitrate	See AMMONIUM NITRATE plus Ammonium Chloride.
Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Ammonium Bromide.
Iodine Heptafluoride	See IODINE HEPTAFLUORIDE plus Ammonium Bromide.
Potassium Chlorate	See POTASSIUM CHLORATE plus Ammonium Chloride.

AMMONIUM DICHROMATE $(NH_4)_2Cr_2O_7$

(self-reactive)	Ammonium dichromate decomposes vigorously with luminescence around 200¡C. It is feebly explosive if confined. *Mellor* **11:** 324 (1946-1947).

AMMONIUM HEXANITROCOBALTATE $(NH_4)_3CO(NO_2)_6$

(self-reactive)	Ammonium hexanitrocobaltate explodes at 230¡C and is impact sensitive. W. R. Tomlinson, Jr., and L. F. Audrieth, *J. Chem. Ed.* **27:** 606-9 (1950).

AMMONIUM HYDROXIDE NH_4OH

Acrolein	See ACROLEIN plus Ammonium Hydroxide.
Acrylic Acid	See ACRYLIC ACID plus Ammonium Hydroxide.
Chlorosulfonic Acid	See CHLOROSULFONIC ACID plus Ammonium

	Hydroxide.
Dimethyl Sulfate	Pure dimethyl sulfate and concentrated aqueous ammonia react extremely violently with one another.
	Berichte **13:** 1700 (1880).
Fluorine	See FLUORINE plus Ammonium Hydroxide.
Gold and Aqua Regia	See GOLD plus Ammonium Hydroxide and Aqua Regia.
Hydrochloric Acid	See HYDROCHLORIC ACID plus Ammonium Hydroxide.
Hydrofluoric Acid	See HYDROFLUORIC ACID plus Ammonium Hydroxide.
Iodine	See IODINE plus Ammonium Hydroxide.
Nitric Acid	See NITRIC ACID plus Ammonium Hydroxide.
Oleum	See OLEUM plus Ammonium Hydroxide.
Propiolactone (BETA)	See PROPIOLACTONE (BETA) plus Ammonium Hydroxide.
Propylene Oxide	See PROPYLENE OXIDE plus Ammonium Hydroxide.
Silver Nitrate	See SILVER NITRATE plus Acetylene and Ammonium Hydroxide. See SILVER NITRATE plus Ammonium Hydroxide.
Silver Oxide	See SILVER OXIDE plus Ammonium Hydroxide.
Silver Oxide and	See SILVER OXIDE plus Aqueous Ammonia
Ethyl Alcohol	and Ethyl Alcohol.
Silver Permanganate	See SILVER PERMANGANATE plus Ammonium Hydroxide.
Sulfuric Acid	See SULFURIC ACID plus Ammonium Hydroxide.

AMMONIUM HYPOPHOSPHITE $NH_2PH_2O_2$

(self-reactive)	Ammonium hypophosphite liberates spontaneously flammable phosphine at about 240¡C.
	Mellor **8:** 880 (1946-1947).

AMMONIUM IODIDE NH_4I

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Ammonium Bromide.
Iodine Heptafluoride	See IODINE HEPTAFLUORIDE plus Ammonium Bromide.
Potassium	See POTASSIUM plus Ammonium Bromide.

AMMONIUM NITRATE NH_4NO_3

Acetic Acid	A mixture of ammonium nitrate and acetic acid ignites when warmed, especially if concentrated.
	Von Schwartz, p. 322 (1918).
Aluminum	See ALUMINUM plus Ammonium Nitrate.
Ammonium Chloride	The decomposition of ammonium nitrate in the presence of ammonium chloride (0.1%) becomes violent around 175¡C. The gases liberated contain chlorine.
	Pascal **10:** 216 (1931-1934).
Antimony	See AMMONIUM NITRATE plus Metals (powdered).
Bismuth	See AMMONIUM NITRATE plus Metals (powdered).
Cadmium	See AMMONIUM NITRATE plus Metals (powdered).
Carbon	See CARBON plus Ammonium Nitrate.
Chlorides	See AMMONIUM NITRATE plus Ammonium Chloride.
Chromium	See AMMONIUM NITRATE plus Metals (powdered).
Cobalt	See AMMONIUM NITRATE plus Metals (powdered).
Contaminant	During the flame-cutting of a pipeline plugged with impure ammonium nitrate, the pipe contents exploded violently.
	MCA Case History **873** (1963).
Copper	See AMMONIUM NITRATE plus Metals (powdered).
	See COPPER plus Ammonium Nitrate.
Lead	See AMMONIUM NITRATE plus Metals (powdered).

Magnesium	See AMMONIUM NITRATE plus Metals (powdered).
Magnesium, Copper Sulfate (anhydrous), Potassium Chlorate and Water	See MAGNESIUM plus Copper Sulfate (anhydrous), Ammonium Nitrate, Potassium Chlorate and Water.
Metals (powdered)	Fused ammonium nitrate with powdered metals is often a violent and sometimes an explosive reaction. Zinc, cadmium, copper, magnesium, lead, cobalt, nickel, bismuth, chromium, and antimony are the metals that reacted in this way.
	Mellor **Supp. I, Part I, 8:** 545 (1964).
	See also SULFUR plus Ammonium Nitrate.
	See also ALUMINUM plus Ammonium Nitrate.
Nickel	See AMMONIUM NITRATE plus Metals (powdered).
Organic Matter	Ammonium nitrate forms explosive mixtures with organic matter.
	Hazardous Chemicals Data (1966); *Lab. Govt. Chemist.*
Phosphorus	See PHOSPHORUS plus Ammonium Nitrate.
Potassium and Ammonium Sulfate	See POTASSIUM plus Ammonium Sulfate and Ammonium Nitrate.
Sodium	See SODIUM plus Ammonium Nitrate.
Sodium Hypochlorite	See SODIUM HYPOCHLORITE plus Ammonium Acetate.
Sodium Perchlorate	See SODIUM PERCHLORATE plus Ammonium Nitrate.
Sodium-Potassium Alloy and Ammonium Sulfate	See POTASSIUM plus Ammonium Sulfate and Ammonium Nitrate.
Sulfur	See SULFUR plus Ammonium Nitrate.
Zinc	See ZINC plus Ammonium Nitrate.

	See also AMMONIUM NITRATE plus Metals (powdered).

AMMONIUM NITRIDOOSMATE NH_4OsNO_3

(self-reactive)	Ammonium osmiamate decomposes explosively at 150¡C.
	Mellor **15:** 727 (1946-1947).

AMMONIUM OXALATE $(NH_4OOC-)_2$

Sodium Hypochlorite	See SODIUM HYPOCHLORITE plus Ammonium Acetate.

AMMONIUM PERCHLORATE NH_4ClO_4

(self-reactive)	Ammonium perchlorate decomposes at 130¡ C and explodes at 380¡ C.
	Mellor **2, Supp. 1:** 608 (1956).
Carbon	See CARBON plus Ammonium Perchlorate.
Dicyclopentadienyliron	Explosions have occurred in propellant formulations using dicyclopentadienyliron (ferrocene), as a burning rate catalyst. Although the definite cause has not been established, the most probable cause is the heat of friction between the mixer sidewall and the spatula while the latter was scraping through a mixture of ammonium perchlorate and sublimed recrystallized ferrocenes.
	ASESB Expl. Report **211** (1966).
Ferrocene	See AMMONIUM PERCHLORATE plus Dicyclopentadienyliron.
Metals	See SULFUR plus Ammonium Perchlorate.
Organic Matter	See SULFUR plus Ammonium Perchlorate.
Sulfur	See SULFUR plus Ammonium Perchlorate.

AMMONIUM PERIODATE NH_4IO_4

(self-reactive)	See PERIODATES (self-reactive).

AMMONIUM PERMANGANATE NH_4MnO_4

(self-reactive)	Dry ammonium permanganate is explosive at 60¡ C and is likely to explode when rubbed. *Lab. Govt. Chemist* (1965).

AMMONIUM PERSULFATE $(NH_4)_2S_2O_8$

Aluminum	See ALUMINUM plus Ammonium Persulfate.
Sodium Peroxide	A mixture of ammonium persulfate and sodium peroxide will explode if subjected to crushing (in a mortar), heating, or if a stream of carbon dioxide is passed over it. *Mellor* **10:** 464 (1946-1947).

AMMONIUM PHOSPHATE $NH_4H_2PO_4$

Sodium Hypochlorite	See SODIUM HYPOCHLORITE plus Ammonium Acetate.

AMMONIUM PICRATE $C_6H_2(NO_3)_3ONH_4$

(self-reactive)	Small traces of metallic picrates may lower appreciably the temperature at which such mixtures will explode. *Military Explosives*, p. 96.
Metals	Explodes when heated to a temperature of about 300¡ C. *Military Explosives*, p. 96.

AMMONIUM SALTS

(See also specific ammonium salt)

Potassium Chlorate	See POTASSIUM CHLORATE plus Ammonium Salts.
Sodium Nitrite	See SODIUM NITRITE plus Ammonium Salts.

AMMONIUM SULFATE $(NH_4)_2SO_4$

Potassium and Ammonium Nitrate	See POTASSIUM plus Ammonium Sulfate and Ammonium Nitrate.
Potassium Chlorate	See POTASSIUM CHLORATE plus Ammonium Sulfate.
Potassium Nitrite	See POTASSIUM NITRITE plus Ammonium Sulfate.
Sodium-Potassium Alloy and Ammonium Nitrate	See POTASSIUM plus Ammonium Sulfate and Ammonium Nitrate.

AMMONIUM TETRACHLOROCUPRATE $(NH_4)_2CuCl_4$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

AMMONIUM TETRACHROMATE $(NH_4)_2Cr_4O_{13}$

(self-reactive)	Ammonium tetrachromate decomposes suddenly at 175¡ C.
	Mellor **11:** 352 (1946-1947).

AMMONIUM TETRAPEROXYCHROMATE $(NH_4)_3$ Cr $(OO)_4$

(self-reactive)	Ammonium triperchromate explodes from percussion or if heated just to 50¡ C.
	Mellor **11:** 356 (1946-1947).
Sulfuric Acid	Contact between these compounds results in an explosion.
	Mellor **11:** 356 (1946-1947).

AMMONIUM THIOCYANATE NH_4SCN

Lead Nitrate	An explosion of guanidine nitrate demolished an autoclave built to withstand 50 atmospheres, in which it was being

	made from ammonium thiocyanate and lead nitrate. C. Schopf and H. Klapproth.
	Angew. Chem. **49:** 23 (1936).

AMMONIUM THIOSULFATE $NH_4S_2O_3$

Sodium Chlorate	See SODIUM CHLORATE plus Ammonium Thiosulfate.

AMMONIUM TRICHROMATE $(NH_4)_2Cr_3O_{10}$

(self-reactive)	Ammonium trichromate detonates at about 190¡ C.
	Mellor **11:** 350 (1946-1947).

AMYL ALCOHOL $C_5H_{11}OH$

Hydrogen Trisulfide	See HYDROGEN TRISULFIDE plus Amyl Alcohol.

ANILINE $C_6H_5NH_2$

Acetic Anhydride	Mixing aniline and acetic anhydride in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Chlorosulfonic Acid	Mixing aniline and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hexachloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.
Nitric Acid	See NITRIC ACID plus Aniline.
Nitric Acid, Nitrogen Tetroxide, and Sulfuric Acid	See UNSYMMETRICAL DIMETHYLHYDRAZINE plus Nitric Acid, Nitrogen Tetroxide, and Sulfuric Acid.

Nitrobenzene and Glycerine	In the reaction of these three ingredients to form quinoline, with ferrous sulfate as catalyst, there was too much sulfuric acid and too little water present. The resultant excessive temperature initiated a runaway reaction. The rupture disc and the manhole cover of the vessel blew out; the contents erupted from the vessel.
	MCA Case History **1008** (1964).
Oleum	Mixing aniline and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ozone	See OZONE plus Aniline.
Perchloric Acid and Formaldehyde	See PERCHLORIC ACID plus Aniline and Formaldehyde.
Perchromates	See PERCHROMATES plus Aniline.
Performic Acid	See PERFORMIC ACID plus Aniline.
Potassium Peroxide	See SODIUM PEROXIDE plus Aniline.
Propiolactone (BETA-)	Mixing aniline and propiolactone (BETA-) in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Silver Perchlorate	See SILVER PERCHLORATE plus Toluene.
	See SILVER PERCHLORATE plus Acetic Acid.
Sodium Peroxide	See SODIUM PEROXIDE plus Aniline.
Sulfuric Acid	Mixing aniline and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Trichloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.

ANISOYL CHLORIDE $CH_3OC_6H_4COCl$

(self-reactive)	A 5-pound bottle containing anisoyl chloride on the laboratory shelf exploded during the night. During cleanup, workers sustained painful eye burns. After several weeks storage in a dessicator at room temperature, a 200-gram bottle of commercial anisoyl chloride exploded with copious emission of hydrogen chloride. *Chem. Eng. News* **38** (34): 40 (1960); **38** (43): 5 (1960).

ANTHRACENE $C_6H_4(CH)_2C_6H_4$

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Anthracene.
Chromic Acid	See CHROMIC ANHYDRIDE plus Anthracene.

ANTIMONY Sb

Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Bromine	Antimony is spontaneously flammable in fluorine, chlorine, or bromine. With iodine, the reaction produces heat, which can cause flame or even an explosion if the quantities are great enough. *Mellor* **9:** 379 (1946-1947).
Bromine Trifluoride	Even at 10¡ C., bromine trifluoride reacts with antimony incandescently. Bromine trifluoride reacts similarly with arsenic, boron, bromine, iodine, phosphorus, and sulfur. *Mellor* **2:** 113 (1946-1947).
Bromoazide	Bromoazide explodes on contact with antimony, arsenic, phosphorus, silver foil or sodium. It is very sensitive to shock and the resulting explosions appear to be spontaneous. *Mellor* **8:** 336 (1946-1947).
Chloric Acid	Explosions of chloric acid have been due to the formation of explosive compounds with antimony, bismuth, ammonia, and organic matter. *Chem. Abst.* **46:** 2805c (1952).

Chlorine	Antimony burns spontaneously in gaseous chlorine. With liquid chlorine, antimony ignites at 33¡ C.
	Mellor **2:** 92-95; **9:** 379, 626 (1946-1947).
Chlorine Monoxide	See POTASSIUM plus Chlorine Monoxide.
Chlorine Trifluoride	Chlorine trifluoride reacts vigorously with antimony, arsenic, osmium, phosphorus, potassium, rhodium, selenium, silicon, sulfur, tellurium, or tungsten, producing flame.
	Mellor **2, Supp. 1:** 156 (1956).
Fluorine	See ANTIMONY plus Bromine.
Iodine	See ANTIMONY plus Bromine.
Nitric Acid	The reaction of finely divided antimony and nitric acid can be violent.
	Pascal **10:** 504 (1931-1934).
Potassium Nitrate	Powdered antimony mixed with an alkali nitrate explodes when heated.
	Mellor **9:** 282 (1946-1947).
Potassium Permanganate	When antimony or arsenic and solid potassium permanganate are ground together, the metals ignite.
	Mellor **12:** 322 (1946-1947).
Potassium Peroxide	See POTASSIUM plus Potassium Peroxide.
Sodium Nitrate	See ANTIMONY plus Potassium Nitrate.
Sodium Peroxide	Sodium peroxide oxidizes antimony, arsenic, copper, potassium, tin and zinc with incandescence.
	Mellor **2:** 490-93 (1946-1947).

ANTIMONY COMPOUNDS (Trivalent)

Perchloric Acid	Trivalent antimony compounds tend to form explosive mixtures with perchloric acid when hot.
	Analyst **84:** 215 (April 1959). *Chem. Eng. News* **41** (31): 47 (1963).

ANTIMONYL CHLORIDE SbOCl

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Antimony Trioxide.

ANTIMONYL PERCHLORATE $SbOClO_4$

(self-reactive)	This chemical decrepitates when heated above 60¡ C.
	Mellor **2, Supp. 1:** 613 (1956).

ANTIMONY PENTAFLUORIDE SbF_5

Phosphorus	See PHOSPHORUS plus Antimony Pentafluoride.

ANTIMONY SULFIDE Sb_2S_3;Sb_2S_5

(See also ANTIMONY TRISULFIDE)

Air	When the crystalline form of antimony trisulfide is heated in air, it burns with a blue flame.
	Mellor **9:** 522 (1946-1947).
Cadmium Chlorate	See CHLORATES plus Antimony Sulfide.
Chlorates	See CHLORATES plus Antimony Sulfide.
Chloric Acid	Antimony sulfide and concentrated solutions of chloric acid react with incandescence.
	Mellor **Supp. II, Part I:** 584 (1956).
Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Magnesium Chlorate	See CHLORATES plus Antimony Sulfide.
Thallic Oxide	See THALLIC OXIDE plus Antimony Sulfide.
Zinc Chlorate	See CHLORATES plus Antimony Sulfide.

ANTIMONY TRIBROMIDE $SbBr_3$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ANTIMONY TRICHLORIDE $SbCl_3$

Aluminum	See ALUMINUM plus Phosphorus Trichloride.
Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ANTIMONY TRIETHYL

(See TRIETHYL ANTIMONY)

ANTIMONY TRIIODIDE SbI_3

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ANTIMONY TRIMETHYL

(See TRIMETHYL ANTIMONY)

ANTIMONY TRIOXIDE Sb_2O_3

Air	When powdered antimony trioxide is heated in air, it ignites and burns. *Mellor* **9:** 425 (1946-1947).
Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Antimony Trioxide.

ANTIMONY TRIPROPYL $(C_3H_7)_3Sb$

(See TRIPROPYL ANTIMONY)

ANTIMONY TRISULFIDE Sb_2S_3

Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Fluorine	See FLUORINE plus Antimony Trisulfide.
Hydrogen Peroxide	Hydrogen peroxide reacts vigorously with antimony trisulfide, arsenic trisulfide, cupric sulfide, lead sulfide, molybdenum disulfide, and ferrous sulfide.
	Mellor **1:** 937 (1946-1947).
Potassium Chlorate	See POTASSIUM CHLORATE plus Antimony Trisulfide.
Potassium Nitrate	See POTASSIUM NITRATE plus Antimony Trisulfide.
Silver Oxide	See SILVER OXIDE plus Antimony Trisulfide.

ANTIMONY TRIVINYL $(CH{=}CH)_3Sb$

(See TRIVINYL ANTIMONY)

ARSENIC As

Barium Bromate	See ARSENIC plus Bromates.
Barium Chlorate	See ARSENIC plus Bromates.
Barium Iodate	See ARSENIC plus Bromates.
Bromates	A combination of finely divided arsenic with finely divided bromates (also chlorates and iodates) of barium, calcium, magnesium, potassium, sodium, or zinc can be exploded by heat, percussion, and sometimes, by light friction.
	Mellor **2:** 310 (1946-1947).
Bromine Pentafluoride	Bromine pentafluoride reacts readily in the cold with arsenic, charcoal, selenium, sulfur, iodine, and alkaline chlorides, bromides, and iodides; ignition usually occurs. A few drops of the liquid falling in water produces an explosion.
	Sidgwick, p. 1158 (1950).
Bromine Trifluoride	See ANTIMONY plus Bromine Trifluoride.

Bromoazide	See ANTIMONY plus Bromoazide.
Calcium Bromate	See ARSENIC plus Bromates.
Calcium Chlorate	See ARSENIC plus Bromates.
Calcium Iodate	See ARSENIC plus Bromates.
Cesium Acetylene	The carbide becomes incandescent when
Carbide	warmed in contact with arsenic.
	Mellor **5:** 848-50 (1946-1947).
Chlorates	See ARSENIC plus Bromates.
Chlorine	Arsenic burns spontaneously in gaseous chlorine. With liquid chlorine, arsenic ignites at 33¡ C.
	Mellor **2:** 92, 95; **9:** 626 (1946-1947).
Chlorine Monoxide	See POTASSIUM plus Chlorine Monoxide.
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Chromium Trioxide	Arsenic reacts with chromium trioxide with incandescence.
	Mellor **11:** 232 (1946-1947).
Fluorine	See FLUORINE plus Arsenic.
Hypochlorous Acid	Arsenic ignites with hypochlorous acid.
	Mellor **2:** 254 (1946-1947).
Iodates	See ARSENIC plus Bromates.
Iodine Pentafluoride	Iodine pentafluoride reacts spontaneously with sulfur, red phosphorus, silicon, bismuth, tungsten, and arsenic, usually with incandescence. Organic compounds react violently, usually carbonizing and often igniting.
	Durrant, p. 515 (1953). *Sidgwick,* p. 1159 (1950).
Lithium	See LITHIUM plus Arsenic.
Magnesium Bromate	See ARSENIC plus Bromates.
Magnesium Chlorate	See ARSENIC plus Bromates.
Magnesium Iodate	See ARSENIC plus Bromates.
Nitrogen Tribromide	Nitrogen tribromide explodes violently in contact with

	arsenic or phosphorus.
	Ann. Chim. et Phys. (2) **42:** 200.
Nitrogen Trichloride	Nitrogen trichloride explodes in contact with powdered arsenic. Also see NITROGEN TRICHLORIDE plus Ammonia.
	Mellor **8:** 602 (1946-1947).
Potassium Bromate	See ARSENIC plus Bromates.
Potassium Chlorate	See ARSENIC plus Bromates.
Potassium Iodate	See ARSENIC plus Bromates.
Potassium Nitrate	A mixture of arsenic and potassium nitrate explodes when ignited.
	Mellor **9:** 35 (1946-1947).
Potassium Permanganate	See ANTIMONY plus Potassium Permanganate.
Potassium Peroxide	See POTASSIUM plus Potassium Peroxide.
Rubidium Acetylene	Rubidium acetylene carbide becomes incandescent
Carbide	when warmed in contact with arsenic.
	Mellor **5:** 849 (1946-1947).
Rubidium Carbide	A mixture of rubidium carbide and arsenic ignites when heated.
	Mellor **5:** 848 (1946-1947).
Silver Nitrate	A mixture of sublimed arsenic ground with 10 times its weight of silver nitrate ignites immediately when shaken out on paper.
	Mellor **3:** 470 (1946-1947).
Sodium Bromate	See ARSENIC plus Bromates.
Sodium Chlorate	See ARSENIC plus Bromates.
Sodium Iodate	See ARSENIC plus Bromates.
Sodium Peroxide	Sodium peroxide oxidizes arsenic with incandescence.
	Mellor **2:** 490-93 (1946-1947).

Zinc Bromate	See ARSENIC plus Bromates.
Zinc Chlorate	See ARSENIC plus Bromates.
Zinc Iodate	See ARSENIC plus Bromates.

ARSENIC DISULFIDE As_2S_2

Air	Arsenic disulfide burns with a blue flame when heated in air.
	Mellor **9:** 270 (1946-1947).
Chlorine	See CHLORINE plus Arsenic Disulfide.
Potassium Nitrate	See POTASSIUM NITRATE plus Arsenic Disulfide.

ARSENIC OXIDE As_2O_3; As_2O_5

Rubidium Carbide	See RUBIDIUM CARBIDE plus Arsenic Oxide.

ARSENIC SULFIDE As_2S_2; As_2S_3; As_2S_5

Cadmium Chlorate	See CHLORATES plus Arsenic Sulfide.
Chlorates	See CHLORATES plus Arsenic Sulfide.
Chloric Acid	Arsenic sulfide and concentrated solutions of chloric acid react with incandescence.
	Mellor **Supp. II, Part I:** 584 (1956).
Magnesium Chlorate	See CHLORATES plus Arsenic Sulfide.
Zinc Chlorate	See CHLORATES plus Arsenic Sulfide.

ARSENIC TRICHLORIDE $AsCl_3$

Aluminum	See ALUMINUM plus Phosphorus Trichloride.
Aluminum Fluoride	See SODIUM plus Aluminum Bromide.
Ammonium	See SODIUM plus Aluminum Bromide.

Chlorocuprate

Antimony Tribromide	See SODIUM plus Aluminum Bromide.
Antimony Trichloride	See SODIUM plus Aluminum Bromide.
Antimony Triiodide	See SODIUM plus Aluminum Bromide.
Arsenic Trichloride	See SODIUM plus Aluminum Bromide.
Arsenic Triiodide	See SODIUM plus Aluminum Bromide.
Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ARSENIC TRIETHYL

(See TRIETHYL ARSINE)

ARSENIC TRIFLUORIDE AsF_3

Phosphorus Trioxide	This reaction is very violent. *Mellor* **8, Supp. 3:** 382 (1971).

ARSENIC TRIMETHYL

(See TRIMETHYL ARSENIC)

ARSENIC TRIIODIDE AsI_3

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ARSENIC TRIOXIDE As_2O_3

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Fluorine	See FLUORINE plus Arsenic Trioxide.
Hydrogen Fluoride	See HYDROGEN FLUORIDE plus Arsenic Trioxide.

Oxygen Difluoride	See OXYGEN DIFLUORIDE plus Aluminum Chloride.
Sodium Chlorate	See SODIUM CHLORATE plus Arsenic Trioxide.

ARSENIC TRISILYL $(SiH_3)_3As$

(See TRISILYLARSINE)

ARSENIC TRISULFIDE As_2S_3

Hydrogen Peroxide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Sulfur and Potassium Nitrate	See SULFUR plus Potassium Nitrate and Arsenic Trisulfide.

ARSINE AsH_3

Chlorine	See CHLORINE plus Arsine.
Nitric Acid	See NITRIC ACID plus Arsine.
Potassium and Ammonia	See POTASSIUM plus Arsine and Ammonia.

ARYL HALIDES

(See DIMETHYL SULFOXIDE plus Acyl Halides)

ASPHALT

Fluorine	See FLUORINE plus Common Materials and Oxygen.

AZIDES

(See also specific azide)

Carbon Disulfide	Carbon disulfide plus any of the azides produces violently explosive, extremely sensitive salts.

Mellor **8:** 338 (1946-1947).

AZIDES (ORGANIC)

Acids

Trace amounts of strong acid, certain metal salts, or conceivably other materials may catalyze explosive reactions with organic azides.

Chem. Eng. News **42** (31): 6 (1964).

Metal Salts

See AZIDES (ORGANIC) plus Acids.

AZIDOALKANES NNNR

(self-reactive)

See ALKYL AZIDES (self-reactive).

4-AZIDO-N,N-DIETHYLANILINE $NNNC_6H_4N(C_2H_5)_2$

(self-reactive)

An attempt to distill this compound resulted in violent decomposition.

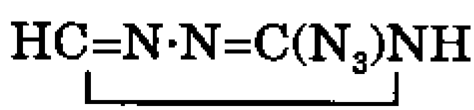
NSC Newsletter, R & D Sec. (July 1973).

AZIDOFLUORINE N_3F

(self-reactive)

See FLUORINE AZIDE (self-reactive).

3-AZIDO-S-TRIAZOLE



(self-reactive)

Samples of this compound detonated during melting point determinations, breaking combustion tubes.

DeNault, Marx and Takimoto, *J. Chem. Eng. Data* **13:** 514-516 (1968).

AZINE FLUORIDE

(See FLUORINE AZIDE)

a,a'-AZODIISOBUTYRONITRILE $[NCC(CH_3)_2N=]_2$

(self-reactive)	An explosion occurred when a solution of a,a'-azodiisobutyronitrile in acetone was concentrated in a glass-lined, steam-jacketed vessel.
	P. J. Carlisle, *Chem. Eng. News* **27:** 150 (1949).

BAKELITE

Fluorine	See FLUORINE plus Solid Nonmetals.

BARIUM Ba

Acids	Barium reacts violently with acids.
	Lab. Govt. Chemist (1965).
Carbon Tetrachloride	A violent reaction occurred when small chunks of barium were cleaned by submerging in chemically pure carbon tetrachloride. See also BARIUM plus Trichlorotrifluoroethane.
	Serious Acc. Series **23** (1952) and **Supp.** (Sept. 30, 1952).
Monofluorotrichloromethane	See BARIUM plus Trichlorotrifluoroethane.
Tetrachloroethylene	See BARIUM plus Trichlorotrifluoroethane.
Trichloroethylene	See BARIUM plus Trichlorotrifluoroethane.
Trichlorotrifluoroethane	It has been determined experimentally that mixtures of finely divided barium metal and a number of halogenated hydrocarbons possess an explosive capability. Specifically, impact sensitivity tests have shown that granular barium in contact with monofluorotrichloromethane, trichlorotrifluoroethane, carbon tetrachloride, trichloroethylene, or tetrachloroethylene can detonate.

	ASESB Pot. Incid. **39** (1968). *Aero. and Astro.*
	6 (3):82 (1968). *Chem. Eng. News* **46** (9):38 (1968).
Water	Barium rapidly decomposes water. The heat of reaction is sufficient that the evolved hydrogen may ignite.
	Lab. Govt. Chemist (1965).

BARIUM ALLOYS

Acids	Alloys containing a substantial proportion of barium react violently with acids.
	Lab. Govt. Chemist (1965).
Water	Alloys containing a substantial proportion of barium rapidly decompose water. The heat of reaction is sufficient that the evolved hydrogen may ignite.
	Lab. Govt. Chemist (1965).

BARIUM AZIDE $Ba(N_3)_2$

(self-reactive)	Barium azide decomposes at 275¡C. It is explosively unstable.
	Mellor **8, Supp. 2:** 43 (1967).
Air	Barium azide is spontaneously flammable in air.
	Ripley (1966).

BARIUM BROMATE $Ba(BrO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.

Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

BARIUM CARBIDE BaC_2

Selenium	See SELENIUM plus Barium Carbide.
Sulfur	See SULFUR plus Barium Carbide.
Water	Barium carbide will flame in contact with water.
	Ellern, p. 45 (1968).

BARIUM CHLORATE $Ba(ClO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Charcoal	See CHLORATES plus Organic Matter.
Copper	See COPPER plus Bromates.
Manganese Dioxide	See CHLORATES plus Manganese Dioxide.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Nitrogen Sulfide	See NITROGEN SULFIDE plus Barium Chlorate.
Organic Matter	See BROMATES plus Organic Matter.
	See CHLORATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates. See SULFUR plus Chlorates.
	See SULFUR plus Barium Chlorate.

BARIUM CHLORIDE $BaCl_2$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.
2-Furan Percarboxylic	See 2-FURAN PERCARBOXYLIC ACID

Acid	(self-reactive).

BARIUM HYDRIDE BaH_2

Air	See BARIUM HYDRIDE plus Water.
Water	Barium hydride reacts vigorously with water. If finely powdered, it ignites spontaneously in moist air or dry air.
	Hurd, p. 48 (1952).

BARIUM HYPOPHOSPHITE $Ba(H_2PO_2)_2 \cdot H_2O$

Potassium Chlorate	See POTASSIUM CHLORATE plus Barium Hypophosphite.

BARIUM IODATE $Ba(IO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

BARIUM NITRATE $Ba(NO_3)_2$

Barium Dioxide, Magnesium, and Zinc	See MAGNESIUM plus Barium Nitrate, Barium Dioxide and Zinc.

BARIUM NITRIDOOSMATE $Ba(OsNO_3)_2$

(self-reactive)	Barium osmiamate detonates at 150¡C.
	Mellor **15:** 728 (1946-1947).

BARIUM OXIDE BaO

Hydrogen Sulfide	See HYDROGEN SULFIDE plus Soda Lime.
Hydroxylamine	Hydroxylamine is ignited on contact with barium oxide.
	Mellor **8:** 291 (1946-1947).
Nitrogen Dioxide	See NITROGEN TETROXIDE plus Barium Oxide.

BARIUM PERCHLORATE $Ba(ClO_4)_2H_2O$

Alcohols	Reflux heating of an alcohol and barium perchlorate yields a perchloric ester, all of which are highly explosive.
	Kirk and Othmer, Second Ed. **5:** 75 (1963).

BARIUM PEROXIDE BaO_2

Hydroxylamine	Reaction of an aqueous solution of hydroxylamine with barium dioxide causes flaming.
	See also LEAD DIOXIDE plus Hydroxylamine.
	Mellor **3:** 670 (1946-1947).
Magnesium, Zinc and	See MAGNESIUM plus Barium Nitrate,
Barium Nitrate	Barium Dioxide, and Zinc.
Organic Matter	Mixtures of barium peroxide and combustible, organic or readily oxidizable materials are explosive and are ignited easily by friction or on contact with a small amount of water.
	Haz. Chem. Data (1969).

BARIUM RHODANIDE

Sodium Nitrate	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).

BARIUM SULFATE $BaSO_4$

Aluminum	See ALUMINUM plus Sulfates.

BARIUM SULFIDE BaS

Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Lead Dioxide	Oxidizing agents like lead dioxide, potassium chlorate and potassium nitrate react vigorously when heated with sulfides of the alkaline earth group.
	Mellor **3:** 745 (1946-1947).
Potassium Chlorate	See BARIUM SULFIDE plus Lead Dioxide.
Potassium Nitrate	See BARIUM SULFIDE plus Lead Dioxide.

BENZALDEHYDE C_6H_5CHO

Performic Acid	See PERFORMIC ACID plus Benzaldehyde.

BENZENE C_6H_6

Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Chlorine	See CHLORINE plus Benzene.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Benzene.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Benzene.
Nitryl Perchlorate	See NITRYL PERCHLORATE plus Benzene.

Oxygen	See OXYGEN (LIQUID) plus Benzene.
Ozone	See OZONE plus Benzene.
Perchlorates	See PERCHLORATES plus Benzene.
Perchloryl Fluoride and Aluminum Chloride	See PERCHLORYL FLUORIDE plus Benzene and Aluminum Chloride.
Permanganates and Sulfuric Acid	See PERMANGANATES plus Sulfuric Acid and Benzene.
Potassium Peroxide	See SODIUM PEROXIDE plus Aniline.
Silver Perchlorate	See SILVER PERCHLORATE plus Benzene.
	See SILVER PERCHLORATE plus Acetic Acid.
	See SILVER PERCHLORATE plus Toluene.
Sodium Peroxide	See SODIUM PEROXIDE plus Aniline.

BENZENEDIAZONIUM 2-CARBOXYLATE HYDROCHLORIDE $N{\equiv}N\text{-}C_6H_4\text{-}2\text{-}CO_2{\bullet}HCl$

(self-reactive)	An explosion occurred during the transfer of dry crystals.
	H.D. *Embry*, *Chem. Eng. News* **49** (30): 3 (1971). R.M. Stiles et al., *J. Am. Chem. Soc.* **85,** p. 1795 (1963). C.A. Matuszak, *Chem. Eng. News* **49** (24): 39 (1971).

BENZENEDIAZONIUM CHLORIDE C_6H_5NNCl

(self-reactive)	Phenylchlorodiazirine is extremely shock sensitive. It should not be handled in an undiluted state.
	Chem. Eng. News **48** (2): 10 (1970). W.H. Graham, *J. Am. Chem. Soc.* **87:** 4396 (1965). A. Padwa and D. Eastman, *J. Org. Chem.* **34:** 2728 (1969).
Hydrogen Sulfide	An explosive product is obtained when hydrogen sulfide and phenyl diazonium chloride are mixed.

Berichte **15:** 1683.

BENZENESULFONYL CHLORIDE $C_6H_5SO_2Cl$

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
Methylformamide	See METHYL ISONITRILE (self-reactive).

BENZOTRIAZOLE $C_6H_4N_3H$

(self-reactive)

During the vacuum distillation of 2,000 lbs. of benzotriazole in a 500-gallon glass-lined kettle at 160¡ C and a pressure of 2 mm of mercury, the vessel suddenly pressurized, the temperature rose to a recorded 220¡ C, and the contents detonated. This same process had been in trouble-free operation for months.

Chem. Eng. News **34:** 2450 (1956).

BENZOYL CHLORIDE C_6H_5COCl

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
Sodium Azide and Potassium Hydroxide	See SODIUM AZIDE plus Benzoyl Chloride and Potassium Hydroxide.

BENZOYL PEROXIDE $(C_6H_5CO)_2O_2$

(See also DIBENZOYL PEROXIDE)

(self-reactive)

Benzoyl peroxide has been reported to explode for apparently no specific reason. Friction while opening bottles has caused other explosions. Purification of benzoyl peroxide in hot chloroform solutions has also resulted in several explosions. Purification in cold chloroform by addition of methanol is without danger.

Chem. Eng. News **37:** 46 (Jan. 3, 1949).

Chem. Abst. **25:** 4127 (1931).

Carbon Tetrachloride and Ethylene	A reaction of ethylene, carbon tetrachloride and benzoyl peroxide caused an explosion.
	R.O. Bolt, R.M. Joyce, *Chem. Eng. News* **25:** 1866 (1947).
Methyl Methacrylate	Benzoyl peroxide was weighed into a stainless steel beaker that had been rinsed previously with methyl methacrylate. The peroxide catalyzed polymerization of the methacrylate and the build-up of heat was sufficient to ignite the remainder of the peroxide.
	MCA Case History **996** (1964).
Organic Matter	While a bottle of benzoyl peroxide was being opened, it exploded. Organic matter may have been entrapped in the threads of the bottle. When cap was unscrewed, friction caused explosion.
	G.R. Lappin, *Chem. Eng. News* **26:** 3518 (1948).

BENZYL ALCOHOL $C_6H_5CH_2OH$

Acids	See ACIDS plus Benzyl Alcohol.

BENZYL SILANE $C_6H_5CH_2SiH_3$

Air	Benzyl silane is spontaneously flammable in air.
	Lehman and Wilson, p. 53 (1949).

BENZYL SODIUM $C_6H_5CH_2Na$

Air	Benzyl sodium is spontaneously flammable in air.
	Ellern (1961).

BERYLLIUM Be

Carbon Tetrachloride	It has been determined experimentally that a mixture of beryllium powder with carbon tetrachloride or with trichloroethylene will flash or spark on heavy impact.

	ASESB Pot. Incid. **39** (1968).
Lithium	See LITHIUM plus Vanadium.
Phosphorus	The reaction between beryllium and the vapors of phosphorus proceeds with incandescence.
	Mellor **8:** 842 (1946-1947).
Trichloroethylene	See BERYLLIUM plus Carbon Tetrachloride.

BERYLLIUM DIISOPROPYL $(C_3H_7)_2Be$

(See DIISOPROPYL BERYLLIUM)

BERYLLIUM OXIDE BeO

Magnesium	See MAGNESIUM plus Beryllium Oxide.

BERYLLIUM TETRAHYDROBORATE $Be(BH_4)_2$

Air	Beryllium borohydride is spontaneously flammable in air.
	Douda (1966).
Oxygen	See OXYGEN plus Beryllium Borohydride.
Water	See OXYGEN plus Beryllium Borohydride.

BIS (2-CHLOROETHYL) ETHER $ClCH_2CH_2OCH_2CH_2Cl$

Chlorosulfonic Acid	Mixing dichloroethyl ether and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing dichloroethyl ether and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

BISCYCLOPENTADIENYL MANGANESE

(See MANGANOCENE)

BIS(DIMETHYLSTIBINE) OXIDE $[(CH_3)_2Sb]_2O$

Air	Bisdimethylstibine oxide is spontaneously flammable in air.
	Coates, p. 555 (1956).

BIS(ETHYLAMINO) CYCLOTRISILOXANE

Air	Bisethylamino siloxane is spontaneously flammable in air.
	Douda (1966).

BISMUTH Bi

Aluminum and Air	A mixture of bismuth hydroxide and aluminum hydroxide, coprecipitated, and reduced by hydrogen at 170¡-210¡C, is spontaneously flammable in air at ordinary temperatures.
	Mellor **9:** 626 (1946-1947).
Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Chloric Acid	See ANTIMONY plus Chloric Acid.
Chlorine	Powdered bismuth burns spontaneously in gaseous chlorine. With liquid chlorine, bismuth ignites at 80¡ C.
	Mellor **2:** 92, 95; **9:** 626 (1946-1947).
Iodine Pentafluoride	See ARSENIC plus Iodine Pentafluoride.
Nitric Acid	If fuming nitric acid is poured over powdered bismuth, the

	metal becomes red hot.
	Mellor **9:** 627 (1946-1947).
Perchloric Acid	When bismuth is heated with perchloric acid at 100¡ C or below, the metal dissolves slowly, but at 110¡ a brown coating forms, which on further heating explodes violently.
	J. Am. Chem. Soc. **57:** 817-18 (May 1935).
	ACS **146:** 188.
	The preparation of a salt from these two chemicals is dangerous.
	Mellor **2, Supp. 1:** 613 (1956).

BISMUTHIC ACID $HBiO_3$

Hydrofluoric Acid	When bismuthic acid is treated with 40 per cent hydrofluoric acid at ordinary temperatures, a violent reaction occurs.
	Mellor **9:** 657 (1946-1947).

BISMUTH PENTAFLUORIDE BiF_5

Water	Bismuth pentafluoride reacts violently with water, sometimes with ignition.
	Brauer (1965).

BISMUTH PENTOXIDE Bi_2O_5

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.

BISMUTH TRIBROMIDE $BiBr_3$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

BISMUTH TRICHLORIDE $BiCl_3$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

BISMUTH TRIETHYL $(C_2H_5)_3Bi$

(See TRIETHYL BISMUTHINE)

BISMUTH TRIIODIDE BiI_3

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

BISMUTH TRIMETHYL $(CH_3)_3Bi$

(See TRIMETHYL BISMUTHINE)

BISMUTH TRIOXIDE Bi_2O_3

Aluminum	See ALUMINUM plus Bismuth Trioxide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Potassium	See POTASSIUM plus Bismuth Trioxide.
Sodium	See SODIUM plus Bismuth Trioxide.

BISMUTH TRIVINYL $(CH_2=CH)_3Bi$

(See TRIVINYL BISMUTHINE)

BIS(TRIFLUOROMETHYL) CHLOROPHOSPHINE $(CF_3)_2PCl$

Air	Bistrifluoromethyl chlorophosphine is spontaneously flammable in air. *Handbook Chem. Phys.*, p. C-428 (1970-1971).

BIS(TRIFLUOROMETHYL) CYANOPHOSPHINE $(CF_3)PCN$

Air	Bistrifluoromethyl cyanophosphine is spontaneously flammable in air. *Handbook Chem. Phys.*, p. C-428 (1970-1971).

BIS(TRIFLUOROMETHYL) PHOSPHINE $(CF_3)_2PH$

Air	Bistrifluoromethyl phosphine is spontaneously flammable in air. *Douda* (1966). *Handbook Chem. Phys.*, p. C-428 (1970-1971).

BORANE-PHOSPHORUS TRIFLUORIDE COMPOUND H_3BPF_3

(self-reactive)	See PHOSPHORUS TRIFLUORIDE plus Diborane.

BORAX $Na_2B_4O_7 \cdot 10H_2O$

Zirconium	See ZIRCONIUM plus Borax.

BORIC ACID $B(OH)_3$

Acetic Anhydride	During an attempt to make triacetyl borate, a mixture of boric acid and acetic anhydride exploded when heated to 58-60¡ C. M. L. Lerner. *Chem. Eng. News.* **51:** (34) (Aug. 20, 1973).
Potassium	See POTASSIUM plus Boric Acid.

BORIC OXIDE B_2O_3

Calcium Oxide and Calcium Chloride	When a mixture of boric oxide and calcium oxide in any proportion is projected into fused calcium chloride, the mass becomes incandescent.

Mellor **5:** 141 (1946-1947).

BORON B

Ammonia	When amorphous boron is heated in dry ammonia, the reaction proceeds with incandescence and hydrogen is evolved.
	Mellor **8:**109 (1946-1947).
Bromine	Boron ignites in bromine vapor at 700¡ C.
	Mellor **5:** 15 (1946-1947).
Bromine Trifluoride	See ANTIMONY plus Bromine Trifluoride.
Cesium Carbide	See SILICON plus Cesium Carbide.
Chlorine	Boron burns spontaneously in gaseous chlorine.
	Mellor **2:** 92, 95; **9:** 626 (1946-1947).
	Boron ignites in chlorine at 410¡ C.
	Mellor **5:** 15 (1946-1947).
Cupric Oxide	Boron reacts violently with cupric oxide after warming, melting glass tubing.
	Mellor **5:** 17 (1946-1947).
Fluorine	Fluorine attacks boron at ordinary temperatures, the mass becoming incandescent.
	Mellor **2:** 12; **5:** 15 (1946-1947).
Iodic Acid	Iodic acid attacks boron below 40¡C. and the mass becomes incandescent.
	Mellor **5:** 15 (1946-1947).
Lead Dioxide	A mixture of boron and lead dioxide explodes violently when ground in a mortar.
	Mellor **5:** 17 (1946-1947).
Nitric Acid	Concentrated nitric acid and boron react so violently that the mass is raised to incandescence.
	Mellor **5:** 16 (1946-1947).

Nitric Oxide	See BORON plus Nitrous Oxide.
Nitrosyl Fluoride	The reaction between nitrosyl fluoride and boron (also phosphorus or silicon) is accompanied by incandescence.
	Z. Anorg. Chemie **47:** 190.
Nitrous Oxide	Amorphous boron ignites when heated in dry nitrous oxide. With nitric oxide, the reaction proceeds with blinding flashes.
	Mellor **8:** 109 (1946-1947).
Potassium Chlorate	The reaction of boron and fused potassium chlorate is vigorous.
	Mellor **5:** 15 (1946-1947).
Potassium Nitrate	Portions of boron powder and potassium nitrate were blended, screened, and placed in aluminum containers. When one of the covered containers was accidentally dropped, there was a flash fire followed by explosions.
	MCA Case History **1334** (1967).
Potassium Nitrite	Molten potassium nitrite is violently decomposed by boron.
	Mellor **5:** 16 (1946-1947).
Rubidium Carbide	See SILICON plus Rubidium Carbide.
Silver Fluoride	Fused silver fluoride reacts explosively with boron at ordinary temperatures.
	Mellor **3:** 389 (1946-1947).
Sulfur	A mixture of boron and sulfur becomes incandescent at 600¡ C.
	Mellor **5:** 15 (1946-1947).

BORON ARSENOTRIBROMIDE BAs_2Br_3

Air	See OXYGEN plus Boron Arsenotribromide.
Oxygen	See OXYGEN plus Boron Arsenotribromide.

BORON BROMODIIODIDE $BBrI_2$

Water	Boron bromodiiodide hydrolyzes violently.
	Mellor **5:** 136 (1946-1947).

BORON DECAHYDRIDE

(See TETRABORANE (10))

BORON DIBROMOIODIDE BBr_2I

Water	Boron dibromoiodide hydrolyzes violently.
	Mellor **5:** 136 (1946-1947).

BORON HEXAHYDRIDE

(See HEXABORANE (10))

BORON NITRIDE BN

Sodium Dioxide	When powdered boron nitride is added to molten sodium dioxide, the reaction proceeds with incandescence.
	Mellor **8:** 111 (1946-1947).

BORON PHOSPHIDE BP

Nitrates	See BORON PHOSPHIDE plus Nitric Acid.
Nitric Acid	Boron phosphide ignites in concentrated nitric acid; with fused alkali nitrates, there is a deflagration.
	Mellor **8:** 845-46 (1946-1947).

BORON PHOSPHODIIODIDE BPI_2

Chlorine	See CHLORINE plus Boron Phosphodiiodide.

Magnesium	See MAGNESIUM plus Boron Phosphodiiodide.
Mercury	See MERCURY plus Boron Phosphodiiodide.

BORON TRIAZIDE $B(N_3)_3$

(self-reactive)	Boron triazide, lithium boroazide, and silicon tetraazide and some of their intermediates are extremely sensitive and explosive.
	Egon Wibergand Horst Michaud, *Z. Naturforsch.* **9b:** 497-500 (1954).

BORON TRIBROMIDE BBr_3

Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Aluminum Bromide.
Water	When boron tribromide and water are mixed, there is an explosion.
	Mellor **5:** 134 (1946-1947). *BCISC* **41**(1962):19 (1970).

BORON TRICHLORIDE BCl_3

Nitrogen Peroxide	Boron trichloride reacts energetically with nitrogen peroxide, phosphine, or fat and grease.
	Mellor **5:** 132 (1946-1947).
Organic Matter	See BORON TRICHLORIDE plus Nitrogen Peroxide.
Oxygen	See OXYGEN plus Boron Trichloride.
Phosphine	See BORON TRICHLORIDE plus Nitrogen Peroxide.

BORON TRI-n-BUTYL $(C_4H_9)_3B$

(See TRIBUTYLBORANE)

BORON TRIFLUORIDE BF_3

Alkali Metals	See ALKALI METALS plus Boron Trifluoride.
Alkaline Earth Metals	See ALKALI METALS plus Boron Trifluoride.
Calcium Oxide	See CALCIUM OXIDE plus Boron Trifluoride.

BORON TRIFLUORIDE ETHERATE $BF_3 \bullet (C_2H_5)_2O$

Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus Boron Trifluoride Etherate.

BORON TRIIODIDE BI_3

Ammonia	Ammonia reacts with boron triiodide with the development of much heat. *Mellor* **5:** 136 (1946-1947).
Carbohydrates	See BORON TRIIODIDE plus Ethers.
Ethers	Boron triiodide and ethers or carbohydrates react vigorously. *Mellor* **5:** 136 (1946-1947).
Phosphorus	See PHOSPHORUS plus Boron Triiodide.
Phosphoryl Chloride	See PHOSPHORYL CHLORIDE plus Boron Triiodide.

BORON TRIMETHYL $B(CH_3)_3$

(See TRIMETHYLBORANE)

BORON TRIPROPYL $(C_3H_7)_3B$

(See TRIPROPYLBORANE)

BORON TRISULFIDE B_2S_3

Chlorine	See CHLORINE plus Boron Trisulfide.

BRASS

Acetylene	See COPPER plus Acetylene.
Chlorine	See CHLORINE plus Brass.
Hydrogen Peroxide	See IRON plus Hydrogen Peroxide.
Lead Azide	See COPPER plus Lead Azide.

BROMATES

(See also specific bromates as primary entries or see under other reactants)

Acids and Metals (powdered)	See CHLORATES plus Metals (powdered).
Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Calcium Hydride	A mixture of calcium hydride and bromates, chlorates or perchlorates explodes violently when rubbed in a mortar. *Mellor* **3:** 651 (1946-1947).
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metals (powdered)	See CHLORATES plus Metals (powdered).
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	A combination of finely divided organic matter with finely divided bromates (also chlorates or iodates) of barium, calcium, magnesium, potassium, sodium, or zinc can be exploded by heat, percussion, and sometimes, light friction. *Mellor* **2:** 310 (1946-1947). *MCA Case History* **874** (1963).
Phosphonium Iodide	Bromates, chlorates or iodates when dry ignite in phosphonium iodide at ordinary temperatures. *Ann. Chim. et Phys.* (2) **47:** 87.

Phosphorus	See PHOSPHORUS plus Bromates.
Strontium Hydride	A mixture of strontium hydride and bromates, chlorates, or perchlorates explodes violently when rubbed in a mortar.
	Mellor **3:** 651 (1946-1947).
Sulfur	See SULFUR plus Bromates.
Sulfuric Acid and Metals	See CHLORATES plus Metals (powdered).

BROMIC ACID $HBrO_3$

Phosphonium Iodide	See PHOSPHONIUM IODIDE plus Bromic Acid.

BROMIDES

(See specific bromides as primary entries or see under other reactants)

BROMINE Br_2

Acetaldehyde	Combination of acetaldehyde with bromine, chlorine, fluorine, or iodine can be violent.
	Chem. Safety Data Sheet **SD-43** (1952).
Acetylene	Acetylene can react explosively with bromine.
	Von Schwartz, p. 142 (1918).
Acrylonitrile	During the drop-wise addition of bromine into a 500 ml. flask containing acrylonitrile, the periodic cooling with an ice bath was insufficient to prevent a runaway exothermic reaction. When the temperature of the reactants exceeded 40¡ C, the flask exploded.
	MCA Case History **1214** (1966).
Aluminum	See ALUMINUM plus Bromine.
Ammonia	Ammonia plus bromine (with heat) explodes due to the formation of extremely sensitive nitrogen tribromide.
	Mellor **2:** 95 (1946-1947).

Antimony	See ANTIMONY plus Bromine.
Boron	See BORON plus Bromine.
Calcium Nitride	Calcium nitride reacts in the cold with bromine, with incandescence.
	Mellor **8:** 99 (1946-1947).
Cesium Acetylene Carbide	Cesium acetylene carbide burns in the vapors of bromine or iodine.
	Mellor **5:** 844 (1946-1947).
Cesium Monoxide	At ordinary temperatures, cesium monoxide plus bromine, chlorine, fluorine or iodine reacts with incandescence. At temperatures above 150¡C., a blue flame appears with fluorine. Chlorine and iodine act similarly.
	Mellor **2:** 487 (1946-1947).
Chlorotrifluoroethylene and Oxygen	See CHLOROTRIFLUOROETHYLENE plus Bromine and Oxygen.
Copper Hydride	Copper hydride ignites in bromine, chlorine or fluorine.
	Mellor **3:** 73 (1946-1947).
Cuprous Acetylide (Copper Carbide)	Cuprous acetylide is spontaneously flammable with bromine vapor, chlorine gas or fine iodine.
	Mellor **5:** 852 (1946-1947).
Dimethyl Formamide	The use of dimethyl formamide as a solvent in one of the catalysis reactions of olefins and bromine resulted in the operation of a rupture disk on an autoclave. The investigation indicated that there was a highly exothermic reaction between dimethyl formamide and bromine. In one instance mixing 40 cc of bromine and 150 cc of dimethyl formamide resulted in an increase of temperature to above 100¡C and an increase in pressure to above 2000 psi.
	H. A. Tayim and M. Absi, *Chem. & Ind.*, p. 347 (April 21, 1973).
Ethyl Phosphine	A mixture of ethyl phosphine and bromine, chlorine, or nitric acid (fuming) explodes.

	Von Schwartz, pp. 324, 325 (1918).
Fluorine	See FLUORINE plus Bromine.
Germanium	See GERMANIUM plus Bromine.
Hydrogen	Hydrogen and bromine explode.
	Mellor **Supp. I:** 707.
Iron Carbide	See CHLORINE plus Iron Carbide.
Isobutyrophenone	Bromine had been added dropwise at 21-31¡C to a solution of isobutyrophenone in carbon tetrachloride. The flask was then packed in ice. After 15 minutes, the flask exploded.
	MCA Guide for Safety, Appendix 3 (1972).
Lithium	See BROMINE plus Potassium.
Lithium Carbide	Lithium carbide burns vigorously and spontaneously in cold chlorine or fluorine. With bromine or iodine, the materials must be warm.
	Mellor **5:** 848 (1946-1947).
Lithium Silicide	See FLUORINE plus Lithium Silicide.
Magnesium Phosphide	See CHLORINE plus Magnesium Phosphide.
Methyl Alcohol	A violent exothermic reaction of these materials occurred in a measuring cylinder.
	MCA Case History **1863** (1972).
Nickel Carbonyl	The reaction between these liquids proceeds with explosive violence.
	Mellor **2, Supp. 1:** 716 (1956). *J. Am. Chem. Soc.* **48:** 872-82 (1926).
Nitrogen Triiodide	Nitrogen triiodide explodes on contact with bromine, chlorine, or ozone, and is almost instantly decomposed by hydrogen sulfide.
	Champion and Pellet, *Bull. Soc. Chim.* (2) **24:** 447 (1875). *Ann. Chim. et Phys.* (2) **42:** 200.
	E. Schneider, *Report Anal. Chem.* **1:** 54 (1881).
Olefins	See BROMINE plus Dimethyl Formamide.

Oxygen Difluoride	A mixture of oxygen difluoride and bromine or iodine explodes on gentle warming.
	Mellor **2, Supp. 1:** 192 (1956).
Ozone	See OZONE plus Bromine.
Phosphine	Phosphine ignites with bromine or chlorine at room temperature.
	Berichte **3:** 660. *Merck Index,* p. 823 (1968).
Phosphorus	Ordinary phosphorus reacts with gaseous bromine with incandescence. Red phosphorus reacts with bromine (liquid) at ordinary temperatures with incandescence. Small pieces of yellow (white) phosphorus thrown into liquid bromine ignite and cause dangerous explosions.
	Ann. Chim. et Phys. (2) **32:** 337. *Lowig* (1829).
	See also PHOSPHORUS plus Chlorine.
Phosphorus Oxide	See CHLORINE plus Phosphorus Oxide.
Phosphorus Trioxide	Phosphorus trioxide, thrown into a jar of chlorine, ignites immediately and burns with a greenish flame. Phosphorus trioxide reacts violently with liquid bromine — generally ignites.
	Thorpe and Tutton, *J. Chem. Soc.* **59:** 1019 (1891).
Potassium	The reaction between potassium and bromine (gas) is vigorous with incandescence. A violent explosion will occur if potassium is brought in contact with liquid bromine.
	R. Cowper, *Chem. News* **47:** 70 (1883). *Sidgwick*, p. 65 (1950). *Mellor* **2:** 469 (1946-1947). The system bromine-plus-sodium, however, requires a small impact to cause an explosion. The system bromine-plus-lithium requires a much larger impact to explode it.
	H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925).
	Mellor **2, Supp. 3:** 1559.
Rubidium Acetylene	Rubidium acetylene carbide burns in cold
Carbide	bromine, chlorine, fluorine, or iodine (vapor).

	Mellor **5:** 849 (1946-1947).
Rubidium Carbide	This carbide burns in bromine gas.
	Mellor **5:** 848 (1946-1947).
Silver Azide	Bromine vapor diluted with some nitrogen plus silver or sodium azides formed bromoazide; explosions often occurred.
	Mellor **8:** 330 (1946-1947).
Sodium	Finely divided sodium reacts with bromine with luminescence. Solid sodium plus liquid bromine can be caused to explode by mechanical shock. See also BROMINE plus Potassium.
	Mellor **Supp. II, Part I:** 714 (1956).
Sodium Acetylene	Sodium acetylene carbide burns in cold chlorine
Carbide	or bromine.
	Mellor **5:** 849 (1946-1947).
Sodium Carbide	Sodium carbide explodes on contact with bromine vapor or water.
	Von Schwartz, p. 328 (1918).
Strontium Phosphide	Mixtures of these materials ignite at about 170¡C.
	Mellor **8:** 841 (1946-1947).
Tin	See TIN plus Bromine.
Uranium Dicarbide	Uranium dicarbide reacts with incandescence with warm fluorine; at 300¡C. with chlorine; or at 390¡C. with bromine.
	Mellor **5:** 890-98 (1946-1947).
Zirconium Dicarbide	Zirconium dicarbide burns in fluorine, in the cold; in chlorine, at 250¡C.; in bromine, at 300¡C.; and in iodine, at 400¡C.
	Mellor **5:** 855-57 (1946-1947).

BROMINE AZIDE N_3Br

(self-reactive)	Spontaneous explosions have been observed with this compound.
	Mellor **8, Supp. 2:** 50 (1967)
	Mellor **8:** 336 (1946-1947).
Antimony	See ANTIMONY plus Bromoazide.
Arsenic	See ANTIMONY plus Bromoazide.
Diethyl Ether	A solution of bromoazide in ether is stable for a few hours, but after a time, or when being concentrated, it is likely to explode on shaking.
	Mellor **8:** 327, 336, 338 (1946-1947).
Phosphorus	See ANTIMONY plus Bromoazide.
Silver	See ANTIMONY plus Bromoazide.
Sodium	See ANTIMONY plus Bromoazide.

BROMINE MONOFLUORIDE BrF

Organic Matter	See BROMINE MONOFLUORIDE plus water.
Water	Halogen fluorides react violently with water and organic compounds.
	Mellor **2, Supp. 1:** 147 (1956).
	See also CHLORINE TRIFLUORIDE plus Elements.

BROMINE PENTAFLUORIDE BrF_5

Acetic Acid	In reactions between bromine pentafluoride and acetic acid, ammonia, benzene, cellulose (in paper), ethyl alcohol, organic matter such as grease or wax, hydrogen sulfide, or methane, fire and explosions are likely.
	Mellor **2, Supp. 1:** 172 (1956).
Ammonia	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Arsenic	See ARSENIC plus Bromine Pentafluoride.
Benzene	See BROMINE PENTAFLUORIDE plus Acetic Acid.

Bromides (Alkaline)	See ARSENIC plus Bromine Pentafluoride.
Cellulose	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Charcoal	See ARSENIC plus Bromine Pentafluoride.
Chlorides (Alkaline)	See ARSENIC plus Bromine Pentafluoride.
Chlorine	See CHLORINE plus Bromine Pentafluoride.
Ethyl Alcohol	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Hydrogen Sulfide	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Iodides (Alkaline)	See ARSENIC plus Bromine Pentafluoride.
Iodine	See ARSENIC plus Bromine Pentafluoride. See IODINE plus Bromine Pentafluoride.
Metallic Halides	See BROMINE PENTAFLUORIDE plus Metal Oxides.
Metal Oxides	Bromine pentafluoride reacts violently with metal oxides and metallic halides. *Mellor* **2, Supp. 1:** 172 (1956).
Metals	See METALS plus Bromine Pentafluoride.
Methane	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Nitric Acid	Bromine pentafluoride reacts violently with strong nitric acid or strong sulfuric acid. *Mellor* **2, Supp. 1:** 172 (1956).
Organic Matter	See BROMINE PENTAFLUORIDE plus Acetic Acid. See also BROMINE MONOFLUORIDE plus Water.
Selenium	See ARSENIC plus Bromine Pentafluoride.
Sulfur	See ARSENIC plus Bromine Pentafluoride.
Sulfuric Acid	See BROMINE PENTAFLUORIDE plus Nitric Acid.
Water	The reaction between bromine pentafluoride and water is very violent. *Mellor* **2, Supp. 1:** 172 (1956). See ARSENIC plus Bromine Pentafluoride. See also BROMINE MONOFLUORIDE plus Water.

BROMINE TRIFLUORIDE BrF_3

(See also other reactants)

Ammonium Bromide	Bromine trifluoride reacts explosively with the following: ammonium bromide, ammonium chloride, ammonium iodide.
	Mellor **2, Supp. 1:** 165 (1956).
Ammonium Chloride	See BROMINE TRIFLUORIDE plus Ammonium Bromide.
Ammonium Iodide	See BROMINE TRIFLUORIDE plus Ammonium Bromide.
Antimony	See ANTIMONY plus Bromine Trifluoride.
Antimonyl Chloride	See BROMINE TRIFLUORIDE plus Antimony Trioxide.
Antimony Trioxide	Bromine trifluoride produces a violent reaction with antimony trioxide, more violent with antimonyl chloride.
	Mellor **2, Supp. 1:** 166 (1956).
Arsenic	See ANTIMONY plus Bromine Trifluoride.
Barium Chloride	Bromine trifluoride rapidly attacks the following salts: barium chloride, cadmium chloride, calcium chloride, cesium chloride, lithium chloride, rubidium chloride, silver chloride.
	Mellor **2, Supp. 1:** 165 (1956).
Bismuth Pentoxide	Bromine trifluoride and bismuth pentoxide, manganous iodate, niobium pentoxide, or tantalum pentoxide react vigorously.
	Mellor **2, Supp. 1:** 166, 173 (1956).
Boron	See ANTIMONY plus Bromine Trifluoride.
Bromine	See ANTIMONY plus Bromine Trifluoride.
Cadmium Chloride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Calcium Chloride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Carbon Monoxide	Bromine trifluoride and carbon monoxide react explosively

	at high temperatures or concentrations.
	Mellor **2, Supp. 1:** 166 (1956).
Carbon Tetrachloride	Bromine trifluoride and carbon tetrachloride react vigorously.
	Mellor **2, Supp. 1:** 167 (1956).
Carbon Tetraiodide	Flaming occurs when bromine trifluoride is dripped onto cooled carbon tetraiodide.
	Mellor **2, Supp. 1:** 166 (1956).
Cesium Chloride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Iodine	See ANTIMONY plus Bromine Trifluoride.
Lithium Chloride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Manganous Iodate	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.
Metals	See METALS plus Bromine Trifluoride.
Molybdenum	See MOLYBDENUM plus Bromine Trifluoride.
Niobium	See NIOBIUM plus Bromine Trifluoride.
Niobium Pentoxide	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.
Organic Matter	See BROMINE MONOFLUORIDE plus Water.
Phosphorus	See ANTIMONY plus Bromine Trifluoride.
Platinic Bromide	Both platinic bromide and platinic chloride are vigorously attacked by bromine trifluoride.
	Mellor **2, Supp. 1:** 165 (1956).
Platinic Chloride	See BROMINE TRIFLUORIDE plus Platinic Bromide.
Platinum and Potassium Fluoride	See PLATINUM plus Bromine Trifluoride and Potassium Fluoride.
Potassium Bromide	The following salts are rapidly attacked by bromine trifluoride: potassium bromide, potassium chloride, potassium iodide, rhodium tetrabromide, sodium bromide, sodium chloride, sodium iodide.
	Mellor **2, Supp. 1:** 164 (1956).

Potassium Chloride	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Potassium Iodide	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Rhodium Tetrabromide	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Rubidium Chloride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Silver Chloride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Sodium Bromide	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Sodium Chloride	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Sodium Iodide	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Stannous Chloride	Bromine trifluoride and stannous chloride react with flame.
	Mellor **2, Supp. 1:** 164 (1956).
Sulfur	See ANTIMONY plus Bromine Trifluoride.
Tantalum	See NIOBIUM plus Bromine Trifluoride.
Tantalum Pentoxide	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.
Tin	See TIN plus Bromine Trifluoride.
Titanium	See MOLYBDENUM plus Bromine Trifluoride.
Tungsten	See MOLYBDENUM plus Bromine Trifluoride.
Uranium Oxides	The reaction between bromine trifluoride and oxides of uranium (UO_2 UO_3, and U_3O_8) is rapid and quantitative below the boiling point of bromine trifluoride.
	Mellor **2, Supp. 1:** 165 (1956).
Vanadium	See MOLYBDENUM plus Bromine Trifluoride.
Water	Bromine trifluoride reacts violently with water.
	Handbook Chem. Phys., **47th Ed.:** B-160 (1966-1967).
	Even at -50¡C., water (present as 6-normal hydrochloric acid) reacted explosively with bromine trifluoride.
	Swanson (1965).
	See BROMINE MONOFLUORIDE plus Water.

BROMOACETYLENE BrC≡CH

Air

During the preparation of solid bromoacetylene an explosion occurred when air was drawn into the Volman trap containing the solid bromoacetylene. Although it was well known that gaseous bromoacetylene reacts violently with oxygen at room temperature, the explosion of the solid material at minus 190¡C was surprising.

Chem. & Ind. (3) (1972).

1-BROMOACETYLENES BrC≡CR

(self-reactive)

The 1-bromoacetylenes should not be distilled. They sometimes explode, even when distilled at reduced pressure.

Rutledge, p. 136 (1968).

p-BROMOBENZOYL ACETANILIDE p-$BrC_6H_4COC_6H_4NHCOCH_3$

Dimethyl Sulfoxide

After a solution of p-bromobenzoyl acetanilide in 600 ml of dimethyl sulfoxide had been heated on a steam bath (100¡C) for 30 minutes, an explosion occurred.

Wischmeyer (1970).

BROMOBENZYL TRIFLUORIDE $BrC_6H_4CF_3$

Magnesium

See MAGNESIUM plus Bromobenzyl Trifluoride.

BROMODIBORANE $BrBH(H_2)BH_2$

Air

This compound burns with a pale green flame in air.

Mellor **5:** 37 (1946-1947).

BROMODIETHYLALUMINUM $(C_2H_5)_2AlBr$

Air

Diethyl aluminum bromide ignites spontaneously in air,

	water, and alcohol.
	Chem. Eng. Progs. **62** (12): 116 (1966).
Alcohol	See DIETHYL ALUMINUM BROMIDE plus Air.
Water	See DIETHYL ALUMINUM BROMIDE plus Air.

2-BROMO-3,5-DIMETHOXYANILINE $NH_2C_6H_2Br(OCH_3)_2$

(self-reactive)	During a laboratory distillation of a mixture of 3, 5-dimethoxyaniline, 2-bromo-3, 5-dimethoxyaniline and dibromo 3,5-dimethoxyaniline an explosion occurred. It was traced to the instability of the brominated compounds.
	Wischmeyer (1970).

BROMOFORM $CHBr_3$

Lithium	See LITHIUM plus Bromoform.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Bromoform.

3-BROMO-1-PROPYNE $CH{\equiv}CCH_2Br$

(self-reactive)	Pure propargyl bromide will decompose violently or detonate at temperatures as low as 220¡C.
	Wischmeyer (1966). R. D. Coffee and J. J. Wheeler, *Chem. Eng. Progr. Tech. Man.* **1:** 6-9 (1968).
	Liquid propargyl bromide is easily ignited by impact from such possible sources as "water hammer" or accidental pressurization of the aerated liquid.
	D. R. Forshey, J. C. Cooper, G. H. Martindill and J. M. Kuchta, *Fire Tech.* **5** (2): 100-111 (1969).
Chloropicrin	Tests at the Bureau of Mines showed the mixture to be shock sensitive.
	Forshey, Cooper, Martindill, and Kuchta, *Fire Tech.* **5** (2): 100-111 (1969).

BROMOSILANE SiH_3Br

Air	Bromosilane is spontaneously flammable in air.
	Handbook Chem. Phys., p. B-132 (1970-1971).

BROMOTRICHLOROMETHANE $BrCCl_3$

Ethylene	During the uncatalyzed addition of bromotrichloromethane to ethylene a violent explosion occurred.
	BCISC **33:** 131 (1962).
	Chem. Abst. **57:** 9638 (1953).

BROMOTRIFLUOROMETHANE $CBrF_3$

Aluminum	See ALUMINUM plus Dichlorodifluoromethane.

BRONZE

Hydrogen Peroxide	See IRON plus Hydrogen Peroxide.

BUNA N

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

BUTADIENE CH_2=CHCH=CH_2; CH=C=$CHCH_3$

(see also 1,3-BUTADIENE)

(self-reactive)	Butadiene, when heated under pressure, may undergo violent thermal decomposition.
	Chem. Eng. News **18:** 404 (1940).
Air	In contact with air, butadiene may form violently explosive peroxides, which can be exploded by mild heat or shock. Solid butadiene absorbs enough oxygen at subatmospheric pressures to make it explode violently when heated just

	above its melting point.
	D. G. Hendry, F. R. Hendry and D. Scheutzle, *Ind. Eng. Chem. Prod. Res. Develop.* **7:** 145-151 (1968). D. G. Hendry et al, *Ind. Eng. Chem. Prod. Res. Develop.* **7:** 151-154 (1968). D. S. Alexander, *Ind. Eng. Chem.* **51:** 733 (1959).
Phenol	See PHENOL plus Butadiene.

1, 3-BUTADIENE CH_2=CHCH=CH_2

Chlorine Dioxide	See CHLORINE DIOXIDE plus Butadiene.
Crotonaldehyde	The Diels-Alder reaction between these chemicals under pressure is a logical approach to the preparation of a number of cyclic aldehydes, alcohols, and hydrocarbons. A destructive explosion, including a secondary gas explosion, occurred in carrying out this reaction.
	K. W. Greenlee, *Chem. Eng. News* **26:** 1985 (1948).

BUTADIYNE HC≡CC≡CH

Air	In the preparation of diacetylene by adding 1,4-dichloro-2-butyne to 10% sodium hydroxide and a little dioxane at 100¡C, no difficulty was experienced if the free diacetylene was collected at minus 25¡C and held below that temperature. At temperatures above minus 25¡C explosions would occur.
	Rutledge, pp. 134-135 (1968).

n-BUTANE $CH_3CH_2CH_2CH_3$

Nickel Carbonyl and Oxygen	See NICKEL CARBONYL plus n-Butane and Oxygen.

1-BUTANETHIOL $CH_3(CH_2)_2CH_2SH$

Nitric Acid	See NITRIC ACID plus Organic Matter.

BUTYL ACETATE $C_4H_9OCOCH_3$

Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

t-BUTYL ALCOHOL $(CH_3)_3COH$

Hydrogen Peroxide	See HYDROGEN PEROXIDE plus t-Butyl Peroxide.

t-BUTYL AZIDOFORMATE $(CH_3)_3COCONNN$

Phosgene	In the formation of tert-butyl azidoformate by the addition of phosgene to alcohols followed by the addition of sodium nitride or hydrazoic acid in the presence of pyridine, reaction of phosgene with the azide can cause the formation of explosive carbazide. To prevent the reaction complete removal of excess phosgene is advocated by passing nitrogen into the solution prior to addition of the azide. *Chem. Abst.* **73:** 14099h (1970). *Chem. Phar. Bull.* **18** (4): 850-851 (1970).

BUTYL BORON DICHLORIDE

(See BUTYL DICHLOROBORANE)

BUTYLDICHLOROBORANE $C_4H_9BCl_2$

Air	Butyl boron dichloride is spontaneously flammable in air. *Buls, Bimonthly Rept. 5,* p. 3 (1953).

BUTYL FLUORIDE C_4H_9F

Magnesium Perchlorate	See MAGNESIUM PERCHLORATE plus Butyl Fluoride.

t-BUTYL HYPOCHLORITE $CH_3C(CH_3)_2OCl$

(self-reactive)	Tertiary butyl hypochlorite requires very careful handling to avoid explosive decomposition under relatively mild conditions. At about 25¡C., an ampoule containing 10 grams exploded violently after several minutes exposure to fluorescent and north window light. *Chem. Eng. News* **40** (42): 63 (1962).

t-BUTYL PERACETATE $(CH_3)_3C\text{-}OO\text{-}COCH_3$

(See t-BUTYL PEROXYACETATE)

t-BUTYL PERBENZOATE $(CH_3)_3C\text{-}OO\text{-}COC_6H_5$

(See t-BUTYL PEROXYBENZOATE)

t-BUTYL PEROXYACETATE $(CH_3)_3C\text{-}OO\text{-}COCH_3$

(self-reactive)	t-Butyl peracetate is sensitive to shock and heat. *Haz. Chem. Data*, p. 77 (1973).
Organic Matter	Upon contact with t-butyl peracetate, combustible organic matter can ignite or give rise to an explosion. *Haz. Chem. Data*, p. 77 (1973).

t-BUTYL PEROXYBENZOATE $(CH_3)_3C\text{-}OO\text{-}COC_6H_5$

Organic Matter	Organic substances can ignite or explode upon contact with t-butyl perbenzoate. *Haz. Chem. Data* p. 79 (1973).

BUTYLLITHIUM LiC_4H_9

Air	Butyl lithium above 20% in air can ignite spontaneously if the humidity exceeds 70%. Concentrations above 25% are

	pyrophoric at any humidity.
	S. B. Mirviss *Ind. Eng. Chem.* **53** (1): Supp. 58A-60A (1961). *Handbook Chem. Phys.,* p. C-695 (1970-1971).

BUTYL MERCAPTAN

(See 1-BUTANETHIOL)

BUTYNEDIOL $HOCH_2C{\equiv}CCH_2OH$

Halides	See BUTYNEDIOL plus Hydroxides.
Hydroxides	Pure butynediol is nonexplosive. Small amounts of certain impurities — alkali hydroxides, alkaline earth hydroxides, halides — may cause explosive decomposition upon distillation. Butynediol should not be treated with basic catalysts in the absence of a solvent at room temperature and still less so at elevated temperature; otherwise, uncontrollable decomposition may occur. In strong acids, contamination with mercury salts can also result in violent decomposition.
	Kirk & Othmer, **Supp. II,** First Ed.: 45 (1960).
Mercury Salts and Acid	See BUTYNEDIOL plus Hydroxides.

n-BUTYRALDEHYDE $CH_3(CH_2)_2CHO$

Chlorosulfonic Acid	Mixing n-butyraldehyde and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing n-butyraldehyde and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing n-butyraldehyde and oleum in a closed container

	caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sulfuric Acid	Mixing n-butyraldehyde and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

CADMIUM Cd

Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Hydrazoic Acid	A violent explosion followed immersion of a cadmium rod in hydrazoic acid after about 30 minutes.
	Mellor **8, Supp. 2:** 50 (1967).
Tellurium	See ZINC plus Selenium.
Zinc	See ZINC plus Selenium.

CADMIUM AMIDE $Cd(NH_2)_2$

Water	Cadmium amide, when wetted, heats spontaneously and can explode.
	Mellor **8:** 261 (1946-1947).

CADMIUM AZIDE $Cd(N_3)_2$

(self-reactive)	This is an extremely hazardous substance, exploding when rubbed with a horn spatula.
	Mellor **8, Supp. 2:** 25 (1967).

CADMIUM BROMIDE $CdBr_2$

Potassium	See POTASSIUM plus Aluminum Bromide.

CADMIUM CHLORATE $Cd(ClO_3)_2$

Antimony Sulfide	See CHLORATES plus Antimony Sulfide.
Arsenic Sulfide	See CHLORATES plus Arsenic Sulfide.
Copper Sulfide	See COPPER SULFIDE plus Cadmium Chlorate.
Stannic Sulfide	See STANNIC SULFIDE plus Cadmium Chlorate.
Stannous Sulfide	See STANNOUS SULFIDE plus Cadmium Chlorate.

CADMIUM CHLORIDE $CdCl_2$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Potassium	See POTASSIUM plus Aluminum Bromide.

CADMIUM CYANIDE $Cd(CN)_2$

Magnesium	See MAGNESIUM plus Cadmium Cyanide.

CADMIUM DIETHYL $(C_2H_5)_2Cd$

(See DIETHYL CADMIUM)

CADMIUM FLUORIDE CdF_2

Potassium	See POTASSIUM plus Ammonium Bromide.

CADMIUM-HEXAMMINE CHLORATE $Cd(NH_3)_6(ClO_3)_2$

(self-reactive)	This compound detonates when struck. *Mellor* **2, Supp. 1:**592 (1956).

CADMIUM-HEXAMMINE PERCHLORATE $Cd(NH_3)_6\ (ClO_4)_2$

(self-reactive)	This compound detonates when struck, but is less sensitive than hexamminocadmium chlorate.

Mellor **2, Supp. 1:** 592 (1956).

CADMIUM IODIDE CdI_2

Potassium	See POTASSIUM plus Aluminum Bromide.

CADMIUM NITRIDE Cd_3N_2

Acids	Cadmium nitride reacts explosively with dilute acids and bases.
	Mellor **8, Supp. I, Part 1:** 161 (1964).
Bases	See CADMIUM NITRIDE plus Acids.
Water	Cadmium nitride explodes violently in contact with water.
	Mellor **8:** 121, 122, 261 (1946-1947).

CADMIUM OXIDE CdO

Magnesium	See MAGNESIUM plus Beryllium Oxide.

CADMIUM SULFIDE CdS

Iodine Monochloride	See IODINE MONOCHLORIDE plus Cadmium Sulfide.

CADMIUM-TRIHYDRAZINE CHLORATE $Cd(N_2H_4)_3(ClO_3)_2$

(self-reactive)	This compound detonates when struck.
	Mellor **2, Supp. 1:** 592 (1956).

CADMIUM-TRIHYDRAZINE PERCHLORATE

$Cd(H_2NNH_2)_3(ClO_4)_2Cd$

(self-reactive)	This is an extremely explosive salt.
	Mellor **8, Supp. 2:** 88 (1967).

CALCIUM Ca

Acids	Calcium reacts violently with acids.
	Lab. Govt. Chemist (1965).
Air	Finely divided calcium burns spontaneously in air.
	Mellor **3:** 637, 638, 651 (1946-1947).
Chlorine	Finely divided calcium burns spontaneously in chlorine. Solid calcium burns spontaneously in chlorine at elevated temperatures.
	Mellor **3:** 637, 638, 651 (1946-1947).
Chlorine Trifluoride.	Chlorine trifluoride combined with calcium or sodium forms a protective crust, but reaction is violent on heating.
	Mellor **2, Supp. 1:** 156 (1956).
Fluorine	Finely divided or massive calcium burns spontaneously in fluorine at ordinary temperatures.
	Mellor **3:** 637, 638, 651 (1946-1947).
Oxygen	Solid calcium ignites spontaneously in moist oxygen.
	Chem. Eng. News **26:** 1985 (1948).
Silicon	Calcium and silicon react violently if heated to 1,050¡C.
	Mellor **6:** 176, 177 (1946-1947).
Sulfur	A mixture of calcium and sulfur, when ignited, reacts explosively. Calcium burns in sulfur vapor with a brilliant flame. The reaction begins at about 400¡C.
	Perkin and Pratt, *Trans. Faraday Soc.* **3:** 176 (1908).
	Mellor **3:** 639 (1946-1947).
Vanadium Oxide,	A mixture of calcium and vanadium oxide
Sulfur and Water	that was contaminated with sulfur and some moisture caused a severe fire.
	Poole (1971).
Water	Calcium rapidly decomposes water. The heat of reaction is

sufficient that the evolved hydrogen may ignite.

Lab. Govt. Chemist (1965).

CALCIUM ALLOYS

Acids	Calcium alloys react violently with acids.
	Lab. Govt. Chemist (1965).
Water	Calcium alloys rapidly decompose water. The heat of reaction is sufficient that the evolved hydrogen may ignite.
	Lab. Govt. Chemist (1965).

CALCIUM BROMATE $Ca(BrO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

CALCIUM CARBIDE CaC_2

Hydrogen Chloride	Calcium carbide reacts with hydrogen chloride gas with incandescence.
	Mellor **5:** 862 (1946-1947).
Lead Fluoride	Calcium carbide mixed with lead fluoride, at ordinary temperatures, becomes incandescent.
	Mellor **5:** 862-64 (1946-1947).
Magnesium	See MAGNESIUM plus Calcium Carbide.

Potassium Hydroxide and Chlorine	See DICHLOROACETYLENE plus Air.
Selenium	See SELENIUM plus Calcium Carbide.
Silver Nitrate	See SILVER NITRATE plus Calcium Carbide.
Sodium Peroxide	See SODIUM PEROXIDE plus Calcium Carbide.
Stannous Chloride	See STANNOUS CHLORIDE plus Calcium Carbide.
Sulfur	See SULFUR plus Calcium Carbide.
Water	The reaction between calcium carbide and water can produce enough heat to ignite the acetylene that is formed. G.W. Jones, G.S. Scott, R.E. Kennedy & W.J. Huff, *BM Report Invest.* **3755** (1944). *Von Schwartz*, p. 142 (1918).

CALCIUM CARBONATE $CaCO_3$

Fluorine	See FLUORINE plus Carbonates. See also FLUORINE plus Common Materials and Oxygen.
Magnesium and Hydrogen	See MAGNESIUM plus Hydrogen and Calcium Carbonate.

CALCIUM CHLORATE $Ca(ClO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Charcoal	See CHLORATES plus Organic Matter.
Copper	See COPPER plus Bromates.

Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Acids (Dibasic)	See CHLORATES plus Organic Acids.

Organic Matter	See CHLORATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

CALCIUM CHLORIDE $CaCl_2$

Boric Oxide and Calcium Oxide	See BORIC OXIDE plus Calcium Oxide and Calcium Chloride.
Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.
2-Furan Percarboxylic Acid	See 2-FURAN PERCARBOXYLIC ACID (self-reactive).

CALCIUM CHLORITE $Ca(OCl)_2$

Chlorine	See CHLORINE plus Calcium Chlorite.

CALCIUM HEXAMMONIATE $Ca(NH_3)_6$

Air	Hexammino calcium is spontaneously flammable in air. *Ellern* (1961).

CALCIUM HYDRIDE CaH_2

Air	Calcium hydride burns fiercely in air when heated. *Lab. Govt. Chemist* (1965). NSC *Nat. Saf. News* **77** (2): 37-40 (1958).
Bromates	See BROMATES plus Calcium Hydride.
Chlorates	See BROMATES plus Calcium Hydride.
Perchlorates	See BROMATES plus Calcium Hydride.
Silver Fluoride	See SILVER FLUORIDE plus Calcium Hydride.

CALCIUM HYDROXIDE $Ca(OH)_2$

Maleic Anhydride	See SODIUM HYDROXIDE plus Maleic Anhydride.
Nitroethane	The nitroparaffins, in the presence of water, form salts with inorganic bases. The dry salts are explosive. *Chem. Eng. News* **30:** 2344 (1952).
Nitromethane	See CALCIUM HYDROXIDE plus Nitroethane.
Nitroparaffins	See CALCIUM HYDROXIDE plus Nitroethane.
Nitropropane	See CALCIUM HYDROXIDE plus Nitroethane.
Phosphorus	See PHOSPHORUS plus Alkaline Hydroxides.

CALCIUM HYPOCHLORITE $Ca(OCl)_2$

(See also HYPOCHLORITES)

Amines	Primary amines and calcium hypochlorite or sodium hypochlorite react to form normal chloroamines, which are explosive. *Kirk and Othmer* **1:** 709 (1947).
Anthracene	Anthracene heats on contact with calcium hypochlorite. *Douglas and Thompson* (1949).
Carbon	See CALCIUM HYPOCHLORITE plus Charcoal.
Carbon Tetrachloride	A severe explosion occurred when a carbon tetrachloride fire extinguisher was used to extinguish a fire in an open container of calcium hypochlorite. *NSC Newsletter, Chem. Sec.* (May 1972).
Charcoal	A mixture of equal parts of bleaching powder and finely divided charcoal exploded when heated in a closed vessel. *Halane — Prelim. Info. Sheet* (1953). *Mellor* **2:** 254-62 (1946-1947).
Ethyl Alcohol	A little calcium hypochlorite added to ethyl alcohol or glycerol will result in a violent explosion after a short time. *Roblee* (1966).

Glycerol

When mixed with calcium hypochlorite, glycerol may ignite spontaneously.

H. Fawcett, *Ind. Eng. Chem.* **51:** 89A-90A (1959).

See also CALCIUM HYPOCHLORITE plus Ethyl Alcohol.

Grease or Oil

A metal scoop kept in a drum of calcium hypochlorite was contaminated with grease or oil. Reaction with the contaminant initiated the violent decomposition of the hypochlorite.

MCA Case History **663** (1960).

Hydrochloric Acid

Reaction of these two chemicals releases copious quantities of chlorine gas.

Fawcett (1969).

Iron Oxide

This material has been the cause of many serious accidents caused by explosions in the containers. Oxygen is evolved by reaction between the hypochlorite and oxide catalysts.

A. H. Gill, *Ind. Eng. Chem.* **16:** 577 (1924).

Manganese Oxide

See CALCIUM HYPOCHLORITE plus Iron Oxide.

Mercaptans

Calcium hypochlorite and mercaptans will react violently.

Barrett (1973).

Methyl Carbitol

Fire occurred when a bag of calcium hypochlorite was inadvertently placed on a methyl carbitol spill on the floor.

Wischmeyer (1965).

Nitromethane

Nitromethane, either alone or in a mixture with methanol and castor oil (model airplane fuel) has a delayed but violent reaction with powdered calcium hypochlorite, especially when confined, as in a plastic bag.

H. Fawcett, *Hazards Home Chem.* (1963).

Organic Matter

Calcium hypochlorite contaminated with one per cent of various common organic materials reacted when heated. The reaction varied from mild flame at 350¡F. with wood, to violent explosion at 275¡F. with oil.

Halane — Prelim. Info. Sheet.

Organic Sulfides	Dry calcium hypochlorite when mixed with organic sulfides causes a violent reaction with the possibility of a flash fire.
	Stephenson (1973).
Phenol	This is an exothermic reaction producing toxic fumes, which may ignite.
	H. Fawcett, *Ind. Eng. Chem.* **51:** 89A-90A (1959).
1-Propanethiol	An explosion occurred when 10 grams of calcium hypochlorite was dumped into a beaker containing 5 milliliters of 1-propanethiol. Identical results were obtained with ethanediol and isobutanethiol.
	R. E. Barrett (1973).
Propyl Mercaptan	See CALCIUM HYPOCHLORITE plus Mercaptans.
Sulfur	See SULFUR plus Calcium Hypochlorite.
Turpentine	Calcium hypochlorite was placed in a turpentine can thought to be empty. A few minutes later reaction between the residual turpentine and the calcium hypochlorite resulted in an explosion.
	Benson (1967).

CALCIUM HYPOPHOSPHITE $Ca(H_2PO_2)_2$

Air	Calcium hypophosphite decomposes when heated, forming phosphine, a spontaneously flammable gas in air.
	Mellor **8:** 881 (1946-1947).
Nitric Acid	The salt ignites when nitric acid is poured onto it.
	Mellor **8:** 883 (1946-1947).
Potassium Chlorate	A mixture of calcium hypophosphite and potassium chlorate exploded when being ground with quartz in a mortar. The mixture of calcium hypophosphite and potassium chlorate can be caused to explode by shock, heat, spark or friction.
	Mellor **8:** 881 (1946-1947).

CALCIUM IODATE $Ca(IO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

CALCIUM-MANGANESE-SILICON

Acids	Calcium-manganese-silicon combinations evolve spontaneously flammable gas when in contact with acids.
	Lab. Govt. Chemist (1965).

CALCIUM NITRIDE Ca_3N_2

Air	Calcium nitride is spontaneously flammable in air.
	Von Schwartz, p. 322 (1918).
Bromine	See BROMINE plus Calcium Nitride.
Chlorine	See CHLORINE plus Calcium Nitride.

CALCIUM OXIDE (QUICKLIME) CaO

Boric Oxide and Calcium Chloride	See BORIC OXIDE plus Calcium Oxide and Calcium Chloride.
Boron Trifluoride	The reaction of calcium oxide and boron trifluoride forms a fused mass after warming.
	Mellor **5:** 123 (1946-1947).

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Fluorine	See FLUORINE plus Calcium Oxide.
Hydrofluoric Acid	Liquid hydrofluoric acid and calcium oxide react very violently.
	Mellor **2, Supp. 1:** 129 (1956).
Phosphorus Pentoxide	Calcium oxide or sodium hydroxide reacts with phosphorus pentoxide extremely violently when initiated by local heating.
	Mellor **8, Supp. 3:** 406 (1971).
Water	Addition of water to quicklime has generated temperatures as high as 800¡C. (1,470¡F.). Some reports describe the reaction as violent. Ignition of sulfur, gunpowder, wood, and straw by the heat of the quicklime-water reaction has been reported.
	Mellor **3:** 673 (1946-1947). *Von Schwartz,* p. 325 (1918).

CALCIUM PERCHROMATE $Ca_3(CrOO_3)_2$

(self-reactive)	Calcium perchromate is a buff-colored powder that explodes at 100¡ C.
	Mellor **11:** 359 (1946-1947).

CALCIUM PEROXIDE CaO_2

Polysulfide Polymers	Dry calcium peroxide floating on liquid polysulfide polymers containing mercaptan radicals caused flashing in small scale tests and ignition in plant scale processes.
	R. Davis (1968).

CALCIUM PHOSPHIDE Ca_3P_2

Chlorine	See CHLORINE plus Calcium Phosphide.
Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Hydrochloric Acid	Calcium phosphide and hydrochloric acid undergo a very

	energetic reaction.
	Mellor **8:** 841 (1946-1947).
Oxygen	See SULFUR plus Calcium Phosphide.
Sulfur	See SULFUR plus Calcium Phosphide.
Water	The reaction forms phosphine which is a spontaneously flammable gas (in moist air).
	Von Schwartz, p. 327 (1918). *Lab. Govt. Chemist* (1965). *Douda* (1966).
	Mellor **8:** 841 (1946-1947).

CALCIUM SILICIDE $CaSi_2$

Acids	Calcium silicide plus acids forms the gas, silicon hydride, which may ignite spontaneously in air.
	Lab. Govt. Chemist (1965).
Fluorine	See FLUORINE plus Calcium Silicide.

CALCIUM-SILICON

Acids	Calcium-silicon combinations evolve spontaneously flammable gas when in contact with acids.
	Lab. Govt. Chemist (1965).

CALCIUM SULFATE $CaSO_4$

Aluminum	See ALUMINUM plus Sulfates.

CALCIUM SULFIDE CaS

Lead Dioxide	See BARIUM SULFIDE plus Lead Dioxide.
Potassium Chlorate	See BARIUM SULFIDE plus Lead Dioxide.
Potassium Nitrate	See BARIUM SULFIDE plus Lead Dioxide.

CAMPHOR $C_{10}H_{16}O$

Chromic Anhydride	See CHROMIC ANHYDRIDE plus Naphthalene.

CARBIDES

(See also specific carbides as primary reactants or under other reactants)

Lithium	See LITHIUM plus Carbides.
Oxidizing Agents	Mixtures of carbides and oxidizing agents are explosive.
	Mellor **5:** 848 (1946-1947).
Sulfuric Acid	See SULFURIC ACID plus Carbides.

CARBOHYDRATES

Boron Triiodide	See BORON TRIIODIDE plus Ethers.

CARBON C

Ammonium Nitrate	Explosions may occur when a mixture of these materials is heated.
	Mellor **5:** 822 (1946-1947).
Ammonium Perchlorate	Ammonium perchlorate mixed with carbon (sugar charcoal) undergoes exothermic decomposition below 240¡ C. Above 240¡, the reaction produces mild explosions.
	Trans. Faraday Soc. **56:** 581-90 (1960).
Barium Bromate	See CARBON plus Bromates.
Barium Chlorate	See CARBON plus Bromates.
Barium Iodate	See CARBON plus Bromates.
Bromates	A combination of finely divided carbon with finely divided bromates (also chlorates or iodates) of barium, calcium, magnesium, potassium, sodium, or zinc will explode with

	heat, percussion, and sometimes light friction.
	Mellor **2:** 310 (1946-1947).
Calcium Bromate	See CARBON plus Bromates.
Calcium Chlorate	See CARBON plus Bromates.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Charcoal.
Calcium Iodate	See CARBON plus Bromates.
Chlorates	See CARBON plus Bromates.
Chlorine	See CHLORINE plus Carbon (Activated).
Chlorine and Chromyl Chloride	See CHLORINE plus Chromyl Chloride and Carbon.
Chlorine Monoxide	There is an immediate explosion when charcoal is added to chlorine monoxide.
	Mellor **5:** 824 (1946-1947).
Fluorine	See FLUORINE plus Carbon.
2-Furan Percarboxylic Acid	See 2-FURAN PERCARBOXYLIC ACID (self-reactive).
Iodates	See CARBON plus Bromates.
Iodine Pentoxide	Iodine pentoxide reacts explosively when warmed with carbon, sulfur, sugar, resin, or powdered combustible elements.
	Mellor **2:** 295 (1946-1947).
Lead Nitrate	Lead nitrate reacts with brilliant sparks when projected on red-hot carbon.
	Mellor **7:** 863 (1946-1947).
Magnesium Bromate	See CARBON plus Bromates.
Magnesium Chlorate	See CARBON plus Bromates.
Magnesium Iodate	See CARBON plus Bromates.
Mercurous Nitrate	At high temperature, a mixture of mercurous nitrate and carbon decomposes explosively.

	Mellor **4:** 987 (1946-1947).
Nitric Acid	Pulverized carbon reacts violently with nitric acid.
	Pascal **10:** 504 (1931-1934).
Oils and Air	Fatty oils are spontaneously flammable when distributed in activated carbon. The carbon enormously increases the surface of oil exposed to the air.
	C. W. Bahme, *NFPA Quarterly* **45:** 341 (1952).
	Von Schwartz, p. 326 (1918).
Potassium and Air	See POTASSIUM plus Carbon and Air.
Potassium Bromate	See CARBON plus Bromates.
Potassium Chlorate	See CARBON plus Bromates.
Potassium Iodate	See CARBON plus Bromates.
Sodium Bromate	See CARBON plus Bromates.
Sodium Chlorate	See CARBON plus Bromates.
Sodium Iodate	See CARBON plus Bromates.
Sodium Sulfide	Mixtures of sodium sulfide and carbon are susceptible to spontaneous heating.
	C. A. Browne, *USDA Tech. Bull.* **141** (1929).
	J. Creevy, *Chem. Age* **44:** 257 (1941).
Zinc Bromate	See CARBON plus Bromates.
Zinc Chlorate	See CARBON plus Bromates.
Zinc Iodate	See CARBON plus Bromates.
Zinc Nitrate	Zinc nitrate explodes when sprinkled on hot carbon.
	Mellor **4:** 655 (1946-1947).

CARBONATES

(See also specific carbonates under other reactants)

Aluminum	See ALUMINUM plus Sodium Carbonate.

Fluorine	See FLUORINE plus Carbonates.
Magnesium	See MAGNESIUM plus Carbonates.
Silicon	See SILICON plus Alkali Carbonates.

CARBON DIOXIDE CO_2

Aluminum and Sodium Peroxide	See ALUMINUM plus Sodium Peroxide and Carbon Dioxide.
Cesium Monoxide	See CESIUM MONOXIDE plus Carbon Dioxide.
Diethyl Magnesium	See DIETHYL MAGNESIUM plus Air.
Lithium	See LITHIUM plus Oxygen. See LITHIUM plus Water.
Lithium Acetylene Carbide Diammino	See LITHIUM ACETYLENE CARBIDE DIAMMINO plus Carbon Dioxide.
Magnesium and Sodium Peroxide	See MAGNESIUM plus Sodium Peroxide and Carbon Dioxide.
Potassium	See POTASSIUM plus Carbon Dioxide.
Potassium Acetylene Carbide	See POTASSIUM ACETYLENE CARBIDE plus Carbon Dioxide.
Sodium	See SODIUM plus Carbon Dioxide.
Sodium Carbide	See SODIUM CARBIDE plus Carbon Dioxide.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Carbon Dioxide.
Titanium	See TITANIUM plus Carbon Dioxide.

CARBON DISULFIDE CS_2

Aluminum	See ALUMINUM plus Carbon Disulfide.
Azides	Carbon disulfide plus any of the azides produces violently

	explosive, extremely sensitive salts.
	Mellor **8:** 338 (1946-1947).
Cesium Azide	See CARBON DISULFIDE plus Azides.
Chlorine	See CHLORINE plus Carbon Disulfide.
Chlorine Monoxide	See CHLORINE MONOXIDE plus Carbon Disulfide.
Ethylene Diamine	Mixing carbon disulfide and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethyleneimine	Mixing carbon disulfide and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Fluorine	See FLUORINE plus Carbon Disulfide.
Lead Azide	See CARBON DISULFIDE plus Azides.
Lithium Azide	See CARBON DISULFIDE plus Azides.
Nitric Oxide	See NITRIC OXIDE plus Carbon Disulfide.
Nitrogen Dioxide	See NITROGEN TETROXIDE plus Carbon Disulfide.
Permanganates and Sulfuric Acid	See PERMANGANATES plus Sulfuric Acid and Benzene.
Potassium	See POTASSIUM plus Carbon Disulfide.
Potassium Azide	See CARBON DISULFIDE plus Azides.
Rubidium Azide	See CARBON DISULFIDE plus Azides.
Sodium Azide	See CARBON DISULFIDE plus Azides.
Zinc	See ZINC plus Carbon Disulfide.

CARBON MONOXIDE CO

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Carbon Monoxide.
Cesium Monoxide	See CESIUM MONOXIDE plus Carbon Dioxide.

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Ammonia.
Iodine Heptafluoride	See IODINE HEPTAFLUORIDE plus Carbon Monoxide.
Lithium and Water	See LITHIUM plus Carbon Monoxide and Water.
Nitrogen Trifluoride	See HYDROGEN plus Nitrogen Trifluoride.
Oxygen	See OXYGEN (LIQUID) plus Carbon Monoxide.
Oxygen Difluoride	See HYDROGEN plus Oxygen Difluoride.
Potassium and Oxygen	See POTASSIUM plus Carbon Monoxide and Oxygen.
Silver Oxide	See SILVER OXIDE plus Carbon Monoxide.
Sodium and Ammonia	See SODIUM plus Carbon Monoxide and Ammonia.

CARBON TETRABROMIDE CBr_4

Lithium	See LITHIUM plus Bromoform.

CARBON TETRACHLORIDE CCl_4

Allyl Alcohol	See ALLYL ALCOHOL, plus Carbon Tetrachloride.
Aluminum	See ALUMINUM plus Carbon Tetrachloride.
Aluminum Triethyl Sesquichlorides	See ALUMINUM TRIETHYL plus Carbon Tetrachloride.
Barium	See BARIUM plus Carbon Tetrachloride.
Benzoyl Peroxide and Ethylene	See BENZOYL PEROXIDE plus Carbon Tetrachloride and Ethylene.
Beryllium	See BERYLLIUM plus Carbon Tetrachloride.
Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Carbon Tetrachloride.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Carbon Tetrachloride.
Diborane	A violent explosion occurred when carbon tetrachloride was used on a borane fire.

	Fawcett (1973).
Dimethyl Formamide	See DIMETHYL FORMAMIDE plus Carbon Tetrachloride.
Disilane	See DISILANE plus Carbon Tetrachloride.
Ethylene	Ethylene and carbon tetrachloride can react explosively under high pressures in the presence of organic peroxide catalysts.
	R. O. Bolt, *Chem. Eng. News* **25:** 1866 (1947).
	R. M. Joyce, *Chem. Eng. News* **25:** 1866-7 (1947).
Fluorine	See FLUORINE plus Carbon Tetrachloride.
Lithium	See LITHIUM plus Trichlorotrifluoroethane.
	See LITHIUM plus Carbon Tetrachloride.
Magnesium	See ALUMINUM plus Chloroform.
Oxygen (Liquid)	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Plutonium	See PLUTONIUM plus Carbon Tetrachloride.
Potassium	See POTASSIUM plus Carbon Tetrachloride.
	See POTASSIUM plus Boron Tribromide.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Silver Perchlorate and Hydrochloric Acid	See SILVER PERCHLORATE plus Carbon Tetrachloride and Hydrochloric Acid.
Sodium	See SODIUM plus Carbon Tetrachloride.
	See SODIUM plus Cobaltous Bromide.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride.
Tetrasilane	See TETRASILANE plus Carbon Tetrachloride.
Trisilane	See TRISILANE plus Carbon Tetrachloride.
Uranium	See URANIUM plus Carbon Tetrachloride.
Wax	An explosion occurred when a stream of carbon tetrachloride (fire extinguisher) was directed on burning

	wax.
	Chem. Eng. News **25:** 1866, 2852 (1947).
	Chem. Eng. News **26:** 957 (1948).
Zirconium	See ZIRCONIUM plus Carbon Tetrachloride.

CARBON TETRAIODIDE CI_4

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Carbon Tetraiodide.

CARO'S ACID H_2SO_5

(See PERMONOSULFURIC ACID plus second reactant)

CAUSTIC POTASH KOH

(See POTASSIUM HYDROXIDE plus second reactant)

CAUSTIC SODA NaOH

(See SODIUM HYDROXIDE plus second reactant)

CELLULOSE $(C_6H_{12}O_5)_\chi$

Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Fluorine	See FLUORINE plus Cellulose.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Cellulose.
Sodium Hypochlorite	See SODIUM HYPOCHLORITE plus Oxalic Acid.
Sodium Nitrite	See SODIUM NITRITE plus Cellulose.

CERIUM Ce

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

Phosphorus	Cerium or lanthanum and phosphorus react violently at 400¡ - 500¡ C.
	Mellor **8, Supp. 3:** 347, 252 (1971).

CERIUM ALUMINOHYDRIDE

(See CERIUM TETRAHYDROALUMINATE)

CERIUM HYDRIDE CeH_3

Air	Cerium hydride is spontaneously flammable in air.
	Douda (1966).

CERIUM NITRIDE CeN

Acids	Cerium nitride sometimes reacts violently with dilute acids.
	Mellor **8:** 121 (1946-1947).
Air	With moist air, cerium nitride undergoes spontaneous, incandescent oxidation. If a few drops of water are added to the cerium nitride, the heat developed is adequate to ignite the ammonia and hydrogen evolved.
	Mellor **8:** 121 (1946-1947).
Water	The reaction of cerium nitride and water can produce enough heat to ignite the hydrogen and ammonia being evolved.
	Mellor **8:** 121 (1946-1947).

CERIUM TETRAHYDROALUMINATE $Ce(AlH_4)_3$

Air	Cerium aluminohydride is spontaneously flammable in air.
	Chem. Abst. **49:** 766e (1955). J. Aubrey and G. Monnier, *Comp. Rend.* **238:** 2534-2535 (1954).

CEROUS PHOSPHIDE CeP

Water	The reaction of cerous phosphide, lanthanum phosphide, or neodymium phosphide and water liberates spontaneously flammable phosphine.
	Mellor **8, Supp. 3:** 347, 342, 348 (1971).

CESIUM Cs

Air	Cesium is spontaneously flammable in air at room temperature, if the surface of the cesium is clean.
	Mellor **2:** 468 (1946-1947).
Chlorine	Chlorine vapors and cesium, lithium, or rubidium react with luminous flame.
	Mellor **2, Supp. 1:** 380 (1956).
Oxygen	Cesium burns spontaneously in dry oxygen.
	Mellor **2:** 468 (1946-1947).
Phosphorus	See PHOSPHORUS plus Cesium.
Water	At 20¡C. the heat of reaction is adequate to ignite the hydrogen liberated in the reaction between water and cesium.
	Mellor **2:** 469 (1946-1947).

CESIUM ACETYLIDE CsC_2H

Arsenic	See ARSENIC plus Cesium Acetylene Carbide.
Bromine	See BROMINE plus Cesium Acetylene Carbide.
Chlorine	See CHLORINE plus Cesium Acetylene Carbide.
Cupric Oxide	Cesium acetylene carbide explodes on contact with lead dioxide or cupric oxide at 350¡C.
	Mellor **5:** 849 (1946-1947).
Fluorine	See CHLORINE plus Cesium Acetylene Carbide.
	See FLUORINE plus Cesium Acetylene Carbide.
Hydrogen Chloride	Cesium acetylene carbide burns in hydrogen chloride gas.

	Mellor **5:** 849 (1946-1947).
Iodine	See IODINE plus Cesium Acetylene Carbide.
Lead Dioxide	See CESIUM ACETYLENE CARBIDE plus Cupric Oxide.
Nitrogen Dioxide	Cesium acetylene carbide ignites at about 100¡C. in nitrogen dioxide.
	Mellor **5:** 848-50 (1946-1947).
Phosphorus	See PHOSPHORUS plus Cesium Acetylene Carbide.
Sulfur Dioxide	Cesium acetylene carbide reacts with sulfur dioxide at ordinary temperatures, with incandescence.
	Mellor **5:** 848-50 (1946-1947).
Sulfuric Acid	Cesium acetylene carbide burns with sulfuric acid.
	Mellor **5:** 849 (1946-1947).

CESIUM AMIDE $CsNH_2$

Water	The reaction between cesium amide and water in the presence of air proceeds with incandescence.
	Mellor **8:** 256 (1946-1947).

CESIUM AZIDE CsN_3

(self-reactive)	Cesium azide decomposes at 326¡ C.
	Mellor **8, Supp. 2:** 43 (1967).
Carbon Disulfide	See CARBON DISULFIDE plus Azides.

CESIUM CARBIDE Cs_2C_2

Boron	See SILICON plus Cesium Carbide.
Ferric Oxide	Ferric oxide is reduced with incandescence when gently heated with cesium carbide.
	Mellor **5:** 849 (1946-1947).

Hydrochloric Acid	Cesium carbide ignites in contact with hydrochloric acid unless the acid is dilute.
	Mellor **5:** 848 (1946-1947).
Iodine	See IODINE plus Cesium Carbide.
Nitric Acid	A mixture of nitric acid and cesium carbide will explode.
	Mellor **5:** 848 (1946-1947).
Silicon	See SILICON plus Cesium Carbide.

CESIUM CHLORIDE CsCl

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.

CESIUM FLUORIDE NITROSYL FLUORIDE COMPLEX $CsF.HNF_2$

(self-reactive)	This complex is an unstable compound at room temperature.
	Lawless and Smith, pp. 39, 76 (1968).

CESIUM HEXAHYDROALUMINATE Cs_3AlH_6

(self-reactive)	See POTASSIUM HEXAHYDROALUMINATE (self-reactive).

CESIUM HYDRIDE CsH

Acetylene	In the presence of moisture, cesium hydride reacts vigorously, even at -60¡C. When dry, no reaction occurs below 42¡C.
	Mellor **2:** 483 (1946-1947).
Oxygen	See OXYGEN plus Cesium Hydride.

CESIUM MONOXIDE Cs_2O

Bromine	See BROMINE plus Cesium Monoxide.

Carbon Dioxide	When heated, cesium monoxide burns in carbon monoxide or carbon dioxide.
	Mellor **2:** 487 (1946-1947).
Carbon Monoxide	See CESIUM MONOXIDE plus Carbon Dioxide.
Chlorine	See BROMINE plus Cesium Monoxide.
Fluorine	See BROMINE plus Cesium Monoxide.
Iodine	See BROMINE plus Cesium Monoxide.
Sulfur Dioxide	Sulfur dioxide bleaches cesium monoxide at ordinary temperatures, and when heated the reaction is attended by incandescence.
	Mellor **2:** 487 (1946-1947).
Water	Cesium monoxide is spontaneously flammable in air.
	Brauer (1965).

CESIUM NITRIDE Cs_3N

Air	Cesium nitride burns in air and is readily attacked by chlorine, phosphorus, or sulfur.
	Mellor **8:** 99, 101 (1946-1947).
Chlorine	See CESIUM NITRIDE plus Air.
Phosphorus	See CESIUM NITRIDE plus Air.
Sulfur	See CESIUM NITRIDE plus Air.

CESIUM PERFLUOROPROPOXIDE $CsOC_3F_7$

Fluorine	See FLUORINE plus Cesium Perfluoropropoxide.

CESIUM PHOSPHIDE Cs_3P

Water	Cesium phosphide reacts with water or moist air instantaneously to yield spontaneously flammable phosphine.

	Van Wazer (1958).

CESIUM SILICIDE Cs_2Si_2

Water	The silicides of cesium, potassium, rubidium, and sodium ignite explosively in contact with water.
	Ellern, p. 29 (1968). *Brauer* (1965).

CHARCOAL C

(See also CARBON)

Air	Charcoal is spontaneously flammable when freshly calcined.
	Von Schwartz, p. 323 (1918).
Air (Liquid)	Explosions may occur when liquid air contacts organic matter. A cracked tube containing activated charcoal, when immersed in liquid air, caused a violent explosion.
	J. Taylor, *J. Sci. Instr.* **5:** 24 (1928).
Barium Chlorate	See CHLORATES plus Organic Matter.
Bromine Pentafluoride	See ARSENIC plus Bromine Pentafluoride.
Calcium Chlorate	See CHLORATES plus Organic Matter.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Charcoal.
Chlorine Monoxide	See CHLORINE MONOXIDE plus Charcoal.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Charcoal.
Fluorine	See FLUORINE plus Common Materials and Oxygen.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Charcoal.
Magnesium Chlorate	See CHLORATES plus Organic Matter.
Oxygen and Wood	See OXYGEN (LIQUID) plus Wood and Charcoal.
Perchlorates	See PERCHLORATES plus Charcoal.
Perchloric Acid	See PERCHLORIC ACID plus Charcoal.

Peroxides	See SODIUM PEROXIDE plus Aniline.
Phosphorus and Air	See PHOSPHORUS plus Charcoal and Air.
Potassium	See POTASSIUM plus Charcoal.
Potassium Chlorate	See CHLORATES plus Organic Matter.
Potassium Nitrate	See POTASSIUM NITRATE plus Ammonium Chloride.
Potassium Perchlorate	See PERCHLORATES plus Charcoal.
Ruthenium Tetroxide	See RUTHENIUM TETROXIDE plus Charcoal.
Silver Nitrate	See SILVER NITRATE plus Charcoal.
Sodium Chlorate	See CHLORATES plus Organic Matter.
Sodium Peroxide	See SODIUM PEROXIDE plus Aniline.
Sodium Peroxide and Silver Chloride	See SODIUM PEROXIDE plus Silver Chloride and Charcoal.
Sulfur	See SULFUR plus Charcoal.
Sulfur and Sodium Nitrate	See SULFUR plus Sodium Nitrate and Charcoal.
Zinc Chlorate	See CHLORATES plus Organic Matter. See ZINC CHLORATE plus Charcoal.

CHLORATES

(See also specific chlorates as primary entries and under other reactants)

Acids	All chlorates, when brought in contact with sulfuric acid or certain other strong acids, may give off chlorine dioxide, an explosive gas (See CHLORINE DIOXIDE, self-reactive). With concentrated sulfuric acid, a violent explosion is usual. *Latimer and Hildebrand* (1940). *Von Schwartz*, p. 323 (1918). Also see CHLORATES plus Organic Acids.
Acids and Metals	See CHLORATES plus Metals (powdered).

(powdered)	
Aluminum	See ALUMINUM plus Bromates.
Antimony Sulfide	Antimony sulfide reacts with incandescence with chlorates of cadmium, magnesium, or zinc.
	Mellor **Supp. II, Part I:** 584 (1956).
	A mixture of chlorates plus antimony sulfide, cyanides or thiocyanates explodes. The reaction may be caused by heat, shock, or friction.
	Von Schwartz, p. 323 (1918). *Pieters,* p. 30 (1957).
Arsenic	See ARSENIC plus Bromates.
Arsenic Sulfide	Arsenic sulfide reacts with incandescence with chlorates of cadmium, magnesium, or zinc.
	Mellor **Supp. II, Part I:** 584 (1956).
Calcium Hydride	See BROMATES plus Calcium Hydride.
Carbon	See CARBON plus Bromates.
Charcoal	See CHLORATES plus Organic Matter.
Copper	See COPPER plus Bromates.
Copper Sulfide	See COPPER SULFIDE plus Cadmium Chlorate.
Cyanides	See CHLORATES plus Antimony Sulfide.
	See CYANIDES plus Chlorates. See POTASSIUM CYANIDE plus Sodium Chlorate.
Manganese Dioxide	A mixture of manganese dioxide plus chlorates of barium, calcium, magnesium, potassium, sodium, or zinc may liberate oxygen and heat explosively. The reaction may be originated by heat, shock, friction, age, or static electricity.
	Chem. Eng. News **30:** 3210. *Von Schwartz,* p. 323 (1918).
Mercury Tetratriphosphide	See MERCURY TETRATRIPHOSPHIDE plus Air.
Metals (powdered)	Some mixtures of chlorates and bromates with combustible substances, including powdered metals, are likely to ignite by friction or percussion. Strong acids have a very violent action on these substances and many mixtures of chlorates and combustible substances are set on fire if acted on by

	strong sulfuric acid.
	Lab. Govt. Chemist (1965).
Metal Sulfides	See METAL SULFIDES plus Bromates. See COPPER SULFIDE plus Cadmium Chlorate.
	See CHLORATES plus Antimony Sulfide.
Organic Acids	When a mixture of chlorates and organic acids
(Dibasic)	is heated above room temperature, explosive chlorine dioxide is evolved.
	U.S. Pat. 2,338,268 (1944).
Organic Matter	A mixture of organic matter plus barium chlorate, calcium chlorate, magnesium chlorate, potassium chlorate, sodium chlorate, or zinc chlorate may liberate oxygen and heat explosively. A similar reaction occurs when manganese dioxide, sulfur, or charcoal is combined with these chlorates.
	Chem. Eng. News **30:** 3210. *Von Schwartz,* p. 323 (1918).
Phosphonium Iodide	See PHOSPHONIUM IODIDE plus Bromates.
Phosphorus	See PHOSPHORUS plus Bromates.
	See PHOSPHORUS plus Chlorates.
Potassium Cyanide	A mixture of potassium cyanide and chlorates reacts explosively.
	Bahme, p. 30 (1961).
Selenium	See SELENIUM plus Chlorates.
Sodium Hypophosphite	Mixtures of sodium hypophosphite and chlorates or nitrates will explode if moistened, then dried slowly over flame.
	Chem. Eng. News **25:** 3176-77 (1947).
Strontium Hydride	See BROMATES plus Strontium Hydride.
Sulfur	See SULFUR plus Chlorates. See CHLORATES plus Organic Matter.
Sulfur and Copper	See SULFUR plus Chlorates and Copper.
Sulfur Dioxide	Dry sulfur dioxide reacts on chlorates with evolution of chlorine peroxide which will flash at 60¡C. and can

	explode.
	Mellor **10:** 217 (1946-1947).
Sulfuric Acid	See CHLORATES plus Acids. See also SULFURIC ACID plus Carbides. See SODIUM CHLORATE plus Sulfuric Acid.
	The reaction of chlorates and sulfuric acid (to form chlorine dioxide) may cause explosions.
	Mellor **2, Supp. 1:** 521 (1956).
Sulfuric Acid and Metals	See CHLORATES plus Metals (powdered).
Thiocyanates	See THIOCYANATES plus CHLORATES.
	See CHLORATES plus Antimony Sulfide.
Zinc	See ZINC plus Chlorates.

CHLORIC ACID $HClO_3$

(self-reactive)	Concentrations of chloric acid above 40% decompose.
	Mellor **2, Supp. 1:** 576 (1956).
Ammonia	See ANTIMONY plus Chloric Acid.
Antimony	See ANTIMONY plus Chloric Acid.
Antimony Sulfide	See ANTIMONY SULFIDE plus Chloric acid.
Arsenic Sulfide	See ARSENIC SULFIDE plus Chloric Acid.
Bismuth	See ANTIMONY plus Chloric Acid.
Copper Sulfide	See COPPER SULFIDE plus Cadmium Chlorate.
Organic Matter	Chloric acid decomposes many organic substances with spontaneous ignition.
	Mellor **2:** 310 (1946-1947).
	See ANTIMONY plus Chloric Acid.
Phosphonium Iodide	See PHOSPHONIUM IODIDE plus Bromic Acid.

Stannic Sulfide	See STANNIC SULFIDE plus Chloric Acid.
Stannous Sulfide	See STANNOUS SULFIDE plus Chloric Acid.

CHLORIDES

(See specific chlorides as primary entries or under other reactants)

CHLORINATED HYDROCARBONS

Aluminum	See ALUMINUM plus Chlorinated Hydrocarbons.
Oxygen (liquid)	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Potassium	See POTASSIUM plus Chlorinated Hydrocarbons.
Sodium	See SODIUM plus Chlorinated Hydrocarbons.

CHLORINATED POLYETHYLENE

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

CHLORINE Cl_2

Acetaldehyde	See BROMINE plus Acetaldehyde.
Acetylene	Acetylene can react explosively with chlorine.
	Von Schwartz, p. 142 (1918).
Alcohols	See ALCOHOLS plus Hypochlorous Acid.
Alkylisothiourea Salts	On long contact or with excess chlorine, explosions occur due to the formation of unstable nitrogen trichloride.
	J. Am. Chem. Soc. **63:** 3520 (1941).
Alkylphosphines	Unless precautions are taken, the reaction of chlorine with alkylphosphines or dialkylphosphines is a vigorous decomposing reaction.
	Mellor **8, Supp. 3:** 900 (1971).
Aluminum	See ALUMINUM plus Chlorine.

Ammonia	Ammonia plus chlorine (with heat) explodes due to the formation of extremely sensitive nitrogen trichloride. Excess chlorine (without heat) reacts similarly.
	Mellor **2:** 95 (1946-1947). *Mathieson Chlorine* (1948).
	Mellor **8, Supp. 2:** 330 (1964).
Antimony	See ANTIMONY plus Chlorine.
Arsenic	See ARSENIC plus Chlorine.
Arsenic Disulfide	Arsenic disulfide ignites in a rapid stream of chlorine.
	Mellor **9:** 270 (1946-1947).
Arsine	When chlorine is bubbled into arsine, each bubble produces a flame.
	Mellor **9:** 55 (1946-1947).
	Mellor **2, Supp. 1:** 379 (1956).
Barium Phosphide	The phosphide ignites in chlorine at 90¡ C.
	Mellor **8, Supp. 3:** 842 (1971).
Benzene	An explosion of benzene vapors and chlorine (inadvertently mixed) was initiated by light.
	Report, Amer. Potash and Chemical Co.
Bismuth	See BISMUTH plus Chlorine.
Boron	See BORON plus Chlorine.
Boron Phosphodiiodide	Powdered magnesium and boron phosphodiiodide react with incandescence.
	Mellor **8:** 845 (1946-1947).
Boron Trisulfide	Boron trisulfide ignites in chlorine, even if cold.
	Mellor **5:** 144 (1946-1947).
Brass	Brass burns spontaneously in gaseous chlorine.
	Mellor **2:** 95, 292; **9:** 626 (1946-1947).
Bromine Pentafluoride	Mixture of chlorine and bromine pentafluoride explodes on heating.

	Mellor **2, Supp. 1:** 173 (1956).
Calcium	See CALCIUM plus Chlorine.
Calcium Carbide and Potassium Hydroxide	See DICHLOROACETYLENE plus Air.
Calcium Chlorite	The reaction of chlorine and a dilute solution of calcium chlorite evolves explosive chlorine dioxide.
	Mellor **2, Supp. 1:** 382 (1956).
	See also CHLORINE DIOXIDE (self-reactive).
Calcium Nitride	Calcium nitride reacts in the cold with chlorine, with incandescence.
	Mellor **8:** 99 (1946-1947).
Calcium Phosphide	Mixtures of chlorine and calcium phosphide react readily at about 100¡C.
	Mellor **8:** 841 (1946-1947).
Carbon (Activated)	The mixture spontaneously ignites in the dry state.
	Bahme, p. 28 (1961).
Carbon Disulfide	When liquid chlorine was added to carbon disulfide in an iron cylinder, the iron catalyzed an explosive reaction.
	MCA Case History **971** (1964).
Cesium	See CESIUM plus Chlorine.
Cesium Acetylene Carbide	Cesium acetylene carbide burns in cold chlorine or fluorine.
	Mellor **5:** 849 (1946-1947).
Cesium Monoxide	See BROMINE plus Cesium Monoxide.
Cesium Nitride	See CESIUM NITRIDE plus Air.
Chromyl Chloride and Carbon	The reaction of a mixture of chlorine and chromyl chloride with red-hot carbon sometimes causes a violent reaction or explosion.

	Mellor **11:** 395 (1946-1947).
Copper	See COPPER plus Chlorine.
Copper Hydride	See BROMINE plus Copper Hydride.
Cuprous Acetylide	See BROMINE plus Cuprous Acetylide.
Dialkylphosphines	See CHLORINE plus Alkylphosphines.
Diborane	Diborane explodes in contact with chlorine at ordinary temperatures.
	Mellor **5:** 37 (1946-1947).
Dibutyl Phthalate	See CHLORINE plus Polypropylene.
Diethyl Ether	When ether is poured into chlorine gas an explosion results.
	Bernthsen (1912).
Diethyl Zinc	Diethyl zinc is spontaneously flammable in air or chlorine.
	Handbook Chem. Phys., p. C-715 (1970-1971).
Drawing Wax	See CHLORINE plus Polypropylene
Ethane	Chlorine and ethane have produced explosions.
	Chem. Abst. **31:** 85025 (1937). W. W. Lawrence and S. E. Cook, *Ind. Eng. Chem. Proc. Dev.* **9** (1): 47-49 (1970).
Ethylene	Ethylene reacts explosively with chlorine in sunlight or ultraviolet light.
	Haz. Chem. Data (1966).
	The reaction of chlorine and ethylene is explosive at room temperature over yellow mercuric oxide, mercurous oxide, or silver oxide.
	Mellor **2, Supp. 1:** 380 (1956).
Ethyleneimine	Ethyleneimine plus chlorine forms an explosive compound, 1-chloroethyleneimine.
	Ethyleneimine.
S-Ethyl Isothiourea	An explosion occurred during the chlorination
Sulfate	of S-ethyl isothiourea sulfate and formamidine thiolacetic acid•HCl. Formation of spontaneously explosive nitrogen

	trichloride was the suggested cause.
	J. Am. Chem. Soc. **63:** 3530-32 (1941).
Ethyl Phosphine	A mixture of ethyl phosphine and chlorine explodes.
	Von Schwartz, pp. 324, 325 (1918).
Fluorine	Reaction of chlorine and fluorine is accompanied by flames. In the presence of a spark, a violent explosion occurs.
	Mellor **2, Supp. 1:** 58 (1956).
Formamidine Thiolacetic Acid•HCl	See CHLORINE plus S-Ethyl Isothiourea Sulfate.
Germanium	See GERMANIUM plus Chlorine.
Glycerol	See CHLORINE plus Polypropylene.
Hydrazine	Hydrazine ignites in contact with chlorine.
	Mellor **8:** 313 (1946-1947).
Hydrocarbons	In a chemical process, chlorine inadvertently contacted hydrocarbon vapors at about 60 psig. An explosion ruptured the pipeline.
	MCA Case History **1035** (1964).
	Chlorine reacts vigorously with most hydrocarbons, causing ignition with some, e.g., turpentine.
	Mathieson Chlorine. Mellor **2, Supp. I:** 404.
	During treatment of naphtha with an aqueous caustic-hypochlorite solution to remove objectionable odors, an explosion occurred in the mixer. Just before the detonation, liquid chlorine had been added to strengthen the hypochlorite solution. The explosion is attributed to the highly exothermic liquid phase reaction of chlorine and saturated hydrocarbons.
	Chem. Eng. Progs. **58**(**6**): 71-74 (1962).
	Mellor **2, Supp. 1:** 380 (1956).
Hydrogen	A mixture of hydrogen and chlorine is exploded by almost any form of energy (heat, sunlight, sparks, etc.). Explosive

	range: 5% to 95%.
	Mathieson Chlorine.
Hydrogen Peroxide and Potassium Hydroxide	Red luminescence occurs during reaction of chlorine and hydrogen peroxide in strong potassium hydroxide solution.
	Mellor **2, Supp. 1:** 378 (1956).
Hydroxylamine	Hydroxylamine is spontaneously flammable in chlorine.
	Mellor **8:** 288 (1946-1947).
Iodine	The reaction of liquid chlorine and iodine is violent.
	Mellor **2, Supp. 1:** 378 (1956).
Iron	See IRON plus Chlorine.
Iron Carbide	Iron carbide burns in chlorine below 100¡C with incandescence and behaves similarly with bromine at about 100¡C.
	Mellor **5:** 858 (1946-1947).
Linseed Oil	See CHLORINE plus Polypropylene.
Lithium	See CESIUM plus Chlorine.
Lithium Acetylene Carbide Diammino	See LITHIUM ACETYLENE CARBIDE DIAMMINO plus Carbon Dioxide.
Lithium Carbide	See BROMINE plus Lithium Carbide.
Lithium Silicide	See FLUORINE plus Lithium Silicide.
Magnesium	See MAGNESIUM plus Chlorine.
Magnesium Phosphide	Magnesium phosphide burns brilliantly when heated in chlorine or bromine vapors.
	Mellor **8:** 842 (1946-1947).
Manganese	See MANGANESE plus Chlorine.
Manganese Ditritaphosphide	This phosphide ignites when gently heated in chlorine.

	Mellor **8:** 853 (1946-1947).
Mercuric Oxide	Chlorine reacts rapidly at room temperature with both mercuric oxide and silver oxide.
	Mellor **2, Supp. 1:** 381 (1956).
Mercuric Sulfide	Mercuric sulfide burns in chlorine with incandescence.
	Mellor **4:** 952 (1946-1947).
Mercury	See MERCURY plus Chlorine.
Mercury Tetratriphosphide	See MERCURY TETRATRIPHOSPHIDE plus Air.
Methane	The reaction of chlorine and methane is explosive at room temperature over yellow mercuric oxide.
	Mellor **2, Supp. 1:** 380 (1956).
Niobium (Columbium)	See NIOBIUM plus Chlorine.
	See NIOBIUM plus Fluorine.
Nitrogen Triiodide	See BROMINE plus Nitrogen Triiodide.
Oxomonosilane	The polymer of oxomonosilane ignites in air or chlorine.
	Mellor **6:** 234 (1946-1947).
Oxygen Difluoride	The reaction between chlorine and oxygen difluoride produces a reddish-brown solid that explodes at about minus 10¡ C.
	Mellor **2, Supp. 1:** 182 (1956).
	A mixture of chlorine and oxygen fluoride explodes on gentle warming. Puffs or more violent explosions occur if mixture is in copper tubing at 300¡ C.
	Mellor **2, Supp. 1:** 192 (1956).
Oxygen Difluoride and Copper	See CHLORINE plus Oxygen Difluoride.
Phosphine	See BROMINE plus Phosphine.
Phosphorus	See PHOSPHORUS plus Chlorine.
Phosphorus and	See PHOSPHORUS plus Chlorine and Heptane.

Heptane	
Phosphorus Isocyanate	The reaction of phosphorus isocyanate and chlorine is vigorous, forming a yellow oil.
	Mellor **8, Supp. 3:** 585 (1971).
Phosphorus Oxide	When phosphorus oxide is thrown into a jar of chlorine vapor, it ignites instantly. It reacts violently with liquid bromine and generally ignites.
	Mellor **8:** 897 (1946-1947).
Phosphorus Trioxide	See BROMINE plus Phosphorus Trioxide.
Polychlorinated	Liquid chlorine reacts exothermically with
Biphenyl	polychlorinated biphenyl heat transfer liquid.
	W. A. Statesir, *Chem. Eng. Progs.* **69** (4): 52-54 (1973).
Polydimethylsiloxane	See CHLORINE plus Polypropylene.
Polypropylene	Liquid chlorine reacts explosively with polypropylene, drawing wax, polydimethyl-siloxane, dibutyl phthalate, glycerol, and linseed oil.
	W. A. Statesir, *Chem. Eng. Progs.* **69** (4): 52-54 (1973).
Potassium	See POTASSIUM plus Chlorine.
Potassium Acetylene	Potassium acetylene carbide ignites spontaneously
Carbide	in cold chlorine, forming hydrogen chloride plus carbon.
	Mellor **5:** 849 (1946-1947) *Comp. Rend.* **127:** 916. *Comp. Rend.* **136:** 1220.
Potassium Hydride	Potassium hydride burns in fluorine or chlorine spontaneously.
	Mellor **2:** 483 (1946-1947).
Rubber	Rubber will burn in liquid chlorine. During chlorination of rubber, an explosion occurred causing pressure of over 1,100 psi.
	Chem. Eng. News **26:** 3369.
Rubidium	See CESIUM plus Chlorine.
Rubidium Acetylene	See BROMINE plus Rubidium Acetylene

Carbide	Carbide.
Silicon	See SILICON plus Chlorine.
Silicon Hydride	Silicon hydride ignites in a chlorine atmosphere. *Mellor* **6:** 219 (1946-1947).
Silver Oxide	See CHLORINE plus Mercuric Oxide.
Sodium	See SODIUM plus Chlorine.
Sodium Acetylene Carbide	See BROMINE plus Sodium Acetylene Carbide.
Sodium Carbide	See SODIUM CARBIDE plus Carbon Dioxide. This carbide burns in chlorine gas. *Mellor* **5:** 848 (1946-1947).
Sodium Hydride	Sodium hydride is spontaneously flammable in fluorine. With chlorine, moisture must also be present. *Mellor* **2:** 483 (1946-1947).
Stannous Fluoride	The reaction of chlorine and stannous fluoride occurs with flaming. *Mellor* **2, Supp. 1:** 382 (1956).
Stibine	See STIBINE plus Ammonia.
Strontium Phosphide	Mixtures of these materials ignite at about 30¡ C. *Mellor* **8:** 841 (1946-1947).
Sulfamic Acid	An explosion occurred when chlorine was being passed at room temperature into a reaction mixture which included sulfamic acid and water. It is suspected that nitrogen trichloride, a very sensitive explosive, was formed. *Short* (1966).
Tellurium	Warm chlorine attacks tellurium with incandescence. *Mellor* **11:** 26, 40 (1946-1947).
Tetramethyl Diarsine	Tetramethyl diarsine is spontaneously flammable in chlorine.

	ACS **15** (1923).
Thorium	See THORIUM plus Chlorine.
Tin	See TIN plus Chlorine.
Tungsten Dioxide	When tungsten dioxide is heated in chlorine the reaction occurs with incandescence.
	Mellor **11:** 851 (1946-1947).
Turpentine	See CHLORINE plus Hydrocarbons.
Uranium	Uranium ignites spontaneously if chlorine is heated to 150¡C.
	Mellor **12:** 31, 32 (1946-1947).
Uranium Dicarbide	See BROMINE plus Uranium Dicarbide.
Vanadium	Powdered vanadium explodes with chlorine, even at 0¡C.
	Mellor **Supp. II, Part I:** 715 (1956).
Zinc	See ZINC plus Chlorine.
Zirconium Dicarbide	See BROMINE plus Zirconium Dicarbide.

CHLORINE AZIDE N_3Cl

(self-reactive)	Chlorine azide is spontaneously explosive.
	Mellor **8:** 336 (1946-1947).
	Mellor **8, Supp. 2:** 50 (1967).
Butadiene-1, 3	Chlorine dioxide mixed with butadiene, ethane, ethylene, methane or propane always explodes spontaneously.
	J.K.K. Ip and P. Gray, *Comb. & Flame* **19:** 117-129 (1972).
Ethane	See CHLORINE DIOXIDE plus Butadiene.
Ethylene	See CHLORINE DIOXIDE plus Butadiene.
Methane	See CHLORINE DIOXIDE plus Butadiene.
Propane	See CHLORINE DIOXIDE plus Butadiene.

CHLORINE FLUOROXIDE ClOF

(self-reactive)	Chlorine fluoroxide is explosively unstable.
	Mellor **2, Supp. 1:** 182 (1956).

CHLORINE MONOFLUORIDE ClF

Organic Matter	See BROMINE MONOFLUORIDE plus Water.
Water	See BROMINE MONOFLUORIDE plus Water.

CHLORINE DIOXIDE ClO_2

(self-reactive)	With over 10% chlorine dioxide in air at pressures from 0.1 to 1.0 atmosphere, chlorine dioxide is violently explosive. Explosion may be initiated by almost any form of energy such as sunlight, heat, or sparks.
	Chem. Eng. News **29:** 5030 (1951).
Difluoroamine	The gas phase reaction of chlorine dioxide and difluoroamine is explosive.
	Lawless and Smith, p. 171 (1968).
Fluorine	See FLUORINE plus Chlorine Dioxide.
Mercury	See MERCURY plus Chlorine Dioxide.
Organic Matter	Organic material in contact with chlorine dioxide can be exploded by shock or sparks.
	R.F. Stedman, *Chem. Eng. News* **29:** 5030 (1951).
Phosphorus	See PHOSPHORUS plus Chlorine Dioxide.
Potassium Hydroxide	See POTASSIUM HYDROXIDE plus Chlorine Dioxide.
Sugar	See SULFUR plus Chlorine Dioxide.
Sulfur	See SULFUR plus Chlorine Dioxide.

CHLORINE FLUORIDE ClF

Tellurium	See TELLURIUM plus Chlorine Fluoride.

CHLORINE MONOXIDE Cl_2O

(self-reactive)	Chlorine monoxide is highly explosive if heated rapidly or overheated locally.
	Mellor **2, Supp. 1:** 517 (1956).
Ammonia	A mixture of chlorine monoxide and ammonia explodes.
	Mellor **2:** 241, 242 (1946-1947).
Antimony	See POTASSIUM plus Chlorine Monoxide.
Antimony Sulfide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Arsenic	See POTASSIUM plus Chlorine Monoxide.
Barium Sulfide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Calcium Phosphide	Calcium phosphide causes chlorine monoxide to explode; chlorine monoxide also causes explosions with sulfides of barium, tin, antimony and mercury.
	Mellor **2:** 242 (1946-1947).
Carbon	See CHLORINE MONOXIDE plus Charcoal.
Carbon Disulfide	Chlorine monoxide explodes in contact with carbon disulfide vapor.
	Mellor **6:** 110 (1946-1947).
Charcoal	An immediate explosion occurs when charcoal is added to chlorine monoxide.
	Mellor **5:** 822-30 (1946-1947).
Hydrogen Sulfide	A mixture of chlorine monoxide and hydrogen sulfide explodes.
	Mellor **2:** 241-42 (1946-1947).
Mercury Sulfide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Metal Sulfides	See CHLORINE MONOXIDE plus Calcium Phosphide.
Nitric Oxide	A mixture of nitric oxide and chlorine monoxide can be explosive.
	Ann. Chim. et Phys. (2) **57:** 225.

Organic Matter	Chlorine monoxide often explodes violently in contact with organic compounds.
	Mellor **2, Supp. 1:** 520 (1956).
	See POTASSIUM plus Chlorine Monoxide.
Phosphine	Chlorine monoxide explodes on contact with phosphine.
	Taylor (1831).
Phosphorus	See CHLORINE MONOXIDE plus Calcium Phosphide.
Sulfur	See POTASSIUM plus Chlorine Monoxide.
Tin Sulfides	See CHLORINE MONOXIDE plus Calcium Phosphide.
Turpentine	See POTASSIUM plus Chlorine Monoxide.

CHLORINE TRIFLUORIDE ClF_3

Acetic Acid	The reaction between chlorine trifluoride and acetic acid is very violent, sometimes explosive.
	Mellor **2, Supp. 1:** 155 (1956).
Aluminum	See ALUMINUM plus Chlorine Trifluoride.
Aluminum Oxide	Chlorine trifluoride reacts violently, producing flame, with aluminum oxide, calcium oxide, chromium oxide, lead dioxide, magnesium oxide, manganese dioxide, molybdenum trioxide, tantalum pentoxide, tungsten trioxide, or vanadium pentoxide.
	Mellor **2, Supp. 1:** 157 (1956).
	See also CHLORINE TRIFLUORIDE plus Elements.
Ammonia	Chlorine trifluoride causes an explosive reaction with ammonia, carbon monoxide, hydrogen sulfide, sulfur dioxide, or hydrogen.
	Mellor **2, Supp. 1:** 157 (1956).
Antimony	See ANTIMONY plus Chlorine Trifluoride.
Arsenic	See ANTIMONY plus Chlorine Trifluoride.
Arsenic Trioxide	Chlorine trifluoride produces a violent reaction without flame in presence of arsenic trioxide, bismuth trioxide,

	lanthanum oxide, phosphorus pentoxide, or stannic oxide.
	Mellor **2, Supp. 1:** 157 (1956).
	See also CHLORINE TRIFLUORIDE plus Elements.
Benzene	The reaction between chlorine trifluoride and benzene is very violent, sometimes explosive.
	Mellor **2, Supp. 1:** 155 (1956).
Bismuth Trioxide	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Calcium	See CALCIUM plus Chlorine Trifluoride.
Calcium Oxide	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Carbon Monoxide	See CHLORINE TRIFLUORIDE plus Ammonia.
Charcoal	Chlorine trifluoride causes charcoal, glass wool (rapidly etched with traces of moisture), or graphite to burst into flame.
	Mellor **2, Supp. 1:** 157 (1956).
Chlorotrifluoroethylene Polymer (Kel-F Oil) and Water	While chlorine trifluoride was being passed through Kel-F Oil for disposal the inadvertent introduction of moisture set up the exothermic water-plus-chlorine trifluoride reaction. The heat evolved initiated a violent reaction with the Kel-F Oil.
	Chem. Eng. News **43** (20): 41 (1965).
Chromic Anhydride	Chlorine trifluoride and chromic anhydride react violently with evolution of brown fumes.
	Mellor **2, Supp. 1:** 157 (1956).
	Mellor **11:** 230 (1946-1947).
Chromic Oxide	Reaction between chlorine trifluoride and chromic oxide is accompanied by incandescence.
	Mellor **11:** 181 (1946-1947).
Chromium Oxide	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Copper	See ALUMINUM plus Chlorine Trifluoride.
Diethyl Ether	The reaction between chlorine and diethyl ether is very

	violent, sometimes explosive.
	Mellor **2, Supp. 1:** 155 (1956).
Elements	Most chemical elements are attacked explosively by chlorine trifluoride. Most oxides behave the same way. Glass wool catches fire in the vapor. One drop of the liquid sets fire to paper, cloth, or wood. The reaction is violent with water or ice.
	Sidgwick, p. 1156 (1950). *Matheson Gas Data,* p. 108 (1961).
Glass	Glass wool catches fire readily in the vapor. Chlorine trifluoride flowing in glass tubing at excessive rates or pressures can cause the glass to burn.
	Sidgwick, p. 1156 (1950). *Yunker* (1966).
	See also CHLORINE TRIFLUORIDE plus Charcoal.
Graphite	See CHLORINE TRIFLUORIDE plus Charcoal.
Hydrogen	See CHLORINE TRIFLUORIDE plus Ammonia.
Hydrogen Sulfide	See CHLORINE TRIFLUORIDE plus Ammonia.
Iodine	See CHLORINE TRIFLUORIDE plus Mercuric Iodide.
Iridium	See IRIDIUM plus Chlorine Trifluoride.
Iron	See IRON plus Chlorine Trifluoride.
Lanthanum Oxide	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Lead	See ALUMINUM plus Chlorine Trifluoride.
Lead Dioxide	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Magnesium	See ALUMINUM plus Chlorine Trifluoride.
Magnesium Oxide	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Manganese Dioxide	See MANGANESE DIOXIDE plus Chlorine Trifluoride.
	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Mercuric Iodide	Combination of chlorine trifluoride and mercuric iodide, tungsten carbide, or iodine results in a reaction with flame.
	Mellor **2, Supp. 1:** 157 (1956).

Molybdenum	See MOLYBDENUM plus Chlorine Trifluoride.
Molybdenum Trioxide	See MOLYBDENUM TRIOXIDE plus Chlorine Trifluoride.
	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Nitric Acid (Fuming)	Combination of chlorine trifluoride and fuming nitric acid, potassium carbonate, potassium iodide, silver nitrate, 10% sodium hydroxide or sulfuric acid results in a violent reaction.
	Mellor **2, Supp. 1:** 157 (1956).
Nitroaromatic Compounds	See NITROAROMATIC COMPOUNDS plus Chlorine Trifluoride.
Organic Matter	Chlorine trifluoride is compatible with other oxidizers such as OF_2 and ClO_3F, but reacts violently with organics. See also CHLORINE TRIFLUORIDE plus Elements.
	Lawless and Smith, p. 114 (1968).
	Mellor **2, Supp. 1:** 155 (1956).
	See also BROMINE MONOFLUORIDE plus Water.
Osmium	See ANTIMONY plus Chlorine Trifluoride.
Oxides	See CHLORINE TRIFLUORIDE plus Elements.
Phosphorus	See ANTIMONY plus Chlorine Trifluoride.
Phosphorus Pentoxide	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Potassium	See ANTIMONY plus Chlorine Trifluoride.
Potassium Carbonate	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Potassium Iodide	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Rhodium	See ANTIMONY plus Chlorine Trifluoride.
Rubber	When chlorine trifluoride is in contact with rubber a violent reaction occurs.
	Mellor **2, Supp. 1:** 156 (1956).
Selenium	See ANTIMONY plus Chlorine Trifluoride.

Silicon	See ANTIMONY plus Chlorine Trifluoride.
Silver	See ALUMINUM plus Chlorine Trifluoride.
Silver Nitrate	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Sodium	See CALCIUM plus Chlorine Trifluoride.
Sodium Hydroxide	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Stannic Oxide	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Sulfur	See ANTIMONY plus Chlorine Trifluoride.
Sulfur Dioxide	See CHLORINE TRIFLUORIDE plus Ammonia.
Sulfuric Acid	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Tantalum Pentoxide	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Tellurium	See ANTIMONY plus Chlorine Trifluoride.
Tin	See ALUMINUM plus Chlorine Trifluoride.
Tungsten	See ANTIMONY plus Chlorine Trifluoride.

Tungsten Trioxide	See TUNGSTEN TRIOXIDE plus Chlorine Trifluoride.
	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Vanadium Pentoxide	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Water	See CHLORINE TRIFLUORIDE plus Elements.
	See also BROMINE MONOFLUORIDE plus Water.
Zinc	See ALUMINUM plus Chlorine Trifluoride.

CHLORINE TRIOXIDE ClO_3

(self-reactive)	Explosions occurred during preparation of chlorine trioxide.
	Mellor **2, Supp. 1:** 540 (1956).
Ethyl Alcohol	No really safe conditions exist under which ethyl alcohol and chlorine oxides can be handled.

	Mellor **2, Supp. 1:** 540 (1956).
Organic Matter	Chlorine trioxide reacts violently, even explosively, with stopcock grease, wood, most forms of organic matter.
	Mellor **2, Supp. 1:** 540 (1956).
Phosphorus	See PHOSPHORUS plus Chlorine Trioxide.
Phosphorus Pentachloride	When chlorine trioxide is passed over phosphorus pentachloride, there is often a vigorous explosion, explosive chlorine monoxide being formed.
	Bull. Acad. Belg. (2) **38:** 503 (1814).
Water	Chlorine trioxide reacts vigorously and may explode with water.
	Mellor **2, Supp. 1:** 540 (1956).

CHLORITES

(See also specific chlorites)

Ammonia	This reaction produces ammonium chlorite, which is a shock-sensitive compound.
	Federoff **3:** C-254 (1966).
Organic Matter	See CHLORITES plus Metals.
Metals	Finely divided metallic or organic substances, if mixed with chlorites, are highly flammable and may be ignited by friction.
	Lab. Govt. Chemist (1965).

CHLOROACETALDEHYDE OXIME $ClCH_2CH{=}NOH$

(self-reactive)	Separation of chloroacetaldehyde oxime from ether by distillation must not be carried out too far or a violent explosion will occur.
	MCA Guide for Safety, Appendix 3 (1972).

CHLOROACETONE $ClCH_2COCH_3$

(self-reactive)	Chloroacetone had turned black during storage for two years on a shelf in dull diffused light. A few days after the bottle of chloroacetone was moved, it exploded. The chloroacetone had polymerized to a black rubber-like substance. *Ind. & Eng. Chem. News* **9:** 184 (1931).

CHLOROACETYLENE HC≡CCl

(self-reactive)	See POTASSIUM HYDROXIDE plus 1,2-Dichloroethylene.
Air	See POTASSIUM HYDROXIDE plus 1,2-Dichloroethylene.

m-CHLOROANILINE DIAZONIUM CHLORIDE $NH_2 \cdot C_6H_4N(\equiv N)Cl$

Sodium Bisulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.
Sodium Polysulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.
Sodium Sulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.

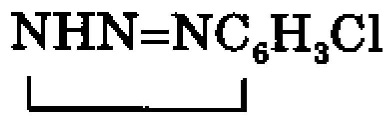
CHLOROAZODIN $ClN{=}C(NH_2)N{=}NC(NH_2)NCl$

(self-reactive)	Chloroazodin decomposes explosively at about 155¡C. The decomposition is accelerated by contact with metals. *Merck Index,* p. 240 (1968).

CHLOROBENZENE C_6H_5Cl

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
Silver Perchlorate	See SILVER PERCHLORATE plus Acetic Acid.

5-CHLOROBENZOTRIAZOLE



(self-reactive)	5-Chlorobenzotriazole spontaneously burst into flame while being packaged.
	H. S. Hopps, *Chem. Eng. News* **49** (30): 3 (1971).
	J. Chem. Eng. Data **17:** 108 and 109 (1972).

3-CHLOROCYCLOPENTENE (-$CH{=}CHCHClCH_2CH_2$-)

(self-reactive)	Thirty-five grams of 3-chlorocyclopentene exploded one day after it was made.
	Merck Safety Report (April 1962).

CHLORODIBORANE $ClBH(H_2)BH_2$

Air	This compound is spontaneously flammable in air.
	Mellor **5:** 37 (1946-1947). *Douda* (1966).

CHLORODIETHYLALUMINUM $(C_2H_5)_2AlCl$

Benzene and Allyl Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Toluene and Allyl Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Water	Diethyl aluminum chloride reacts violently with water.
	Rose (1961).

CHLORODIETHYLBISMUTHINE $(C_2H_5)_2BiCl$

Air	Diethyl bismuth chloride is spontaneously flammable in air.
	Coates, p. 161 (1956).

CHLORODIETHYLBORANE $(C_2H_5)_2BCl$

Air	Diethyl boron chloride is spontaneously flammable in air.
	Buls, *Bimonthly Rept. 5*, p. 3 (1953).

2-CHLORO-1, 1-DIETHOXYETHANE $(C_2H_5O)_2CHCH_2Cl$

Sodium Amide	See SODIUM AMIDE plus 1,1-Diethoxy-2-Chloroethane.

CHLORODIISOBUTYLALUMINUM $AlCl(C_4H_9)_2$

Air	Diisobutyl aluminum chloride ignites spontaneously in air.
	J. E. Knap, R. E. Leach et al., *Ind. Eng. Chem.* **49** (5): 874-879 (1957).

CHLORO (DIMETHYLAMINO) DIBORANE $(CH_3)_2NB_2H_4Cl$

Air	Dimethylamino chlorodiborane is spontaneously flammable in air.
	A. B. Burg and C. L. Randolph, Jr., *J. Am. Chem. Soc.* **71:** 3451-3455 (1949).

1-CHLORO-2, 4-DINITROBENZENE $(O_2N)_2C_6H_3Cl$

(self-reactive)	An explosion may occur when the solvent symmetrical tetrachlorethane is almost removed in the chlorinolysis of 2, 4-dinitrophenyl disulfide.
	MCA Guide for Safety, Appendix 3 (1972).
	2, 4-Dinitrochlorobenzene has been known to detonate at

	about 300¡F. It can be detonated by shock or heat under confinement that will permit high pressure build-up.
	Haz. Chem. Data, p. 85 (1966).
Hydrazine Hydrate	See HYDRAZINE HYDRATE plus 2, 4-Dinitrochlorobenzene.
	See also 2, 4-Dinitrochlorobenzene.

4-CHLORO-3,6-DINITROPHENYLDIAZONIUM-2-OXIDE

$C_6H_2(NO_2)_2ClNNO$

(self-reactive)	See 4-CHLORO-2-NITROANILINE plus Nitric Acid.

x-CHLORO-2, 4-DINITROTOLUENE $C_6H_3(NO_2)_2CH_2Cl$

(self-reactive)	2,4-Dinitrochlorotoluene has been known to detonate at about 300¡F. It can be exploded by shock or heat under confinement that will permit high pressure build-up.
	Van Dolah (1966).

CHLORODIPROPYLBORANE $(C_3H_7)_2BCl$

Air	Dipropylchloroborine is spontaneously flammable in air.
	Douda (1966).

2-CHLOROETHANOL $ClCH_2CH_2OH$

Chlorosulfonic Acid	Mixing ethylene chlorohydrin and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	Mixing ethylene chlorohydrin and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete

	reference.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Chlorohydrin.

2-CHLOROETHYLENIMINE CHCl=C=NH

(self-reactive)	A distilled 50-gram quantity, after sitting in an amber bottle for three months, exploded suddenly. A black residue indicated it may have polymerized.
	Chem. Eng. News **42** (8): 41 (1964); *Chem. Eng. News* **36** (43): 52 (1958).

N-CHLOROETHYLENIMINE

(self-reactive)	*MCA Guide for Safety*, Appendix 3 (1972).

CHLOROFLUOROHYDROCARBONS

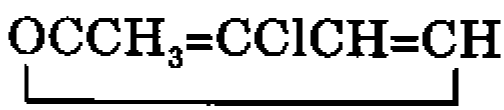
Aluminum	See ALUMINUM plus Chlorofluorohydrocarbons.

CHLOROFORM Cl_3CH

Acetone	See ACETONE plus Chloroform.
Aluminum	See ALUMINUM plus Chlorinated Hydrocarbons and ALUMINUM plus Chloroform.
Disilane	See DISILANE plus Carbon Tetrachloride.
Lithium	See LITHIUM plus Chloroform.
Magnesium	See MAGNESIUM plus Chloroform.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Perchloric Acid and	See PHOSPHORUS PENTOXIDE plus Perchloric

Phosphorus Pentoxide	Acid and Chloroform.
Potassium	See POTASSIUM plus Chloroform.
Potassium Hydroxide and Methyl Alcohol	See SODIUM HYDROXIDE plus Chloroform and Methyl Alcohol.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Sodium	See SODIUM plus Chloroform.
Sodium Hydroxide and Methyl Alcohol	See SODIUM HYDROXIDE plus Chloroform and Methyl Alcohol.
Sodium Methylate	See SODIUM METHYLATE plus Chloroform.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride.
	See LITHIUM plus Chloroform.

3-CHLORO-2-METHYLFURAN



(self-reactive)	A small sample (20 milliliters) had been made, distilled and allowed to stand over the weekend. During the weekend it exploded. *MCA Guide for Safety,* Appendix 3 (1972).
Lithium Aluminum Hydride and Ethyl Acetate	A mixture of chlorinated organic compounds consisting principally of 3-CHLORO-2-METHYLFURAN was subjected to reductive dechlorination with lithium aluminum hydride, after which ethyl acetate was added in small increments to decompose excess lithium aluminum hydride. After a few drops had been added, a violent explosion occurred. *Chem. & Ind.* **14:** 432 (1957).

4-CHLORO-2-NITROANILINE $NO_2(Cl)C_6H_3NH_2$

Nitric Acid	In a large scale-up of the method for preparing 4-chloro-2,6-dinitroaniline by reacting nitric acid with 4-chloro-2-nitroaniline, an unexpected strong evolution of heat was experienced. The exotherm was found due to the simultaneous formation of two explosive products — the isomer 2-chloro-4,6-dinitroaniline and also 4-chloro-3,6-dinitrophenyldiazonium-2-oxide. The latter is very shock sensitive. *MCA Case History* **1489** (1968).

CHLORONITROTOLUENES

Sodium Hydroxide	The feed stream into a tank of mixed chloronitrotoluenes became inadvertently contaminated with caustic. The runaway reaction within the tank ripped the tank open in spite of a 10-inch relief vent. *MCA Case History* **907** (1963).

CHLOROPENTAMMINE COBALT PERCHLORATE

(See COBALTOUS-PENTAMMINE CHLORO-PERCHLORATE)

p-CHLOROPHENYL ISOCYANATE ClC_6H_4NCO

(self-reactive)	A violent explosion occurred in a laboratory during vacuum distillation of p-chlorophenyl isocyanate that had been prepared by the Curtius reaction of p-chlorobenzoylazide. *Chem. & Ind.* **38:** 1625 (1965).

CHLOROPICRIN Cl_3CNO_2

(self-reactive)	Tank car volumes of this material may detonate under certain conditions. There is a critical volume above which sufficient shock may cause detonation.

	Chem. Eng. News **50** (38): 13 (1972).
Propargyl Bromide	See PROPARGYL BROMIDE plus Chloropicrin.

3-CHLORO-1-PROPYNE CH≡CCH_2Cl

(self-reactive)	See PROPARGYL BROMIDE. Liquid propargyl chloride is much less susceptible to this type ignition. D. R. Forshey et al., *Fire Tech.* **5** (2):100-111 (1969).

CHLOROSILANE $ClSiH_3$

Ammonia	With insufficient ammonia, chlorosilane forms trisilylammonia which is spontaneously flammable in air. *Mellor* **8:** 262 (1946-1947).

CHLOROSILANES ClxSiHy

Air	The chlorosilicon hydrides are spontaneously flammable in air. *Ellern*, p. 22 (1968).

CHLOROSILICON HYDRIDES

(See CHLOROSILANES)

CHLOROSULFONIC ACID

(See CHLOROSULFURIC ACID)

CHLOROSULFURIC ACID $ClSO_2OH$

Acetic Acid	See ACETIC ACID plus Chlorosulfonic Acid.
Acetic Anhydride	See ACETIC ANHYDRIDE plus Chlorosulfonic Acid.
Acetonitrile	See ACETONITRILE plus Chlorosulfonic Acid.

Acrolein	See ACROLEIN plus Chlorosulfonic Acid.
Acrylic Acid	See ACRYLIC ACID plus Chlorosulfonic Acid.
Acrylonitrile	See ACRYLONITRILE plus Chlorosulfonic Acid.
Allyl Alcohol	See ALLYL ALCOHOL plus Chlorosulfonic Acid.
Allyl Chloride	See ALLYL CHLORIDE plus Chlorosulfonic Acid.
2-Aminoethanol	See 2-AMINOETHANOL plus Chlorosulfonic Acid.
Ammonium Hydroxide	Mixing chlorosulfonic acid and 28% ammonia in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Aniline	See ANILINE plus Chlorosulfonic Acid.
n-Butyraldehyde	See n-Butyraldehyde plus Chlorosulfonic Acid.
Creosote Oil	Mixing chlorosulfonic acid and creosote oil in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Cresol	See CRESOL plus Chlorosulfonic Acid.
Cumene	See CUMENE plus Chlorosulfonic Acid.
Dichloroethyl Ether	See DICHLOROETHYL ETHER plus Chlorosulfonic Acid.
Diethylene Glycol Monomethyl Ether	See DIETHYLENE GLYCOL MONOMETHYL ETHER plus Chlorosulfonic Acid.
Diisobutylene	See DIISOBUTYLENE plus Chlorosulfonic Acid.
Diisopropyl Ether	See DIISOPROPYL ETHER plus Chlorosulfonic Acid.
Epichlorohydrin	See EPICHLOROHYDRIN plus Chlorosulfonic Acid.
Ethyl Acetate	See ETHYL ACETATE plus Chlorosulfonic Acid.
Ethyl Acrylate	See ETHYL ACRYLATE plus Chlorosulfonic Acid.
Ethylene Chlorohydrin	See ETHYLENE CHLOROHYDRIN plus Chlorosulfonic Acid.
Ethylene Cyanohydrin	See ETHYLENE CYANOHYDRIN plus Chlorosulfonic

	Acid.
Ethylene Diamine	See ETHYLENE DIAMINE plus Chlorosulfonic Acid.
Ethylene Glycol	See ETHYLENE GLYCOL plus Chlorosulfonic Acid.
Ethylene Glycol Monoethyl Ether Acetate	See ETHYLENE GLYCOL MONOETHYL ETHER ACETATE plus Chlorosulfonic Acid.
Ethyleneimine	See ETHYLENEIMINE plus Chlorosulfonic Acid.
Glyoxal	See GLYOXAL plus Chlorosulfonic acid.
Hydrochloric Acid	Mixing chlorosulfonic acid and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing chlorosulfonic acid and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Hydrogen Peroxide	Permonosulfonic acid was being prepared by reacting chlorosulfonic acid and 90% hydrogen peroxide. A sample was stored overnight at 0¡ C, then removed to a test tube rack. In ten minutes it exploded. *Chem. Eng. News* **33:** 3336 (1955). See also PERMONOSULFURIC ACID plus Acetone.
Isoprene	See ISOPRENE plus Chlorosulfonic Acid.
Mesityl Oxide	See MESITYL OXIDE plus Chlorosulfonic acid.
Metallic Powders	See CHLOROSULFONIC ACID plus Organic Matter.
Methyl Ethyl Ketone	See METHYL ETHYL KETONE plus Chlorosulfonic Acid.
Nitric Acid	Mixing chlorosulfonic acid and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete

	reference.
2-Nitropropane	Mixing chlorosulfonic acid and 2-nitropropane in a closed container caused the temperature pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Organic Matter	This material is dangerous in contact with combustible materials, nitrates, chlorates, metallic powders, carbides, picrates and fulminates. It develops great heat in contact with water.
	Chem. Safety Data Sheet **SD-33** (1949).
Phosphorus	See PHOSPHORUS plus Chlorosulfonic Acid.
Propiolactone (beta-)	See PROPIOLACTONE (beta-) plus Chlorosulfonic Acid.
Propylene Oxide	See PROPYLENE OXIDE plus Chlorosulfonic Acid.
Pyridine	See PYRIDINE plus Chlorosulfonic Acid.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Chlorosulfonic Acid.
Styrene Monomer	See STYRENE MONOMER plus Chlorosulfonic Acid.
Sulfolane	See SULFOLANE plus Chlorosulfonic Acid.
Sulfuric Acid	Mixing chlorosulfonic acid and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Vinyl Acetate	See VINYL ACETATE plus Chlorosulfonic Acid.
Vinylidene Chloride	See VINYLIDENE CHLORIDE plus Chlorosulfonic Acid.
Water	See CHLOROSULFONIC ACID plus Organic Matter.

CHLOROTHION $(CH_3O)_2P(S)OC_6H_3ClNO_2$

(self-reactive)	When a sample was heated in a small test tube it decomposed and in a few minutes the residue exploded.
	J.B. McPherson and G.A. Johnson, *Agri. Food Chem.* **4** (1): 42 (1956).

4-CHLORO-o-TOLUIDINE DIAZONIUM CHLORIDE SALT

$NH_2C_6H_3(Cl)CH_2N(\equiv N)Cl$

Sodium Bisulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.
Sodium Polysulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.
Sodium Sulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.

CHLOROTRIFLUOROETHYLENE $ClFC{=}CF_2$

Bromine and Oxygen	Addition of bromine to a mixture of chlorotrifluoroethylene and oxygen causes an explosion. One of the products of the reaction is chlorotrifluoroethylene peroxide, which explodes when heated.
	R.N. Haszeldine and F. Nyman, *J. Chem. Soc.* **1959:** 1084-1090 (1959).
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Chlorotrifluoroethylene
and Water	Polymer and Water.

CHLOROTRIFLUOROETHYLENE PEROXIDE CF_2ClCOF

(self-reactive)	Chlorotrifluoroethylene peroxide explodes when heated.
	R.N. Haszeldine and F. Nyman, *J. Chem. Soc.* **1959:** 1084-90 (1959).

CHLOROTRIFLUOROMETHANE $CClF_3$

Aluminum	See ALUMINUM plus Dichlorodifluoromethane.

CHLOROTRIMETHYLSILANE $(CH_3)_3SiCl$

Water	Trimethyl chlorosilane reacts violently with water yielding heat and white acid fumes. *Title* 46 (1970).

CHROMATES

Hydrazine	Hydrazine is decomposed explosively by chromates and chromic anhydride. *Mellor* **11:** 234 (1946-1947).

CHROMIC ACID

(See CHROMIC ANHYDRIDE)

CHROMIC ANHYDRIDE CrO_3

(CHROMIC ACID; CHROMIUM VI OXIDE;

CHROMIUM TRIOXIDE)

Acetic Acid	Acetic acid or acetic anhydride can explode with chromic acid if not kept cold. *Von Schwartz*, p. 321 (1918).
Acetic Anhydride	During the preparation of chromyl acetate by the direct reaction of chromic anhydride on acetic anhydride without the use of diluting solvents, a violent explosion occurred. J.G. Dawber, *Chem. & Ind.* **23:** 973 (Part I, 1964). See also CHROMIC ANHYDRIDE plus Acetic Acid.
Acetic Anhydride and Acetic Acid	Acetic anhydride was gradually being titrated into a mixture of chromic anhydride and acetic acid in a 20-gallon, glass-lined tank. After 1 1/2 hours of this procedure, the contents of the reactor exploded. *Doyle* (1966).
Acetone	An attempt to purify acetone by refluxing with chromic anhydride led to an explosion and fire when the acetone

	was first brought into contact with the chromic anhydride.
	Robert Delhez, *Chem. & Ind.:* 931 (Sept. 8, 1956).
Aluminum	See ALUMINUM plus Chromic Anhydride.
Ammonia	Ammonia gas decomposes the dry trioxide with incandescence at ordinary temperatures.
	Mellor **11:** 161 (1946-1947).
	Mellor **11:** 233 (1946-1947).
Anthracene	Anthracene will burst into flame on contact with chromic acid.
	Douglas and Thompson (1949).
Arsenic	See ARSENIC plus Chromium Trioxide.
Benzene	Benzene ignites in contact with powdered chromic anhydride.
	Mellor **11:** 235 (1946-1947).
Camphor	See CHROMIC ANHYDRIDE plus Naphthalene.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Chromic Anhydride.
Chromous Sulfide	Ignition occurs when chromium trioxide comes in contact with a small proportion of chromium sulfide.
	Mellor **11:** 430 (1946-1947).
Diethyl Ether	These compounds react violently at room temperature.
	Mellor **11:** 235 (1946-1947).
Dimethyl Formamide	A violent reaction occurred when chromic anhydride was added rapidly or in large lumps to dimethyl formamide.
	Chem. Eng. News **48** (28): 4 (July 6, 1970).
Ethyl Alcohol	Chromic anhydride ignites ethyl alcohol.
	Durrant, p. 990 (1962).
Glycerol	See CHROMIC ANHYDRIDE plus Naphthalene.
Hydrocarbons	Chromic anhydride ignites many hydrocarbons.
	Campbell and Young, *Science* **104:** 353 (1946).

Hydrogen Sulfide	When hydrogen sulfide is passed over heated chromium trioxide, decomposition occurs with incandescence.
	Mellor **11:** 232 (1946-1947).
	See also CHROMIC ANHYDRIDE plus Naphthalene.
Methyl Alcohol	A laboratory preparation of hexa-aquochromic sulfate required the reduction of chromic anhydride by methyl alcohol. When the alcohol was contacted by the anhydride, an explosion and fire resulted.
	Delhez (1967).
Naphthalene	Naphthalene, camphor, glycerol, or turpentine will react violently with chromic anhydride.
	Haz. Chem. Data, p. 68 (1967).
Organic Matter	A container of 50 kilograms of chromic anhydride exploded when laid on the ground. The container may have been contaminated with an oxidizable substance.
	Chem. Abst. **31:** 4010 (1937).
Phosphorus	See PHOSPHORUS plus Chromium Trioxide.
Potassium	See POTASSIUM plus Chromium Trioxide.
Potassium Ferricyanide	While these two compounds were being mixed, an explosion occurred when the dust was ignited by a spark.
	Mich. Occ. Health **7:** No. 2, p. 2 (Winter 1962).
Pyridine	During the preparation of a chromium trioxide-pyridine complex, the proportion of the trioxide was increased. Since the trioxide dissolves in the pyridine by swelling, then rapidly dissolving with evolution of heat, the excessive amount of chromium trioxide produced overheating, which resulted in an explosion and fire.
	MCA Case History **1284** (1967).
Selenium	See SELENIUM plus Chromium Trioxide.
Sodium	See SODIUM plus Chromium Trioxide.
Sodium Amide	See SODIUM AMIDE plus Chromic Anhydride.
Sulfur	See SULFUR plus Chromic Anhydride.

Turpentine	See CHROMIC ANHYDRIDE plus Naphthalene.

CHROMIC-HEXAMMINE NITRATE $[Cr(NH_3)_6](NO_3)_3$

(self-reactive)	Hexammine chromium nitrate explodes at 265¡C and is impact sensitive. W.R. Tomlinson, Jr., and L.F. Audrieth, *J. Chem. Edu.* **27:** 606-609 (1950).

CHROMIC OXIDE Cr_2O_3

(See CHROMIUM OXIDE)

CHROMIUM Cr

Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Hydrogen Peroxide	See IRON plus Hydrogen Peroxide.
Lithium	See LITHIUM plus Vanadium.
Nitric Oxide	Pyrophoric chromium unites with nitric oxide with incandescence. *Mellor* **11:** 162 (1946-1947).
Potassium Chlorate	Chromium is attacked vigorously by fused potassium chlorate, producing vivid incandescence. *Mellor* **11:** 163 (1946-1947).
Sulfur Dioxide	Pyrophoric chromium unites with sulfur dioxide with incandescence. *Mellor* **11:** 161 (1946-1947).

CHROMIUM-AMMINE NITRATES

(self-reactive)	Chromium-ammine nitrates may be impact-sensitive: $Cr(NH_3)_5NO_2(NO_3)_2$ detonates when heated. *Mellor* **11:** 477 (1946-1947).

CHROMIUM-AMMINE PERCHLORATES

(self-reactive)	Chromium-ammine perchlorates may be impact-sensitive.
	Mellor **11:** 477 (1946-1947).

CHROMIUM OXIDE Cr_2O_3

(CHROMIC OXIDE; CHROMIUM iii OXIDE;
CHROMIUM SESQUIOXIDE)

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Chromic Oxide.
Glycerol	Contact between the two may produce an explosion.
	Merck Index, 7th Ed., p. 489 (1960). *Pieters,* p. 30 (1957).
Lithium	See LITHIUM plus Chromic Oxide.
Oxygen Difluoride	See OXYGEN DIFLUORIDE plus Aluminum Chloride.

CHROMIUM iii OXIDE

(See CHROMIUM OXIDE)

CHROMIUM vi OXIDE

(See CHROMIC ANHYDRIDE)

CHROMIUM SESQUIOXIDE

(See CHROMIUM OXIDE)

CHROMIUM TETRACHLORIDE $CrCl_4$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Chromium Tetrachloride.

CHROMIUM TRIAMMINOTETROXIDE $Cr(NH_3)_3O_4$

(self-reactive)	Chromium triamminotetroxide detonates and becomes incandescent when heated.
	Mellor **11:** (1946-1947).

CHROMIUM TRICHLORIDE $CrCl_3$

Lithium	See LITHIUM plus Chromium Trichloride.

CHROMIUM TRIFLUORIDE CrF_3

Potassium	See POTASSIUM plus Ammonium Bromide.

CHROMIUM TRIOXIDE

(See CHROMIC ANHYDRIDE)

CHROMOUS OXIDE CrO

Air	Chromous monoxide is spontaneously flammable in air.
	Ellern (1968).

CHROMOUS SULFIDE CrS

Chromic Anhydride	See CHROMIC ANHYDRIDE plus Chromous Sulfide.
Fluorine	See FLUORINE plus Chromous Sulfide.

CHROMYL CHLORIDE CrO_2Cl_2

Acetone	Alcohol, ether and acetone react with chromyl chloride with incandescence. Turpentine is ignited by chromyl chloride.
	Mellor **11:** 396 (1946-1947).
Ammonia	Chromyl chloride causes ammonia and ethyl alcohol to

	ignite.
	Durrant, p. 991 (1962).
Chlorine and Carbon	See CHLORINE plus Chromyl Chloride and Carbon.
Diethyl Ether	See CHROMYL CHLORIDE plus Acetone.
Ethyl Alcohol	See CHROMYL CHLORIDE plus Ammonia.
Fluorine	See FLUORINE plus Chromyl Chloride.
Phosphorus	See PHOSPHORUS plus Chromyl Chloride.
Phosphorus Trichloride	Each drop of chromyl chloride added to well-cooled phosphorus trichloride produces a hissing noise, incandescence, and sometimes an explosion.
	Mellor **11:** 395 (1946-1947).
Sodium Azide	See SODIUM AZIDE plus Chromyl Chloride.
Sulfur	See SULFUR plus Chromyl Chloride.
Sulfur Monochloride	If chromyl chloride vapor is passed through a narrow jet into the vapor of sulfur monochloride, vivid combustion occurs.
	Mellor **11:** 394 (1946-1947).
Turpentine	See CHROMYL CHLORIDE plus Acetone.

COBALT Co

Acetylene	Pyrophoric cobalt decomposes acetylene in the cold and the metal becomes incandescent.
	Mellor **14:** 513 (1946-1947).
Air	Pyrophoric cobalt, a black powder, burns brilliantly when exposed to air.
	Mellor **14:** 453 (1946-1947).
Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).

COBALT ALLOYS See LITHIUM plus Cobalt Alloys.

COBALT-HEXAMMINE CHLORATE $Co(NH_3)_6(ClO_3)_2$

(self-reactive)	This compound detonates when struck.
	Mellor **2, Supp. 1:** 592 (1956).

COBALT-HEXAMMINE CHLORITE $Co(NH_3)_6ClO_23H_2O$

(self-reactive)	Hexamminocobaltic chlorite contains an explosive combination of ions.
	Mellor **2, Supp. 1:** 575 (1956).
	Cobalt ammine azides explode violently on impact.
	Mellor **8, Supp. 2:** 48 (1967).

COBALT-HEXAMMINE PERCHLORATE $Co(NH_3)_6(ClO_4)_2$

(self-reactive)	This compound detonates when struck but is less sensitive than hexamminocobalt chlorate.
	Mellor **2, Supp. 1:** 592 (1956).

COBALT NITRIDE CoN

Air	Cobalt nitride is spontaneously flammable in air.
	Brauer (1965).
	Mellor **8, Supp. 1:** 238 (1964).

COBALT-PENTAMMINE AZIDE PERCHLORATE

$[Co(NH_3)_5N_3](ClO_4)_2$

Phenyl Isocyanate and Nitrosyl Perchlorate	See PHENYL ISOCYANATE plus Cobalt Pentammine Triazo Perchlorate and Nitrosyl Perchlorate.

COBALT-PENTAMMINE HYPOPHOSPHITE PERCHLORATE

$[Co(NH_3)_5]H_2PO_2(ClO_4)_2$

(self-reactive)	When a chemist touched a platinum wire (temperature uncertain) into the freshly prepared chemical to make a flame test, the preparation exploded.
	Serious Acc. Series **253** (1965).

COBALT TRIPHOSPHINE

(See COBALTIC DIHYDROPHOSPHIDE)

COBALTIC DIHYDROPHOSPHIDE $Co(PH_2)_3$

Air	Cobalt triphosphine is spontaneously flammable in air.
	J. Zehr, *Staub* **22** (11): 494-508 (1962).

COBALTIC FLUORIDE CoF_3

Silicon	See SILICON plus Colbatic Fluoride.

COBALTIC-HEXAMMINE IODATE $[Co(NH_3)_6](IO_3)_3$

(self-reactive)	Hexammine cobalt iodate explodes at 355¡ C and is impact sensitive.
	W. R. Tomlinson, Jr. and L. F. Audrieth,
	J. Chem. Edu. **27:** 606-609 (1950).

COBALTIC-HEXAMMINE PERCHLORATE $[Co(NH_3)_6](ClO_4)_3$

(self-reactive)	Hexammine cobalt perchlorate explodes at 360¡ C and is impact sensitive.
	W. R. Tomlinson, Jr. and L. F. Audrieth,

J. Chem. Edu. **27:** 606-609 (1950).

COBALTIC-PENTAMMINE AZIDE $CoN_3(NH_3)_5(N_3)_2$

(self-reactive)	Cobalt ammine azide exploded violently on impact.
	Mellor **8, Supp. 4:** 48 (1967).

COBALTIC-PENTAMMINE CHLORITE $Co(NH_3)_5Cl(ClO_2)_2$

(self-reactive)	Pentamminochlorocobaltic chlorite contains an explosive combination of ions.
	Mellor **2, Supp. 1:** 575 (1956).

COBALTIC-TETRAMMINE AZIDE $Co(N_3)_2(NH_3)_4N_3$

(self-reactive)	See COBALTIC-PENTAMMINE AZIDE (self-reactive).

COBALTIC-TRIAMMINE AZIDE $Co(N_3)_3(NH_3)_3$

(self-reactive)	See COBALTIC-PENTAMMINE AZIDE (self-reactive)

COBALTOUS BROMIDE $CoBr_2$

Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Cobaltous Bromide.

COBALTOUS CHLORIDE $CoCl_2$

COBALTOUS CYANIDE $Co(CN)_2$

Magnesium	See MAGNESIUM plus Cadmium Cyanide.

COBALTOUS HYPOPHOSPHITE $CO(PH_2O_2)_2$

(self-reactive) | Cobaltous hypophosphite liberates spontaneously flammable phosphine above 150¡ C.

Mellor **8:** 889 (1946-1947).

COBALTOUS-PENTAMMINE CHLORO-PERCHLORATE

$[Co(NH_3)_5Cl]ClO_4$

(self-reactive) | Cobaltous-pentammine chloro-perchlorate explodes at 320¡C and is impact sensitive.

J. Chem. Educ. **27:** 606-609 (1950).

COBALTOUS-PENTAMMINE NITRITO-N NITRATE

$[Co(NH_3)_5NO_2]NO_3$

(self-reactive) | Nitropentammine cobalt nitrate explodes at 310¡C and is impact sensitive.

W. R. Tomlinson, Jr. and L. F. Audrieth,

J. Chem. Edu. **27:** 606-609 (1950).

COBALTOUS-TRIHYDRAZINE CHLORATE $CO(N_2H_4)_3(ClO_3)_2$

(self-reactive) | This compound detonates when struck.

Mellor **2, Supp. 1:** 592 (1956).

COKE

Fluorine | See FLUORINE plus Common Materials and Oxygen.

COPPER Cu

Acetylene | Unstable acetylides form when acetylene is passed over copper that has been heated enough to form a tarnish of oxide coating. In the presence of wet acetylene and

	ammonia, copper and brasses down to 60 per cent copper react readily to form explosive acetylides.
	Brameld, Clark and Seyfond, *J. Soc. Chem. Ind.* **66:** 346-53 (1947). G. Benson, *Comp. Gas Bull.* 1950-83. *Miller,* pp. 484-6 (1965). *Rutledge,* p. 84 (1968).
Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
	Mellor **8, Supp. 1:** 546 (1964).
Barium Bromate	See COPPER plus Bromates.
Barium Chlorate	See COPPER plus Bromates.
Barium Iodate	See COPPER plus Bromates.
Bromates	A combination of finely divided copper with finely divided bromates (also chlorates or iodates) of barium, calcium, magnesium, potassium, sodium, or zinc will explode with heat, percussion, and sometimes light friction.
	Mellor **2:** 310 (1946-1947).
Calcium Bromate	See COPPER plus Bromates.
Calcium Chlorate	See COPPER plus Bromates.
Calcium Iodate	See COPPER plus Bromates.
Chlorates	See COPPER plus Bromates.
Chlorine	Copper foil burns spontaneously in gaseous chlorine.
	Mellor **2:** 92, 95 (1946-1947). *Mellor* **9:** 626 (1946-1947).
	Copper reacts vigorously with chlorine at around 320¡ C.
	Mellor **2, Supp. 1:** 380 (1956).
Chlorine and Oxygen Difluoride	See CHLORINE plus Oxygen Difluoride.
Chlorine Trifluoride	See ALUMINUM plus Chlorine Trifluoride.
Ethylene Oxide	Copper and other acetylide-forming metals should not be used in process equipment handling ethylene oxide because of the danger of the possible presence of acetylene. See COPPER plus Acetylene.
	L. G. Hess and V. V. Tilton, *Ind. Eng. Chem.* **42:** 1251-8

	(1950).
Fluorine	See FLUORINE plus Copper. See also FLUORINE plus Metals.
Hydrazine Mononitrate	See ZINC plus Hydrazine Mononitrate.
Hydrazoic Acid	Explosions resulted from corrosion of brass parts of a vacuum gage and water jet vacuum pump on prolonged contact with hydrozoic acid vapors.
	Chem. & Ind. **10,** p. 444 (1973).
Hydrogen Peroxide	See IRON plus Hydrogen Peroxide.
Hydrogen Sulfide	If a mixture of air and hydrogen sulfide is passed over powdered copper, the mixture may heat to redness.
	Mellor **10:** 140 (1946-1947).
Iodates	See COPPER plus Bromates.
Lead Azide	Lead azide, when in contact with copper, zinc, or alloys containing copper or zinc, forms, over a period of time, the extremely sensitive copper and zinc azides which on slight disturbance can set off the main body of lead azide.
	Federoff **1:** A532, A551 (1960).
	Mustaparta (1966).
Magnesium Bromate	See COPPER plus Bromates.
Magnesium Chlorate	See COPPER plus Bromates.
Magnesium Iodate	See COPPER plus Bromates.
Phosphorus	The reacting mass formed by the mixture of phosphorus and copper, iron, nickel, or platinum can become incandescent when heated.
	Mellor **8, Supp. 3:** 228 (1971).
Potassium Bromate	See COPPER plus Bromates.
Potassium Chlorate	See COPPER plus Bromates.
Potassium Iodate	See COPPER plus Bromates.
Potassium Peroxide	See POTASSIUM plus Potassium Peroxide and POTASSIUM plus Potassium Tetroxide.

Sodium Azide	See SODIUM AZIDE plus Copper.
Sodium Bromate	See COPPER plus Bromates.
Sodium Chlorate	See COPPER plus Bromates.
Sodium Iodate	See COPPER plus Bromates.
Sodium Peroxide	Sodium peroxide oxidizes copper with incandescence. *Mellor* **2:** 490-93 (1946-1947).
Sulfur and Chlorates	See SULFUR plus Chlorates and Copper.
Zinc Bromate	See COPPER plus Bromates.
Zinc Chlorate	See COPPER plus Bromates.
Zinc Iodate	See COPPER plus Bromates.

COPPER ACETYLIDE

(See CUPROUS CARBIDE)

COPPER ALUMINOHYDRIDE

(See CUPROUS TETRAHYDROALUMINATE)

COPPER CYANIDE CuCN

(See CUPROUS CYANIDE)

COPPER METHYL CH_3Cu

(See METHYL COPPER)

COPPER OXIDE CuO

(See CUPRIC OXIDE)

COPPER OXYCHLORIDE Cu_2OCl_2

Potassium	See POTASSIUM plus Boric Acid.

COPPER SALTS

Acetylene	Many copper salts form dangerous acetylides. The copper acetylides formed in ammoniacal or caustic solutions with cupric salts and acetylene are more explosive than those derived from cuprous salts.
	Brameld, Clark and Seyfond, *J. Soc. Chem. Ind.* **66:** 346-53 (1947). G. Benson, *Comp. Gas Bull.* 1950-83. *Miller,* pp. 484-6 (1965).
Hydrazine	Copper salts promote the decomposition of hydrazine.
	Chem. Eng. News **48** (48): 97 (Nov. 16, 1970). See also CUPRIC OXIDE plus Hydrazine.
Nitromethane	Nitromethane and salts of copper, silver, gold or mercury spontaneously form explosive materials.
	Chem. Eng. News **49** (23): 6 (1971).

CREOSOTE OIL

Chlorosulfonic Acid	See CHLOROSULFURIC ACID plus Creosote Oil.

CRESOL $CH_3C_6H_4OH$

Chlorosulfonic Acid	Mixing cresol and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing cresol and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing cresol and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete

reference.

CROTONALDEHYDE $CH_3CH=CHCHO$

Butadiene-1,3	See BUTADIENE-1,3 plus Crotonaldehyde.

CUMENE $C_6H_5CH(CH_3)_2$

Chlorosulfonic Acid	Mixing Cumene and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Nitric Acid	Mixing cumene and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing cumene and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

CUMENE HYDROPEROXIDE $C_6H_5C(CH_3)_2OOH$

(self-reactive)	At concentrations of 91 and 95%, cumene hydroperoxide decomposed violently at about 150¡ C. A. Le Roux, *Mem. Poudres* **37:** 49-58 (1955).

CUPRIC AZIDE $CU(N_3)_2$

(self-reactive)	Spontaneous explosions have been observed with this compound. *Mellor* **8, Supp. 2:** 50 (1967). See SODIUM AZIDE plus Copper.

CUPRIC BROMIDE $CuBr_2$

Potassium	See POTASSIUM plus Aluminum Bromide.

CUPRIC CHLORIDE $CuCl_2$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

CUPRIC CHLORITE $Cu(ClO_2)_2$

(self-reactive)

Cupric chlorite explodes violently on percussion. In the dry state it decomposes within 12 days.

Mellor **2, Supp. 1:** 574 (1956).

CUPRIC-DIHYDRAZINE CHLORATE $Cu(H_2NNH_2)_2ClO_3$

(self-reactive)

This is an extremely explosive salt and will detonate on drying.

Mellor **8, Supp. 2:** 88 (1967).

Mellor **2, Supp. 1:** 592 (1956).

CUPRIC HYPOPHOSPHITE $Cu(PH_2O_2)_2$

(self-reactive)

Cupric hypophosphite forms impact-sensitive ammunition-priming mixtures.

Mellor **8, Supp. 3:** 623 (1971).

Cupric hypophosphite explodes suddenly at about 90¡ C.

Mellor **8:** 883 (1946-1947).

CUPRIC NITRATE $Cu(NO_3)_2$

Paper

On prolonged contact with cupric nitrate in the presence of moisture paper will ignite spontaneously.

	Ellern, p. 46 (1968).
Potassium Ferrocyanide	A finely ground mixture of potassium ferrocyanide and cupric nitrate when dried at 220¡ C exploded within a few minutes.
	Chem. Abst. **77:** 13431f (1972).
Tin	See TIN plus Cupric Nitrate.

CUPRIC NITRIDE Cu_3N_2

Nitric Acid	Concentrated nitric acid plus cupric nitride explodes with great violence.
	Mellor **8:** 100 (1946-1947).

CUPRIC OXIDE CuO

Aluminum	See ALUMINUM plus Copper Oxide.
Boron	See BORON plus Cupric Oxide.
Cesium Acetylene Carbide	See CESIUM ACETYLENE CARBIDE plus Cupric Oxide.
Hydrazine	Hydrazine reacts vigorously with cupric oxide.
	Mellor **3:** 137 (1946-1947).
Magnesium	See MAGNESIUM plus Cupric Oxide.
Phospham	See PHOSPHAM plus Cupric Oxide.
Potassium	See POTASSIUM plus Cupric Oxide.
Rubidium Acetylene Carbide	See RUBIDIUM ACETYLENE CARBIDE plus Cupric Oxide.
Sodium	See SODIUM plus Cupric Oxide.
Titanium	See TITANIUM plus Cupric Oxide.
Zirconium	See ZIRCONIUM plus Cupric Oxide.

CUPRIC PHOSPHIDE Cu_3P_2

Potassium Chlorate	When copper phosphide is mixed with oxidizing agents, such as potassium chlorate, it explodes on impact.
	Mellor **8:** 839 (1946-1947).
Potassium Nitrate	When copper phosphide is mixed with potassium nitrate and heated, an explosion occurs.
	Mellor **8:** 839 (1946-1947).
Water	On contact with water, copper phosphide yields phosphine, which is spontaneously flammable.
	Schwab (1970).

CUPRIC SALTS

Sodium Hypobromite	See SODIUM HYPOBROMITE plus Cupric Salts.

CUPRIC SULFATE $CuSO_4$

Hydroxylamine	Anhydrous copper sulfate causes hydroxylamine to ignite and the hydrated salt is vigorously reduced.
	Mellor **8:** 292 (1946-1947).
Magnesium	See MAGNESIUM plus Cupric Sulfate.

CUPRIC SULFIDE CuS

Cadmium Chlorate	Copper sulfide explodes on contact with a concentrated solution of chloric acid or chlorates of cadmium, magnesium, or zinc.
	Mellor **Supp. II, Part I:** 584 (1956).
Chlorates	See COPPER SULFIDE plus Cadmium Chlorate.
Chloric Acid	See COPPER SULFIDE plus Cadmium Chlorate.
Hydrogen Peroxide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Magnesium, Ammonium	See MAGNESIUM plus Copper Sulfate

Nitrate, Potassium Chlorate and Water	(anhydrous), Ammonium Nitrate, Potassium Chlorate and Water.
Magnesium Chlorate	See COPPER SULFIDE plus Cadmium Chlorate.
Zinc Chlorate	See COPPER SULFIDE plus Cadmium Chlorate.

CUPRIC-TETRAMMINE CHLORATE $Cu(NH_3)_4(ClO_3)_2$

(self-reactive)	This compound will detonate when struck. *Mellor* **2, Supp. 1:** 592 (1956).

CUPRIC-TETRAMMINE PERCHLORATE $Cu(NH_3)_4(ClO_4)_2$

(self-reactive)	This compound will detonate when struck but is less sensitive than tetramminocupric chlorate. *Mellor* **2, Supp. 1:** 592 (1956).

CUPROUS AZIDE CuN_3

(self-reactive)	Cuprous azide decomposes at 205¡ C. It is explosively unstable. *Mellor* **8, Supp. 2:** 43 (1967).

CUPROUS BROMIDE CuBr

Potassium	See POTASSIUM plus Aluminum Bromide.

CUPROUS CARBIDE Cu_2C_2

(self-reactive)	Cuprous acetylide is explosive and can be detonated by percussion or when heated above 100¡C. *Mellor* **5:** 851, 852 (1946-1947). *Rutledge,* p. 84 (1968).
Acetylene	If warmed in air or oxygen for several hours, it explodes

	when brought in contact with acetylene.
	Mellor **5:** 851, 852 (1946-1947).
Bromine	See BROMINE plus Cuprous Acetylide.
Chlorine	See BROMINE plus Cuprous Acetylide.
Iodine	See BROMINE plus Cuprous Acetylide.
Silver Nitrate	Cuprous acetylide and silver nitrate give off an explosive mixture.
	Mellor **5:** 853 (1946-1947). J. K. Luchs, *Photo. Sci. Eng.* **10** (6): 334-7 (1966).

CUPROUS CHLORIDE CuCl

Potassium	See POTASSIUM plus Aluminum Bromide.

CUPROUS CYANIDE CuCN

Magnesium	See MAGNESIUM plus Cadmium Cyanide.

CUPROUS HYDRIDE Cu_2H_2

Air	Dry copper hydride is spontaneously flammable in air.
	Von Schwartz, p. 156 (1964).
Bromine	See BROMINE plus Copper Hydride.
Chlorine	See BROMINE plus Copper Hydride.
Fluorine	See BROMINE plus Copper Hydride.

CUPROUS IODIDE CuI

Potassium	See POTASSIUM plus Aluminum Bromide.

CUPROUS NITRIDE Cu_3N

Nitric Acid	See CUPRIC NITRIDE plus Nitric Acid.

	See CUPROUS NITRIDE plus Sulfuric Acid.
Sulfuric Acid	The reaction of cuprous nitride and sulfuric or nitric acid is violent.
	Mellor **8, Supp. 1:** 154 (1964).

CUPROUS TETRAHYDROALUMINATE $CuAlH_4$

Air	Copper aluminohydride is spontaneously flammable in air.
	J. Aubrey and G. Monnier, *Comp. Rend.* **238:** 2534-2535 (1954).

CYANIDES

(See also specific cyanides as primary entries or under other reactants)

Chlorates	Violent explosion occurs if cyanide salt is melted with nitrite salt. The melt explodes if cyanide plus chlorate or nitrite is heated to 450¡C.
	Von Schwartz, pp. 299, 327 (1918).
	Also see ANTIMONY SULFIDE plus Chlorates.
Fluorine	See FLUORINE plus Chlorides.
Magnesium	See MAGNESIUM plus Cadmium Cyanide.
Nitrates	See NITRATES plus Cyanides.
Nitric Acid	See NITRIC ACID plus Cyanides.
Nitrites	See CYANIDES plus Chlorates.
	See NITRITES plus Potassium Cyanide.

CYANOACETIC ACID $NCCH_2COOH$

Furfuryl Alcohol	See FURFURYL ALCOHOL plus Cyanoacetic Acid.

CYANOACETYL CHLORIDE $NCCH_2COCl$

(self-reactive)	Cyanoacetyl chloride was prepared from cyanoacetic acid

and phosphorus pentachloride. Following distillation of the volatile material, the crude cyanoacetyl chloride was placed in a hood in a stoppered, 1-liter flask. About 24 hours later the flask exploded.

Wischmeyer (1967).

CYANODIMETHYLARSINE $(CH_3)AsCN$

Air	Dimethylcyanoarsine is spontaneously flammable in air.
	Ripley (1966).

2-CYANOETHANOL $HOCH_2CH_2CN$

Sulfuric Acid	Concentrated sulfuric acid reacts violently with both ethylene cyanohydrin and epichlorohydrin.
	Confidential information furnished to NFPA.

CYANOGEN NCCN

Fluorine	See FLUORINE plus Cyanogen.
Oxygen	See OXYGEN (LIQUID) plus Cyanogen.

CYANOGEN AZIDE NCNNN

(self-reactive)	Cyanogen azide explodes when shocked mechanically or thermally.
	Chem. Eng. News **43** (52): 29, 30 (Dec. 27, 1965).

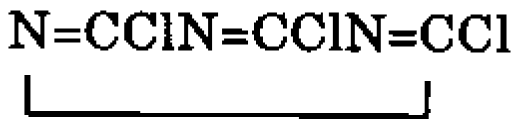
CYANOGEN IODIDE NCI

Phosphorus	See PHOSPHORUS plus Cyanogen Iodide.

CYANURIC ACID

Ethyl Alcohol — See CYANURIC ACID plus Water.

CYANURIC CHLORIDE



Dimethyl Sulfoxide — See DIMETHYL SULFOXIDE plus Acyl Halides.

Water — Cyanuric chloride acts autocatalytically with water at a temperature of about 30¡ C to produce cyanuric acid, hydrochloric acid and heat. An explosion occurred during an industrial process in which cyanuric chloride and water were mixed. The refrigeration had been turned off. Pressure built up in the reactor and blew gaskets, allowing flammable vapors to fill the building. The explosion occurred when the vapors were ignited.

MCA Case History **1869** (1972).

CYCLOHEXANE C_6H_{12}

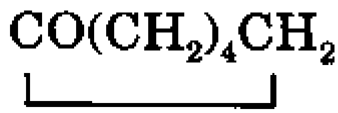
Nitrogen Dioxide — Through an error, liquid nitrogen dioxide instead of gaseous was fed into a nitration column containing hot cyclohexane. An explosion resulted.

MCA Case History **128** (1962).

CYCLOHEXANOL $C_6H_{11}OH$

Nitric Acid — See NITRIC ACID plus Cyclohexanol.

CYCLOHEXANONE



Nitric Acid — See NITRIC ACID plus Cyclohexanone.

CYCLOPENTADIENYLCHROMIUM DINITROSYL DIMER

$[C_5H_5(NO)_2Cr]_2$

(self-reactive) — A glass vial of the dimer in the sample compartment of a laser Raman spectrophotometer exploded on excitation by the helium-neon beam.

Chem. & Ind. No. **7:** 201 (1969). R. B. King and M. B. Bisnette, *Inorg. Chem.* **3:** 79 (1964).

DECABORANE (14) $B_{10}H_{14}$

Oxygen — See OXYGEN plus Decaborane.

DEXTROSE $C_6H_{12}O_6$

Sodium Peroxide and Potassium Nitrate — See SODIUM PEROXIDE plus Dextrose and Potassium Nitrate.

DIACETYLENE

(See BUTADIYNE)

DIACETYL PEROXIDE $(CH_3CO)_2O_2$

(self-reactive) — Acetyl peroxide is unpredictable. Five grains of it being removed from an ice chest detonated violently.

Chem. Eng. News **26:** 3197 (1948).

	Pure diacetyl peroxide is a severe explosion hazard.
	Cond. Chem. Dict. **10:** (1971).
	See also HYDROGEN PEROXIDE plus Acetic Anhydride.
Diethyl Ether	Solid acetyl peroxide in contact with ether or any volatile solvent may explode violently. A 5-gram portion in ether detonated while being carried.
	L. P. Kuhn, *Chem. Eng. News* **26:** 3197 (1948); E.S. Shanley, *Chem. Eng. News* **27:** 175 (1949).
Organic Materials	See ACETYL PEROXIDE plus Solvents.
Solvents	Acetyl peroxide is extremely shock-sensitive. When a solution of acetyl peroxide in any volatile solvent is evaporated, the concentration may become high enough for spontaneous explosions. Acetyl peroxide is a powerful oxidizing agent; it may cause ignition of organic materials on contact.
	Chem. Eng. News **26:** 3197 (1948). *Chem. Eng. News* **27:** 175 (1949).

DIALKYLPHOSPHINES

Chlorine	See CHLORINE plus Alkylphosphines.

DIALLYL METHYL CARBINOL $(CH_2{=}CHCH_{2-})_2C(OH)CH_3$

Ozone and Acetic Acid	During the preparation of β-hydroxy-β-methyl glutaric acid using 75 grams of diallyl methyl carbinol, the material had been ozonized and allowed to stand overnight. Glacial acetic acid had been added and the mixture was being concentrated under vacuum in a desiccator. After 1 $^1/_2$ hours the mixture exploded. Previous preparations using 12.6 grams were successful.
	Chem. Eng. News. **51** (6): 29 (Feb. 5, 1973).

DIALLYL PHOSPHITE $(C_3H_5O)_2POH$

(self-reactive)	Diallyl phosphite is made from allyl alcohol and

phosphorus trichloride. When the product is distilled in vacuo in a carbon dioxide stream, explosions usually occur after about two-thirds is distilled.

Zh. Obshch. Khim. **21:** 658-62 (1951).

DIAMIDOPHOSPHOROUS ACID $POH(NH_2)_2$

Water	This material dissolves in water with such violence that the mass becomes incandescent. *Mellor* **8:** 704 (1946-1947).

DIAZIDO ALKANES

(See AZIDOALKANES)

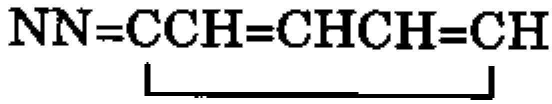
DI-o-AZIDOBENZOYL PEROXIDE $[C_6H_4(N_3)CO]_2O_2$

(self-reactive)	A 2-gram sample of the crystalline material on a sintered glass funnel detonated "with extreme violence" when touched with a metal spatula. A build-up of static charge on the sintered glass may have initiated the decomposition. *Chem. Eng. News* **41** (48): 45; **41** (52): 5 (1963).

1,3-DIAZIDOPROPENE $N_3CH{=}CHCH_2N_3$

(self-reactive)	In the determination of the weight of a sample of 1,3-diazidopropene, a violent explosion occurred. J. H. Bover and F. C. Canter, *Chem. Reviews* **54:** 32, 33 (1954).

DIAZOCYCLOPENTADIENE



(self-reactive) — Diazocyclopentadiene should be handled cautiously since during one preparation a violent explosion took place after distillation.

F. Ranairez and S. Levy, *J. Org. Chem.* **23:** 2036-7 (1958).

DIAZOMALONIC ACID $(HOCO)_2C{=}NN$

(self-reactive) — Six grams of impure diazomalonic acid was being distilled under 3 millimeters pressure in a 50 milliliter flask. After three minutes of heating, during which no product was obtained, the flask exploded.

NSC Newsletter, Campus Safety **3** (1973).

DIAZOMETHANE $NN{=}CH_2$

(self-reactive) — Diazomethane will undergo violent thermal decomposition. Above 200¡ C, the vapor may explode violently. Explosions at low temperatures can occur if traces of organic matter are present.

J. Phys. Chem. **35:** 1493 (1931).

Organic Matter — See DIAZOMETHANE (self-reactive).

DIAZONIUM CHLORIDE SALTS

Sodium Sulfide — See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.

DIAZONIUM PERCHLORATES

(self-reactive) — Diazonium perchlorates are particularly hazardous, being exploded by the slightest shock when dry.

Berichte **39:** 3146-8 (1906). *German Pat.* 258,679 (Apr.

	27, 1911). *ACS* **146:** 213.

DIAZONIUM SALTS

Sodium Bisulfide	See DIAZONIUM SALTS plus Thiophenates.
Sodium Sulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.
	See DIAZONIUM SALTS plus Thiophenates.
Thiophenates	This reaction is often quoted as a route to diaryl sulfides without mention of explosive hazards. Unstable p-chlorodiazobenzene thiophenyl ether has been prepared by this route. Two reactions of this type were attempted and in both cases explosive compounds were produced. Also, reported explosions from reactions of diazonium salts with xanthates, sodium bisulfide, and sodium sulfide are attributed to formation of diazo ethers or related compounds.
	BCISC **40** (158): 17-18 (1969).
Xanthates	See DIAZONIUM SALTS plus Thiophenates.

DIBENZOYL PEROXIDE $(C_6H_5CO)_2O_2$

N,N-Dimethylaniline	Explosive decomposition occurred when finely ground benzoyl peroxide was allowed to react with N,N-dimethylaniline by breaking an ampoule containing 0.5 grams of dimethylaniline in an autoclave.
	L. Horner and C. Betzel, *Chem. Ber*. **86:** 1071-72 (1953).
Lithium Aluminum Hydride	An attempted reduction of benzoyl peroxide with lithium aluminum hydride resulted in an explosion.
	D.A. Sutton, *Chem. & Ind.* **1951:** 272 (1951).

DIBENZYL CHLOROPHOSPHONATE $(C_6H_5CH_2O)_2POCl$

(self-reactive)	Dibenzylchlorophosphonate can decompose violently during vacuum distillation.

Chem. Eng. News **28:** 3452 (Oct. 2, 1950).

J. Chem. Soc. 1106-10 (1948).

DIBENZYL PHOSPHITE $(C_6H_5CH_2O)_2PHO$

(self-reactive)	Dibenzyl phosphite can decompose violently during vacuum distillation.
	Chem. Eng. News **28:** 3452 (Oct. 2, 1950).
	J. Chem. Soc. **385** (1945).

DIBORANE $BH_2(H_2)BH_2$

Aluminum	See ALUMINUM plus Diborane.
Carbon Tetrachloride	See CARBON TETRACHLORIDE plus Diborane.
Chlorine	See CHLORINE plus Diborane.
Halogenated Hydrocarbons	Diborane reacts violently with halogenated hydrocarbons (as in vaporizing liquid fire extinguishing agents).
	Haz. Chem. Data (1966).
Nitric Acid	See NITRIC ACID plus Diborane.
Nitrogen Trifluoride	See NITROGEN TRIFLUORIDE plus Diborane.
Oxygen	See OXYGEN plus Diborane.
Phosphorus Trifluoride	See PHOSPHORUS TRIFLUORIDE plus Diborane.
Water	Diborane ignites spontaneously in moist air.
	Haz. Chem. Data (1966). E. L. Poling and H. P. Simons, *Ind. Eng. Chem.* **50:** 1695-1698 (1958). P. L. Sampl and H. P. Simons, *Ind. Eng. Chem.* **50:** 1699-1702 (1958).

DIBORON TETRACHLORIDE

(See TETRACHLORODIBORANE)

2,6-DIBROMO-p-BENZOQUINONE-4-CHLORIMINE

$O{=}C_6H_2Br_2{=}NCL$

(self-reactive)

While thin layer chromatograms were being dried with a hot-air dryer, a 25-gram bottle of 2,6-dibromo-p-benzoquinone-4-chlorimine, one to two feet away, exploded.

Chem. & Ind. **37:** 1551 (1967).

DIBROMOBORYL-PHOSPHINE Br_2BPH_2

Air

Dibromoborine phosphine is spontaneously flammable in air.

Douda (1966).

2,6-DIBROMO-N-CHLOROBENZOQUINONIMINE

$OC_6H_2(Br)_2NCl$

(self-reactive)

This chromatographic reagent can decompose violently under readily obtainable laboratory conditions. After a small quantity exploded on a laboratory reagent shelf, tests were made on one-half-gram quantities in a thermal stability bomb. When the temperature was raised gradually to 120¡ C, a violent exothermic reaction raised the pressure to 1,800 psi and burst the rupture diaphragm. A second sample held at 60¡ C decomposed similarly after 3 hours. Tests on the chlorocompound 2,6-DICHLOROQUINONECHLORIMIDE showed similar, but less severe instability.

Chem. Eng. News **45** (50):54 (Dec. 11, 1967).

Chem. & Ind. **37:** 1551 (Sept. 1967).

DIBROMO-3,5-DIMETHOXYANILINE $(CH_3O)_2C_6HBr_2NH_2$

(self-reactive)

See 2-BROMO-3,5-DIMETHOXYANILINE (self-reactive).

DIBROMOMALONONITRILE $CBr_2(CN)_2$

Sodium Azide	See SODIUM AZIDE plus Dibromomalononitrile.

DIBROMOTRIMETHYLALUMINUM $(CH_3)_3AlBr_2$

Air	Trimethyl aluminum bromide is spontaneously flammable in air. *Chem. Eng. Progs.* **63** (7): 126 (1967).

DIBUTYLCHLOROBORANE $(C_4H_9)_2BCl$

Air	Dibutyl boron chloride is spontaneously flammable in air. *Buls, Bimonthly Rept.* **8**, p. 4 (1953).

DIBUTYL ETHER $C_4H_9OC_4H_9$

Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Di-n-Butyl Ether.

DIBUTYLMAGNESIUM $(C_4H_9)_2Mg$

Air	Dibutyl magnesium is spontaneously flammable in air. *Douda* (1966).

2,6-DI-t-BUTYL-4 NITROPHENOL $HOC_6H_3[C(CH_3)\ 2CH_3]_2$

(self-reactive)	This material exploded violently after being warmed for two to three minutes on a steam bath. *ASESB Expl. Report* **24** (1961).

2,6-DI-t-BUTYLPHENOL $HOC_6H_3[C(CH_3)_2CH_3]_2$

Nitric Acid	See NITRIC ACID plus Di-t-Butylphenol.

DIBUTYL PHTHALATE $(C_4H_9OCO)_2C_6H_4$

Chlorine	See CHLORINE plus Polypropylene.

DIBUTYL SULFOXIDE $(C_4H_9)_2SO$

Perchloric Acid	See PERCHLORIC ACID plus Dibutyl Sulfoxide.

DICHLORINE HEPTOXIDE Cl_2O_7

(self-reactive)	Dichlorine heptoxide explodes violently under a blow or when heated rapidly.
	Mellor **2, Supp. 1:** 542 (1956).

DICHLOROACETYLENE ClC=CCl

(self-reactive)	During synthesis of dichloroacetylene, the dichloroacetylene accidentally condensed and collected in a water trap. When the chemist attempted to sample the material in the trap, a violent explosion occurred. Since dichloroacetylene is reported to be shock-sensitive, the touching of the sample could have initiated the detonation.
	MCA Case History **1989** (1974).
Air	Dichloroacetylene ignites or explodes on contact with air.
	MCA Case History **495** (1956); **1065** (1965).
	When moist chlorine was passed over calcium carbide and potassium hydroxide, a solution of 58% dichloroacetylene was collected in ether. The solution burned spontaneously and filled the laboratory with phosgene. When the head was removed from a steel bomb used for one of the experiments, contact with air caused an explosion that drove the base of the bomb through the floor.
	R. Reemschneider and K. Brendel, *Ann. Chem.* **640:** 5(1961). *Rutledge*, p. 138 (1968).

DICHLOROBENZENE ClC_6H_4Cl

Aluminum	See ALUMINUM plus Ethylene Dichloride, Propylene Dichloride, and Orthodichlorobenzene.

DICHLORODIETHYLDIAMMINE COBALT PERCHLORATE

$[Co(Cl)_2(C_2H_5)_2(NH_2)_2]ClO_4$

(self-reactive)	Dichlorodiethyldiammine cobalt perchlorate explodes at 300¡C and is impact sensitive.
	W. R. Tomlinson, Jr., and L. F. Audrieth, *J. Chem. Edu.* **27:** 606-609 (1950).

DICHLORODIFLUOROMETHANE CCl_2F_2

Aluminum	See ALUMINUM plus Dichlorodifluoromethane.

DICHLORODIMETHYLSILANE $(CH_3)_2SiCl_2$

Water	Dimethyldichlorosilane reacts violently with water.
	Title 46 (1970).

DICHLORO(DISILYLAMINO)BORANE $(SiH_3)_2NBCl_2$

Air	Disilylamino dichloroborane is spontaneously flammable in air.
	Douda (1966).

1,2-DICHLOROETHANE ClC_2H_4Cl

Aluminum	See ALUMINUM plus Ethylene Dichloride, Propylene Dichloride, and Orthodichlorobenzene.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.

DICHLOROETHYLALUMINUM $C_2H_5AlCl_2$

Air	Ethyl aluminum dichloride is spontaneously flammable in

	air.
	Douda (1966).
Benzene and Allyl Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Toluene and Allyl Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Water	Ethyl aluminum dichloride reacts violently with water.
	Rose (1961).

DICHLOROETHYLBORANE $C_2H_5BCl_2$

Air	Ethyl boron dichloride is spontaneously flammable in air.
	Buls, Bimonthly Rept. 5, p. 3 (1953).

1,2-DICHLOROETHYLENE ClCH=CHCl

Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Potassium Hydroxide	See POTASSIUM HYDROXIDE plus 1,2-Dichloroethylene.
Sodium	See SODIUM plus 1,2-Dichloroethylene.
Sodium Hydroxide	See SODIUM plus 1,2-Dichloroethylene.

DICHLOROFLUORAMINE Cl_2NF

(self-reactive)	Dichlorofluoramine is explosive in the liquid state.
	Lawless and Smith, p. 88 (1968).

1,6-DICHLORO-2,4-HEXADIYNE $(Cl{\bullet}CH_2C{\equiv}C\text{-})_2$

(self-reactive)	1, 6-dichloro-2, 4-hexadiyne is shock-sensitive. P.E. Drieder and H.V. Isaacson,

	Chem. Eng. News **50** (12): 51 (1972).

DICHLOROMETHANE $ClCH_2Cl$

Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Oxygen (Liquid)	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Potassium	See POTASSIUM plus Chloroform.
Sodium	See POTASSIUM plus Chloroform.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride.

N,N-DICHLOROMETHYLAMINE CH_3NCl_2

Sodium Sulfide	N,N-dichloromethylamine exploded violently on addition of sodium sulfide.
	Biul. Wojskowej Akad. Tech. **8** (48): 75-9 (1959).

1,2-DICHLOROPROPANE $ClCH_2CHClCH_3$

Aluminum	See ALUMINUM plus Ethylene Dichloride, Propylene Dichloride and Orthodichlorobenzene. See ALUMINUM plus Propylene Dichloride.

2,6-DICHLOROQUINONECHLORIMIDE

(See 2,6,N-TRICHLORO-BENZOQUINONIMINE)

1,2-DICHLORO-1,1,2,2-TETRAFLUOROETHANE $CClF_2CF_2Cl$

Aluminum	See ALUMINUM plus Dichlorodifluoromethane.

DICYANDIAZIDE $NCN{=}C(NNN)_2$

(self-reactive)	Dicyandiazide is a shock-sensitive compound.

Chem. Eng. News **43** (52): 29, 30 (Dec. 27, 1965).

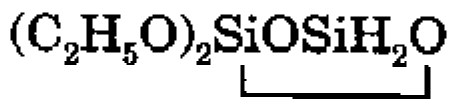
DICYCLOPENTADIENYLIRON

(See FERROCENE)

1,1-DIETHOXY-2-CHLOROETHANE

(See 2-CHLORO-1,1-DIETHOXYETHANE)

2,2-DIETHOXYCYCLODISILOXANE



Air	Diethoxycyclodisiloxane is spontaneously flammable in air. *Kaufman* (1961).

DIETHOXY-SILOXENE

(See 2,2-DIETHOXYCYCLODISILOXANE)

DIETHYL ALUMINUM BROMIDE

(See BROMODIETHYLALUMINUM)

DIETHYL ALUMINUM CHLORIDE

(See CHLORODIETHYLALUMINUM)

DIETHYLALUMINUM HYDRIDE $(C_2H_5)_2AlH$

Air	Diethyl aluminum hydride ignites spontaneously in air.

Fire Haz. Prop. (1969).

DIETHYLARSINE $(C_2H_5)_2AsH$

Air — Diethylarsine is spontaneously flammable in air.

Douda (1966).

DIETHYL AZODICARBOXYLATE $C_2H_5OCON{=}NCOOC_2H_5$

(self-reactive) — A sample decomposed upon attempted distillation with sufficient violence to shatter the distillation apparatus.

Org. Syntheses **28,** p. 59 (1948).

DIETHYL BISMUTH CHLORIDE

(See CHLORODIETHYLBISMUTHINE)

DIETHYL BORON CHLORIDE

(See CHLORODIETHYLBORANE)

DIETHYLCADMIUM $(C_2H_5)_2Cd$

Air — Diethylcadmium fumes explode in air.

Brauer (1965).

DIETHYL (3-DIETHYLAMINOPROPYL) ALUMINUM

$(C_2H_5)_2Al(CH_2)_3N(C_2H_5)_2$

Air — Diethyl 3-diethylaminopropyl aluminum is spontaneously flammable in air.

Douda (1966).

DIETHYLENE GLYCOL DIMETHYL ETHER

(See BIS(2-METHOXYETHYL)ETHER)

DIETHYLENE GLYCOL MONOMETHYL ETHER

(See 2 (2-METHOXYETHOXY) ETHANOL)

DIETHYL ETHER $C_2H_5OC_2H_5$

Acetyl Peroxide	See ACETYL PEROXIDE plus Diethyl Ether.
Air	See OXYGEN plus Diethyl Ether.
Air (Liquid)	A mixture of liquid air and diethyl ether exploded spontaneously.
	Z. Angew. Chem. **40:** 1317. *MCA Case History* **616** (1960).
Bromoazide	See BROMOAZIDE plus Diethyl Ether.
Chlorine	See CHLORINE plus Diethyl Ether.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Diethy Ether.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Diethyl Ether.
Chromyl Chloride	See CHROMYL CHLORIDE plus Acetone.
Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus Diethyl Ether.
Nitrosyl Perchlorate	See NITROSYL PERCHLORATE plus Diethyl Ether.
Nitryl Perchlorate	See NITRYL PERCHLORATE plus Benzene.
Ozone	See OZONE plus Diethyl Ether.
Perchloric Acid	See PERCHLORIC ACID plus Diethyl Ether.
Permanganates and Sulfuric Acid	See PERMANGANATES plus Sulfuric Acid and Benzene.
Potassium Peroxide	See SODIUM PEROXIDE plus Aniline.
Sodium Peroxide	See SODIUM PEROXIDE plus Aniline.

Triethyl Aluminum and Air	See TRIETHYL ALUMINUM plus Diethyl Ether and Air.
Trimethyl Aluminum and Air	See TRIMETHYL ALUMINUM plus Diethyl Ether and Air.

DIETHYL-4-ETHOXYBUTYLAMINE

(See (4-ETHOXYBUTYL) DIETHYLALUMINUM)

DIETHYLMAGNESIUM $(C_2H_5)_2Mg$

Air	Diethyl magnesium is spontaneously flammable in air; it explodes violently on contact with water and will glow and catch fire even in carbon dioxide. It must be handled in high vacuum, or under dry nitrogen or hydrogen.
	Merck Index, p. 359 (1968).
Carbon Dioxide	See DIETHYL MAGNESIUM plus Air.
Water	See DIETHYL MAGNESIUM plus Air.

DIETHYLPHOSPHINE $(C_2H_5)_2PH$

Air	Diethyl phosphine is spontaneously flammable in air.
	Von Schwartz, p. 323 (1918).

DIETHYL PEROXIDE $C_2H_5OOC_2H_5$

(self-reactive)	See OXYGEN plus Ethers.

DIETHYL PEROXYDICARBONATE $[C_2H_5OCOO-]_2$

(self-reactive)	Diethyl peroxydicarbonate decomposes rapidly at room temperature, sometimes with an explosion. It becomes hazardous above 10¡ C. One must avoid allowing it to crystallize.

Kirk and Othmer, Second Ed. **14:** 801, 803 (1963).

DIETHYL SULFATE $(C_2H_5O)_2SO_2$

Metals and Water	The presence of moisture in a metal container of diethyl sulfate caused formation of sulfuric acid which reacted with the metal to release hydrogen which pressurized and exploded the container.
	Chem. Abst. **28:** 2908 (1934).
	Angew. Chem. Intern. Ed. Engl. **47:** 105 (1934).
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

DIETHYL TELLURIDE $(C_2H_5)_2Te$

Air	Diethyl telluride is spontaneously flammable in air.
	Ellern, pp. 24-25 (1968).

1,2-DIETHYLTETRAIODODIALUMINUM $C_2H_5I_2Al_2I_2C_2H_5$

Air	1,2-Diethyl tetraiodo dialuminum is spontaneously flammable in air.
	Douda (1966).

DIETHYLZINC $(C_2H_5)_2Zn$

Air	Diethyl zinc is spontaneously flammable in air.
	Douda (1966). *Handbook Chem. Phys.*, p. C-715 (1970-1971).
	Mellor **1:** 376 (1946-1947).
	See also CHLORINE plus Diethyl Zinc.
Chlorine	See CHLORINE plus Diethyl Zinc.
Hydrazine	See ZINC DIAMIDE plus Hydrazine.

Water — Diethyl zinc reacts violently with water.

Brauer (1965).

2,4-DIETHYNYL-5-METHOXYTOLUENE

$(CH{\equiv}C\text{-})_2C_6H_2(CH_3)OCH_3$

(self-reactive) — The polymer of this material explodes thermally.

Chem. Abst. **75:** 19831 (1971).

2,4-DIETHYNYL-5-METHYLPHENOL $(CH{=}C\text{-})_2C_6H_2(OH)CH_3$

(self-reactive) — This compound is unstable in light and air.

Chem. Abst. **75:** 19831 (1971).

DIFLUORAMINE NHF_2

(self-reactive) — A small flask of gaseous difluoramine in a train of glass apparatus broke loose and exploded when it fell to the concrete floor. A nearby glass U-tube containing liquid difluoramine at minus 80¡ C exploded either from the shock of the first explosion or from the inrush of air after the apparatus broke.

MCA Case History **768** (1961).

Difluoramine has a tendency to explode when in the solid state or during the process of freezing or melting.

Lawless and Smith, pp. 70-71 (1968).

Chlorine Dioxide — See CHLORINE DIOXIDE plus Difluoramine.

DIFLUORINE PEROXIDE O_2F_2

Organic Matter — Even at minus 160¡C or below a violent reaction or an explosion results when dioxygen difluoride reacts with any organic material and most inorganic materials containing hydrogen.

Solomon, Kacmarck, and McDonough, *J. Chem. Eng. Data* **13** (4): 529-531 (1968).

Sulfur Trioxide

The reaction of sulfur trioxide and oxygen difluoride is very vigorous and explosions occur if the reaction is carried out in the absence of a solvent.

Solomon, Kacmarck and McDonough, *J. Chem. Eng. Data* **13** (4): 529-531 (1968).

DIFLUORODIAZENE N_2F_2

(self-reactive)

Studies of the isomerization of difluorodiazine in a copper tube indicated that the cis form is much less stable than the trans.

Lawless and Smith, pp. 42, 43 (1968).

DIGERMANE Ge_2H_6

Air

Digermane ignites spontaneously in air.

Ellern, p. 22 (1968).

DIHYDRAZINOCUPRIC CHLORATE $Cu(H_2NNH_2)_2ClO_3$

(See CUPRIC-DIHYDRAZINE CHLORATE)

DIHYDRAZINOZINC CHLORATE $Zn(N_2H_4)_2(ClO_3)_2$

(self-reactive)

This compound detonates when struck.

Mellor **2, Supp. 1:** 592 (1956).

See ZINC-HYDRAZINE CHLORATE.

DIHYDROHEXABORANE

(See HEXABORANE (12))

1, 6-DIIODO-2,4-HEXADIYNE $(I•CH_2C≡C-)_2$

(self-reactive)	1, 6-diiodo-2,4-hexadiyne is shock-sensitive.
	P.E. Drieder and H.V. Isaacson, *Chem. Eng. News* **50** (12): 51 (1972).

DIIODOMETHANE ICH_2I

Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Diiodomethane.

DIISOAMYL ZINC $((CH_3)_2CHC_2H_4)_2Zn$

Air	Isoamyl zinc is spontaneously flammable in air.
	Dangerous Chem. Code, p. 343 (1951).

DIISOBUTYL ALUMINUM CHLORIDE

(See CHLORODIISOBUTYL ALUMINUM)

DIISOBUTYLALUMINUM HYDRIDE $(C_4H_9)_2AlH$

Air	Diisobutyl aluminum hydride is spontaneously flammable in air.
	Rose (1961).

DIISOBUTYLENE $CH_2{=}C(CH_3)CH_2C(CH_3)_3$

Chorosulfonic Acid	Mixing diisobutylene and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing diisobutylene and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete

	reference.
Sulfuric Acid	Mixing diisobutylene and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

DIISOBUTYL ZINC $((CH_3)_2CHCH_2)_2Zn$

Air	Isobutyl zinc is spontaneously flammable in air.
	Dangerous Chem. Code, p. 343 (1951).

DIISOPROPYLBERYLLIUM $(C_3H_7)_2Be$

Water	Diisopropyl beryllium reacts explosively with water.
	G.E. Coates and F. Glockling, *J. Chem. Soc.* **106:** 22 (1954).

DIISOPROPYL ETHER $(CH_3)_2CHOCH(CH_3)_2$

Air	A flask of diisopropyl ether was being heated on a steam bath with gentle shaking when an explosion occurred. In a second instance, an explosion occurred after practically all the ether had been distilled.
	MCA Guide for Safety, Appendix 3 (1972).
	Diisopropyl ether and air form highly explosive peroxides.
	Wischmeyer (1969).
Air or Oxygen	See OXYGEN plus Ethers.
	See OXYGEN plus Isopropyl Ether.
Chlorosulfonic Acid	Mixing diisopropyl ether and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing diisopropyl ether and 70% nitric acid in a closed

	container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

DIISOPROPYL PEROXYDICARBONATE $[(CH_3)_2CHOC(O)O-]_2$

(self-reactive)	Diisopropyl perdicarbonate decomposes rapidly at room temperature and sometimes explodes. It becomes hazardous above 10¡ C. It should not be allowed to crystallize.
	Kirk and Othmer, Second Ed. **14:** 801, 803 (1963).
Organic Matter	Upon contact with diisopropyl peroxydicarbonate, combustible organic materials can ignite or explode.
	Haz. Chem. Data p. 121 (1973).

DILITHIUM METHYLENE CH_2Li_2

(See METHYLENE DILITHIUM)

1,2-DIMETHOXYETHANE $CH_2(OCH_3)CH_2(OCH_3)$

Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus 1,2-Dimethoxyethane.

2,2-DIMETHOXYPROPANE $CH_3C(OCH_3)_2CH_3$

Manganese Perchlorate and Ethyl Alcohol	See ETHYL ALCOHOL plus Manganese Perchlorate and 2,2-Dimethoxypropane.
Nickel Perchlorate	See NICKEL PERCHLORATE plus 2,2-Dimethoxypropane.

DIMETHYLALLYLARSINE

(See ALLYLDIMETHYL ARSINE)

DIMETHYLAMINO CHLORODIBORANE

(See CHLORO (DIMETHYLAMINO) DIBORANE)

N, N-DIMETHYLANILINE $C_6H_5N(CH_3)_2$

Benzoyl Peroxide	See BENZOYL PEROXIDE plus N, N-Dimethylaniline.

DIMETHYLARSINE $(CH_3)_2AsH$

Air	Dimethylarsine is spontaneously flammable in air. *Douda* (1966). *Handbook Chem. Phys.,* p. C-681 (1970-1971).

DIMETHYLBENZYLCARBINOL

(See 2(X,Y-XYLYL)ETHANOL)

DIMETHYL CARBONATE $CH_3OCOOCH_3$

Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

DIMETHYL ETHER CH_3OCH_3

Aluminum Hydride	See ALUMINUM HYDRIDE plus Dimethyl Ether.
Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus Dimethyl Ether.

DIMETHYL FORMAMIDE $HCON(CH_3)_2$

Bromine	See BROMINE plus Dimethyl Formamide.
Carbon Tetrachloride	Dimethyl formamide and carbon tetrachloride react violently at temperatures above 65¡ C.

	Kittila, p. 165 (1967).
Chlorinated Hydrocarbons	Some halogenated hydrocarbons reacted with dimethyl formamide in the presence of iron at moderate temperatures.
	Kittila, p. 165 (1967).
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Dimethyl Formamide.
2,5-Dimethylpyrrole and Phosphorus Oxychloride	See 2,5-DIMETHYLPYRROLE plus Phosphorus Oxychloride and Dimethyl Formamide.
Hexachlorobenzene	Dimethyl formamide and hexachlorobenzene react violently above 65¡ C.
	Kittila, p. 165 (1967).
Magnesium Nitrate	This mixture undergoes spontaneous decomposition. Nitrates of sodium, lithium, lead, copper and silver do not react under similar conditions.
	Kittila, p. 165 (1967).
Methylene Diisocyanate	Methylene diisocyanate polymerized violently on contact with dimethyl formamide.
	Kittila, p. 122 (1967).
Organic Nitrates	Dimethyl formamide undergoes spontaneous decomposition in the presence of organic nitrates.
	du Pont Prod. Inf. Bull., Dimethylformamide.
Phosphorus Trioxide	Dimethyl formamide, dimethyl sulfoxide, dimethyl sulfite, or methanol and phosphorus trioxide react very violently, often charring.
	Mellor **8, Supp. 3:** 382 (1971).
Triethyl Aluminum	Dimethyl formamide and triethyl aluminum form an explosive mixture when heated together.
	du Pont Prod. Inf. Bull., Dimethylformamide.

uns-DIMETHYLHYDRAZINE (UDMH)

$(CH_3)_2NNH_2$

Air	Unsymmetrical dimethyl hydrazine, when spread on a large surface, may ignite spontaneously.
	Def. Res. and Eng., pp. 299-300 (1963).
Hydrogen Peroxide	Spontaneous ignition of UDMH can occur on contact with oxidants like hydrogen peroxide and fuming nitric acid.
	Haz. Chem. Data (1966).
Nitric Acid	See NITRIC ACID plus Dimethylhydrazine.
Nitric Acid (Fuming)	See UNSYMMETRICAL DIMETHYL HYDRAZINE plus Hydrogen Peroxide.
Nitric Acid, Nitrogen Tetroxide, and Sulfuric Acid	Combinations of unsymmetrical dimethylhydrazine, aniline, or furfuryl alcohol as fuels with hydrogen peroxide or a mixture of nitric acid-nitrogen tetroxide-sulfuric acid as oxidizers ignite with little delay and are used as propellants.
	Chem. Abst. **51:** 3961d (1957); **63:** 4067h (1965).
	Brennstoff-Chem. **46** (4): 117-24 (1965).
Nitric Oxide	See NITRIC OXIDE plus Unsymmetrical Dimethylhydrazine.

DIMETHYLMAGNESIUM $(CH_3)_2Mg$

Air	Dimethyl magnesium is spontaneously flammable in air.
	Coates, p. 29 (1956).

DIMETHYL MALONATE $CH_2(COOCH_3)_2$

Methyl Azide	See METHYL AZIDE plus Dimethyl Malonate.

DIMETHYLMANGANESE $(CH_3)_2Mn$

Air	Dimethyl manganese is spontaneously flammable in air.
	Zeiss, p. 432 (1960).

2,5-DIMETHYLPYRROLE $(CH_3)_2C_4H_3N$

Phosphorus Oxychloride and Dimethyl Formamide	A complex of phosphorus oxychloride and dimethyl formamide was formed, then 2,5-dimethylpyrrole was added slowly. Internal temperature was 15¡ C. When only a part of the 2,5-dimethylpyrrole had been added the chemist noted that a vortex was no longer being formed by the stirrer. When he agitated the flask, the mixture erupted.
	MCA Case History **1460** (1968).

DIMETHYL SULFATE $(CH_3)_2SO_4$

Ammonium Hydroxide	See AMMONIUM HYDROXIDE plus Dimethyl Sulfate.
Sodium Azide	See SODIUM AZIDE plus Dimethyl Sulfate.

DIMETHYL SULFITE $SO_3(CH_3)_2$

Phosphorus Trioxide	See DIMETHYL FORMAMIDE plus Phosphorus Trioxide.

DIMETHYL SULFOXIDE $(CH_3)_2SO$

Acetyl Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
Acyl Halides	Dimethyl sulfoxide decomposes violently on contact with a wide range of acyl halides, aryl halides and related compounds. Examples are phenyl and tolyl chloride, acetyl chloride, benzenesulfonyl chloride, benzoyl chloride, cyanuric chloride, phosphorus chloride, phosphorus oxychloride, and thionyl chloride. Dimethyl sulfoxide should be used with caution in exploratory reactions.

	Chem. Eng. News **35** (9): 87 (1957). *BCISC* **39** (154): 15 (1968). *Chem. Ind.* **40:** 1706-1707 (1967).
Benzenesulfonyl Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
Benzoyl Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
p-Bromobenzoyl Acetanilide	See p-BROMOBENZOYL ACETANILIDE plus Dimethyl Sulfoxide.
Cyanuric Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
Iodine Pentafluoride	The reaction of dimethyl sulfoxide and iodine pentafluoride can be controlled to give a number of products, but the unmoderated reaction is quite violent because of the predominant formation of gaseous fluoromethanes and sulfuroxyfluorides as the temperature increases.
	E.M. Lawless, *Chem. Eng. News* **47** (12): 8, 109 (1969).
Magnesium Perchlorate	In the preparation of anhydrous dimethyl sulfoxide by vacuum distillation from anhydrous magnesium perchlorate, an explosion occurred.
	MCA Case History **1187** (1966). *Karasch* (1961). *Chem. Eng. News* **43** (37): 62 (1965).
Methyl Bromide	See METHYL BROMIDE plus Dimethyl Sulfoxide.
Perchloric Acid	An explosion occurs when 70% perchloric acid contacts sulfoxides.
	MCA Case History **1187** (1966). *Karasch* (1961).
	See also SULFOXIDES plus Perchloric Acid.
Periodic Acid	In periodic-dimethyl sulfoxide oxidizing systems, violent explosions can occur if the concentration of periodic acid is too strong. For example, in oxidizing glycopyranosides an explosion took place at a 1.5N concentration of the periodic acid.
	R. J. Yu and C. T. Bishop, *Can. J. Chem.* **45:** 2195 (1967). *Chem. Eng. News* **44** (15): 48 (1966). *J. Am. Chem. Soc.* **90** (7): 1924 (1968).
Phenyl Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.

Phosphorus Oxychloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
Phosphorus Trichloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
Phosphorus Trioxide	See DIMETHYL FORMAMIDE plus Phosphorus Trioxide.
Potassium Permanganate	A mixture of the two will flash instantaneously. *Ellern*, p. 50 (1968).
Silver Fluoride	Dimethyl sulfoxide is violently reactive with fluorinating agents such as silver fluoride. *Chem. Eng. News* **47** (12): 8, 109 (1969).
Sodium Hydride	The reaction of these two reagents to prepare methyl sulfinyl carbanion can cause explosions. *Chem. Eng. News* **44** (14): 48 (1966); **44** (24): **7** (1966).
Thionyl Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.
Tolyl Chloride	See DIMETHYL SULFOXIDE plus Acyl Halides.

DINITROANILINE HYDROCHLORIDE $(O_2N)_2C_6H_3NH_2{\bullet}HCl$

Nitrosylsulfuric Acid	See NITROSYLSULFURIC ACID plus Dinitroaniline Hydrochloride.

2,4-DINITROBENZENE SULFENYL CHLORIDE $(NO_2)_2C_6H_3SCl$

(self-reactive)	An explosion may occur when the solvent symmetrical tetrachlorethane is almost removed in the chlorinolysis of 2,4-dinitrophenyl disulfide. *MCA Guide for Safety*, Appendix 3 (1972).

2,4-DINITROCHLOROBENZENE $(O_2N)_2C_6H_3Cl$

(self-reactive)	B. D. Halpern, *Chem. and Eng. News*, **29:** 2666 (1951).

DINITROGEN PENTOXIDE O_2NONO_2

Ozone	See OZONE plus Dinitrogen Pentoxide.

2,4-DINITROPHENYL DISULFIDE $[(O_2N)_2C_6H_3S\text{-}]_2$

Tetrachlorethane	See 2, 4-DINITROBENZENE SULFENYL-CHLORIDE (self-reactive).

DINITROSOPENTAMETHYLENETETRAMINE $(ON)_2(CH_2)_5N_4$

(self-reactive)	This chemical is a blowing agent with an exothermic decomposition slightly above its melting point of 203¡C. *Ellern,* p. 161 (1968).

DIOXANE

Hydrogen and	See HYDROGEN plus Dioxane and Nickel
Nickel (Raney)	(Raney).
Silver Perchlorate	See SILVER PERCHLORATE plus Toluene.

DIOXYGEN DIFLUORIDE

(See DIFLUORINE PEROXIDE)

DIPEROXYTEREPHTHALIC ACID $(HOOOC)_2C_6H_4$

(self-reactive)	This acid explodes under the influence of a shock or an increase in temperature. *Chem. Reviews* **45:** 14, 15 (1949).

DIPHENYLAMINE $(C_6H_5)_2NH$

Hexachloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.
Trichloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.

DIPHENYL DIAZOSULFIDE $(C_6H_5N_2)_2S$

Air	Phenyldiazosulfide explodes when air-dried.
	Chem. Eng. News **29:** 5473 (1951).

1,2-DIPHENYLETHYLENE $C_6H_5CH{=}CHC_6H_5$

Oxygen	See OXYGEN plus Diphenylethylene.

DIPHENYLTETRACETYLENE $(C_6H_5C{=}CC{=}C)_2$

(self-reactive)	Diphenyltetracetylene was stable for at least 13 months at room temperature in the dark. When placed on a metallic plate, it decomposed explosively with much soot.
	Chem. Abst. **45:** 7082 (1962).

DIPHOSPHINE H_2PPH_2

Air	The liquid is spontaneously flammable in air and the presence of a trace of the vapor makes phosphine and other combustible gases spontaneously flammable in air.
	Mellor **8:** 829 (1946-1947).
	Mellor **1:** 376 (1946-1947).
	Mellor **8, Supp. 3:** 273 (1971).

DIPHOSPHORYL CHLORIDE $P_2O_3Cl_2$

Water	The vigorous hydrolysis of pyrophosphoryl chloride is like that of phosphorus pentoxide.
	Mellor **8, Supp. 3:** 505.

DIPOTASSIUM NITROACETATE

(See POTASSIUM ACI-NITROACETATE)

DIPROPARGYL ETHER $(CH{=}CCH_2)_2O$

Air	An explosion occurred in a 50-gallon stainless steel still during the distillation of dipropargyl ether.
	MCA Guide for Safety, Appendix 3 (1972).

DIPROPYLALUMINUM HYDRIDE $(C_3H_7)_2AlH$

Air	Di-n-propylaluminum hydride ignites spontaneously in air.
	Aluminum Alkyls, p. 21. *Fire Haz. Prop.* (1969).
Water	Di-n-propylaluminum hydride reacts violently with water.
	Aluminum Alkyls, p. 21.

DIPROPYLCHLOROBORINE

(See CHLORODIPROPYLBORANE)

DIPROPYLZINC $(C_3H_7)_2Zn$

Air	Di-n-propyl zinc is spontaneously flammable in air.
	Douda (1966).

DISILANE (SILICOETHANE) Si_2H_6

Air	See OXYGEN plus Disilane.
Carbon Tetrachloride	Disilane explodes violently when mixed with carbon

	tetrachloride; reacts vigorously with incandescence in contact with chloroform.
	Mellor **6:** 223 (1946-1947).
Chloroform	See DISILANE plus Carbon Tetrachloride.
Oxygen	See OXYGEN plus Disilane.
Sulfur Hexafluoride	Disilane explodes violently in contact with sulfur hexafluoride.
	Mellor **6:** 223 (1946-1947).

DISILOXANE $(SiH_3)_2O$

Air	See SILANES plus Air.

(DISILYLAMINO) DIBORANE $B_2H_5N(SiH_3)_2$

Air	Disilylamino diborane is spontaneously flammable in air.
	Douda (1966).

DISILYLAMINO DICHLOROBORINE

(See DICHLORO(DISILYLAMINO)BORANE)

DISODIUM NITRITE Na_2NO_2

(self-reactive)	See POTASSIUM plus Sodium Nitrite and Ammonia.

DISULFUR DINITRIDE

(See SULFUR NITRIDE)

DISULFURYL AZIDE $(N_3SO_2)_2O$

(self-reactive)	Pyrosulfuryl azide decomposes explosively below 80¡C.

Mellor **8, Supp. 2:** 36 (1967).

DIVANADIUM DODECACARBONYL $V_2(CO)_{12}$

Air	Divanadium dodecacarbonyl is spontaneously flammable in air.
	R. L. Pruett and J. E. Wyman, *Chem. and Ind.* **9** (1): 119-120 (1960).

DIVINYL ACETYLENE

(See 1,5-HEXADIEN-3-YNE)

DIVINYL ETHER $(CH_2{=}CH)_2O$

Air	See OXYGEN plus Ethers.
Oxygen	See OXYGEN plus Ethers.

DIVINYLZINC$(CH_2{=}CH)_2Zn$

Air	Divinyl zinc is spontaneously flammable in air.
	Zeiss (1960).

DOWICIL 100 [1-(3-CHLOROALLYL)-3,5,7-TRIAZO-1-

AZONIAADAMANTANE CHLORIDE]

$C_6H_{12}N_4$-$(CH_2CHCHCl)Cl$

Hydrogen Chloride	This compound is stable below 120¡C if kept dry and away from hydrogen chloride. Both water and hydrogen chloride will cause chemical decomposition. Decomposition is immediate with hydrogen chloride; it is somewhat slower in water.
	Dowicil
Water	See DOWICIL 100 plus Hydrogen Chloride.

DYSPROSIUM Dy

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

ENDRIN $C_{12}H_8OCl_6$

Parathion	See PARATHION plus Endrin.

EPICHLOROHYDRIN

2-Aminoethanol	See 2-AMINOETHANOL plus Epichlorohydrin.
Chlorosulfonic Acid	Mixing epichlorohydrin and 2-aminoethanol in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Ethylene Diamine	See ETHYLENE DIAMINE plus Epichlorohydrin.
Ethyleneimine	Mixing epichlorohydrin and ethyleneimine in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Nitric Acid	Mixing epichlorohydrin and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing epichlorohydrin and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Sulfuric Acid	See ETHYLENE CYANOHYDRIN plus Sulfuric Acid.
	Mixing epichlorohydrin and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

ERBIUM Er

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

ERBIUM PERCHLORATE $Er(ClO_4)_3$

Acetonitrile	See ACETONITRILE plus Erbium Perchlorate.

ESTERS

Nitrates	See NITRATES plus Esters.

ETHANE C_2H_6

Chlorine	See CHLORINE plus Ethane.
Chlorine Dioxide	See CHLORINE DIOXIDE plus Butadiene.

1,2-ETHANETHIOL $HSCH_2CH_2SH$

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus 1-Propanethiol.

ETHERS

(See also specific ethers)

Air or Oxygen	Peroxides form on standing and are very dangerous.

	Bahme, p. 46 (1961).
Boron Triiodide	See BORON TRIIODIDE plus Ethers.

ETHOXYACETYLENE $C_2H_5OC{\equiv}CH$

Ethylmagnesium Iodide	See ETHYLMAGNESIUM IODIDE plus Ethoxyacetylene.

(4-ETHOXYBUTYL) DIETHYLALUMINUM $(C_2H_5)_2Al(CH_2)_4OC_2H_5$

Air	Diethyl-4-ethoxybutylamine is spontaneously flammable in air. *Douda* (1966).

2-(2-ETHOXYETHOXY)ETHYL ACETATE $CH_3COOCH_2CH_2OCH_2CH_2OC_2H_5$

Chlorosulfonic Acid	Mixing ethyl glycol monoethyl ether acetate and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing ethylene glycol monoethyl ether acetate and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

ETHOXYETHYNYLCARBINOL $C_2H_5OCHOHC{\equiv}CH$

(self-reactive)	Violent explosions have been recorded in the use of this material. *Rutledge*, p. 35 (1968).

ETHOXYTRIETHYLDIPHOSPHINYL OXIDE

$(C_2H_5)_2POP(C_2H_5)(OC_2H_5)$

Air	Triethyl ethoxy diphosphinyl oxide is spontaneously flammable in air. *Kaufman* (1961).

ETHYL ACETATE $C_2H_5COOCH_3$

Chlorosulfonic Acid	Mixing ethyl acetate and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Lithium Aluminum Hydride and 2-Chloromethylfuran	See 2-CHLOROMETHYLFURAN plus Lithium Aluminum Hydride and Ethyl Acetate.
Oleum	Mixing ethylacetate and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

ETHYL ACETOACETATE $C_2H_5OCOCH_2COCH_3$

Tribromoneopentyl Alcohol and Zinc	Tribromoneopentyl alcohol, ethyl acetoacetate and zinc were being reacted to prepare the zinc chelate of tribromoneopentyl acetoacetate. When the reaction had proceeded to where 80% of the by-product ethanol had been removed, a violent decomposition occurred. *Wischmeyer* (1972). *U.S. Pat.* 3,578,619 (1971).

ETHYL ACRYLATE $C_2H_5OCOCH{=}CH_2$

Chlorosulfonic Acid	Mixing ethyl acrylate and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

ETHYL ALCOHOL CH_3CH_2OH

Acetyl Chloride	See ACETYL CHLORIDE plus Ethyl Alcohol.
Ammonium Hydroxide and Silver Oxide	See SILVER OXIDE plus Aqueous Ammonia and Ethyl Alcohol.
Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Ethyl Alcohol.
Chlorine Trioxide	See CHLORINE TRIOXIDE plus Alcohol.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Ethyl Alcohol.
Chromyl Chloride	See CHROMYL CHLORIDE plus Ammonia.
Cyanuric Acid	See CYANURIC ACID plus Water.
Hydrogen Peroxide	The addition of alcohols to highly concentrated hydrogen peroxide forms powerful explosives which can be detonated by shock. *Bahme,* p. 9 (1961).
Hydrogen Peroxide and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Iodine, Methyl Alcohol, and Mercuric Oxide	See IODINE plus Ethyl Alcohol, Methyl Alcohol, and Mercuric Oxide.
Manganese Perchlorate and 2,2-Dimethoxypropane	A violent explosion occurred when manganese perchlorate, absolute alcohol and 2,2-dimethoxypropane were gently refluxed for about two hours under a stream of nitrogen. *Chem. Eng. News* **48** (28): 6 (July 6, 1970).

Mercuric Nitrate	See MERCURIC NITRATE plus Ethyl Alcohol.
Nitric Acid	See NITRIC ACID plus Ethyl Alcohol.
Perchlorates	See PERCHLORATES plus Benzene.
Perchloric Acid	See PERCHLORIC ACID plus Ethyl Alcohol.
Permanganates and Sulfuric Acid	See PERMANGANATES plus SULFURIC Acid and Benzene.
Permanganic Acid	See PERMANGANIC ACID plus Ethyl Alcohol.
Potassium Superoxide	See POTASSIUM SUPEROXIDE plus Ethyl Alcohol.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Silver and Nitric Acid	See SILVER plus Ethyl Alcohol and Nitric Acid.
Silver Nitrate	See SILVER NITRATE plus Ethyl Alcohol.
Silver Perchlorate	See SILVER PERCHLORATE plus Benzene.
Sodium Hydrazide	See SODIUM HYDRAZIDE plus Air.
Uranyl Perchlorate	See URANYL PERCHLORATE plus Ethyl Alcohol.

ETHYL ALUMINUM DICHLORIDE

(See DICHLOROETHYLALUMINUM)

ETHYL ALUMINUM SESQUICHLORIDE

(See TRICHLOROTRIETHYLDIALUMINUM)

m-ETHYLANILINE $C_2H_5C_6H_4NH_2$

Nitric Acid	See NITRIC ACID plus m-Ethylaniline.

ETHYL AZIDES

(self-reactive)	See METHYL AZIDES (self-reactive).

ETHYL BORON DICHLORIDE

(See DICHLOROETHYLBORANE)

ETHYLENE $CH_2=CH_2$

Aluminum Chloride	See ALUMINUM CHLORIDE plus Ethylene.
Benzoyl Peroxide and Carbon Tetrachloride	See BENZOYL PEROXIDE plus Carbon Tetrachloride and Ethylene.
Bromotrichloromethane	See BROMOTRICHLOROMETHANE plus Ethylene.
Carbon Tetrachloride	See CARBON TETRACHLORIDE plus Ethylene.
Chlorine	See CHLORINE plus Ethylene.
Chlorine Dioxide	See CHLORINE DIOXIDE plus Butadiene.
Nitrogen Dioxide	See NITROGEN TETROXIDE plus Olefins.
Nitromethane and Aluminum Chloride	A mixture of ethylene with nitromethane-aluminum chloride catalyst in an autoclave exploded at a temperature below 40¡C. F. M. Cowen and O. Rorso, *Chem. Eng. News* **26:** 2257 (1948). See also ALUMINUM CHLORIDE plus Nitromethane and Organic Matter.
Ozone	See OZONE plus Ethylene.

ETHYLENE CYANOHYDRIN

(See 2-CYANOETHANOL)

ETHYLENEDIAMINE $H_2NCH_2CH_2NH_2$

Acetic Acid	See ACETIC ACID plus Ethylene Diamine.

Acetic Anhydride	See ACETIC ANHYDRIDE plus Ethylene Diamine.
Acrolein	See ACROLEIN plus Ethylene Diamine.
Acrylic Acid	See ACRYLIC ACID plus Ethylene Diamine.
Acrylonitrile	See ACRYLONITRILE plus Ethylene Diamine.
Allyl Chloride	See ALLYL CHLORIDE plus Ethylene Diamine.
Carbon Disulfide	See CARBON DISULFIDE plus Ethylene Diamine.
Chlorosulfonic Acid	Mixing ethylene diamine and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Epichlorohydrin	Mixing ethylene diamine and epichlorohydrin in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Ethylene Chlorohydrin	See ETHYLENE CHLOROHYDRIN plus Ethylene Diamine.
Hydrochloric Acid	Mixing ethylene diamine and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Mesityl Oxide	See MESITYL OXIDE plus Ethylene Diamine.
Nitric Acid	Mixing ethylene diamine and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing ethylene diamine and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Propiolactone (beta-)	Mixing ethylene diamine and propiolactone (beta-) in a closed container caused the temperature and pressure to

	increase.
	Flynn and Rossow (1970). See Note under complete reference.
Silver Perchlorate	See SILVER PERCHLORATE plus Ethylenediamine.
Sulfuric Acid	Mixing ethylene diamine and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Vinyl Acetate	Mixing ethylene diamine and vinyl acetate in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

ETHYLENEDIAMINE DIPERCHLORATE

$NH_2CH_2CH_2NH_2(ClO_4)_2$

(self-reactive)	This compound is an explosive that exceeds the power and brisance of TNT.
	ACS **146:**206. *Chem. Reviews* **44:**419-45 (1949).

ETHYLENE DICHLORIDE $ClCH_2CH_2Cl$

(See also 1,2-DICHLOROETHANE)

Ammonia	See AMMONIA plus Ethylene Dichloride.
Dimethyl Amino Propyl Amine	A tank of dimethyl amino propyl amine exploded violently when it reacted with wet ethylene dichloride which had been the tank's previous contents. Investigation revealed that this combination can be extremely hazardous.
	Doyle (1973).

ETHYLENE DIOXYAMINE PERCHLORATE

$CH_2CH_2ONHOHClO_4$

(self-reactive) | An explosion occurred in a laboratory during synthesis of ethylene dioxyamine perchlorate. It is believed that during some stage of purification of the material a low order explosion occurred.

BCISC **41** (162): 18 (April-June 1970).

ETHYLENE GLYCOL HOC_2H_4OH

Chlorosulfonic Acid | Mixing ethylene glycol and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.

Flynn and Rossow (1970). See Note under complete reference.

Oleum | Mixing ethylene glycol and oleum in a closed container caused the temperature and pressure to increase.

Flynn and Rossow (1970). See Note under complete reference.

Sulfuric Acid | Mixing ethylene glycol and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.

Flynn and Rossow (1970). See Note under complete reference.

ETHYLENE GLYCOL MONOMETHYL ETHER

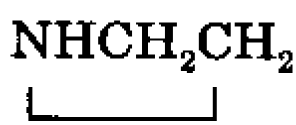
(See 2-METHOXYETHANOL)

ETHYLENE OXIDE $(CH_2)_2O$

Acids and Bases | Alkali metal hydroxides; acids; anhydrous chlorides of iron, tin, and aluminum; pure oxides of iron and aluminum; and metallic potassium are some of the catalysts that may cause liquid ethylene oxide to rearrange and/or polymerize, liberating heat.

	L. G. Hess and V. V. Tilton, *Ind. Eng. Chem.* **42:** 1251-8 (1950). A. K. Gupta, *J. Soc. Chem. Ind.* **68:** 179-83 (1949).
Alcohols	Explosions occur, although infrequently, from the combination of ethylene oxide and alcohols or mercaptans.
	Chem. Eng. News **20:** 1318 (1942).
Aluminum Chloride	See ETHYLENE OXIDE plus Acids and Bases. See ETHYLENE OXIDES plus Aluminum Oxide.
Aluminum Oxide	Ethylene oxide may polymerize violently when in contact with highly catalytic surfaces such as anhydrous chlorides of iron, tin and aluminum, or the pure oxides of aluminum and iron.
	Hazardous Chemicals Data (1966).
	See also ETHYLENE OXIDE plus Acids and Bases.
Ammonia	See AMMONIA plus Ethylene Oxide.
Copper	See COPPER plus Ethylene Oxide.
Iron Chlorides	See ETHYLENE OXIDE plus Acids and Bases. See ETHYLENE OXIDE plus Aluminum Oxide.
Iron Oxides	See ETHYLENE OXIDE plus Acids and Bases. See ETHYLENE OXIDE plus Aluminum Oxide.
Magnesium Perchlorate	See MAGNESIUM PERCHLORATE plus Ethylene Oxide.
Mercaptans	See ETHYLENE OXIDE plus Alcohols.
Potassium	See POTASSIUM plus Ethylene Oxide. See ETHYLENE OXIDE plus Acids and Bases.
Tin Chlorides	See ETHYLENE OXIDE plus Acids and Bases. See ETHYLENE OXIDE plus Aluminum Oxide.

ETHYLENEIMINE



(self-reactive)	Undiluted ethyleneimine can polymerize violently in the

	presence of acids or acid-forming materials.
	Ethyleneimine.
Acetic Acid	See ACETIC ACID plus Ethyleneimine.
Acetic Anhydride	See ACETIC ANHYDRIDE plus Ethyleneimine.
Acrolein	See ACROLEIN plus Ethyleneimine.
Acrylic Acid	See ACRYLIC ACID plus Ethyleneimine.
Allyl Chloride	See ALLYL CHLORIDE plus Ethyleneimine.
Carbon Disulfide	See CARBON DISULFIDE plus Ethyleneimine.
Chlorine	See CHLORINE plus Ethyleneimine.
Chlorosulfonic Acid	Mixing ethyleneimine and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Epichlorohydrin	See EPICHLOROHYDRIN plus Ethyleneimine.
Glyoxal	See GLYOXAL plus Ethyleneimine.
Hydrochloric Acid	Mixing ethyleneimine and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing ethyleneimine and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing ethyleneimine and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	See OLEUM plus Ethyleneimine.
Propiolactone (beta-)	Mixing ethyleneimine and propiolactone (beta-) in a closed

	container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Silver	See SILVER plus Ethyleneimine.
Sodium Hypochlorite	Chlorination of ethyleneimine with sodium hypochlorite gives the explosive compound, 1-chloroethyleneimine.
	A.F. Graefe and R.E. Meyer, J. *Am. Chem. Soc.* **80:** 3939 (1958).
Sulfuric Acid	Mixing ethyleneimine and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Vinyl Acetate	See VINYL ACETATE plus Ethyleneimine.

2-ETHYLHEXANAL $CH_3(CH_2)_3CH(C_2H_5)CHO$

Air	2-Ethylhexaldehyde is spontaneously flammable in air.
	A.B. Steele and J. Duggan, *Chem. Eng.* **66:** 160 (April 20, 1969).

ETHYL HYPOCHLORITE CH_3CH_2OCl

(self-reactive)	Ethyl hypochlorite decomposes explosively when exposed to light and rapidly even in its absence.
	Mellor **2, Supp. 1:** 560 (1956).
	See also ALCOHOLS plus Hypochlorous Acid.

ETHYLIODOMETHYLARSINE $(CH_3)(C_2H_5)AsI$

Air	Methyl ethyliodoarsine occasionally ignites spontaneously in air.
	ACS **15** (1923).

ETHYL ISONITRILE

(See ISOCYANOETHANE)

S-ETHYLISOTHIOUREA SULFATE $NH_2C(NH)SC_2H_5 \bullet H_2SO_4$

Chlorine	See CHLORINE plus S-Ethyl Isothiourea Sulfate.

ETHYLLITHIUM C_2H_5Li

Air	Ethyl lithium is spontaneously flammable in air. *Ellern* (1961).

ETHYLMAGNESIUM IODIDE C_2H_5MgI

Ethoxyacetylene	A laboratory scale-up of this reaction had failed to yield the desired Grignard end-product. After one hour, the reaction vessel exploded. *Chem. Eng. News* **44** (8): 40 (1966).

ETHYLMETHYLARSINE $HAs(CH_3)(C_2H_5)$

Air	Ethylmethylarsine is spontaneously flammable in air. *Ellern*, pp. 24-25 (1968).

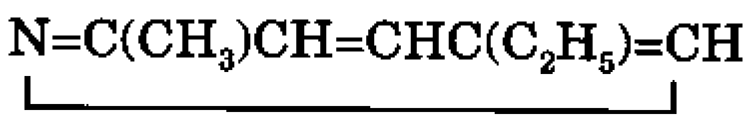
ETHYL METHYL ETHER $CH_3OC_2H_5$

Air	See OXYGEN plus Ethers.
Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus Dimethyl Ether.
Oxygen	See OXYGEN plus Ethers.

ETHYL METHYL KETONE $CH_3COC_2H_5$

Chlorosulfonic Acid	Mixing methyl ethyl ketone and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing methyl ethyl ketone and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

5-ETHYL-2-METHYLPYRIDINE



Nitric Acid	See NITRIC ACID plus 2-Methyl-5-Ethylpyridine.
	See NITRIC ACID plus 5-Ethyl-2-Methyl Pyridine.

ETHYL NITRITE C_2H_5ONO

(self-reactive)	The decomposition of ethyl nitrite above 194¡F can be violently explosive.
	Chem. Haz. Data (1969).

ETHYL PERCHLORATE $C_2H_5ClO_4$

(self-reactive)	This compound is an explosive that exceeds the power and brisance of TNT.
	*ACS **146:** 296. Chem. Reviews* **44:** 419-45 (1949).

ETHYLPHOSPHINE $C_2H_5PH_2$

Bromine	See BROMINE plus Ethyl Phosphine.
Chlorine	See BROMINE plus Ethyl Phosphine.
Nitric Acid	See BROMINE plus Ethyl Phosphine.

5-ETHYL-2-PICOLINE $C_8H_{11}N$

Nitric Acid	This reaction results in the formation of 5-(1,1 dinitroethyl)-2-picoline, an explosive compound. In addition, the reaction itself is potentially violent, especially in closed systems.
	H. Rubenstein, G. Hazen, and R. Zerfing, *Chem. Eng. Data* **12:** 149-50 (1967).

ETHYL SODIO-ACETOACETATE $C_2H_5OCOCH{=}CO(Na)CH_3$

2-Iodo-3, 5-Dinitrobiphenyl	See 2-IODO-3, 5-DINITROBIPHENYL plus Ethyl Sodio-Acetoacetate.

ETHYLSODIUM C_2H_5Na

Air	Ethyl sodium is spontaneously flammable in air.
	Douda (1966).

ETHYLTRICHLOROSILANE

(See TRICHLOROETHYLSILANE)

EUROPIUM

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

FERRIC BROMIDE $FeBr_3$

Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Cobaltous Bromide.

FERRIC CHLORIDE $FeCl_3$

Allyl Chloride	See SULFURIC ACID plus Allyl Chloride.
Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Cobaltous Bromide.

FERRIC FERROCYANIDE $Fe_4[Fe(CN)_6]_3$

Lead Chromate	See LEAD CHROMATE plus Ferric Ferrocyanide.

FERRIC HYPOPHOSPHITE $Fe(PH_2O_2)_3$

(self-reactive)	Ferric hypophosphite forms impact-sensitive ammunition-priming mixtures. *Mellor* **8, Supp. 3:** 623 (1971).

FERRIC OXIDE Fe_2O_3

Aluminum	See ALUMINUM plus Iron Oxide.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Lead Oxide.
Cesium Carbide	See CESIUM CARBIDE plus Ferric Oxide.
Ethylene Oxide	See ETHYLENE OXIDE plus Acids and Bases. See ETHYLENE OXIDE plus Aluminum Oxide.

FERRIC OXIDE (HYDRATED) $Fe_2O_3XH_2O$

Hydrogen Sulfide	See HYDROGEN SULFIDE plus Hydrated Iron Oxide.

FERROCENE $(C_5H_5)_2Fe$

Ammonium Perchlorate	See AMMONIUM PERCHLORATE plus Dicyclopentadienyliron.

FERROUS BROMIDE $FeBr_2$

Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Cobaltous Bromide.

FERROUS CHLORIDE $FeCl_2$

Ethylene Oxide	See ETHYLENE OXIDE plus Acids and Bases.
	See ETHYLENE OXIDE plus Aluminum Oxide.
Potassium	See POTASSIUM Plus Boron Tribromide.
Sodium	See SODIUM plus Ferrous Chloride.

FERROUS IODIDE FeI_2

Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Cobaltous Bromide.

FERROUS OXIDE FeO

Air	Ferrous oxide is spontaneously flammable in air.
	Chem. Abst. **45:** 3276i (1951).
Ethylene Oxide	See ETHYLENE OXIDE plus Acids and Bases. See ETHYLENE OXIDE plus Aluminum Oxide.
Fluorine	See FLUORINE plus Ferrous Oxide.
Nitric Acid	When pyrophoric iron oxide is gently warmed with nitric acid, the oxide becomes incandescent.
	Mellor **13:** 716 (1946-1947).
Sulfur Dioxide	When ferrous oxide, prepared at 300¡C., is heated in sulfur dioxide, the mass becomes incandescent.

Mellor **13:** 715 (1946-1947).

FERROUS SULFIDE FeS

Air	Moist ferrous sulfide readily oxidizes in air and the heat evolved may cause incandescence. When ground in a mortar, the mass becomes incandescent.
	Mellor **14:** 157 (1946-1947).
Hydrogen Peroxide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Lithium	See LITHIUM plus Ferrous Sulfide.

FLUORAZIDE N_3F

(self-reactive)	See FLUORINE AZIDE (self-reactive).

FLUORINE F_2

Acetaldehyde	See BROMINE plus Acetaldehyde.
Acetylene	Acetylene and fluorine will react violently.
	Chem. Safety Data Sheet **SD-7** (1957).
Acrylonitrile-Butadiene	See FLUORINE plus Solid Nonmetals and
Copolymer	Oxygen.
Alkali Oxides	The oxides of the alkalies and alkaline earths are vigorously attacked by fluorine gas with incandescence.
	Mellor **2:** 13 (1946-1947).
Alkaline Earth Oxides	See FLUORINE plus Alkali Oxides.
Alkenes	Fluorine causes unsaturated hydrocarbons to ignite spontaneously.
	Mellor **2, Supp. 1:** 55 (1956).
Alkylbenzenes	Fluorine causes aromatic hydrocarbons to ignite spontaneously.
	Mellor **2, Supp. 1:** 55 (1956).

Aluminum	See FLUORINE plus Metals.
Ammonia	Fluorine and ammonia burst into flame.
	Mellor **1:** 12; **8:** 216 (1946-1947).
	Mellor **8, Supp. 2:** 329 (1964).
Ammonium Hydroxide	Combination of fluorine and ammonium hydroxide results in flames and explosion.
	Mellor **2, Supp. 1:** 56 (1956).
Antimony	See ANTIMONY plus Bromine.
Antimony Trisulfide	The reaction at ordinary temperatures between fluorine and antimony trisulfide is accompanied by a blue flame.
	Mellor **9:** 522 (1946-1947).
Arsenic	Fluorine vigorously reacts with arsenic at ordinary temperatures.
	Mellor **9:** 34 (1946-1947).
Arsenic Trioxide	Fluorine reacts violently with arsenic trioxide.
	Mellor **9:** 101 (1946-1947).
Asphalt	See FLUORINE plus Common Materials and Oxygen.
Bakelite□	See FLUORINE plus Solid Nonmetals.
Boron	See BORON plus Fluorine.
Bromides	See FLUORINE plus Chlorides.
Bromine	Bromine unites with fluorine at ordinary temperatures with a luminous flame, forming bromine trifluoride.
	Mellor **2:** (1946-1947).
Buna N	See FLUORINE plus Solid Nonmetals and Oxygen.
Calcium	See CALCIUM plus Fluorine.
Calcium Carbonate	See FLUORINE plus Carbonates.
Calcium Oxide	Even when cold, fluorine will attack calcium oxide, evolving much heat and some light.
	Mellor **3:** 663 (1946-1947).

Calcium Silicide	Calcium silicide burns readily in fluorine. *Mellor* **6:** 169 (1946-1947).
Carbon	Graphitic or crystallized carbon tends to react explosively with fluorine after an intermediate induction period in a manner similar to that of ice. *NASA SP*-**3037:** 53, 84. *Mellor* **5:** 822-30: **2:** 310 (1946-1947). *Mellor* **2, Supp. 1:** 60 (1956).
Carbonates	The carbonates of sodium, lithium, calcium and lead in contact with fluorine are decomposed at ordinary temperatures with incandescence. *Mellor* **2:** 13 (1946-1947).
Carbon Disulfide	A mixture of fluorine and carbon disulfide ignites at ordinary temperatures. *Mellor* **2:** 13; **6:** 111 (1946-1947).
Carbon Tetrachloride	The reaction is violent and sometimes explosive. *NASA SP*-**3037:** 82. *Mellor* **2, Supp. I.** 198 (1956).
Cellulose	Fluorine in contact with cotton produces a violent explosion. *Mellor* **2, Supp. 1:** 54 (1956).
Cesium Acetylene Carbide	Cesium acetylene carbide burns in cold fluorine. *Mellor* **5:** 849 (1946-1947).
Cesium Monoxide	See BROMINE plus Cesium Monoxide.
Cesium Perfluoro-propoxide	During preparation of perfluoropropyl hypofluorite, the intermediate cesium compound was being fluorinated with a 50/50 fluorine-nitrogen mix at minus 50¡C. After 10 hours addition of fluorine, the set-up exploded. *Chem. Eng. News* **43** (9): 36 (1965). *MCA Case History* **1045** (1964).
Charcoal	See FLUORINE plus Common Materials and Oxygen.
Chlorides	Chlorides, bromides, iodides and cyanides are generally

	vigorously attacked by fluorine in the cold.
	Mellor **2:** 13 (1946-1947).
Chlorinated Polyethylene	See FLUORINE plus Solid Nonmetals.
Chlorine	See CHLORINE plus Fluorine.
Chlorine Dioxide	The uncontrolled reaction between chlorine dioxide and fluorine is explosive.
	Lawless and Smith, p. 133 (1968).
	Mellor **2, Supp. 1:** 532 (1956).
Chromous Sulfide	Chromous sulfide combines with fluorine with incandescence.
	Mellor **11:** 430 (1946-1947).
Chromyl Chloride	Fluorine reacts with chromyl chloride, producing flame at certain concentrations.
	Mellor **2, Supp. 1:** 64 (1956).
Coke	See FLUORINE plus Common Materials and Oxygen.
Common Materials and Oxygen	Spill tests of 100% liquid fluorine, 30% liquid fluorine-in-oxygen, and 100% liquid oxygen on various common materials demonstrated the following effects of the fluorine content: asphalt and also crushed limestone (calcium carbonate) burned with sputtering and small flames; JP-4 fuel produced loud, rapid explosions and a large fireball; coke burned with a small flame; charcoal burned smoothly with a large, brilliant fireball; and rich soil burned with a bright flame.
	NASA SP-**3037:** 110-119 (1967).
Copper	When fluorine flows too rapidly or under too much pressure in copper tubing, the copper burns in the fluorine atmosphere. See also FLUORINE plus Metals.
	Yunker (1966). *Cady* (1966).
Copper Hydride	See BROMINE plus Copper Hydride.
Cyanides	See FLUORINE plus Chlorides.

Cyanogen	Cyanogen is decomposed by fluorine gas at ordinary temperatures with the production of a white flame. *Mellor* **2:** 13 (1946-1947).
Ferrous Oxide	Fluorine does not act in the cold on ferrous oxide, but with gentle heat a reaction sets in with incandescence. *Mellor* **13:** 715 (1946-1947).
Graphite	Graphite burns in a stream of fluorine. See also FLUORINE plus Carbon. *Mellor* **2, Supp. I:** 198 (1956).
Halogenated Compounds	See FLUORINE plus Hydrogen.
Hexafluoropropylene-Vinylidene Fluoride Copolymer	See FLUORINE plus Solid Nonmetals and Oxygen.
Hydrazine	Spontaneous ignition occurs when these chemicals are mixed. *Mellor* **8, Supp. 2:** 95 (1967).
Hydriodic Acid	The reaction of fluorine with gaseous hydriodic acid is accompanied by flame. *Mellor* **2:** 12 (1946-1947).
Hydrobromic Acid	The reaction of fluorine with gaseous or aqueous hydrobromic acid is accompanied by flame. *Mellor* **2:** 12 (1946-1947).
Hydrocarbons	Violent explosions are encountered when attempts are made to fluorinate hydrocarbons in the liquid phase with elementary fluorine. Many lubricants burn in fluorine. *Mellor* **2: Supp. I:** 198 (1956). *NASA SP*-**3037:** 82-84 (1967). *Mellor* **2, Supp. 1:** 55 (1956).
Hydrochloric Acid	The reaction of fluorine with gaseous or aqueous hydrochloric acid is accompanied by flame.

	Mellor **2:** 12, 204-6 (1946-1947).
Hydrofluoric Acid (Aqueous)	If fluorine is passed into a 50 per cent solution of hydrofluoric acid, there is an energetic reaction with the water and it is accompanied by flame.
	Mellor **2:** 12 (1946-1947).
Hydrogen	Hydrogen and fluorine combine with extreme violence. The reactions of most organic compounds with fluorine occur explosively. Even halogenated organic materials burn or explode in a fluorine atmosphere. The reaction with water is violent even at minus 210¡C.
	Matheson Gas Data, p. 215 (1961). *Stecher*, pp. 301-2 (1953).
	Fluorine and hydrogen react as low as minus 210¡C when impurities are present.
	Mellor **1:** 327 (1946-1947).
Hydrogen Azide	See AZINE FLUORIDE (self-reactive).
Hydrogen Sulfide	Fluorine ignites in contact with hydrogen sulfide.
	Mellor **10:** 133 (1946-1947).
Iodides	See FLUORINE plus Chlorides.
Iodine	Iodine unites with fluorine at ordinary temperatures with a luminous flame.
	Mellor **2:** 12 (1946-1947).
Iridium	See IRIDIUM plus Fluorine.
Iron	See FLUORINE plus Metals. See also IRON plus FLUORINE.
JP-4 Fuel	See FLUORINE plus Common Materials and Oxygen.
Lead Carbonate (Basic)	White lead burns in fluorine. See also FLUORINE plus Carbonates.
	NASA SP-**3037:** 83 (1967).
Lead Oxide and Glycerol	A mixture of litharge and glycerol burns in fluorine.

	NASA SP-**3037:** 84 (1967).
Limestone (crushed)	See FLUORINE plus Common Materials and Oxygen.
Lithium Carbide	See BROMINE plus Lithium Carbide.
Lithium Carbonate	See FLUORINE plus Carbonates.
Lithium Silicide	When lithium silicide is warmed with gaseous fluorine, a reaction takes place with incandescence. With chlorine, bromine, and iodine a higher temperature is required.
	Mellor **6:** 169 (1946-1947).
Lucite	See FLUORINE plus Solid Nonmetals and Oxygen.
Magnesium	See MAGNESIUM plus Fluorine.
Manganese	See MANGANESE plus Fluorine.
Manganous Oxide	See FLUORINE plus Trimanganese Tetroxide.
Manufactured Gas	Unlighted manufactured gas issuing from a gas jet is immediately ignited by fluorine gas.
	Mellor **2:** 13 (1946-1947).
Mercuric Cyanide	Fluorine and mercuric cyanide react vigorously when gently heated, producing flames.
	Mellor **2, Supp. 1:** 63 (1956).
Metals	Metals (powdered) are in general attacked by fluorine at ordinary temperatures. If the temperature is raised nearly all the metals are vigorously attacked with incandescence.
	Mellor **2:** 13 (1946-1947).
	Some average ignition temperatures (¡F) of various metals in fluorine are: aluminum, greater than 1220; copper, 692; iron, 672; molybdenum, 205; monel, 396; nickel, 1162; stainless steel (No. 302), 681; and tungsten, 283.
	NASA SP-**3037:** 79-80 (1967).
Molybdenum	See FLUORINE plus Metals. See also MOLYBDENUM plus FLUORINE.
Monel	See FLUORINE plus Metals.
Neoprene	When pieces of neoprene are dropped into liquid fluorine slight explosions occur and the neoprene burns. Neoprene

	covered fiberglass exploded in liquid fluorine. See also FLUORINE plus Solid Nonmetals.
	NASA SP-**3037:** 84
	Mellor **2, Supp. 1:** 54 (1956).
	Chem. Eng. News **26:** 3336-7 (1948).
Nickel	See FLUORINE plus Metals.
Nickel Monoxide	Nickel monoxide becomes incandescent in fluorine gas.
	Ann. Chim. et Phys. (5) **21:** 199, 386.
	NASA SP-**3037:** 84.
Niobium (Columbium)	See NIOBIUM plus Fluorine.
Nitric Acid	If fluorine is passed into nitric acid, each bubble of gas is attended by the decomposition of the acid and accompanied by flame.
	Ann. Chim. et Phys. (6) **24:** 224.
	Fluorine in contact with nitric acid creates a danger of explosion if acid is not 100% strength.
	Mellor **8, Supp. 2:** 319 (1967).
Nitric Oxide	Fluorine reacts immediately with nitric oxide with a pale yellow flame.
	Ann. Chim. et Phys. (8) **9:** 221.
	Mellor **2, Supp. 1:** 54 (1956).
Nitrogen Dioxide	Fluorine and nitrogen dioxide react vigorously when heated.
	Mellor **2, Supp. 1:** 54 (1956).
Nylon	See FLUORINE plus Solid Nonmetals and Oxygen.
Organic Matter	Fluorine in contact with leather causes it to
(Leather)	smolder and char.
	Mellor **2, Supp. 1:** 54 (1956).
Perchloric Acid	Reaction of fluorine and perchloric acid produces fluorine perchlorate, a highly reactive material.

	Mellor **2, Supp. 1:** 59 (1956).
	See also FLUORINE PERCHLORATE (self-reactive).
	The action of fluorine gas in 60-72% perchloric acid leads to the formation of fluorine perchlorate, a very unstable gas that explodes under the most diverse physical and chemical influences.
	Pascal **16:** 316 (1931-1934). *Kirk and Othmer, Second Ed.* **5:** 74 (1963).
Perfluoropropionyl Fluoride	Fluorination of perfluoropropionyl fluoride to synthesize perfluoropropionyl hypofluorite in the presence of activated cesium fluoride catalyst involves potential explosion hazards. No temperature change was noted during the 10-hour addition of fluorine at minus 40¡C, but the set-up exploded at the finish of the addition.
	MCA Case History **1045** (1965).
	Chem. Eng. News **43:** 36 (March 1, 1965).
Phenol-Formaldehyde Resin	See FLUORINE plus Solid Nonmetals and Oxygen.
Phosphorus	Fluorine reacts with red or yellow phosphorus at ordinary temperatures and the reaction is accompanied by incandescence.
	Mellor **8:** 785 (1946-1947).
	Mellor **2, Supp. 1:** 60 (1956).
	See also PHOSPHORUS plus Chlorine.
Phosphorus Pentachloride	When phosphorus pentachloride is treated with fluorine, the entire mass becomes incandescent.
	Moissan, p. 134 (1900).
Phosphorus Trichloride	Phosphorus trichloride reacts with fluorine with incandescence.
	Moissan, p. 134 (1900).
Phosphorus	A yellow flame appears when fluorine contacts

Trifluoride	phosphorus trifluoride.
	Comp. Rend. **138:** 789.
Polyamide	See FLUORINE plus Solid Nonmetals and Oxygen.
Polychloroprene	See FLUORINE plus Solid Nonmetals and Oxygen.
Polyethylene	See FLUORINE plus Solid Nonmetals and Oxygen.
Polymethylmethacrylate	See FLUORINE plus Solid Nonmetals and Oxygen.
Polytetrafluoroethylene	See FLUORINE plus Solid Nonmetals and Oxygen.
Polyurethane	See FLUORINE plus Solid Nonmetals and Oxygen.
Polyvinylchloride Acetate	See FLUORINE plus Solid Nonmetals and Oxygen.
Potassium	See POTASSIUM plus Fluorine.
Potassium Hydride	See CHLORINE plus Potassium Hydride.
Potassium Nitrate	Fluorine attacks potassium nitrate to give fluorine nitrate.
	Mellor **2, Supp. 1:** 62 (1956).
	See also FLUORINE NITRATE (self-reactive).
Potassium Perchlorate	The action at low pressure of fluorine on potassium perchlorate produces fluorine perchlorate, which is very unstable and explodes easily.
	Pascal **16:** 316 (1931-1934).
Rhenium	See RHENIUM plus Fluorine.
Rubber (LS-53 and LS-63)	See FLUORINE plus Solid Nonmetals and Oxygen.
Rubidium Acetylene Carbide	See BROMINE plus Rubidium Acetylene Carbide.
Selenium	Selenium, silicon, or sulfur ignites in fluorine gas at ordinary temperatures.
	Mellor **2:** 11-13; **6:** 161-4 (1946-1947).
Silicon	See FLUORINE plus Selenium.
Silver Cyanide	Fluorine and silver cyanide react with explosive violence at

	ordinary temperatures.
	Mellor **2, Supp. 1:** 63 (1956).
Sodium	See SODIUM plus Fluorine.
Sodium Acetate	Fluorine and sodium acetate produce an explosive reaction involving formation of diacetyl peroxide.
	Mellor **2, Supp. 1:** 56 (1956).
	See also DIACETYL PEROXIDE (self-reactive).
Sodium Carbonate	See FLUORINE plus Carbonates.
Sodium Hydride	See CHLORINE plus Sodium Hydride.
Sodium Silicate	Sodium silicate (water glass) burns in fluorine.
	NASA SP-**3037:** 82 (1967).
Soil (rich)	See FLUORINE plus Common Materials and Oxygen.
Solid Nonmetals	Numerous nonmetal materials were tested
and Oxygen	statically on gaseous and liquid fluorine-oxygen mixtures with 50 to 100% fluorine. Substances that burned or reacted violently were: Tygon (polyvinyl chloride-acetate), nylon (polyamide), Bakelite (phenol-formaldehyde resin), polyethylene, neoprene (polychloroprene), Buna N (acrylonitrile-butadiene copolymer), LS-53 and LS-63 Rubber (trifluoropropyl methyl polysiloxane), Viton A (vinylidene fluoride-hexafluoropropylene copolymer) and polyurethane foam. Under dynamic conditions, i.e., flow and pressure, other materials such as Lucite (polymethyl methacrylate), Teflon (polytetrafluoroethylene), and CPE products (chlorinated polyethylenes) also ignited in fluorine-oxygen mixtures.
	NASA SP-**3037:** 87-110 (1967).
Stainless Steel (302)	See FLUORINE plus Metals.
Strontium Phosphide	Mixtures of these materials ignite at room temperatures.
	Mellor **8:** 841 (1946-1947).
Sulfur	See FLUORINE plus Selenium.
Sulfur Dioxide	Each bubble of sulfur dioxide gas led into a container of

	fluorine produces an explosion.
	Mellor **2:** 1 (1946-1947)
Tantalum	Fluorine attacks powdered tantalum with incandescence.
	Mellor **9:** 891 (1946-1947).
	Fluorine reacts vigorously with tantalum. The metal should not be used to handle it.
	Mellor **2, Supp. 1:** 62 (1956).
Teflon□	See FLUORINE plus Solid Nonmetals and Oxygen.
Tellurium	Fluorine attacks tellurium with incandescence.
	Mellor **11:** 26, 40 (1946-1947).
Thallium	Fluorine acts so vigorously on thallium that the metal becomes incandescent.
	Mellor **5:** 421, 434 (1946-1947).
Thallous Chloride	Fluorine and thallous chloride react violently, melting the product.
	Mellor **2, Supp. 1:** 63 (1956).
Titanium	When titanium is fractured in a liquid fluorine atmosphere, it ignites. With catalysis, titanium has ignited in gaseous fluorine at minus 113¡ F.
	NASA SP-**3037:** 70 (1967).
Trifluoropropyl Methyl	See FLUORINE plus Solid Nonmetals and
Polysiloxane	Oxygen.
Trimanganese	Fluorine and trimanganese tetroxide or manganous
Tetroxide	oxide react vigorously below 100¡ C, even when diluted with nitrogen.
	Mellor **2, Supp. 1:** 64 (1956).
Tungsten	The reaction between fluorine and tungsten is accompanied by incandescence. See also FLUORINE plus Metals.
	Mellor **11:** 730 (1946-1947).
Tungsten Carbide	Tungsten carbide becomes incandescent in cold fluorine.

	Mellor **5:** 890 (1946-1947).
Tygon	See FLUORINE plus Solid Nonmetals and Oxygen.
Uranium	Electrolytic uranium, as fine powder, is vigorously attacked by fluorine, and burns. Uranium ignites spontaneously in cold fluorine.
	Mellor **2:** 13; **12:** 31, 32 (1946-1947).
Uranium Carbide	See BROMINE plus Uranium Dicarbide.
Viton A	See FLUORINE plus Solid Nonmetals and Oxygen.
Water	Water *vapor* will react combustively with fluorine; an explosive reaction occurs between liquid fluorine and ice, after an intermediate induction period.
	NASA SP-**3037:** 52 (1967).
	If liquid air which has stood for some time is treated with fluorine, a precipitate is formed which is very likely to explode. Explosive material is thought to be fluorine hydrate.
	Mellor **2:** 11 (1946-1947).
	See also FLUORINE plus Hydrogen.
Zinc	Zinc burns in moist fluorine.
	Mellor **4:** 476 (1946-1947).
Zirconium Dicarbide	See BROMINE plus Zirconium Dicarbide.

FLUORINE AZIDE N_3F

(self-reactive)	Azine fluoride was detected in the products obtained from the reaction of fluorine with nitrogen-diluted hydrogen azide. The liquid is extremely shock- and light-sensitive and often explodes on vaporization.
	Lawless and Smith, p. 104 (1968).
	Fluorine azide is extremely unstable and easily decomposes explosively.
	Mellor **2, Supp. 1:** 59 (1956).

Mellor **8, Supp. 2:** 24 (1967).

FLUORINE FLUOROSULFATE FSO_2OF

(self-reactive)	Fluorine fluorosulfate, which has a vapor pressure of 10 atmospheres at room temperature, was distilled cold into a steel cylinder rated at 135 atmospheres. When the cylinder reached room temperature, it exploded. The violence indicated a chemical explosion.
	Chem. Eng. News **44:** 40 (Feb. 21, 1966).
	MCA Case History **1189** (1966).

FLUORINE NITRATE $FONO_2$

(self-reactive)	Fluorine nitrate explodes on slight concussion.
	Merck Index, p. 464 (1968).

FLUORINE PERCHLORATE $FOClO_3$

(self-reactive)	Pure fluorine perchlorate exploded in three attempts to determine its freezing point. The gas readily explodes on contact with a small flame or spark.
	ACS **146:** 209. *J. Am. Chem. Soc.* **69:** 667-8 (1947).
	Mellor **2, Supp. 1:** 59, 184 (1956).
	See also POTASSIUM PERCHLORATE plus Fluorine.
Organic Matter	Fluorine perchlorate undergoes explosive decomposition on contact with grease, dirt, or rubber tubing.
	Mellor **2, Supp. 1:** 184 (1956).
Potassium Iodide	A sample of fluorine perchlorate exploded on contact with a potassium iodide solution.
	ACS **146:** 209-10. *J. Am. Chem. Soc.* **69:** 667-8 (1947).
	Fluorine perchlorate in contact with potassium iodide can cause an explosion.

Mellor **2, Supp. 1:** 184 (1956).

FLUORINE PEROXIDE F_2O_2

(self-reactive)

Fluorine peroxide is a very unstable vapor above minus 100¡ C, decomposing to fluorine and oxygen gases.

Mellor **2, Supp. 1:** 194 (1956).

FLUOROACETYLENE HC≡CF

(self-reactive)

Fluoroacetylene is a colorless gas that freezes at minus 196¡ C to a white solid, which melts to a liquid whose boiling point is a little below minus 80¡ C. The liquid sometimes explodes with great force. The silver salt detonates when warmed, and the mercury salt decomposes violently without detonation when warmed.

Rutledge, p. 135 (1968).

FLUOROCHLORO-LUBRICANTS

Aluminum

See ALUMINUM plus Fluorochloro-lubricants.

FLUORODIMETHYLARSINE $(CH_3)_2AsF$

Air

Dimethylfluoroarsine is spontaneously flammable in air.

Ripley (1966).

1-FLUORO-2,2-DINITROETHANE $CH_2FCH(NO_3)_2$

Air

Abnormal operating conditions during the nitration process in preparation of dinitrofluoroethane caused the operator to relieve the vacuum by introducing air. The resulting reaction with air caused an explosion.

MCA Case History **784** (1962).

FORMALDEHYDE HCHO

Nitrogen Dioxide	The slow reaction between nitrogen dioxide and formaldehyde becomes explosive in the region of 180¡ C. F. H. Pollard and P. Woodward, *Trans. Faraday Soc.* **45:** 767-770 (1949).
Perchloric Acid and Aniline	See PERCHLORIC ACID plus Aniline and Formaldehyde.
Performic Acid	See PERFORMIC ACID plus Formaldehyde.

FORMAMIDINE THIOLACETIC ACID HYDROCHLORIDE

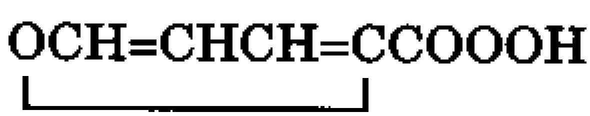
$NH_2C(NH)SCH_2COOH \cdot HCl$

Chlorine	See CHLORINE plus S-Ethyl Isothiourea Sulfate.

FORMIC ACID HCOOH

Furfuryl Alcohol	See FURFURYL ALCOHOL plus Formic Acid.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Formic Acid and Organic Matter.
Thallium Trinitrate Trihydrate	See THALLIUM TRINITRATE TRIHYDRATE plus Formic Acid.

FURAN-2-PEROXYCARBOXYLIC ACID



(self-reactive)	This acid explodes when heated to 30 to 40¡ C, or at room temperature upon addition of organic or inorganic materials such as carbon black, calcium chloride, barium chloride, strontium chloride or magnesium chloride. *Chem. Reviews* **45:** 15, 16 (1949).

FURFURYL ALCOHOL $OCH{=}CHCH{=}CCH_2OH$

Cyanoacetic Acid	An explosion occurred in a laboratory when cyanoacetic acid was reacted with furfuryl alcohol in an attempt to form the ester, furfuryl cyanoacetate. The explosion occurred a few minutes after the agitator was turned on and the heat applied.
	MCA Case History **858** (1963).
Formic Acid	During an attempt to prepare furfuryl formate from furfuryl alcohol and concentrated formic acid, an explosion occurred.
	Chem. Eng. News **18:** 72 (1940).
Mineral Acids	Furfuryl alcohol will polymerize rapidly, and sometimes with explosive violence, in the presence of strong mineral acids.
	Hexagon Alpha Chi Sigma (October 1949).
Nitric Acid	See NITRIC ACID plus Organic Matter.
	See NITRIC ACID plus Furfuryl Alcohol.
	See also NITRIC ACID plus Diborane.
Nitric Acid, Nitrogen Tetroxide, and Sulfuric Acid	See UNSYMMETRICAL DIMETHYLHYDRAZINE plus Nitric Acid, Nitrogen Tetroxide, and Sulfuric Acid.

GADOLINIUM Gd

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

GALLIC ACID $(OH)_3C_6H_2COOH$

Potassium Chlorate	See POTASSIUM CHLORATE plus Gallic Acid.

GALLIUM HYDRIDE Ga_2H_6

Air	Gallium hydride is spontaneously flammable in air.
	Hurd, p. 99 (1952).

GALLIUM PERCHLORATE $Ga(ClO_3)_3$

Urea	The double salt formed decomposes violently on heating.
	Mellor **2, Supp. 1:** 611 (1956).

GALLIUM TRIETHYL $(C_2H_5)_3Ga$

(See TRIETHYL GALLIUM)

GALLIUM TRIMETHYL $(CH_3)_3Ga$

(See TRIMETHYL GALLIUM)

GERMANE (GERMANIUM HYDRIDE) GeH_4

Air	The germanium hydrides are spontaneously flammable in air.
	Fawcett (1965). *Brauer* (1965).

GERMANIUM

Bromine	When heated in bromine, germanium burns with a yellowish flame.
	Mellor **7:** 260 (1946-1947).
Chlorine	When germanium is heated in chlorine, it burns with a bluish-white flame. Powdered germanium ignites spontaneously in chlorine at ordinary temperatures.
	Mellor **7:** 260 (1946-1947).
Nitric Acid	The action of concentrated nitric acid on powdered

	germanium is very violent.
	Mellor **7:** 260 (1946-1947).
Oxygen	Germanium burns with incandescence when heated in oxygen.
	Mellor **7:** 260 (1946-1947).
Potassium Chlorate	See GERMANIUM plus Potassium Nitrate.
Potassium Nitrate	Mixture of germanium with potassium nitrate or potassium chlorate explodes when heated.
	Mellor **7:** 261 (1946-1947).

GERMANIUM HYDRIDE GeH_4

Air	See GERMANE plus Air.

GERMANIUM HYDRIDES GeH_4; Ge_2H_6; Ge_3H_8

Air	The germanium hydrides decompose in air, often bursting into flames.
	Brauer (1965).

GERMANIUM SULFIDE GeS_2

Potassium Nitrate	When germanium sulfide is mixed with potassium nitrate and heated, it explodes.
	Mellor **7:** 274 (1946-1947).

GERMANIUM TETRACHLORIDE $GeCl_4$

Water	Germanium tetrachloride is decomposed by water and much heat is developed.
	Mellor **7:** 270 (1946-1947).

GERMANIUM TETRAIODIDE GeI_4

Air	The vapor of germanium tetraiodide is flammable in air.
	Mellor **7:** 272, 273 (1946-1947).

GLASS

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Charcoal.

GLYCERIDES $(RCOOCH_2)CHOCOR$

Nitric Acid and Sulfuric Acid	See NITRIC ACID plus Sulfuric Acid and Glycerides.

GLYCEROL $HOCH_2CHOHCH_2OH$

Acetic Anhydride	See ACETIC ANHYDRIDE plus Glycerol.
Aniline and Nitrobenzene	See ANILINE plus Nitrobenzene and Glycerine.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Glycerol and CALCIUM HYPOCHLORITE plus Ethyl Alcohol.
Chlorine	See CHLORINE plus Polypropylene.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Naphthalene.
Chromium Oxide	See CHROMIUM OXIDE plus Glycerol.
Fluorine and Lead Oxide	See FLUORINE plus Lead Oxide and Glycerol.
Perchloric Acid and Lead Oxide	See LEAD OXIDE plus Perchloric Acid and Glycerine.
Potassium Permanganate	See POTASSIUM PERMANGANATE plus Glycerol.
Potassium Peroxide	See SODIUM PEROXIDE plus Aniline.
Silver Perchlorate	See SILVER PERCHLORATE plus Acetic Acid.

Sodium Peroxide	See SODIUM PEROXIDE plus Aniline.

GLYCOL ETHERS

Perchloric Acid	See PERCHLORIC ACID plus Glycol Ethers.

GLYCOLONITRILE $HOCH_2CN$

(self-reactive)	A bottle containing freshly purified glycolonitrile sat for a week before a portion of it was removed. Six days later, the remainder polymerized and exploded the bottle. *Chem. Eng. News* **42** (48): 50 (Nov. 28, 1966).

GLYCOL PERCHLORATES

(self-reactive)	Glycol perchlorate and epichlorohydrin perchlorate are more explosive than nitroglycerine. Ethylene glycol perchlorate is so sensitive that a few drops of water cause a violent explosion. *ACS* **146:** 214. *Berichte* **42:** 2031-4 (1909).

GLYCOLS

Perchloric Acid	See PERCHLORIC ACID plus Glycol Ethers.

GLYOXAL OCHCHO

(self-reactive)	See GLYOXAL plus Water.
Air	Mixtures with air may explode. *Merck Index,* p. 502 (1968). See also GLYOXAL plus Water.
Chlorosulfonic Acid	Mixing glyoxal and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

Ethyleneimine	Mixing glyoxal and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	See NITRIC ACID plus Glyoxal.
Oleum	Mixing glyoxal and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Glyoxal.
Water	Glyoxal polymerizes quickly on standing, on contact with water (violent reaction), or when dissolved in solvents containing water.
	Merck Index, p. 502 (1968).

GOLD Au

Ammonia	The reaction between ammonia and gold, silver, or mercury produces fulminate-like compounds of variable and uncertain composition that explode when dried. Severe accidents have occurred.
	Chem. Abst. **60:** 12, 14327 (1964).
	Mellor **3:** 579-84 (1946-1947).
	Allison (1966). J. K. Luchs, *Phot. Sci. Eng.* **10:** 334-7 (1966).
Ammonium Hydroxide	In an effort to precipitate finely divided gold
and Aqua Regia	from aqua regia, ammonium hydroxide was substituted for ammonium oxalate. When the gold precipitate was heated in a muffle furance with other metals to produce an alloy, an explosion occurred.
	U. Wash. Occ. Health Newsletter **16** (1967).
Hydrogen Peroxide	Finely divided gold and a strong hydrogen peroxide solution may explode.
	Mellor **1:** 936 (1946-1947).

GOLD CYANIDE $AuCN$; $Au(CN)_3 \cdot 3H_2O$

Magnesium	See MAGNESIUM plus Gold Cyanide.

GOLD SALTS

Nitromethane	See COPPER SALTS plus Nitromethane.

GRAPHITE C

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Charcoal.
Fluorine	See FLUORINE plus Charcoal.
Potassium	See POTASSIUM plus Charcoal.
Potassium Superoxide	See POTASSIUM plus Graphite and Air. Also see POTASSIUM plus Graphite and Potassium Superoxide.

GUANIDINE NITRATE $H_2NC(NH)NH_2HNO_3$

(self-reactive)	See AMMONIUM THIOCYANATE plus Lead Nitrate.

GUANIDINE PERCHLORATE $(NH_2)_3CClO_4$

(self-reactive)	Guanidine perchlorate is unusually sensitive to initiation and has extraordinary explosive power. *ACS* **146:** 213 *Davis* (1943).

HAFNIUM BOROHYDRIDE

(See HAFNIUM TETRAHYDROBORATE)

HAFNIUM TETRAHYDROBORATE $Hf(BH_4)_4$

Air	Hafnium borohydride burns violently when exposed to air. *Gaylord*, p. 58 (1966).

HALOGENATED HYDROCARBONS

(See specific halogenated hydrocarbon; see also under other reactant)

HALOGEN FLUORIDES

Organic Matter	See BROMINE MONOFLUORIDE plus Water. See individual fluoride plus Organic Matter.

HALOGENS

Cerium	See RARE EARTH METALS plus Halogens.
Dysprosium	See RARE EARTH METALS plus Halogens.
Erbium	See RARE EARTH METALS plus Halogens.
Europium	See RARE EARTH METALS plus Halogens.
Gadolinium	See RARE EARTH METALS plus Halogens.
Hafnium	See RARE EARTH METALS plus Halogens.
Holmium	See RARE EARTH METALS plus Halogens.
Lutetium	See RARE EARTH METALS plus Halogens.
Neodymium	See RARE EARTH METALS plus Halogens.
Praseodymium	See RARE EARTH METALS plus Halogens.
Rare Earth Metals	See RARE EARTH METALS plus Halogens.
Samarium	See RARE EARTH METALS plus Halogens.
Terbium	See RARE EARTH METALS plus Halogens.
Thulium	See RARE EARTH METALS plus Halogens.
Tri-iso-Butyl Aluminum	See TRI-iso-BUTYL ALUMINUM plus Acids.

Ytterbium	See RARE EARTH METALS plus Halogens.
Yttrium	See RARE EARTH METALS plus Halogens.

HEPTANE C_7H_{16}

Phosphorus and Chlorine	See PHOSPHORUS plus Chlorine and Heptane.

HEXABORANE (10) B_6H_{10}

Air	Boron hexahydride is spontaneously flammable in air. *Douda* (1966).

HEXABORANE (12) B_6H_{12}

Air	This hydride is spontaneously flammable in air. *Mellor* **5:** 36 (1946-1947). *Douda* (1966).

HEXACHLOROBENZENE C_6Cl_6

Dimethyl Formamide	See DIMETHYL FORMAMIDE plus Hexachlorobenzene.

HEXACHLOROMELAMINE $N{=}C(NCl_2)N{=}C(NCl_2)N{=}C(NCl_2)$

Acetone	See HEXACHLOROMELAMINE plus Organic Contaminants.
Ammonia	See HEXACHLOROMELAMINE plus Organic Contaminants.
Aniline	See HEXACHLOROMELAMINE plus Organic Contaminants.
Diphenylamine	See HEXACHLOROMELAMINE plus Organic Contaminants.

Organic Contaminants	Organic contaminants added to hexachloromelamine cause a very rapid reaction to take place with or without visible flame. Contaminants tested were acetone, aniline, diphenylamine, ammonia and others. The hexachloromelamine would explode if the amount were large and confined. Trichloromelamine behaves similarly; however, it consumes itself less rapidly, but with more flame and fume production. After the contaminant is added, there is a delay of several seconds before anything happens.
	Ventrone (1968).
Turpentine	See HEXACHLOROMELAMINE plus Organic Contaminants.

1,5-HEXADIEN-3-YNE $H_2C{=}CHC{\equiv}CCH{=}CH_2$

Air	Divinylacetylene reacts with oxygen to form an explosive peroxide polymer. Divinylacetylene must be handled in an oxygen-free atmosphere. After experiments are completed the equipment should be rinsed immediately with solvents containing a polymerization inhibitor to prevent formation of unstable films. Handy and Bensen, *J. Org. Chem.* **27:** 39 (1962).

2, 4-HEXADIYN-1, 6-BISCHLOROSULFITE $(ClSOOCH_2C{\equiv}C\text{-})_2$

(self-reactive)	See THIONYL CHLORIDE plus 2, 4-Hexadiyn-1, 6-Diol.
	2, 4-hexadiyn-1, 6-bischlorosulfite is shock-sensitive and decomposes violently upon distillation.
	P. E. Drieder and H. V. Isaacson, *Chem. Eng. News* **50** (12): 51 (1972).

2, 4-HEXADIYN-1, 6-DIOL $(HOCH_2C{\equiv}C\text{-})_2$

Phosgene	See PHOSGENE plus 2, 4-Hexadiyn-1, 6-Diol.
Thionyl Chloride	See THIONYL CHLORIDE plus 2, 4-Hexadiyn-1, 6-Diol.

HEXAFLUOROPROPYLENE-VINYLIDINE COPOLYMER

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

HEXAMETHYLBENZENE $C_6(CH_3)_6$

Nitromethane	The electro-oxidation of various methyl benzenes was being studied. During the reactions, violent explosions occurred at the auxiliary electrode. *Chem. Eng. News* **49** (23): 6 (1971).

HEXAMETHYLENE DIISOCYANATE $OCN(CH_2)_6NCO$

Alcohols	See ALCOHOLS plus Isocyanates.

HEXAMETHYLENETETRAMINE $(CH_2)_6N_4$

Sodium Peroxide	See SODIUM PEROXIDE plus Hexamethylenetetramine.

HEXAMMINE CHROMIUM NITRATE

(See CHROMIC-HEXAMMINE NITRATE)

HEXAMMINE COBALT IODATE

(See COBALTIC-HEXAMMINE IODATE)

HEXAMMINE COBALT PERCHLORATE

(See COBALTIC-HEXAMMINE PERCHLORATE)

HEXAMMINOCADMIUM CHLORATE

(See CADMIUM-HEXAMMINE CHLORATE)

HEXAMMINOCADMIUM PERCHLORATE $Cd(NH_3)_6(ClO_4)_2$

(See CADMIUM-HEXAMMINE PERCHLORATE)

HEXAMMINO CALCIUM

(See CALCIUM HEXAMMONIATE)

HEXAMMINOCOBALT CHLORATE $Co(NH_3)_6(ClO_3)_2$

(See COBALT-HEXAMMINE CHLORATE)

HEXAMMINOCOBALTIC CHLORITE $Co(NH_3)_6ClO_2.3H_2O$

(See COBALTIC-HEXAMMINE CHLORITE)

HEXAMMINOCOBALT PERCHLORATE $Co(NH_3)_6(ClO_4)_2$

(See COBALT-HEXAMMINE PERCHLORATE)

HEXAMMINONICKEL CHLORATE $Ni(NH_3)_6(ClO_3)_2$

(See NICKEL-HEXAMMINE CHLORATE)

HEXAMMINONICKEL PERCHLORATE $Ni(NH_3)_6(ClO_4)_2$

(See NICKEL-HEXAMMINE PERCHLORATE)

HOLMIUM Ho

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

HYDRAZINE H_2NNH_2

Air	Hydrazine may ignite spontaneously while absorbed on

	porous materials such as earth, asbestos, cloth, or wood unless the heat of the gradual hydrazine-air reaction has a chance to dissipate. Spontaneous ignition can occur with hydrogen peroxide and nitric acid. Contact with many metallic oxide surfaces may lead to flaming decomposition.
	Haz. Chem. Data (1966).
	Mellor **8, Supp. 2:** 95 (1967).
Alkali Metals and	Explosive metal hydrazides form when hydrazine
Ammonia	and alkali metals are mixed in liquid ammonia.
	Mellor **8, Supp. 2:** 73 (1967).
Chlorine	See CHLORINE plus Hydrazine.
Chromates	See CHROMATES plus Hydrazine.
Cupric Oxide	See CUPRIC OXIDE plus Hydrazine.
Cupric Salts	See CUPRIC SALTS plus Hydrazine.
Fluorine	See FLUORINE plus Hydrazine.
Hydrogen Peroxide	See HYDRAZINE plus Air.
	Mellor **8, Supp. 2:** 95 (1967).
Iron Oxide	While boiling a sample of a polyester fiber in hydrazine in a glass beaker, the technician used a somewhat rusty pair of metal tweezers to handle the sample. When the tweezers were put in the solution, the solution ignited. The ignition temperature of hydrazine varies from 75¡ F in the presence of iron oxide to 518¡ F in a glass container.
	MCA Case History **1893** (1973).
Metallic Oxides	See HYDRAZINE plus Air.
Nickel	See NICKEL plus Hydrazine.
Nickel Perchlorate	See NICKEL PERCHLORATE plus Hydrazine.
Nitric Acid	See HYDRAZINE plus Air.
	Spontaneous ignition occurs when these chemicals are mixed.
	Mellor **8, Supp. 2:** 95 (1967).

Nitrous Oxide	See NITROUS OXIDE plus Lithium Hydride.
Oxygen	See OXYGEN plus Hydrazine.
Oxygen (liquid)	See OXYGEN (LIQUID) plus Hydrazine.
Potassium Dichromate	See POTASSIUM DICHROMATE plus Hydrazine.
Sodium Dichromate	See POTASSIUM DICHROMATE plus Hydrazine.
Tetryl	During the measurement of shock sensitivity of a mixture containing hydrazine, a drop of the hydrazine mixture fell inadvertently on the tetryl donor explosive. The tetryl immediately burst into flame. *ASESB Operational Incident Report* **105**.
Zinc Diamide	See ZINC DIAMIDE plus Hydrazine.
Zinc Diethyl	See ZINC DIAMIDE plus Hydrazine.

HYDRAZINE AZIDE $H_2NNH_3N_3$

(self-reactive)	This is an explosive salt. *Mellor* **8, Supp. 2:** 86 (1967).
Air	When hydrazine azide is rapidly heated in air, as by a white-hot wire, the salt decomposes violently. Similar explosions occur when a detonator is used. The moist salt is also explosive. *Mellor* **8:** 344 (1946-1947).

HYDRAZINE CHLORITE $H_2NNH_3ClO_2$

(self-reactive)	This is an explosive salt, highly flammable when dry. *Mellor* **8, Supp. 2:** 85 (1967). *Mellor* **2, Supp. 1:** 573 (1956).

HYDRAZINE HYDRATE $H_2NNH_2 \cdot H_2O$

2,4-Dinitrochlorobenzene	This reaction is exothermic; it shattered the reaction flask.

	Wischmeyer (1967).
Mercuric Oxide	See MERCURIC OXIDE plus Hydrazine Hydrate.
Sodium	See SODIUM plus Hydrazine Hydrate.
Stannous Chloride	See STANNOUS CHLORIDE plus Hydrazine Hydrate.

HYDRAZINE MONONITRATE $H_2NNH_2HNO_3$

Copper	See ZINC plus Hydrazine Mononitrate.
Metal Carbides	See ZINC plus Hydrazine Mononitrate.
Metal Nitrides	See ZINC plus Hydrazine Mononitrate.
Metal Oxides	See ZINC plus Hydrazine Mononitrate.
Metal Sulfides	See ZINC plus Hydrazine Mononitrate.
Zinc	See ZINC plus Hydrazine Mononitrate.

HYDRAZINE NITRATE $H_2NNH_3NO_3$

(self-reactive)	This explosive salt is less stable than ammonium nitrate. *Mellor* **8, Supp. 2:** 86 (1967).

HYDRAZINE PERCHLORATE $H_2NNH_3ClO_4$

(self-reactive)	Dry hydrazine perchlorate can be detonated by shock or friction. *ACS*-**146:** 209. *Comp. Rend.* **228:** 1497-8 (1949). *Mellor* **8, Supp. 2:** 85 (1967).

HYDRAZINE SELENATE $H_2NNH_2SeO_3OH$

(self-reactive)	This salt is explosive. *Mellor* **8, Supp. 2:** 85 (1967).

HYDRAZOIC ACID N_3H

Cadmium	See CADMIUM plus Hydrazoic Acid.
Copper	See COPPER plus Hydrazoic Acid.
Nickel	See NICKEL plus Hydrazoic Acid.
Nitric Acid	The reaction of hydrazoic acid and nitric acid is energetic. *Mellor* **8, Supp. 2:** 4 (1967).

HYDRIDES

Oleum	See OLEUM plus Hydrofluoric Acid.
Propiolactone (beta-)	See PROPIOLACTONE (beta-) plus Hydrofluoric Acid.
Propylene Oxide	See PROPYLENE OXIDE plus Hydrofluoric Acid.
Sodium	See SODIUM plus Hydrofluoric Acid.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Hydrofluoric Acid.
Sulfuric Acid	Mixing 48.7% hydrofluoric acid and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Vinyl Acetate	See VINYL ACETATE plus Hydrofluoric Acid.

HYDROGEN H_2

Air and Platinum	Finely divided platinum and some other metals will cause a

	mixture of hydrogen and oxygen to explode at ordinary temperatures. If a jet of hydrogen in air impinges on platinum black, the metal becomes hot enough to ignite the gas.
	Mellor **1:** 325; **16:** 146 (1946-1947).
Bromine	See BROMINE plus Hydrogen.
Chlorine	See CHLORINE plus Hydrogen.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Ammonia.
Dioxane and Nickel	Dioxane reacts explosively with hydrogen and
(Raney)	Raney nickel above 210¡C.
	Organic Synthesis, **Coll. Vol. III:** 182 (1955).
Fluorine	See FLUORINE plus Hydrogen.
Lithium	See LITHIUM plus Hydrogen.
Magnesium and	See MAGNESIUM plus Hydrogen and Calcium
Calcium Carbonate	Carbonate.
Nitroanisole	Catalytic hydrogenation of nitroanisole in the presence of nickel catalyst has resulted in an explosion.
	J. Am. Chem. Soc. **53:** 2417 (1931).
Nitrogen Trifluoride	Explosive reactions occur upon ignition of mixtures of nitrogen trifluoride with good reducing agents such as ammonia, carbon monoxide, hydrogen, hydrogen sulfide or methane.
	Lawless and Smith, p. 34 (1968).
Oxygen Difluoride	Mixtures of hydrogen, carbon monoxide, or methane and oxygen difluoride are exploded when a spark is discharged.
	Mellor **2, Supp. 1:** 192 (1956).
Oxygen and Platinum	See HYDROGEN plus Air and Platinum.
Palladium and	When a stream of hydrogen entrained isopropyl
Isopropyl Alcohol	alcohol vapors and palladium particles, the mixture caught fire on exposure to air.
	Confidential information furnished to NFPA.

1-Pentol	An explosion and subsequent investigation revealed that heating 1'-pentol and 1"-pentol under hydrogen pressure is extremely dangerous. It appears to cause this acetylenic compound to break down suddenly to elemental carbon, hydrogen, and carbon monoxide with the release of sufficient energy to develop pressures in excess of 1,000 atmospheres. The presence of small quantities of sulfuric acid or potassium hydroxide reduces the temperature of instability of 1-pentol. Also heating 1-pentol isomers above 100¡C during vacuum distillation should be avoided to prevent polymerization.
	F. Lorenz, *AIChE Loss Prevention, 1967,* p. 1.

HYDROGEN AZIDE HN_3

Fluorine	See AZINE FLUORIDE (self-reactive).

HYDROGEN BROMIDE HBr

Ammonia	The reaction is vigorous even at minus 80¡C with intensely dried reactants.
	Mellor **2, Supp. 1:** 737 (1956).
Ozone	See OZONE plus Hydrogen Bromide.

HYDROGEN CHLORIDE HCl

(See also HYDROCHLORIC ACID)

Calcium Carbide	See CALCIUM CARBIDE plus Hydrogen Chloride.
Cesium Acetylene Carbide	See CESIUM ACETYLENE CARBIDE plus Hydrogen Chloride.
Cesium Carbide	See CESIUM CARBIDE plus Hydrochloric Acid.
Dowicil 100	See DOWICIL 100 plus Hydrogen Chloride.
Lithium Silicide	See LITHIUM SILICIDE plus Hydrogen Chloride.
Magnesium Boride	See MAGNESIUM BORIDE plus Hydrochloric Acid.

Mercuric Sulfate	See MERCURIC SULFATE plus Hydrogen Chloride.
Rubidium Acetylene Carbide	See RUBIDIUM ACETYLENE CARBIDE plus Hydrochloric Acid.
Rubidium Carbide	See RUBIDIUM CARBIDE plus Hydrochloric Acid.
Sodium	See SODIUM plus Hydrochloric Acid.
	See SODIUM plus Hydrogen Chloride.

HYDROGEN CYANIDE HCN

(self-reactive)	Hydrogen cyanide containing water up to 10% was polymerized in glass ampoules at 50-60¡C or catalyzed at room temperature under the effect of a minute amount of alkali. In view of the possibility of running into dangerous conditions with a water content of 2-5%, it is important to keep it below this range.
	J. Chem. Soc. Japan Ind. Chem. Sec. **71** (8): 1119-1123 (1968).
Acetaldehyde	See ACETALDEHYDE plus Ammonia (Anhydrous).

HYDROGEN DIPHOSPHIDE P_2H

Air	Hydrogen diphosphide in air ignites when suddenly heated to 100¡C., or when struck with a hammer.
	Mellor **8:** 831 (1946-1947).

HYDROGEN FLUORIDE HF

(See also HYDROFLUORIC ACID)

Arsenic Trioxide	Hydrogen fluoride and arsenic trioxide react with incandescence.
	Mellor **9:** 101 (1946-1947).
Phosphorus Pentoxide	See PHOSPHORUS PENTOXIDE plus Hydrogen Fluoride.

HYDROGEN IODIDE HI

(See also HYDRIODIC ACID)

Magnesium	See MAGNESIUM plus Hydrogen Iodide.
Nitric Acid	When hydrogen iodide is passed through fuming nitric acid, each bubble produces a red flame with the separation of iodine. *Berichte* **3:** 3660.
Ozone	See OZONE plus Hydrogen Iodide.
Potassium	See POTASSIUM plus Hydrogen Iodide.
Potassium Chlorate	See POTASSIUM CHLORATE plus Hydrogen Iodide.

HYDROGEN PEROXIDE H_2O_2

Acetic Acid	Even dilute hydrogen peroxide added to dilute acetic acid and heated will initiate an exothermic reaction with production of peracetic acid which will explode at 110¡C. *Weed* (1966).
Acetic Anhydride	Addition of hydrogen peroxide to acetic anhydride yields peroxyacetic acid; but an excess of acetic anhydride reacts with peroxyacetic acid yielding diacetyl peroxide, which is very unstable and explodes readily. *Chem. Reviews* **45:** 5 (1949). See also HYDROGEN PEROXIDE plus Acetic Acid. See also PERACETIC ACID plus Acetic Anhydride.
Acetone	See HYDROGEN PEROXIDE plus Organic Matter.
Alcohols and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Antimony Trisulfide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Arsenic Trisulfide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Brass	See IRON plus Hydrogen Peroxide.

Bronze	See IRON plus Hydrogen Peroxide.
t-Butyl Alcohol	The preparation of di tertiary butyl peroxide by the addition of tertiary butyl alcohol to a mixture of hydrogen peroxide and sulfuric acid (2 to 1 weight ratio of 78% sulfuric acid to 50% hydrogen peroxide) has resulted in severe explosions particularly during the early stages of large batches.
	T.A. Schenach, *Chem. Eng. News.* **51** (6): 39 (Feb. 5, 1973).
Cellulose	Hydrogen peroxide plus cellulose (in cotton) ignites spontaneously.
	Mellor **1:** 938 (1946-1947).
Charcoal	Charcoal mixed with a trace of manganese dioxide ignites immediately in contact with hydrogen peroxide.
	Mellor **1:** 938 (1946-1947).
Chlorine and Potassium Hydroxide	See CHLORINE plus Hydrogen Peroxide and Potassium Hydroxide.
Chlorosulfonic Acid	See CHLOROSULFURIC ACID plus Hydrogen Peroxide.
Chromium	See IRON plus Hydrogen Peroxide.
Copper	See IRON plus Hydrogen Peroxide.
Cupric Sulfide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Dimethylbenzylcarbinol and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Ethyl Alcohol	See ETHYL ALCOHOL plus Hydrogen Peroxide.
Ethyl Alcohol and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Ferrous Sulfide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Formic Acid and Organic Matter	A chemist working with a 50-50 mixture of formic acid and 90 per cent hydrogen peroxide, introduced a small amount of organic material into the solution. When

	the reaction had subsided, the container was removed to a workbench. Later, when the flask was picked up, the material exploded violently.
	Chem. Eng. News **28:** 418 (1950).
Gold	See GOLD plus Hydrogen Peroxide.
Hydrazine	See HYDRAZINE plus Air.
	See HYDRAZINE plus Hydrogen Peroxide.
Hydrogen Selenide	See HYDROGEN SELENIDE plus Hydrogen Peroxide.
Iron	See IRON plus Hydrogen Peroxide.
Ketones and	See KETONES plus Nitric Acid and Hydrogen
Nitric Acid	Peroxide.
Lead	See IRON plus Hydrogen Peroxide.
Lead Dioxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Lead Monoxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Lead Sulfide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Magnesium	See MAGNESIUM plus Hydrogen Peroxide.
Manganese	See IRON plus Hydrogen Peroxide.
Manganese Dioxide	See MANGANESE DIOXIDE plus Hydrogen Peroxide.
Mercuric Oxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Mercurous Oxide	See MERCUROUS OXIDE plus Hydrogen Peroxide.
Molybdenum Disulfide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.
Nitric Acid	This mixture is unstable when more than 50% of acid is present.
	Mellor **8, Supp. 2:** 315 (1967).
Organic Matter	Under certain circumstances, hydrogen peroxide is capable of developing an explosive power in excess of its weight equivalent of TNT when mixed with organic compounds; the acetone-hydrogen peroxide system is a good example.
	Chem. Safety Data Sheet **SD-53** (1955). **SD-53 Supp. A** (1961). **SD-53 Supp. B** (1961).

	BCISC **36:** 29 (July-Sept. 1969). *BCISC* **40** (158): 17 (1969). *Chem. in Brit.* **5** (1): 36 (1969).
	Chem. in Brit. **5** (6): 287 (1969).
1-Phenyl-2-methyl-propyl Alcohol and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Platinum	See PLATINUM plus Hydrogen Peroxide.
Potassium	See LEAD DIOXIDE plus Hydrogen Peroxide.
Potassium Permanganate	See POTASSIUM PERMANGANATE plus Hydrogen Peroxide.
Silver	See IRON plus Hydrogen Peroxide.
	See SILVER plus Hydrogen Peroxide.
Sodium	See LEAD DIOXIDE plus Hydrogen Peroxide.
Sodium Iodate	See SODIUM IODATE plus Hydrogen Peroxide.
Thiodiglycol	See THIODIGLYCOL plus Hydrogen Peroxide.
Unsymmetrical Dimethyl Hydrazine	See UNSYMMETRICAL DIMETHYL HYDRAZINE plus Hydrogen Peroxide.

HYDROGEN PHOSPHIDE

(See DIPHOSPHINE)

HYDROGEN SELENIDE SeH_2

Hydrogen Peroxide	Hydrogen selenide and hydrogen peroxide undergo a very swift decomposition.
	Mellor **1:** 941 (1946-1947).
Nitric Acid	Fuming nitric acid reacts with incandescence with hydrogen selenide.
	Berichte **3:** 658.

HYDROGEN SULFIDE H_2S

Acetaldehyde	See ACETALDEHYDE plus Ammonia (Anhydrous).
Barium Oxide, Mercurous Oxide and Air	See HYDROGEN SULFIDE plus Soda Lime.
Barium Oxide, Nickel Oxide and Air	See HYDROGEN SULFIDE plus Soda Lime.
Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Chlorine Monoxide	Hydrogen sulfide ignites in contact with chlorine monoxide.
	Mellor **10:** 134 (1946-1947).
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Ammonia.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Hydrogen Sulfide. Also see CHROMIC ANHYDRIDE plus Naphthalene.
Copper	See COPPER plus Hydrogen Sulfide.
Fluorine	See FLUORINE plus Hydrogen Sulfide.
Hydrated Iron Oxide	A pyrophoric iron sulfide was made from hydrated iron oxide and hydrogen sulfide under gasoline.
	Ellern, p. 33 (1968).
Lead Dioxide	See LEAD DIOXIDE plus Hydrogen Sulfide.
Nitric Acid	Fuming nitric acid reacts with incandescence with hydrogen sulfide.
	Berichte **3:** 658.
	Chem. Safety Data Sheet **SD-5,** p. 6.
Nitrogen Iodide	See BROMINE plus Nitrogen Triiodide.
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Nitrogen Trifluoride	See HYDROGEN plus Nitrogen Trifluoride.
Oxygen Difluoride	See OXYGEN DIFLUORIDE plus Hydrogen Sulfide.

Phenyl Diazonium Chloride	See PHENYL DIAZONIUM CHLORIDE plus Hydrogen Sulfide.
Soda Lime (Sodium Hydroxide and Calcium Oxide) and Air	The reaction between hydrogen sulfide and soda lime is attended with incandescence in the presence of air; in oxygen, there is a violent explosion. Mixtures of barium oxide with mercurous or nickel oxide also react vigorously with hydrogen sulfide in air and vivid incandescence or explosions may result. *Mellor* **10:** 140 (1946-1947).
Sodium	See SODIUM plus Hydrogen Sulfide.
Sodium Peroxide	When hydrogen sulfide is passed over sodium peroxide, a very vigorous reaction occurs, even in the absence of air, and the reaction may be accompanied by flame. *Mellor* **10:** 132 (1946-1947).

HYDROGEN TELLURIDE H_2Te

Nitric Acid	See NITRIC ACID plus Hydrogen Telluride.

HYDROGEN TRISULFIDE HSSSH

Amyl Alcohol	The decomposition of amyl alcohol by hydrogen trisulfide is explosively violent. *Mellor* **10:** 158 (1946-1947).
Iron Oxide (Magnetite)	See HYDROGEN TRISULFIDE plus Lead Oxide.
Lead Oxide	Lead oxide, stannic oxide, and magnetite (Fe_3O_4) brought about a violent decomposition of hydrogen trisulfide. *Mellor* **10:** 159 (1946-1947).
Potassium Permanganate	Potassium permanganate decomposes hydrogen trisulfide so rapidly that sufficient heat is liberated to ignite the trisulfide.

	Mellor **10:** 159 (1946-1947).
Stannic Oxide	See HYDROGEN TRISULFIDE plus Lead Oxide.

HYDROQUINONE $C_6H_4(OH)_2$

Sodium Hydroxide	See SODIUM HYDROXIDE plus Hydroquinone.

HYDROXIDES

(See also specific hydroxides as primary entries or see under other reactants)

Acrolein	See SODIUM HYDROXIDE plus Acrolein.

4-HYDROXY-3, 5-DINITROBENZENEAR SONIC ACID

$4,3,5,1\text{-}OHC_6H_2(NO_2)_2AsO_3H_2$

(self-reactive)	This compound and its metallic salts may be as explosive as its close relative picric acid. When a wet cake of the acid was heated an explosion occurred that was accompanied by liberation of arsenic or arsine.
	M. A. Phillips, *Chem. & Ind.* **1947:** 61.

a-HYDROXYISOBUTYRONITRILE $(CH_3)_2COHCN$

Sulfuric Acid	During addition of sulfuric acid to a vat of acetone cyanhydrin, pressure produced by rapid reaction ruptured the vessel explosively.
	Occupancy Fire Record **FR57-5:** 5 (1957).

HYDROXYLAMINE NH_2OH

Barium Dioxide	See BARIUM DIOXIDE plus Hydroxylamine.
Barium Oxide	See BARIUM OXIDE plus Hydroxylamine.
Chlorine	See CHLORINE plus Hydroxylamine.
Copper Sulfate	See COPPER SULFATE plus Hydroxylamine

Lead Dioxide	See LEAD DIOXIDE plus Hydroxylamine.
Phosphorus Pentachloride	See PHOSPHORUS TRICHLORIDE plus Hydroxylamine.
Phosphorus Trichloride	See PHOSPHORUS TRICHLORIDE plus Hydroxylamine.
Potassium Dichromate	See POTASSIUM DICHROMATE plus Hydroxylamine.
Potassium Permanganate	See POTASSIUM PERMANGANATE plus Hydroxylamine.
Sodium	See SODIUM plus Hydroxylamine.
Zinc	See ZINC plus Hydroxylamine.

HYDROXYLAMINE HYPOPHOSPHITE $NH_2OHPH_2O_2$

(self-reactive) Hydroxylamine hypophosphite detonates above 100¡ C.

Mellor **8:** 880 (1946-1947).

HYDROXYLAMINES

(See also under other reactants)

(self-reactive) Several scale-ups of previously successful hydroxylamine reactions have resulted in explosions, e.g.: 1) During preparation of an oxime from an aldehyde, an ether solution of the reaction mixture, containing hydroxylamine hydrochloride decomposed violently under vacuum distillation at 80¡ C. 2) The hydrochloride can be made to decompose exothermically at 140¡ C. and solid hydroxylamine sulfate will explode when heated to 170¡ C. 3) A mixture containing the hydrochloride, pyridine, and sodium acetate in a stainless steel autoclave at 90¡ C. suddenly heated and pressurized to 5000 psi to rupture the relief disk.

Chem. Process (Chicago) **26:** 30 (1963).

4-HYDROXY-3-METHOXYBENZALDEHYDE

$CH_3O(HO)C_6H_3CHO$

(See VANILLIN.)

Bromine	See BROMINE plus Methyl Alcohol.
Perchloric Acid	See PERCHLORIC ACID plus Ethyl Alcohol.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Tetrachlorobenzene and Sodium Hydroxide	See SODIUM HYDROXIDE plus Tetrachlorobenzene and Methyl Alcohol.

n-HYDROXYMETHYLACRYLAMIDE $HOCH_2NHCOCH{=}CH_2$

Contaminant	Among four fiber drums of this chemical, two of which had never been opened, excessive heat, smoke, crackling, and small flames were noted. Very small amounts of contaminant are believed to have catalyzed this polymerization reaction, but storage in excessively heated areas can also start the reaction. *Coventry* (1965). *Spence* (1966).

3-HYDROXYPROPIONITRILE $HOCH_2CH_2CN$

Chlorosulfonic Acid	Mixing ethylene cyanohydrin and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	See OLEUM plus Ethylene Cyanohydrin.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Ethylene Cyanohydrin.
Sulfuric Acid	Mixing ethylene cyanohydrin and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

HYPOCHLORITES

(See also specific hypochlorites as primary entries or under other reactants)

Urea	Hypochlorites react with urea to form nitrogen trichloride which explodes spontaneously in air.
	J. Am. Chem. Soc. **63:** 3530-32.

HYPOCHLOROUS ACID HOCl

Alcohols	See ALCOHOLS plus Hypochlorous Acid.
Ammonia	Gaseous ammonia explodes in contact with hypochlorous acid; toxic chlorine is liberated.
	Mellor **8:** 217 (1946-1947).
Arsenic	See ARSENIC plus Hypochlorous Acid.

HYPOPHOSPHITES

(See specific hypophosphites as primary entries or see under other reactants.)

Perchloric Acid	Some inorganic materials, such as hypophosphites, tend to form explosive mixtures with perchloric acid when hot. When a precipitate of scandium hypophosphite was heated in a perchloric acid solution, the perchloric acid concentrated from evaporation and the mixture of perchloric acid with the inorganic reducing compound exploded violently.
	Analyst **84:** 215 (April 1959). *NSC Newsletter, Chem. Sec.* (November 1966).

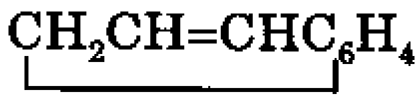
HYPOPHOSPHORIC ACID $H_4P_2O_6$

Mercuric Nitrate	See MERCURIC NITRATE plus Hypophosphoric Acid.

HYPOPHOSPHOROUS ACID H_3PO_2

Mercuric Oxide — See MERCURIC OXIDE plus Hypophosphorous Acid.

INDANE



Nitric Acid and Sulfuric Acid — In the preparation of 4 and 5 nitroindanes according to the procedure of Lindner and Brukin (*Chem. Ber.* **60,** 435 (1925)) the crude nitro mix was distilled in vacuo. After allowing the pot to cool, air was admitted to the residue. After a short period the pot erupted. A second preparation exploded at the beginning of the distillation.

G.W. Grebble, *Chem. Eng. News* **51** (6): 39 (Feb. 5, 1973).

INDIUM In

Sulfur — When indium is heated with sulfur, the elements unite with incandescence.

Mellor **5:** 393 (1946-1947).

INDIUM MONOXIDE InO

Air — Indium monoxide is spontaneously flammable in air.

Ellern (1961).

INDIUM TRIETHYL $(C_2H_5)_3In$

(See TRIETHYL INDIUM)

INDIUM TRIPROPYL $(C_3H_7)_3In$

(See TRIPROPYL INDIUM)

IODATES

(See also specific iodates as primary entries or under other reactants)

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphonium Iodide	See BROMATES plus Phosphonium Iodide.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

IODIC ACID HIO_3

Boron	See BORON plus Iodic Acid.
Phosphonium Iodide	See PHOSPHONIUM IODIDE plus Bromic Acid.

IODIDES

(See specific iodides as primary entries or under other reactants)

IODINE I_2

Acetaldehyde	See BROMINE plus Acetaldehyde.
Acetylene	Acetylene can react explosively with iodine.
	Von Schwartz, p. 142 (1918).
Aluminum	See ALUMINUM plus Iodine.
Ammonia	Mixture explodes spontaneously.
	Von Schwartz, p. 324 (1918).

Ammonium Hydroxide	The reaction of excess iodine with strong aqueous ammonium hydroxide forms explosive iodide.
	Mellor **8, Supp. 1:** 330 (1964).
	Nitrogen iodides, which detonate on drying, are formed from concentrated solutions.
	Mellor **2, Supp. 1:** 851 (1956).
Antimony	See ANTIMONY plus Bromine.
Bromine Pentafluoride	See ARSENIC plus Bromine Pentafluoride.
	An immediate reaction with evolution of heat occurs between iodine and bromine pentafluoride.
	Mellor **2, Supp. 1:** 173 (1956).
Cesium Acetylene Carbide	Cesium Acetylene Carbide burns in the vapors of iodine.
	Mellor **5:** 844 (1946-1947).
Cesium Carbide	Cesium carbide, rubidium carbide or lithium carbide (after warming) burn in iodine vapor.
	Mellor **5:** 848 (1946-1947).
Cesium Monoxide	See BROMINE plus Cesium Monoxide.
Chlorine	See CHLORINE plus Iodine.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Mercuric Iodide.
Cuprous Acetylide	See BROMINE plus Cuprous Acetylide.
Ethyl Alcohol, Methyl Alcohol, and Mercuric Oxide	The Petrov method of preparing 1-iodo-2-ethoxy-3-butene calls for addition of 15 grams of mercuric oxide to 0.11 molar ethyl alcohol in 25 ml of methyl alcohol, followed by 25 grams of powdered iodine at -10 to -15¡ C, filtration, and dilution. A change in the procedure used 1 molar ethyl alcohol. While the alcohol was being distilled off under vacuum, a violent explosion occurred.
	Chem. Eng. News **44** (42): 7 (October 17, 1966).

	Chem. Abst. **44:** 1003-d (1950).
Fluorine	See FLUORINE plus Iodine.
Lithium	A highly luminous reaction occurs at room temperature, between iodine and lithium, potassium, and sodium.
	Mellor **2, Supp. 1:** 848 (1956).
Lithium Carbide	See BROMINE plus Lithium Carbide.
	See IODINE plus Cesium Carbide.
Lithium Silicide	See FLUORINE plus Lithium Silicide.
Magnesium	See MAGNESIUM plus Iodine.
Oxygen Difluoride	See BROMINE plus Oxygen Difluoride.
Phosphorus	Ordinary (white or yellow) phosphorus unites with iodine at ordinary temperatures. Even at minus 24¡C., heat is developed. The product is spontaneously flammable in air. With red phosphorus, the reaction does not occur at ordinary temperatures; but when warmed, it reacts without incandescence.
	C.L. Gazzaniga, *Bibl. Univ. Genéve* **54:** 186 (1833).
	See also PHOSPHORUS plus Oxygen.
Potassium	Potassium burns on contact with liquid iodine.
	Mellor **2:** 469 (1946-1947).
	Iodine and potassium vapors at 0.001 mm pressure react with luminescence.
	Mellor **2, Supp. 3:** 1563 (1963).
Rubidium Acetylene	See BROMINE plus Rubidium Acetylene
Carbide	Carbide.
Rubidium Carbide	See IODINE plus Cesium Carbide.
Silver Azide	Silver azide in a cold ethereal solution of iodine gives a yellow explosive, iodoazide.
	Mellor **8:** 336-7 (1946-1947).
Sodium Hydride	Sodium hydride reacts with iodine with incandescence at 100¡C.

	Mellor **2:** 483 (1946-1947).
Zirconium Dicarbide	See BROMINE plus Zirconium Dicarbide.

IODINE AZIDE N_3I

(self-reactive)	Iodine azide is spontaneously explosive.
	Mellor **8:** 336 (1946-1947).
	Mellor **8, Supp. 2:** 50 (1967).

IODINE HEPTAFLUORIDE IF_7

Ammonium Bromide	Iodine heptafluoride reacts violently with ammonium bromide, ammonium chloride or ammonium iodide.
	Mellor **2, Supp. 1:** 179 (1956).
Ammonium Chloride	See IODINE HEPTAFLUORIDE plus Ammonium Bromide.
Ammonium Iodide	See IODINE HEPTAFLUORIDE plus Ammonium Bromide.
Carbon Monoxide	Carbon monoxide burns in gaseous iodine heptafluoride.
	Mellor **2, Supp. 1:** 179 (1956).
Organic Matter	See BROMINE MONOFLUORIDE plus Water.
Sulfuric Acid	In reaction between iodine heptafluoride and sulfuric acid, the acid becomes effervescent.
	Mellor **2, Supp. 1:** 185 (1956).
Water	See BROMINE MONOFLUORIDE plus Water.

IODINE MONOBROMIDE IBr

Phosphorus	See PHOSPHORUS plus Iodine Monobromide.
Potassium	See POTASSIUM plus Iodine Monobromide.
Sodium	See SODIUM plus Ferrous Chloride.

	See SODIUM plus Iodine Monobromide.

IODINE MONOCHLORIDE ICl

Aluminum Foil	See ALUMINUM plus Iodine Monochloride.
Cadmium Sulfide	The reaction between iodine monochloride and cadmium sulfide, lead sulfide, silver sulfide, or zinc sulfide is vigorous.
	Mellor **2, Supp. 1:** 502 (1956).
Lead Sulfide	See IODINE MONOCHLORIDE plus Cadmium Sulfide.
Organic Matter	Iodine monochloride produces a vigorous reaction with cork, rubber and other organic substances.
	Mellor **2, Supp. 1:** 500 (1956).
Phosphorus	See PHOSPHORUS plus Iodine Monobromide.
Phosphorus Trichloride	The reaction of iodine monochloride and phosphorus trichloride is intensely exothermal.
	Mellor **2, Supp. 1:** 502 (1956).
Potassium	See POTASSIUM plus Iodine Monochloride.
Rubber	See IODINE MONOCHLORIDE plus Organic Matter.
Silver Sulfide	See IODINE MONOCHLORIDE plus Cadmium Sulfide.
Sodium	See POTASSIUM plus Iodine Monochloride.
	See SODIUM plus Iodine Monochloride.
Zinc Sulfide	See IODINE MONOCHLORIDE plus Cadmium Sulfide.

IODINE PENTAFLUORIDE IF_5

Arsenic	See ARSENIC plus Iodine Pentafluoride.
Bismuth	See ARSENIC plus Iodine Pentafluoride.
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Iodine Pentafluoride.
Organic Matter	See ARSENIC plus Iodine Pentafluoride.

	See also BROMINE MONOFLUORIDE plus Water.
	See also IODINE PENTAFLUORIDE plus Water.
Phosphorus	See ARSENIC plus Iodine Pentafluoride.
Potassium	See POTASSIUM plus Iodine Pentafluoride.
Silicon	See ARSENIC plus Iodine Pentafluoride.
Sodium	See POTASSIUM plus Iodine Pentafluoride.
Sulfur	See ARSENIC plus Iodine Pentafluoride.
Tetrafluoroethylene and Limonene	Compressed gas cylinders made of tetrafluoroethylene were being purged with nitrogen. Failure of a ball check valve in a related system caused the purge gas to be contaminated with iodine pentafluoride. The iodine pentafluoride reacted with the polymerization inhibitor, limonene, in the TFE, generating enough heat to cause deflagration of the cylinder material.
	MCA Case History **1520** (1968).
Tetraiodoethylene	Explosions occur with too rapid admixture of iodine pentafluoride and tetraiodoethylene.
	Mellor **2, Supp. 1:** 176 (1956).
Tungsten	See ARSENIC plus Iodine Pentafluoride.
Water	Iodine pentafluoride reacts violently with water.
	Matheson Gas Data, p. 254 (1961).
	The reaction between iodine pentafluoride and water is violent. Water-containing materials and many organics also react violently.
	Mellor **2, Supp. 1:** 176 (1956).
	See also BROMINE MONOFLUORIDE plus water.

IODINE PENTOXIDE I_2O_5

Carbon	See CARBON plus Iodine Pentoxide.
Organic Matter	See CARBON plus Iodine Pentoxide.

Sulfur	See CARBON plus Iodine Pentoxide.

IODODIACETYLENE HC≡CC≡CI

(self-reactive)	Iododiacetylene detonates if scratched in light. *Rutledge*, p. 137 (1968).

IODODIMETHYLARSINE $(CH_3)AsI$

Air	Dimethyliodarsine is spontaneously flammable in air. *Ripley* (1966).

2-IODO-3, 5-DINITROBIPHENYL $IC_6H_2(NO_2)_2C_6H_5$

Ethyl Sodio-Acetoacetate	The condensation of 2-iodo-3, 5-dinitrobiphenyl with ethyl sodio-aceto-acetate should be carried out with only 5-6 grams of the 2-iodo-3, 5-dinitrobiphenyl since larger amounts lead to explosions. S.H. Zahur and I.K. Kocker. *J. Indian Chem. Soc.* **32:** 491 (1955).

IODOFORM CHI_3

Lithium	See LITHIUM plus Bromoform.

3-IODO-1-PHENYL-1-PROPYNE $C_6H_5C{\equiv}C{\bullet}CH_2I$

(self-reactive)	While being distilled at about 180¡ C 3-iodo-1-phenyl-1-propyne detonated. *Chem. Eng. News* **50** (23): 86, 87 (June 5, 1972).

IRIDIUM Ir

Chlorine Trifluoride	Chlorine trifluoride reacts with iridium with incandescence.

	Mellor **15:** 745 (1946-1947).
	Mellor **2, Supp. 1:** 156 (1956).
Fluorine	Powdered iridium and fluorine react vigorously at 260¡ C, forming the hexafluoride.
	Mellor **2, Supp. 1:** 65 (1956).
Oxygen Difluoride	An incandescent reaction occurs when any of the following metals are warmed gently in gaseous oxygen difluoride: iridium, osmium, palladium, platinum, rhodium, ruthenium.
	Mellor **2, Supp. 1:** 192 (1956).

IRIDIUM-AMMINE NITRATES

(self-reactive)	Iridium-ammine nitrates may be impact-sensitive.
	$Ir(NH_3)_5OH(NO_3)_3$ and Ir $(NH_3)_5Cl(NO_3)_3$ detonate at red heat.
	Mellor **15:** 787 (1946-1947).

IRIDIUM-AMMINE PERCHLORATES

(self-reactive)	Iridium-ammine perchlorates may be impact-sensitive.
	Mellor **15:** 787 (1946-1947).

IRON Fe

(For iron compounds see also FERRIC and FERROUS compounds)

Chlorine	Hot iron (wire) burns in chlorine gas.
	Mellor **2:** 95, 469 (1946-1947).
	Mellor **2, Supp. 1:** 380 (1956).
Chlorine Trifluoride	Chlorine trifluoride reacts with iron with incandescence.
	Mellor **13:** 315 (1946-1947).
	Mellor **2, Supp. 1:** 156 (1956).
Fluorine	Powdered iron reacts with fluorine below redness with

	incandescence.
	Mellor **13:** 314 (1946-1947).
Hydrogen Peroxide	Violent decomposition of hydrogen peroxide (52% by weight or greater) may be caused by contact with many substances, such as iron, copper, chromium, brass, bronze, lead, silver, manganese, etc., and their salts.
	Chem. Safety Data Sheet **SD-53** (1955); **SD-53 Supp. A** (1961); **SD-53 Supp. B** (1961).
	Iron and hydrogen peroxide ignite immediately if a trace of manganese dioxide is present.
	Mellor **1:** 938 (1946-1947).
Nitrogen Dioxide	Reduced iron decomposes nitrogen dioxide at ordinary temperatures with incandescence.
	Mellor **13:** 342 (1946-1947).
Phosphorus	See COPPER plus Phosphorus.
Sodium Carbide	See MERCURY plus Sodium Carbide.
Sulfuric Acid	While steel piping, which had held sulfuric acid in cold climates during the winter, was being refitted, two explosions occurred; these were possibly due to trapped hydrogen from the acid-metal reaction.
	Chem. Eng. News **29:** 1770 (1951). *Chem. Eng. News* **30:** 707 (1952).

IRON ALLOYS

(See LITHIUM plus Cobalt Alloys)

IRON CARBIDE FeC_2

Bromine	See CHLORINE plus Iron Carbide.
Chlorine	See CHLORINE plus Iron Carbide.

IRON OXIDE Fe_2O_3

Hydrazine	See HYDRAZINE plus Iron Oxide.

IRON OXIDE (MAGNETITE) Fe_3O_4

Hydrogen Trisulfide	See HYDROGEN TRISULFIDE plus Iron Oxide.

IRON PENTACARBONYL $Fe(CO)_5$

Air	Iron pentacarbonyl is spontaneously flammable in air. R. Kamo, *IIT Progs. Rept. 1,* p. 23 (1962).

ISOAMYL NITRITE $(CH_3)_2CHCH_2CH_2ONO$

(self-reactive)	Vapors will explode when heated. *Von Schwartz and Salter,* p. 322 (1940).

ISOBUTANETHIOL $(CH_3)_2CHCH_2SH$

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus 1-Propanethiol.

ISOBUTYL METHYL KETONE $CH_3COCH_2CH(CH_3)_2$

Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

ISOBUTYROPHENONE $(CH_3)_2CHCOC_6H_5$

Bromine	See BROMINE plus Isobutyrophenone.

ISOCYANATES	See ALCOHOLS plus Isocyanates.

ISOCYANOETHANE C_2H_5NC

(self-reactive)	Ethyl isonitrile is reported to have exploded when heated on a hot plate.

	Chem. Eng. News **46** (42): 7 (1968).

ISOCYANOMETHANE CH_3NC

(self-reactive)	The dehydration of n-methyl formamide by benzenesulfonyl chloride in tributylamine solution produces methyl isonitrile. In a subsequent distillation, the isonitrile was allowed to go to dryness and the flask exploded.
	Chem. Eng. News **46** (42): 7 (1968).

ISOPRENE $CH_2=C(CH_3)CH=CH_2$

Chlorosulfonic Acid	Mixing isoprene and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing isoprene and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing isoprene and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sulfuric Acid	Mixing isoprene and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

ISOPROPYL ALCOHOL $(CH_3)_2CHOH$

Hydrogen and Palladium	See HYDROGEN plus Palladium and Isopropyl Alcohol.

Nitroform	See NITROFORM plus Isopropyl Alcohol.
Oleum	See OLEUM plus Isopropyl Alcohol.
Phosgene	The reaction between isopropyl alcohol and phosgene forms isopropyl chloroformate and hydrogen chloride. In the presence of iron salts thermal decomposition can occur, which in some cases can become explosive.
	Konstantinov, I.I, Pereslegina, L.S., Zhuravlev, E.Z., and Gusev, Yu. M.
	Tr. po Khim. i Khim. Teknol. **10** (2): 171-4 (1967).
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

ISOPROPYL CHLOROFORMATE $(CH_3)_2CHOCOCl$

(self-reactive)	Isopropylchloroformate stored in a refrigerator exploded.
	Wischmeyer (1973).
	See also ISOPROPYL ALCOHOL plus Phosgene.

ISOPROPYL ETHER

(See DIISOPROPYL ETHER)

ISOPROPYL HYPOCHLORITE $(CH_3)_2CHOCl$

(self-reactive)	Isopropyl hypochlorite decomposes explosively when exposed to light and rapidly even in its absence.
	Mellor **2, Supp. 1:** 550 (1956).
	See also ALCOHOLS plus Hypochlorous Acid.

JP-4 FUEL

Fluorine	See FLUORINE plus Common Materials and Oxygen.

KETONES

(See also specific ketones)

Acetaldehyde	See ACETALDEHYDE plus Acid Anhydrides.
Nitric Acid	See NITRIC ACID plus Ketones (Cyclic).
Nitric Acid and Hydrogen Peroxide	These reactants produce solids or oils that are highly explosive. The reaction itself proceeds explosively with excess of nitric acid or inadequate cooling.
	Trans. Roy. Soc. Can. **Sect. III 44:** 1934-5 (1954).
Perchloric Acid	See PERCHLORIC ACID plus Glycol Ethers.

LACTIC ACID $CH_3CHOHCOOH$

Nitric Acid and Hydrofluoric Acid	See NITRIC ACID plus Lactic Acid and Hydrofluoric Acid.

LANTHANUM La

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.
Phosphorus	See CERIUM plus Phosphorus.

LANTHANUM OXIDE La_2O_3

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE Plus Arsenic Trioxide.

LANTHANUM PHOSPHIDE LaP

Water	See CEROUS PHOSPHIDE plus Water.

LEAD Pb

Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered)
Chlorine Trifluoride	See ALUMINUM plus Chlorine Trifluoride.

Hydrogen Peroxide	See IRON plus Hydrogen Peroxide.
Sodium Azide	See SODIUM AZIDE plus Copper.
Sodium Carbide	See MERCURY plus Sodium Carbide.
Zirconium	An alloy of 10% to 70% zirconium plus lead will ignite when struck with a hammer. *U.S. Pat.* 2,611,316 (1952).

LEAD ACETATE $(CH_3COO)_2Pb$

Potassium Bromate	See POTASSIUM BROMATE plus Lead Acetate.

LEAD AZIDE $Pb(N_3)_2$

(self-reactive)	Lead azide decomposes at 250¡ C. It is explosively unstable. *Mellor* **8, Supp. 2:** 43 (1967). See also SODIUM AZIDE plus Copper.
Brass	See COPPER plus Lead Azide.
Calcium Stearate	In the production of lead azide, addition of calcium stearate was tried for the first time. An explosion ensued. Cause not understood. *MCA Case History* **949** (1963).
Carbon Disulfide	See CARBON DISULFIDE plus Azides.
Copper	See COPPER plus Lead Azide.
Zinc	See COPPER plus Lead Azide.

LEAD CARBONATE $PbCO_3$

Fluorine	See FLUORINE plus Carbonates and FLUORINE plus Lead Carbonate (Basic).

LEAD CARBONATE (BASIC) $2PbCO_3 \cdot Pb(OH)_2$

Fluorine	See FLUORINE plus Lead Carbonate (Basic) and FLUORINE plus Carbonates.

LEAD CHLORATE $Pb(ClO_3)_3$

Sulfur	See SULFUR plus Lead Chlorate.

LEAD CHLORITE $Pb(ClO_2)_2$

(self-reactive)	Lead chlorite has detonator properties but its behavior is somewhat unpredictable.
	Mellor **2, Supp. 1:** 574 (1956).
Sulfur	See SULFUR plus Lead Chlorite.

LEAD CHROMATE $PbCrO_4$

Ferric Ferrocyanide	While these two chemicals were being ground together in a ball mill to form chrome green, a spark initiated a reaction that produced a fierce fire in the pigment.
	Chem. Process (Chicago) **30:** 118 (August 1967)

LEAD CYANIDE $Pb(CN)_2$

Magnesium	See MAGNESIUM plus Cadmium Cyanide.

LEAD DIOXIDE PbO_2

(See also LEAD OXIDE)

Aluminum Carbide	See ALUMINUM CARBIDE plus Lead Peroxide.
Barium Sulfide	See BARIUM SULFIDE plus Lead Dioxide.
Boron	See BORON plus Lead Dioxide.
Calcium Sulfide	See BARIUM SULFIDE plus Lead Dioxide.
Cesium Acetylene	See CESIUM ACETYLENE CARBIDE plus

Carbide	Cupric Oxide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Hydrogen Peroxide	Hydrogen peroxide reacts violently with lead dioxide, lead monoxide, mercuric oxide, potassium, and sodium.
	Mellor **1:** 937 (1946-1947).
Hydrogen Sulfide	When hydrogen sulfide is passed over moist or dry lead dioxide, the mass becomes red-hot, producing a blue flame.
	Mellor **7:** 689 (1946-1947).
Hydroxylamine	A mixture of hydroxylamine with barium dioxide or lead dioxide ignites.
	Mellor **8:** 291 (1946-1947).
Molybdenum	See MOLYBDENUM plus Lead Dioxide.
Performic Acid	See PERFORMIC ACID plus Lead Dioxide.
Phenyl Hydrazine	Lead dioxide reacts instantly and vigorously with phenyl hydrazine.
	Mellor **7:** 637 (1946-1947).
Phosphorus	See PHOSPHORUS plus Lead Dioxide.
Phosphorus Trichloride	When lead dioxide is added to warm phosphorus trichloride, the mixture becomes incandescent.
	Mellor **7:** 690 (1946-1947).
Sulfur	See SULFUR plus Lead Dioxide.
Sulfuryl Chloride	See SULFURYL CHLORIDE plus Lead Dioxide.
Tungsten	See MOLYBDENUM plus Lead Dioxide.
Zirconium	See ZIRCONIUM plus Cupric Oxide.

LEAD FLUORIDE PbF_2

Calcium Carbide	See CALCIUM CARBIDE plus Lead Fluoride.
Fluorine	See FLUORINE plus Lead Fluoride.

LEAD HYPOPHOSPHITE $Pb(PH_2O_2)_2$

(self-reactive)	Lead hypophosphite forms impact-sensitive ammunition-priming mixtures. *Mellor* **8, Supp. 3:** 623 (1971).
Lead Nitrate	This mixture forms a highly explosive double salt with rate of detonation greater than that of mercury fulminate. *Mellor* **8:** 887 (1946-1947).

LEAD IMIDE PbNH

Acids	See LEAD IMIDE plus Water.
Water	Lead imide explodes when heated or when treated with water or dilute acids. *Mellor* **8:** 265 (1946-1947).

LEAD MONOXIDE PbO

Hydrogen Peroxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Lithium Carbide	See LITHIUM CARBIDE plus Lead Monoxide.

LEAD NITRATE $Pb(NO_3)_2$

Ammonium Thiocyanate	See AMMONIUM THIOCYANATE plus Lead Nitrate.
Carbon	See CARBON plus Lead Nitrate.
Lead Hypophosphite	See LEAD HYPOPHOSPHITE plus Lead Nitrate.

LEAD OXIDE PbO; PbO_2; Pb_2O_3; Pb_3O_4

(See also LEAD DIOXIDE)

Aluminum	See ALUMINUM plus Lead Oxide.
Cesium Acetylene	See CESIUM ACETYLENE CARBIDE plus

Carbide	Cupric Oxide.
Fluorine and Glycerol	See FLUORINE plus Lead Oxide and Glycerol.
Hydrogen Trisulfide	See HYDROGEN TRISULFIDE plus Lead Oxide.
Perchloric Acid and	Over a period of time, perchloric acid fumes
Glycerine	from a laboratory hood condensed on the cover plate of the exhaust fan, which was sealed with a cement of glycerine and litharge (lead monoxide). When a workman tapped the plate with a chisel, a violent explosion caused two injuries and one fatality.
	Serious Acc. Series **184** (1962).
Rubidium Acetylene	See RUBIDIUM ACETYLENE CARBIDE
Carbide	plus Lead Oxide.
Rubidium Carbide	See RUBIDIUM CARBIDE plus Lead Oxide.
Silicon and Aluminum	See SILICON plus Aluminum and Lead Oxide.
Sodium	See SODIUM plus Lead Oxide.
Sulfur Trioxide	The reaction between sulfur trioxide and lead oxide is attended by white luminescence.
	Mellor **7:** 654 (1946-1947).
Titanium	See TITANIUM plus Cupric Oxide.
Zirconium	See ZIRCONIUM plus Cupric Oxide.

LEAD OXYCHLORIDE Pb_2OCl_2

Potassium	See POTASSIUM plus Boric Acid.

LEAD PERCHLORATE $Pb(ClO_4)_2$

Methyl Alcohol	A flask containing a saturated solution of anhydrous lead perchlorate dissolved in methyl alcohol exploded when it was disturbed.
	ACS **146:** 209. *J. Am. Chem. Soc.* **52:** 2391-6 (1930).

LEAD PEROXIDE PbO_2

(See LEAD DIOXIDE)

Potassium	See POTASSIUM plus Boric Acid.

LEAD PHOSPHITE $Pb(H_2PO_3)_2$

(self-reactive)	A fiber drum of lead diphosphite caught fire apparently without any external cause. Since phosphite salts decompose rapidly at elevated temperatures (200¡ C), it is believed a gradual decomposition took place, yielding lead phosphate, water, and phosphine. Phosphine, in turn, is spontaneously flammable in air and was the probable secondary cause of the fire. *Schwab* (1967). *Kirk and Othmer* **10:** 489 (1947).

LEAD STYPHNATE $PbO_2C_6H(NO_2)_3$

(self-reactive)	This compound is a weak but highly sensitive explosive. *Urbanski,* Vol. III, p. 213 (1967). An employee was removing a beaker of lead styphnate from a laboratory oven when he apparently bumped the beaker on the side of the oven. A detonation occurred. *MCA Case History* **957** (1966). Three kilograms of lead styphnate detonated from an unknown cause in the anteroom of a dry-house. Wet material in two adjacent drying rooms did not detonate. *Chem. Abst.* **26:** 5210 (1932).

LEAD SULFATE $PbSO_4$

Potassium	See POTASSIUM plus Boric Acid.

LEAD SULFIDE PbS

Iodine Monochloride	See IODINE MONOCHLORIDE plus Cadmium Sulfide.
Hydrogen Peroxide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.

LEAD TETRAAZIDE $Pb(N_3)_4$

(self-reactive)	Lead tetraazide is too unstable to be isolated. The ammonium double salt is an unstable explosive compound.
	Mellor **8, Supp. 2:** 22 (1967).

LEAD TRINITRORESORCINATE $Pb\ O_2C_6H(NO_2)_3$

(See LEAD STYPHNATE)

LEWIS-TYPE CATALYSTS

Allyl Chloride	See SULFURIC ACID plus Allyl Chloride.

LIMESTONE (CRUSHED)

Fluorine	See FLUORINE plus Common Materials and Oxygen.

LIMONENE $C_{10}H_{16}$

Iodine Pentafluoride and Tetrafluoroethylene	See IODINE PENTAFLUORIDE plus Tetrafluoroethylene and Limonene.

LINSEED OIL

Chlorine	See CHLORINE plus Polypropylene.

LITHIUM Li

Air	Lithium is spontaneously flammable in air if heated to 180¡C., if the surface of the metal is clean. See also LITHIUM plus Oxygen.

	Mellor **2:** 468 (1946-1947).
Arsenic	The reaction of lithium is violent with both strongly heated arsenic and phosphorus.
	Mellor **2, Supp. 1:** 77 (1956).
Beryllium	See LITHIUM plus Vanadium.
Bromine	See BROMINE plus Potassium.
Bromoform	Lithium mixed with the following compounds can explode on impact: bromoform, carbon tetrabromide, chloroform, iodoform, methyl dichloride, and methyl diiodide.
	Mellor **2, Supp. 2:** 83 (1961).
Carbides	Molten lithium attacks carbides and silicates.
	Mellor **2, Supp. 2:** 84 (1961).
Carbon Dioxide	See LITHIUM plus Oxygen.
	See also LITHIUM Plus Water.
Carbon Monoxide	The product of the reaction between lithium
and Water	and carbon monoxide, lithium carbonyl, detonates violently with water, igniting gaseous products.
	Mellor **2, Supp. 2:** 88 (1961).
Carbon Tetrabromide	See LITHIUM plus Bromoform.
Carbon Tetrachloride	There was no reaction when a drop or two of carbon tetrachloride was added to burning lithium. When the quantity was eventually increased to about 25 cc of carbon tetrachloride, a violent explosion occurred.
	Allison (1968).
	See also LITHIUM plus Trichlorotrifluoroethane.
	A billet-cutting knife initiated a violently explosive reaction between lithium and carbon tetrachloride.
	Mellor **2, Supp. 2:** (1961).
	See also LITHIUM plus Water.
Chlorine	See CESIUM plus Chlorine.
Chloroform	Chloroform with various alkali metals is impact-sensitive

	as follows: weak explosion with lithium; fairly strong with sodium; strong with potassium; and violent with sodium-potassium.
	H. Staudinger, *Z. Electrochem.* **31:** 549-52 (1925).
	See LITHIUM plus Bromoform.
Chromic Oxide	The reaction of lithium and chromic oxide occurs around 180¡ C with consequent temperature rise to 965¡ C.
	Mellor **2, Supp. 2:** 81 (1961).
Chromium	See LITHIUM plus Vanadium.
Chromium Trichloride	On dusting a lithium strip with either chromium trichloride or zirconium tetrachloride then warming in a nitrogen atmosphere, the lithium burns vigorously, presumably forming lithium nitride.
	BCISC **40** (158): 17 (1968).
Cobalt Alloys	Molten lithium attacks the following alloys: cobalt alloys, iron alloys, manganese alloys, nickel alloys.
	Mellor **2, Supp. 2:** 80 (1961).
Diborane	See ALUMINUM plus Diborane.
Ferrous Sulfide	The reaction of lithium and ferrous sulfide occurs around 260¡ C with consequent temperature rise to 945¡ C.
	Mellor **2, Supp. 2:** 82 (1961).
Halogenated Hydrocarbons	See LITHIUM plus Oxygen.
Hydrogen	Lithium burns in gaseous hydrogen.
	Mellor **1:** 327 (1946-1947).
Iodine	See IODINE plus Lithium.
Iodoform	See LITHIUM plus Bromoform.
Iron Alloys	See LITHIUM plus Cobalt Alloys.
Maleic Anhydride	See ALKALI METALS plus Maleic Anhydride.
Manganese Alloys	See LITHIUM plus Cobalt Alloys.

Methyl Dichloride	See LITHIUM plus Bromoform.
Methyl Diiodide	See LITHIUM plus Bromoform.
Molybdenum Trioxide	The reaction of lithium and molybdenum trioxide occurs at about 180¡ C with consequent temperature rise to 1400¡ C. *Mellor* **2, Supp. 2:** 82 (1961).
Monofluorotrichloromethane	See LITHIUM plus Trichlorotrifluoroethane.
Nickel Alloys	See LITHIUM plus Cobalt Alloys.
Niobium Pentoxide	The reaction of lithium and niobium pentoxide occurs around 320¡ C, with consequent temperature rise to 490¡ C. *Mellor* **2, Supp. 2:** 81 (1961).
Nitric Acid	When 15 ml. of nitric acid were poured onto 15 grams of lithium in an attempt to dissolve the metal, a small fire started in the flask. In less than a minute, the reaction was so vigorous that burning lithium was thrown upward in the laboratory hood. *Acc. and Fire Prev. Inf.* (March 31, 1954).
Nitrogen	See LITHIUM plus Oxygen; also LITHIUM plus Trichlorotrifluoroethane. The reaction of lithium and nitrogen increases greatly as the metal melts. *Mellor* **2, Supp. 2:** 77 (1961).
Organic Matter	Molten lithium attacks plastics and rubber. *Mellor* **2, Supp. 2:** 84 (1961).
Oxygen	Lithium will burn in air, oxygen, nitrogen, and carbon dioxide. The susceptibility of molten lithium surfaces to spontaneous ignition is increased by the presence of lithium oxides or nitrides. These reactions and the reaction with water are extremely violent at higher temperatures. Contact with halogenated hydrocarbons can produce extremely violent reactions, especially on impact. *ASESB Pot. Incid.* **39** (1968). *Haz. Chem. Data* (1966).
Phosphorus	See LITHIUM plus Arsenic.

	See PHOSPHORUS plus Cesium.
Platinum	Platinum and molten lithium react violently at 540¡ C plus or minus 20¡. An intermetallic compound is formed.
	Chem. Eng. News **39** (5): 42 (January 30, 1961).
Rubber	See LITHIUM plus Organic Matter.
Silicates	See LITHIUM plus Carbides.
Sodium Chloride	Sodium chloride extinguishant should not be used on lithium fires since the reaction releases sodium and results in a more violent fire.
	Fatt and Tashima, p. 32.
Sodium Nitrite	Lithium reacts with sodium nitrite to form lithium sodium hydronitrite, a compound which decomposes violently around 100¡-130¡ C.
	Mellor **2, Supp. 2:** 78 (1961).
Sulfur	The reaction of lithium and sulfur is very violent when either is molten, starting with explosive violence.
	Mellor **2, Supp. 2:** 74 (1961).
Tantalum Pentoxide	The reaction of lithium and tantalum pentoxide occurs around 410¡ C with consequent temperature rise to 595¡ C.
	Mellor **2, Supp. 2:** 81 (1961).
Tetrachloroethylene	See LITHIUM plus Trichlorotrifluoroethane.
Titanium Dioxide	The reaction of lithium and titanium dioxide occurs around 200¡ C with a flash of light; the temperature can reach 900¡ C.
	Mellor **2, Supp. 2:** 81 (1961).
Trichloroethylene	See LITHIUM plus Trichlorotrifluoroethane.
Trichlorotrifluoroethane	It has been determined experimentally that mixtures of lithium shavings and a number of halogenated hydrocarbons possess an explosive capability. Specifically, impact sensitivity tests have shown that lithium shavings in contact with monofluorotrichloromethane, trichlorotrifluoroethane, carbon tetrachloride, trichloroethylene, or tetrachloroethylene can detonate.

	ASESB Pot. Incid. **39** (1968).
Tungsten Trioxide	The reaction of lithium and tungsten trioxide occurs at about 200¡ C with consequent temperature rise to 1030¡ C.
	Mellor **2, Supp. 2:** 82 (1961).
Vanadium	Molten lithium at 180¡ C attacks vanadium, beryllium, or chromium severely.
	Mellor **2, Supp. 2:** 80 (1961).
Vanadium Pentoxide	The reaction of lithium and vanadium pentoxide occurs around 400¡ C; the temperature then rises rapidly to 768¡ C.
	Mellor **2, Supp. 2:** 81 (1961).
Water	See LITHIUM plus Oxygen.
	Liquid lithium is readily ignited and reacts with most extinguishing agents, including water, carbon tetrachloride and carbon dioxide.
	Mellor **2, Supp. 2:** 71 (1961).
Zirconium Tetrachloride	See LITHIUM plus Chromium Trichloride.

LITHIUM ACETYLENE CARBIDE DIAMMINO $LiC{\equiv}CHNH_3$

Carbon Dioxide	Lithium acetylene carbide diammino burns on contact with carbon dioxide, chlorine, sulfur dioxide, and water.
	Mellor **5:** 849 (1946-1947).
Chlorine	See LITHIUM ACETYLENE CARBIDE DIAMMINO plus Carbon Dioxide.
Sulfur Dioxide	See LITHIUM ACETYLENE CARBIDE DIAMMINO plus Carbon Dioxide.
Water	See LITHIUM ACETYLENE CARBIDE DIAMMINO plus Carbon Dioxide.

LITHIUM ALUMINUM HYDRIDE

(See LITHIUM TETRAHYDROALUMINATE)

LITHIUM AMIDE $LiNH_2$

Water	Lithium amide reacts readily with water and develops a dangerous amount of heat. *Chaney* (1948). *Chapman* (1948). F. W. Bergstrom and W. C. Fernelius, *Chem. Reviews* **12:** 61 (1933).

LITHIUM AZIDE LiN_3

Carbon Disulfide	See AZIDES plus Carbon Disulfide.

LITHIUM BOROHYDRIDE

(See LITHIUM TETRAHYDROBORATE)

LITHIUM BUTYL LiC_4H_9

(See BUTYL LITHIUM)

LITHIUM CARBIDE Li_2C_2

Bromine	See BROMINE plus Lithium Carbide.
Chlorine	See BROMINE plus Lithium Carbide.
Fluorine	See BROMINE plus Lithium Carbide.
Iodine	See BROMINE plus Lithium Carbide. See IODINE plus Cesium Carbide.
Lead Monoxide	Lithium carbide in the presence of lead monoxide is reduced with great vigor and with incandescence. *Mellor* **5:** 849 (1946-1947).
Phosphorus	See PHOSPHORUS plus Lithium Carbide.
Selenium	See SULFUR plus Lithium Carbide.
Sulfur	See SULFUR plus Lithium Carbide.

LITHIUM CARBONATE Li_2CO_3

Fluorine	See FLUORINE plus Carbonates.

LITHIUM CARBONYL LiCOCOLi

(self-reactive)	See LITHIUM plus Carbon Monoxide and Water.

LITHIUM CHLORIDE LiCl

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.

LITHIUM ETHYL C_2H_5Li

(See ETHYL LITHIUM)

LITHIUM HEXAPHENYLTUNGSTATE ETHERATE

$Li_3W(C_6H_5)_63(C_2H_5)_2O$

Air	Triphenyl tungsten-tris(phenyl lithium)-tri (diethyl ether) is spontaneously flammable in air. *Douda* (1966).

LITHIUM HYDRIDE LiH

Nitrous Oxide	See NITROUS OXIDE plus Lithium Hydride.
Oxygen (Liquid)	See OXYGEN (LIQUID) plus Lithium Hydride.

LITHIUM METHYL

(See METHYL-LITHIUM)

LITHIUM METHYLIDE CH_2Li_2

Air	Methylene dilithium is spontaneously flammable in air.
	Douda (1966).

LITHIUM PHENYL C_6H_5Li

(See PHENYL LITHIUM)

LITHIUM PHENYLAZOXIDE $LiON{=}NC_6H_5$

(self-reactive)	See PHENYL-LITHIUM plus Nitrous Oxide.

LITHIUM PHOSPHIDE Li_3P

Water	Lithium phosphide reacts with water to form spontaneously flammable phosphine.
	Van Wazer (1958).

LITHIUM PROPYL C_3H_7Li

(See PROPYL LITHIUM)

LITHIUM SILICIDE Li_6Si_2

Bromine	See FLUORINE plus Lithium Silicide.
Fluorine	See FLUORINE plus Lithium Silicide.
Hydrogen Chloride	Lithium silicide in contact with hydrogen chloride becomes incandescent. When dilute hydrochloric acid is used, a gas spontaneously flammable in air is evolved.
	Mellor **6:** 170 (1946-1947).
Nitric Acid	Lithium silicide reacts explosively with nitric acid, producing nitrogen dioxide and silica.
	Mellor **6:** 170 (1946-1947).
Phosphorus	See PHOSPHORUS plus Lithium Silicide.

Selenium	See PHOSPHORUS plus Lithium Silicide.
Sulfuric Acid	When lithium silicide is placed on sulfuric acid, it becomes incandescent.
	Mellor **6:** 170 (1946-1947).
Tellurium	See PHOSPHORUS plus Lithium Silicide.
Water	The reaction between lithium silicide and water is very violent; a spontaneously flammable gas is evolved.
	Mellor **6:** 170 (1946-1947).

LITHIUM SODIUM HYDRONITRITE

(See LITHIUM plus Sodium Nitrite)

LITHIUM TETRAAZIDOBORATE $LiB(N_3)_4$

(self-reactive)	See BORON TRIAZIDE (self-reactive)

LITHIUM TETRAHYDROALUMINATE $LiAlH_4$

Air	Lithium aluminum hydride can burn in heated or moist air.
	Haz. Chem. Data, p. 101 (1966).
	Lab. Govt. Chemist (1965).
Alcohols	See LITHIUM ALUMINUM HYDRIDE plus Water.
Acids	See LITHIUM ALUMINUM HYDRIDE plus Water.
Benzoyl Peroxide	See BENZOYL PEROXIDE plus Lithium Aluminum Hydride.
Boron Trifluoride Etherate	In a laboratory effort to prepare diborane gas from these reactants, the boron trifluoride etherate in ether was frozen at liquid nitrogen temperature, lumps of lithium aluminum hydride were added, and the system was evacuated. Because of insufficient vacuum, the connection between the apparatus and the vacuum source was reopened. When this action jarred the reaction flask, an explosion and orange flame resulted. The presence of

	oxides in the etherate probably initiated the reaction.
	Chem. Eng. News **45** (20): 51 (1967); **45** (27): **7** (1967).
2-Chloromethylfuran and Ethyl Acetate	See 2-CHLOROMETHYLFURAN plus Lithium Aluminum Hydride and Ethyl Acetate.
Diethylene Glycol Dimethyl Ether	A violent explosion occurred when lithium aluminum hydride was being used to dry diethylene glycol dimethyl ether. About 75 per cent of the ether had been distilled when the explosion occurred.
	R. M. Adams, *Chem. Eng. News* **31:**2334 (1953).
	MCA Case History **1494** (1968).
Diethyl Ether	With aluminum chloride as a catalyst, occasional explosions involving these materials have been traced to carbon dioxide as an impurity in the ether.
	J. Am. Chem. Soc. **70:** 877 (1948).
1,2-Dimethoxyethane	When the solvent, dimethoxyethane was poured into a funnel previously used to introduce the hydride into a reaction flask, a fire ignited in the funnel.
	MCA Case History **1182** (1966).
Dimethyl Ether	Use of lithium aluminum hydride to dry methyl ethers may cause explosions, which are attributed to solubility of carbon dioxide. High concentrations of peroxides were found to be present.
	MCA Guide for Safety, Appendix 3 (1972).
Methyl Ethyl Ether	See LITHIUM ALUMINUM HYDRIDE plus Dimethyl Ether.
Nitriles and Water	The nitrile reaction with an ether solution of the hydride was conducted in a flask equipped with a reflux condenser having a drying tube. After the apparatus had stood over the weekend, moisture worked back into the flask through the ground glass joint. The lubricant had evidently been dissolved by the ether. When the moisture reached the reactants in the flask an explosion resulted.
	NSC Newsletter, *Chem. Sec.* (April 1967).
Perfluorosuccinamide	Perfluorosuccinamide was added to an ether solution of

	lithium aluminum hydride in a nitrogen atmosphere. Hydrolysis was then attempted but as the second drop of water was added, a violent explosion occurred.
	MCA Guide for Safety, Appendix 3 (1972).
Perfluorosuccinamide and Water	Perfluorosuccinamide was added to an ether solution of lithium aluminum hydride in an atmosphere of nitrogen. When hydrolysis of the mixture was attempted, a violent explosion and fire occurred after the second drop of water was added.
	T.S. Reid and G.H. Smith, *Chem. Eng. News* **29:** 3042 (1951).
Tetrahydrofuran	See TETRAHYDROFURAN plus Lithium Aluminum Hydride.
Water	Lithium aluminum hydride reacts vigorously with hydroxy compounds: water, alcohols, carboxylic acids.
	Mellor **2, Supp. 2:** 142 (1961).

LITHIUM TETRAHYDROBORATE $LiBH_4$

Cellulosic Material	Lithium borohydride is likely to ignite in contact with cellulosic materials.
	Lab. Govt. Chemist (1965).
Water	Lithium borohydride is likely to ignite when moistened with water.
	Lab. Govt. Chemist (1965). *Gaylord*, p. 22 (1956).

LITHIUM TETRAMETHYLBORATE $LiB(CH_3)_4$

Water	Lithium tetramethyl borate may ignite spontaneously in moist air.
	Dreisback, pp. 93-94 (1961).

LITHIUM TRI-tert-BUTOXYALUMINATE

$LiAl(OC(CH_3)_3)_3H$

Water	Lithium aluminum tri-tert-butoxyhydride reacts with water to form hydrogen. Ignition sometimes occurs.
	Rose (1961).

LUCITE□

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

LUTETIUM Lu

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

MAGNESIUM Mg

Air	Magnesium ribbon and fine magnesium shavings can be ignited at air temperatures of about 950¡ F and very finely divided magnesium powder has been ignited at air temperatures below 900¡ F.
	Magnesium Standard, p. 4 (1967).
Aluminum and	See ALUMINUM plus Magnesium and Potassium
Potassium Perchlorate	Perchlorate.
Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Barium Nitrate,	A mixture consisting of barium dioxide,
Barium Dioxide	barium nitrate, magnesium and zinc exploded
and Zinc	from an unknown cause, demolishing a small plant.
	Sprengstoffe, Waffen u. Munitions (1905).
Beryllium Oxide	Oxides of beryllium, cadmium, mercury, molybdenum and zinc can react explosively with magnesium when heated.
	Mellor **4:** 272 (1946-1947).
Boron Phosphodiiodide	Powdered magnesium and boron phosphodiiodide react

	with incandescence.
	Mellor **8:** 845 (1946-1947).
Bromobenzyl Trifluoride	Bromobenzyl trifluoride was added to magnesium turnings in sodium-dried ether at a rate so as to maintain reflux. After a period of time an explosion occurred.
	MCA Case History **1834** (1972).
Cadmium Cyanide	Magnesium reacts with incandescence when heated with cyanides of cadmium, cobalt, copper, lead, nickel, or zinc.
	Mellor **4:** 271 (1946-1947).
Cadmium Oxide	See MAGNESIUM plus Beryllium Oxide.
Calcium Carbide	Magnesium reacts with incandescence when heated in air with calcium carbide.
	Mellor **4:** 271 (1946-1947).
Carbonates	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Carbon Tetrachloride	See MAGNESIUM plus Trichloroethylene; also ALUMINUM plus Chloroform.
Chlorine	Magnesium exposed to moist chlorine is spontaneously flammable.
	Mellor **4:** 267 (1946-1947).
Chlorine Trifluoride	See ALUMINUM plus Chlorine Trifluoride.
Chloroform	When chloroform or methyl chloride (or mixtures of both) contacts magnesium, an explosion occurs.
	C.C. Clogston, *UL Bull. Research* **34:** 15 (1945).
Cobalt Cyanide	See MAGNESIUM plus Cadmium Cyanide.
Copper Cyanide	See MAGNESIUM plus Cadmium Cyanide.
Copper Sulfate (anhydrous), Ammonium Nitrate,	The water permits both the exothermic reaction of $Mg+Cu^{++}$ to give $Cu+Mg^{++}$ and the metathetical reaction of the salts, which

Potassium Chlorate	produces the unstable ammonium chlorate.
and Water	The mixture is unstable and hazardous.
	Ellern, p. 46 (1968).
Cupric Oxide	The reduction of heated cupric oxide by admixed magnesium is accompanied by incandescence and an explosion.
	Mellor **3:** 138 (1946-1947).
Cupric Sulfate	The action of magnesium on a solution of cupric sulfate is attended by the evolution of hydrogen.
	Mellor **3:** 247 (1946-1947).
Fluorine	Magnesium exposed to moist fluorine is spontaneously flammable.
	Mellor **4:** 267 (1946-1947).
Gold Cyanide	Cyanides of gold or mercury decompose to the metals and cyanogen. The latter reacts explosively with magnesium.
	Mellor **4:** 271 (1946-1947).
Hydrogen and	When a mixture of magnesium and calcium
Calcium Carbonate	carbonate is heated in a current of hydrogen, a violent explosion occurs.
	Mellor **4:** 272 (1946-1947).
Hydrogen Iodide	Magnesium burns momentarily in hydrogen iodide.
	Mellor **2:** 206 (1946-1947).
Hydrogen Peroxide	Magnesium mixed with a trace of manganese dioxide ignites immediately in contact with hydrogen peroxide.
	Mellor **1:** 938 (1946-1947).
Iodine	Magnesium burns vigorously when heated in iodine vapor.
	Mellor **4:** 267 (1946-1947).
Lead Cyanide	See MAGNESIUM plus Cadmium Cyanide.
Mercuric Oxide	See MAGNESIUM plus Beryllium Oxide.
Mercury Cyanide	See MAGNESIUM plus Gold Cyanide.

Methyl Chloride	See MAGNESIUM plus Chloroform.
Molybdenum Trioxide	When molybdenum trioxide is heated with molten magnesium, a violent detonation occurs.
	H.N. Warren, *Chem. News* **64:** 75 (1891).
	See MAGNESIUM plus Beryllium Oxide.
Nickel Cyanide	See MAGNESIUM plus Cadmium Cyanide.
Nitric Acid	A mixture of finely divided magnesium and nitric acid is explosive.
	Pieters, p. 28 (1957).
Nitrogen Dioxide	Magnesium, phosphorus or sulfur burns vigorously in nitrogen dioxide.
	Comp. Rend. **116:** 756
Oxygen (Liquid)	*Liquid* oxygen (LOX) gives a detonable mixture when combined with *powdered* magnesium.
	Kirschenbaum (1956).
Performic Acid	Powdered magnesium can decompose performic acid violently.
	Berichte **48:** 1139 (1915).
Phosphates	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Potassium Chlorate	An explosion occurred during heating of a mixture of potassium chlorate and magnesium.
	Chem. Eng. News **14:** 451 (1936).
Potassium Perchlorate	Powdered magnesium plus potassium (or sodium) perchlorate is a friction-sensitive explosive mixture.
	V.E. Ready, *Safety Eng. Reports* (1947).
Silver Nitrate	A mixture of the two ingredients will burst into flame on moistening. The water causes electrochemical exchange between the magnesium and the silver ion. The heat of reaction of this exchange provokes the pyrochemical effect.
	Ellern, p. 46 (1968).

Silver Oxide	See SILVER OXIDE plus Magnesium.
Sodium Perchlorate	See MAGNESIUM plus Potassium Perchlorate.
Sodium Peroxide	Sodium peroxide oxidizes magnesium powder with incandescence. The mixture explodes when heated to redness. When the mixture is exposed to moist air, spontaneous combustion occurs.
	Mellor **2:** 490; **5:** 217 (1946-1947).
Sodium Peroxide and Carbon Dioxide	When carbon dioxide gas is passed over a mixture of powdered magnesium and sodium peroxide, the mixture explodes.
	Mellor **2:** 490 (1946-1947).
Stannic Oxide	Stannic oxide, heated with magnesium, explodes.
	Mellor **7:** 401 (1946-1947).
Sulfates	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Trichloroethylene	It has been determined experimentally that a mixture of magnesium powder with trichloroethylene or with carbon tetrachloride will flash or spark under heavy impact.
	ASESB Pot. Incid. **39** (1968).
Zinc Cyanide	See MAGNESIUM plus Cadmium Cyanide.
Zinc Oxide	See MAGNESIUM plus Beryllium Oxide.

MAGNESIUM ALLOYS

Air	Magnesium alloy powders containing more than 50% magnesium readily ignite in air.
	Lab. Govt. Chemist (1965).
	Magnesium Standard, p. 5 (1967).

MAGNESIUM ALUMINUM PHOSPHIDE Mg_3AlP_3

Water	In contact with water or damp air, magnesium aluminum

	phosphide evolves phosphine, which is spontaneously flammable in air.
	Lab. Govt. Chemist (1965).

MAGNESIUM BORIDE Mg_3B_2

Hydrochloric Acid	Magnesium boride, when treated with concentrated hydrochloric acid, produces a spontaneously flammable gas.
	Mellor **5:** 25 (1946-1947).

MAGNESIUM BROMATE $Mg(BrO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

MAGNESIUM CHLORATE $Mg(ClO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Antimony Sulfide	See CHLORATES plus Antimony Sulfide.
	See METAL SULFIDES plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Arsenic Sulfide	See CHLORATES plus Arsenic Sulfide. See METAL SULFIDES plus Bromates.
Carbon	See CARBON plus Bromates.

Charcoal	See CHLORATES plus Organic Matter.
Copper	See COPPER plus Bromates.
Copper Sulfide	See COPPER SULFIDE plus Cadmium Chlorate.
Manganese Dioxide	See CHLORATES plus Manganese Dioxide.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Acids (Dibasic)	See CHLORATES plus Organic Acids.
Organic Matter	See BROMATES plus Organic Matter. See CHLORATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Stannic Sulfide	See STANNIC SULFIDE plus Cadmium Chlorate. See METAL SULFIDES plus Bromates.
Stannous Sulfide	See STANNIC SULFIDE plus Cadmium Chlorate.
	See METAL SULFIDES plus Bromates.
Sulfur	See SULFUR plus Bromates. See CHLORATES plus Organic Matter.

MAGNESIUM CHLORIDE MgCl

2-Furan Percarboxylic Acid	See 2-FURAN PERCARBOXYLIC ACID (self-reactive).

MAGNESIUM DIBUTYL $(C_4H_9)Mg$

(See DIBUTYL MAGNESIUM)

MAGNESIUM DIETHYL $(C_2H_5)_2Mg$

(See DIETHYL MAGNESIUM)

MAGNESIUM DIMETHYL $(CH_3)_2Mg$

(See DIMETHYL MAGNESIUM)

MAGNESIUM HYDRIDE MgH_2

Air	Magnesium hydride ignites spontaneously in air.
	Merck Index, p. 637 (1968).
Water	Magnesium hydride ignites violently with water.
	Merck Index, p. 637 (1968).

MAGNESIUM HYDROXIDE $Mg(OH)_2$

Maleic Anhydride	See SODIUM HYDROXIDE plus Maleic Anhydride.
Phosphorus	See PHOSPHORUS plus Alkaline Hydroxide.

MAGNESIUM HYPOPHOSPHITE $Mg(PH_2O_2)_2$

(self-reactive)	Magnesium hypophosphite liberates spontaneously flammable phosphine when heated.
	Mellor **8:** 885 (1946-1947).

MAGNESIUM IODATE $Mg(IO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

MAGNESIUM METHYLIDE CH_2Mg

Air	Methylene magnesium is spontaneously flammable in air.
	Coates, p. 29 (1956).

MAGNESIUM NITRATE $Mg(NO_3)_2$

Dimethyl Formamide	See DIMETHYL FORMAMIDE plus Magnesium Nitrate.

MAGNESIUM OXIDE MgO

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Phosphorus Pentachloride	See PHOSPHORUS PENTACHLORIDE plus Magnesium Oxide.

MAGNESIUM PERCHLORATE $Mg(ClO_4)_2$

Acids (Mineral)	Magnesium perchlorate should not be contacted by mineral acids because of the danger of explosion.
	ACS **146:** 208. *Chem. Weekblad.* **38:** 85 (1941); **54:** 277 (1958). *Ind. & Eng. Chem. News* **17:** 70 (1939).
Ammonia	Magnesium perchlorate was contained in a small steel refrigeration-type drying tube and the ammonia was passed through it (after the system was evacuated) in small increments in an attempt to further desiccate it. It was noted that the outside of the drying tube was warm to the touch. Shortly thereafter the tube exploded violently.
	F.F. Chapman (1973).
Butyl Fluoride	The butyl fluoride content of hydrocarbon gases being dried by magnesium perchlorate hydrolyzed. Reaction of the acid formed with the perchlorate caused an explosion.
	ACS **146:** 208-9. *Chem. Weekblad.* **38:** 85 (1941); **54:** 277 (1958). *Ind. & Eng. Chem. News* **17:** 70 (1939).
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Magnesium Perchlorate.
Ethylene Oxide	Drying gaseous ethylene oxide with magnesium perchlorate resulted in an explosion.

	NSC Newsletter, Chem. Sec. (Oct. 1959).
Hydrocarbons	Magnesium perchlorate, used in drying hydrocarbon gases, exploded when it was heated to 220¡ C.
	ACS **146:**208-9, *Chem. Weekblad.* **38:**85 (1941); **54:**277 (1958). *Ind. & Eng. Chem. News* **17:** 70 (1939).
	Magnesium perchlorate, used in drying unsaturated hydrocarbons, exploded on being heated to 220¡ C.
	P. M. Heertjes and J. P. W. Houtman, *Chem. Weekblad* **38:**85 (1941).
Organic Matter	Several instances of explosions from using magnesium perchlorate as a drying agent for organic matter have been documented.
	Chem. Eng. News **43** (37):62 (1965); **43**(47):5 (1965).
Phosphorus	See PHOSPHORUS plus Magnesium Perchlorate.
Trimethyl Phosphite	As soon as trimethyl phosphite contacted a small quantity of magnesium perchlorate in a small flask there was a brilliant flash and a loud explosion that shattered the flask.
	Allison (1968).

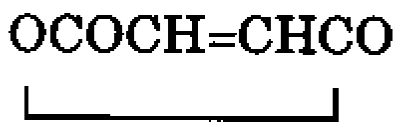
MAGNESIUM PHOSPHIDE Mg_3P_2

Bromine	See CHLORINE plus Magnesium Phosphide.
Chlorine	See CHLORINE plus Magnesium Phosphide.
Nitric Acid	Nitric acid oxidizes magnesium phosphide with incandescence.
	Mellor **8:**842 (1946-1947).
Water	Magnesium phosphide produces spontaneously flammable phosphine and diphosphine on contact with water.
	Douda (1966).

MAGNESIUM-TITANIUM ALLOY

Nitric Acid	See TITANIUM-MAGNESIUM ALLOY plus Nitric Acid.

MALEIC ANHYDRIDE



Alkali Metals	See ALKALI METALS plus Maleic Anhydride.
Amines	See SODIUM HYDROXIDE and Maleic Anhydride; also SODIUM HYDROXIDE plus Pyridine or other Tertiary Amines.
Calcium Hydroxide	See SODIUM HYDROXIDE plus Maleic Anhydride.
Lithium	See ALKALI METALS plus Maleic Anhydride.
Potassium	See ALKALI METALS plus Maleic Anhydride.
Potassium Hydroxide	See SODIUM HYDROXIDE plus Maleic Anhydride.
Pyridine or Other Tertiary Amines	A 0.1 per cent solution of pyridine in maleic anhydride at 185¡C. gives an exothermic decomposition with rapid evolution of gas.
	Chem. Eng. News **42** (8):41 (1964). *Chem. Haz. Info. Series* **C-71,** p. 5 (1960).
Sodium	See ALKALI METALS plus Maleic Anhydride.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Maleic Anhydride.

MANGANESE Mn

Aluminum and Air	During a fire in an industrial bag filter, a mixture of aluminum and manganese dusts was inadvertently released from the hopper below the bag and a drastic explosion resulted.
	Occ. Haz. **28:**44-6 (November 1966).
Chlorine	Heated manganese ignites in chlorine and burns brilliantly. Powdered manganese ignites in chlorine and burns brilliantly.

	Mellor **12:**185-7 (1946-1947).
Fluorine	When powdered manganese is exposed to fluorine, the reaction takes place with incandescence.
	Mellor **12:**344 (1946-1947).
Hydrogen Peroxide	See IRON plus Hydrogen Peroxide.
Nitric Acid	Concentrated nitric acid reacts with powdered manganese with incandescence and a feeble explosion.
	Mellor **12:**188 (1946-1947).
Nitrogen Dioxide	Manganese or potassium ignites in nitrogen dioxide.
	Ann. Chim. et Phys. (2) **2:**317.
Phosphorus	When manganese is heated in the vapor of phosphorus at a very dull red heat, union occurs with incandescence.
	Mellor **8:**853 (1946-1947).
Sulfur Dioxide	Pyrophoric manganese burns with a brilliant flame when heated in sulfur dioxide vapor.
	Mellor **12:**187 (1946-1947).

MANGANESE ALLOYS

Lithium	See LITHIUM plus Cobalt Alloys.

MANGANESE ALUMINOHYDRIDE

(See MANGANOUS TETRAHYDROALUMINATE)

MANGANESE DIMETHYL $(CH_3)_2Mn$

(See DIMETHYL MANGANESE)

MANGANESE DIOXIDE MnO_2

Chlorates	See CHLORATES plus Manganese Dioxide.
Chlorine Trifluoride	Chlorine trifluoride reacts with manganese dioxide with

	incandescence.
	Mellor **12:**254 (1946-1947).
	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Hydrogen Peroxide	Powdered manganese dioxide dropped into a concentrated solution of hydrogen peroxide may cause an explosion.
	Mellor **1:**936, 938 (1946-1947).
Permonosulfuric Acid	See PERMONOSULFURIC ACID plus Manganese Dioxide. See PLATINUM plus Permonosulfuric Acid.
Potassium Azide	When manganese dioxide is gently heated with potassium azide the reaction is very violent.
	Mellor **8:**347 (1946-1947).
Rubidium Acetylene	See RUBIDIUM ACETYLENE CARBIDE
Carbide	plus Manganese Dioxide.
Sodium Peroxide	See SODIUM PEROXIDE plus Manganese Dioxide.

MANGANESE HEPTOXIDE Mn_2O_7

(self-reactive)	About three cubic centimeters of manganese heptoxide, stored in a brown glass bottle, exploded 5 or 6 hours after its preparation from sulfuric acid and potassium permanganate.
	Delhez (1967).
Organic Matter	When these materials are mixed, explosions may result.
	A. M. Patterson, *Chem. Eng. News* **26:**711 (1948). J. R. Archer, *Chem. Eng. News* **26:**205 (1948).
	See also POTASSIUM PERMANGANATE plus Sulfuric Acid.

MANGANESE TRIFLUORIDE MnF_3

Glass	When manganese trifluoride is heated in a glass vessel, there is a violent reaction involving the silicon in the glass,

	since silicon tetrafluoride is released.
	Mellor **12:**344 (1946-1947).

MANGANOCENE $Mn(C_5H_5)_2$

Air	Biscyclopentadienyl manganese is spontaneously flammable in air.
	Douda (1966).

MANGANOUS BROMIDE $MnBr_2$

Potassium	See POTASSIUM plus Ammonium Bromide.

MANGANOUS CHLORIDE $MnCl_2$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Ferrous Chloride.
Zinc	See ZINC plus Manganese Chloride.

MANGANOUS HYPOPHOSPHITE $Mn(PH_2O_2)_2$

(self-reactive)	Manganous hypophosphite detonates above 200¡ C.
	Mellor **8:**889 (1946-1947).

MANGANOUS IODATE $Mn(IO_3)_3$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.

MANGANOUS IODIDE MnI_2

Potassium	See POTASSIUM plus Ammonium Bromide.

MANGANOUS OXIDE MnO

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Iron Oxide.
Fluorine	See FLUORINE plus Trimanganese Tetroxide.

MANGANOUS PERCHLORATE $Mn(ClO_4)_2 6H_2O$

Ethyl Alcohol and 2,2-Dimethoxypropane	See ETHYL ALCOHOL plus Manganese Perchlorate and 2,2-Dimethoxypropane.

MANGANOUS PHOSPHIDE Mn_3P_2

Chlorine	See CHLORINE plus Manganese Ditritaphosphide.

MANGANOUS SULFIDE MnS

Air	Red manganese sulfide, when dried in vacuo, becomes red-hot when exposed to air. *Mellor* **12:** 344 (1946-1947).

MANGANOUS TETRAHYDROALUMINATE $Mn(AlH_4)_2$

Air	Manganese aluminohydride is spontaneously flammable in air. *Chem. Abst.* **49:** 766e (1955). J. Aubrey and G. Monnier, *Comp. Rend.* **238:** 2534-2535 (1954).

MERCAPTANS RSH

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Mercaptans.

MERCURIC AZIDE $Hg(N_3)_2$

(self-reactive)	Mercuric azide decomposes at 190¡ C. It is explosively unstable. *Mellor* **8, Supp. 2:** 43 (1967).

MERCURIC BROMIDE $HgBr_2$

Sodium	See SODIUM plus Ferrous Chloride.
Potassium	See POTASSIUM plus Aluminum Bromide.

MERCURIC CHLORIDE $HgCl_2$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Ferrous Chloride.

MERCURIC CHLORITE $Hg(ClO_2)_2$

(self-reactive)	Mercuric chlorite is an explosive salt.
	Mellor **2, Supp. 1:** 575 (1956).

MERCURIC CYANIDE $Hg(CN)_2$

Fluorine	See FLUORINE plus Mercuric Cyanide.
Magnesium	See MAGNESIUM plus Gold Cyanide.

MERCURIC CYANIDE OXIDE $Hg_2(CN)_2O$

(self-reactive)	Several instances are cited where explosions have occurred in handling or manipulating this substance. Rubbing the material is a frequent cause of the explosions.
	Chem. Abst. **16:** 2010 (1972).
	Chem. Abst. **11:** 300 (1917).

MERCURIC FLUORIDE HgF_2

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Ferrous Chloride.

MERCURIC IODIDE HgI_2

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Mercuric Iodide.
Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Ferrous Chloride.

MERCURIC NITRATE $Hg(NO_3)_2$

Acetylene	Acetylene forms a sensitive acetylide when passed into an aqueous solution of mercuric nitrate.
	Mellor **4:** 933 (1946-1947).
Ethyl Alcohol	Alcohols should not be mixed with mercuric nitrate, as explosive mercury fulminate may be formed.
	Bahme, p. 9 (1961).
Hypophosphoric Acid	Mercuric nitrate is violently reduced to mercury by hypophosphoric acid.
	Mellor **4:** 993 (1946-1947).
Phosphine	The reaction of these materials gives a yellow precipitate which explodes when heated or subjected to shock.
	Mellor **4:** 993 (1946-1947).
Sulfur	See SULFUR plus Mercuric Nitrate.
Unsaturates;	Mercuric nitrate reacts with unsaturates and
Aromatics	aromatics with violence if given time to generate enough heat.
	J. Ball, *Chem. Eng. News* **26:** 3300 (1948).

MERCURIC NITRIDE Hg_3N_2

(self-reactive)	Mercuric nitride is said to be very explosive.
	Mellor **8:** 107 (1946-1947).
Sulfuric Acid	Mercuric nitride explodes when brought in contact with

	sulfuric acid.
	Mellor **8:** 108 (1946-1947).

MERCURIC OXIDE HgO

Chlorine	See CHLORINE plus Mercuric Oxide.
Hydrazine Hydrate	When hydrazine hydrate is dropped on mercuric oxide, an explosion may occur.
	Mellor **8:** 318 (1946-1947).
Hydrogen Peroxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Hypophosphorous Acid	Hypophosphorous acid reduces mercuric oxide explosively to the metal.
	Mellor **4:** 778 (1946-1947).
Iodine, Methyl Alcohol, and Ethyl Alcohol	See IODINE plus Ethyl Alcohol, Methyl Alcohol, and Mercuric Oxide.
Magnesium	See MAGNESIUM plus Beryllium Oxide.
Phospham	See PHOSPHAM plus Cupric Oxide.
Phosphorus	See PHOSPHORUS plus Mercuric Oxide.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM plus Mercuric Oxide.
Sulfur	See SULFUR plus Mercuric Oxide.

MERCURIC SULFATE $HgSO_4$

Hydrogen Chloride	Absorption of gaseous hydrogen chloride on mercuric sulfate becomes violent at 125¡ C.
	Mellor **2, Supp. 1:** 462 (1956).

MERCURIC SULFIDE HgS

Chlorine	See CHLORINE plus Mercuric Sulfide.
Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Silver Oxide	See SILVER OXIDE plus Antimony Trisulfide.

MERCUROUS AZIDE HgN_3

(self-reactive)	Mercurous azide decomposes at 210¡ C. It is explosively unstable.
	Mellor **8, Supp. 2:** 43 (1967).

MERCUROUS CHLORIDE HgCl

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Ferrous Chloride.

MERCUROUS FLUORACETYLIDE FC≡CHg

(self-reactive)	See FLUORACETYLENE (self-reactive)

MERCUROUS HYPOPHOSPHATE $Hg_4P_2O_6$

(self-reactive)	Mercurous hypophosphate decomposes explosively.
	Mellor **8, Supp. 3:** 651 (1971).

MERCUROUS NITRATE $HgNO_3$

Carbon	See CARBON plus Mercurous Nitrate.
Phosphorus	See PHOSPHORUS plus Mercurous Nitrate.

MERCUROUS OXIDE Hg_2O

Hydrogen Peroxide	Mixture reacts with explosive violence.
	V. Autropoff, *J. Prakt. Chem.* **77:** 316 (1908).

Hydrogen Sulfide, Barium Oxide and Air	See HYDROGEN SULFIDE plus Soda Lime.
Potassium	See POTASSIUM plus Mercurous Oxide.
Sodium	See POTASSIUM plus Mercurous Oxide.
Sulfur	See SULFUR plus Mercurous Oxide.

MERCURY Hg

Acetylene	Insoluble, explosive acetylide is formed with mercury.
	Von Schwartz, p. 142 (1918).
Ammonia	Mercury and ammonia can produce explosive compounds. A residue resulting from such a reaction exploded when an attempt was made to clean out the residue with a steel rod.
	C. Van Brunt, *Science* **65:** 63-4 (1927). L.M. Henderson, *Ind. & Eng. Chem. News* **10:** 73 (1932). *Chem. Eng. News* **25:** 2138 (1947).
	See also GOLD plus Ammonia.
Boron Phosphodiiodide	When thrown into mercury vapor, boron phosphodiiodide ignites at once.
	Mellor **8:** 845 (1946-1947).
Chlorine	Flame forms with chlorine jet over mercury surface at 200¡ -300¡ C.
	Mellor **2, Supp. 1:** 381 (1956).
Chlorine Dioxide	Chlorine dioxide and liquid mercury explode violently.
	Mellor **2:** 288 (1946-1947). *Von Schwartz,* p. 142 (1918).
Methyl Azide	Methyl azide in the presence of mercury was shown to be potentially explosive.
	C.L. Currie and B. Darwent, *Can. J. Chem.* **41:** 1048 (1963).
Sodium Carbide	Ground mixtures of sodium carbide and mercury, aluminum, lead, or iron can react vigorously.

	Mellor **5:** 848 (1946-1947).

MERCURY SALTS

Acetylene	Mercury salts and silver salts give acetylides from ammoniacal solutions in the same way copper salts do. The dried acetylides are extremely sensitive and violent.
	G. Benson, *Comp. Gas Bull.* (Oct. 18, 1950); J.K. Luchs, *Phot. Sci. Eng.* 10:334-7 (1966).
Butynediol and Acid	See BUTYNEDIOL plus Hydroxides.
Nitromethane	See COPPER SALTS plus Nitromethane.

MERCURY TETRAPHOSPHIDE Hg_3P_4

Air	Mercury tetratriphosphide ignites when warmed in air, or in chlorine at ordinary temperatures. Mixed with potassium chlorate, it explodes by percussion.
	Comp. Rend. **115:** 230.
Chlorates	See MERCURY TETRATRIPHOSPHIDE plus Air.
Chlorine	See MERCURY TETRATRIPHOSPHIDE plus Air.
Potassium Chlorate	See MERCURY TETRATRIPHOSPHIDE plus Air.

MESITYLENE $C_6H_3(CH_3)_3$

Nitric Acid	See NITRIC ACID plus Mesitylene.

MESITYL OXIDE $(CH_3)_2C{=}CHCOCH_3$

2-Aminoethanol	Mixing mesityloxide and 2-aminoethanol in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Chlorosulfonic Acid	Mixing mesityl oxide and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.

	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	Mixing mesityl oxide and ethylene diamine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing mesityl oxide and nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	Mixing mesityl oxide and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sulfuric Acid	Mixing mesityl oxide and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

METALLIC HALIDES

Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Metal Oxides.

METAL OXIDES

Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Metal Oxides.
Performic Acid	Metal oxides catalyze the decomposition of performic acid, resulting in an explosion.
	Grignard **11:** 179 (1935-1954).

METALS

Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Bromine Pentafluoride	Very violent reactions may occur between bromine

	pentafluoride and powdered or warmed metals.
	Mellor **2, Supp. 1:** 172 (1956).
Bromine Trifluoride	Halogen fluorides appear to react with all metals. The reaction is vigorous when no film forms.
	Mellor **2, Supp. 1:** 163 (1956).
Chlorates	See CHLORATES plus Metals (powdered).
Performic Acid	Metals catalyze the decomposition of performic acid and can make it explosive.
	Grignard **11:** 179 (1935-1954).

METAL SULFIDES

Bromates	A combination of finely divided metal sulfides with finely divided bromates (also chlorates and iodates) of barium, calcium, magnesium, potassium, sodium, and zinc can be exploded by heat, percussion and, sometimes, light friction.
	Mellor **2:** 310 (1946-1947).
Chlorates	See METAL SULFIDES plus Bromates. See COPPER SULFIDE plus Cadmium Chlorate.
Chloric Acid	See COPPER SULFIDE plus Cadmium Chlorate. See ANTIMONY SULFIDE plus Chloric Acid.
Hydrazine Mononitrate	See ZINC plus Hydrazine Mononitrate.
Iodates	See METAL SULFIDES plus Bromates.
Silver Oxide	See SILVER OXIDE plus Antimony Trisulfide.

METHANE CH_4

Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Chlorine	See CHLORINE plus Methane.
Chlorine Dioxide	See CHLORINE DIOXIDE plus Butadiene.

Nitrogen Trifluoride	See HYDROGEN plus Nitrogen Trifluoride.
Oxygen (Liquid)	See OXYGEN (LIQUID) plus Methane.
Oxygen Difluoride	See HYDROGEN plus Oxygen Difluoride.

METHANOL CH_3OH

Chromic Anhydride	See CHROMIC ANHYDRIDE plus Methyl Alcohol.
Iodine, Ethyl Alcohol and Mercuric Oxide	See IODINE plus Ethyl Alcohol, Methyl Alcohol, and Mercuric Oxide.
Lead Perchlorate	See LEAD PERCHLORATE plus Methyl Alcohol.
Perchloric Acid	See PERCHLORIC ACID plus Ethyl Alcohol.
Phosphorus Trioxide	See DIMETHYL FORMAMIDE plus Phosphorus.
Potassium Hydroxide and Chloroform	See SODIUM HYDROXIDE plus Chloroform and Methyl Alcohol.
Sodium Hydroxide and Chloroform	See SODIUM HYDROXIDE plus Chloroform and Methyl Alcohol.

p-METHOXYBENZYL FORMATE $CH_3OC_6H_4CH_2OCHO$

Phosgene

In the formation of p-methoxybenzyl formate by the addition of phosgene to alcohols followed by the addition of sodium nitride or hydrazoic acid in the presence of pyridine, reaction of phosgene with the azide can cause the formation of explosive carbazide. To prevent the reaction, complete removal of excess phosgene is advocated by passing nitrogen into the solution prior to addition of the azide.

Chem. Abst. **73:** 14099h (1970). *Chem. Phar. Bull.* **18** (4): 850-851 (1970).

2-METHOXYETHANOL $HOCH_2CH_2OCH_3$

Air

Ethylene glycol monomethyl ether forms peroxides that are highly explosive.

Wischmeyer (1969).

2(2-METHOXYETHOXY) ETHANOL $CH_3OCH_2CH_2OCH_2CH_2OH$

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Methyl Carbitol.
Chlorosulfonic Acid	Mixing diethylene glycol monomethyl ether and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	Mixing diethylene glycol monomethyl ether and oleum in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

BIS(2-METHOXYETHYL)ETHER $(CH_3OCH_2CH_2)_2O$

Lithium Aluminum Hydride	See LITHIUM ALUMINUM HYDRIDE plus Diethylene Glycol Dimethyl Ether.

METHYL ACETYLENE

(See PROPYNE)

METHYL ALCOHOL

(See METHANOL)

METHYL ALUMINUM SESQUICHLORIDE

(See TRICHLOROTRIMETHYLDIALUMINUM)

METHYL AZIDE CH_3N_3

(self-reactive)	Methyl and ethyl azides are stable at room temperatures but are likely to detonate upon rapid heating.
	J. H. Bover and F. C. Canter, *Chem. Reviews* **54:** 32-3 (1954).
Dimethyl Malonate and Sodium Methylate	A serious explosion occurred in the condensation of methyl azide with dimethyl malonate in the presence of sodium methylate.
	Ch. Grundmann and H. Haldenwanger, *Angew Chem.* **62A:** 410 (1950).
Mercury	See MERCURY plus Methyl Azide.

METHYL 2-AZIDOBENZOATE $CH_3OCOC_6H_4$-2-NNN

(self-reactive)	During distillation of this material the apparatus exploded.
	Wischmeyer (1972).

METHYL BROMIDE CH_3Br

Aluminum	See ALUMINUM plus Methyl Bromide.
Dimethyl Sulfoxide	A reaction between methyl bromide and dimethyl sulfoxide resulted in an explosion that shattered the apparatus.
	Scaros and Serauskas (1973).

METHYL CARBITOL $CH_3OCH_2CH_2OCH_2CH_2OH$

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Methyl Carbitol.

METHYL CHLORIDE CH_3Cl

Aluminum	See ALUMINUM plus Methyl Chloride.
Magnesium	See MAGNESIUM plus Chloroform.

Potassium	See POTASSIUM plus Chloroform.
Sodium	See POTASSIUM plus Chloroform.
	See SODIUM plus Methyl Chloride.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride.

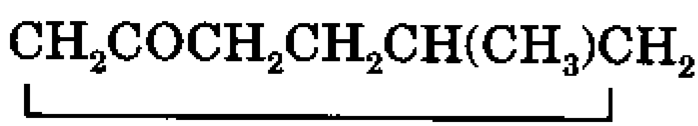
METHYL CHLOROFORM CH_3CCl_3

(See under TRICHLOROETHANE or under other reactant plus trichloroethane)

METHYLCOPPER CH_3Cu

Air	Methyl copper explodes violently when allowed to dry in air.
	Coates, p. 172 (1956).

4-METHYLCYCLOHEXANONE



Nitric Acid	See NITRIC ACID plus 4-Methylcyclohexanone.

n-METHYL n,n-bis DIETHYLBORINIMIDE

(See METHYL-bis (DIETHYLBORYL) AMINE)

METHYL-bis (DIETHYLBORYL) AMINE $((C_2H_5)_2B)_2NCH_3$

Air	n-Methyl n,n-bis diethylborinicimide is spontaneously flammable in air.

	Buls, Bimonthly Rept. 6, p. 3 (1953).

METHYLENE CHLORIDE $ClCH_2Cl$

(See DICHLOROMETHANE)

Lithium	See LITHIUM plus Bromoform.
N-Methyl-N-Nitroso Urea and Potassium Hydroxide	See N-METHYL-N-NITROSO UREA plus Potassium Hydroxide and Methylene Chloride.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Methyl Dichloride.

METHYLENE DIISOCYANATE $OCN-CH_2-NCO$

Dimethyl Formamide	See DIMETHYL FORMAMIDE plus Methylene Diisocyanate.

METHYLENE DILITHIUM

(See LITHIUM METHYLIDE)

METHYLENE IODIDE ICH_2I

Lithium	See LITHIUM plus Bromoform.

METHYLENE MAGNESIUM

(See MAGNESIUM METHYLIDE)

METHYL ETHYL ETHER

(See ETHYL METHYL ETHER)

METHYL ETHYLIODOARSINE

(See ETHYLIODOMETHYLARSINE)

METHYL FORMAMIDE CH_3NHCHO

Benzenesulfonyl Chloride	See METHYL ISONITRILE (self-reactive).

METHYLHYDRAZINE CH_3NHNH_2

Air	Exposure of monomethylhydrazine in air on a large surface may result in spontaneous ignition. *Def. Res. and Eng.,* p. 27 (1963).

METHYL HYPOCHLORITE CH_3OCl

(self-reactive)	Methyl hypochlorite decomposes explosively when exposed to light and rapidly even in its absence. *Mellor* **2, Supp. 1:** 550 (1956). See also ALCOHOLS plus Hypochlorus Acid.

METHYL ISONITRILE

(See ISOCTANOMETHANE)

METHYLLITHIUM CH_3Li

Air	Methyl lithium is spontaneously flammable in air. *Douda* (1966). *Mellor* **2, Supp. 2:** 91 (1961).

METHYL METHACRYLATE $CH_2=C(CH_3)COOCH_3$

Benzoyl Peroxide	See BENZOYL PEROXIDE plus Methyl Methacrylate.

METHYL METHACRYLATE POLYMER

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

N-METHYL-N-NITROSO UREA $ON-N(CH_3)CONH_2$

Potassium Hydroxide and Methylene Chloride	Diazomethane was being prepared by portion-wise additions of N-methyl-N-nitroso urea to a flask containing 40% potassium hydroxide and methylene chloride. At the fourth addition a loud detonation occurred.
	MCA Guide for Safety, p. 301 (1972).

METHYL PARATHION $(CH_3O)_2P(S)OC_6H_4NO_2$

(self-reactive)	When a sample was heated in a small test tube it decomposed and in a few minutes the residue exploded.
	J. B. McPherson and G. A. Johnson, *Agri. Food Chem.* **4** (1): 42 (1956).

METHYLOLACRYLAMIDE

(See n-HYDROXYMETHYLACRYLAMIDE)

2-METHYL-3-PHENYL-1-PROPANOL
$C_6H_5CH_2CH(CH_3)CH_2OH$

Hydrogen Peroxide and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.

METHYL PERCHLORATE CH_3ClO_4

(self-reactive)	Methyl, ethyl, and propyl perchlorates are oily liquids of extraordinary explosive power, extremely sensitive to heat, shock, and friction.
	ACS **146:** 214. *Berichte* **42:** 4390-4 (1909).
	Z. Anorg. Chemie **228:** 341-51 (1936).

METHYLPHOSPHINE CH_3PH_2

Air	Methyl phosphine is spontaneously flammable in air.
	Hurd, p. 128 (1952).

METHYLSILYLAMINO DIBORANE $(B_2H_5)N(CH_3)(SiH_3)$

Air	Methyl silyamino diborane is spontaneously flammable in air.
	Douda (1966).

METHYLSODIUM CH_3Na

Air	Methyl sodium is spontaneously flammable in air.
	Douda (1966).

METHYL TRICHLOROSILANE

(See TRICHLOROMETHYLSILANE)

METHYL(TRIFLUOROPROPYL)POLYSILOXANE

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

MOLYBDENUM Mo

Bromine Trifluoride	Powdered molybdenum, powdered titanium, and powdered vanadium all react with bromine trifluoride, producing incandescence.

	Mellor **2, Supp. 1:** 164 (1956).
	Reaction between molybdenum or tungsten and bromine trifluoride is vigorous. No protective film forms with the volatile hexafluoride of the metal.
	Mellor **2, Supp. 1:** 163 (1956).
Chlorine Trifluoride	Chlorine trifluoride acts on powdered molybdenum with incandescence.
	Z. Anorg. Chemie **190:** 270.
	Mellor **2, Supp. 1:** 156 (1956).
Fluorine	Fluorine acts on powdered molybdenum with incandescence. Other interhalogen compounds containing fluorine may act similarly.
	Z. Anorg. Chemie **190:** 270.
Lead Dioxide	Powdered molybdenum or tungsten mixed with lead dioxide becomes incandescent when heated.
	Mellor **7:** 691 (1946-1947).

MOLYBDENUM DISULFIDE MoS_2

Hydrogen Peroxide	See ANTIMONY TRISULFIDE plus Hydrogen Peroxide.

MOLYBDENUM TRIOXIDE MoO_3

Chlorine Trifluoride	Chlorine trifluoride attacks molybdenum trioxide with incandescence.
	Z. Anorg. Chemie **190:** 270.
	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Lithium	See LITHIUM plus Molybdenum Trioxide.
Magnesium	See MAGNESIUM plus Molybdenum Trioxide.
Potassium	See POTASSIUM plus Molybdenum Trioxide.
Sodium	See POTASSIUM plus Molybdenum Trioxide.

MONEL

Fluorine	See FLUORINE plus Metals.

MONOAMMONIUM PHOSPHATE $NH_4H_2PO_4$

Sodium	See SODIUM plus Monoammonium Phosphate.
Sodium Bicarbonate	See SODIUM BICARBONATE plus Monoammonium Phosphate.

MONOFLUOROTRICHLOROMETHANE

(See TRICHLOROFLUOROMETHANE)

NaK

(See SODIUM-POTASSIUM ALLOY)

NAPHTHALENE $C_{10}H_8$

Chromic Anhydride	See CHROMIC ANHYDRIDE plus Naphthalene.

NEODYMIUM Nd

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.
Nitrogen	Neodymium and nitrogen react vigorously.
	Mellor **8, Supp. 1:** 164 (1964).
Phosphorus	Neodymium and phosphorus react vigorously at 400¡ — 500¡ C.
	Mellor **8, Supp. 3:** 347 (1971).

NEODYMIUM PHOSPHIDE NdP

Nitric Acid	Neodymium phosphide and nitric acid react violently.
	Mellor **8, Supp. 3:** 348 (1971).
Water	See CEROUS PHOSPHIDE plus Water.

NEOPRENE $(CH_2{=}CClCH{=}CH_2)_x$

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.
Fluorine (liquid)	See FLUORINE plus Neoprene.

NICKEL Ni

Ammonium Nitrate	See AMMONIUM NITRATE plus Metals (powdered).
Fluorine	See FLUORINE plus Metals.
Hydrazine	The catalytic decomposition of hydrazine in the presence of Raney nickel may be vigorous at room temperature.
	Mellor **8, Supp. 2:** 83 (1967).
Hydrazoic Acid	Raney nickel and hydrazoic acid undergo a vigorous decomposition.
	Mellor **8, Supp. 2:** 4 (1967).
Hydrogen and Dioxane	See HYDROGEN plus Dioxane and Nickel (Raney).
Performic Acid	Powdered nickel can decompose performic acid violently.
	Berichte **48:** 1139 (1915).
Phosphorus	See COPPER plus Phosphorus.
Selenium	When powdered nickel is heated with selenium or sulfur, the elements unite with incandescence.
	Berichte **14:** 2823. *Comp. Rend.* **131:** 557. G. Little, *Ann. Chem.* **112:** 211 (1859).
Sulfur	See SULFUR plus Nickel.
Titanium and Potassium Perchlorate	Mixtures containing potassium perchlorate with nickel and titanium powders and infusorial earth gave

severe explosions during a friction test. Very small sparks — less than those available from static electricity on the human body — can ignite the mixture.

ACS **146:** 210. *BM Info. Circ.* **7349** (1945).

NICKEL ALLOYS

Lithium	See LITHIUM plus Cobalt Alloys.

NICKEL BROMIDE $NiBr_2$

Potassium	See POTASSIUM plus Aluminum Bromide.

NICKEL CARBONYL $Ni(CO)_4$

Air	In the presence of air, nickel carbonyl forms a deposit which becomes peroxidized. This tends to decompose and ignite. See also NICKEL CARBONYL plus n-Butane and Oxygen. Edgerton & Radra-Kanchana, *Proc. Roy. Soc.* **A225:** 427 (1954).
Bromine	See BROMINE plus Nickel Carbonyl.
n-Butane and Oxygen	Nickel carbonyl vapor explodes in air or oxygen at 20¡C. and a partial pressure of 15 mm. Addition of nickel carbonyl to an n-butane-oxygen mixture causes explosion at 20-40¡C. E. J. Badin, P. C. Hunter, R. N. Pease, *J. Am. Chem. Soc.* **70:** 2055-6 (1948).
Oxygen	See NICKEL CARBONYL plus n-Butane and Oxygen.

NICKEL CHLORIDE $NiCl_2$

Potassium	See POTASSIUM plus Aluminum Bromide.

NICKEL CHLORITE $Ni(ClO_2)_2$

(self-reactive)	The dihydrate of nickel chlorite explodes when heated to

100¡C.

Mellor **2, Supp. 1:** 574 (1956).

NICKEL CYANIDE $Ni(CN)_2$

Magnesium	See MAGNESIUM plus Cadmium Cyanide.

NICKEL FLUORIDE NiF_2

Potassium	See POTASSIUM plus Ammonium Bromide.

NICKEL-HEXAMMINE CHLORATE $Ni(NH_3)_6(ClO_3)_2$

(self-reactive)	This compound detonates when struck. *Mellor* **2, Supp. 1:** 592 (1956)

NICKEL-HEXAMMINE PERCHLORATE $Ni(NH_3)_6(ClO_4)_2$

(self-reactive)	This compound detonates when struck but is less sensitive than hexamminonickel chlorate. *Mellor* **2, Supp. 1:** 592 (1956).

NICKEL HYPOPHOSPHITE $Ni(PH_2O_2)_2$

(self-reactive)	Nickel hypophosphite liberates spontaneously flammable phosphine above 100¡C. *Mellor* **8:** 890 (1946-1947).

NICKEL IODIDE NiI_2

Potassium	See POTASSIUM plus Aluminum Bromide.

NICKEL MONOXIDE NiO

Fluorine	See FLUORINE plus Nickel Monoxide.
Hydrogen Sulfide, Barium Oxide and Air	See HYDROGEN SULFIDE plus Soda Lime.

NICKEL NITRIDE Ni_3N

Acids	The reaction of nickel nitride and acids may be explosive with high acid concentrations and heat. *Mellor* **8, Supp. 1:** 238 (1964).

NICKEL PERCHLORATE $Ni(ClO_4)_2$

2,2-Dimethoxypropane	When nickel perchlorate and 2,2-dimethoxypropane were heated, a violent reaction occurred. *Chem. Eng. News* **48** (28): 7-8 (Oct. 26, 1970). See also 2,2-DIMETHOXYPROPANE plus Manganese Perchlorate and Ethyl Alcohol.
Hydrazine	The blue precipitate formed from nickel perchlorate and hydrazine in water exploded violently when a glass stirring rod was introduced into the suspension. *ACS* **146:** 209. *Helv. Chim. Acta.* **34:** 2084-5 (1951).

NICKEL-TRIHYDRAZINE CHLORATE $Ni(N_2H_4)_3(ClO_3)_2$

(self-reactive)	This compound detonates when struck. *Mellor* **2, Supp. 1:** 592 (1956).

NICKEL-TRIHYDRAZINE NITRATE $Ni(NO_3)3H_2NNH_2$

(self-reactive)	A small amount of thoroughly washed, dry trihydrazine nickel nitrate exploded about ten minutes after exposure to the atmosphere.

H. Ellern and D. E. Olander, *J. Chem. Edu.* **32:**24 (1955).

NIOBIUM (COLUMBIUM) Nb

Bromine Trifluoride	Niobium and tantalum each reacts with bromine trifluoride with incandescence.
	Mellor **2, Supp. 1:** 164 (1956).
Chlorine	Powdered niobium reacts energetically with chlorine.
	Mellor **2, Supp. 1:** 381 (1956).
	See NIOBIUM plus Fluorine.
Fluorine	At ordinary temperatures, niobium (columbium) becomes incandescent in the presence of fluorine. It ignites when gently heated in chlorine.
	Mellor **9:** 849 (1946-1947).

NIOBIUM PENTOXIDE Nb_2O_5

Aluminum and Sulfur	See ALUMINUM plus Niobium Oxide and Sulfur.
Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.
Lithium	See LITHIUM plus Niobium Pentoxide.

NITRATE-NITRITE

Aluminum	See ALUMINUM plus Nitrate-Nitrite and Organic Matter.
Organic Matter	See ALUMINUM plus Nitrate-Nitrite and Organic Matter.

NITRATES

(See also specific nitrates as primary entries or under other reactants)

Aluminum	See ALUMINUM plus Nitrates.
Boron Phosphide	See BORON PHOSPHIDE plus Nitric Acid.
Cyanides	Addition of cyanides to a molten nitrate bath (or vice versa)

	will result in an explosion.
	NBFU Research Report **2** (1950).
Esters	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Phospham	A mixture of phospham and a nitrate explodes when heated.
	H. Rose, *Ann. Phys.* **24:** 308 (1832).
Phosphorus	See PHOSPHORUS plus Nitrates.
Sodium Cyanide	See NITRATES plus Cyanides.
Sodium Hypophosphite	See CHLORATES plus Sodium Hypophosphite.
Stannous Chloride	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Thiocyanates	See THIOCYANATES plus Chlorates.

NITRIC ACID HNO_3

Acetic Acid	Acetic acid or acetic anhydride can explode with nitric acid if not kept cold.
	Von Schwartz, p. 321 (1918). *Comp Rend.* **269** (15): 1114-1116 (1968).
Acetic Anhydride	See NITRIC ACID plus Acetic Acid.
	See ACETIC ANHYDRIDE plus Nitric Acid.
	Experiments demonstrate that mixtures containing more than 50% by weight of nitric acid in acetic anhydride may act as detonating explosives under certain conditions. An indication is given of the percentage mixtures of acetic anhydride-nitric acid which could be detonated using a priming charge and detonator.
	BCISC **42** (166): 2 (1971).
Acetone and Acetic	An etching reagent of equal parts of acetone,
Acid	concentrated nitric acid, and 75 per cent acetic acid exploded four hours after it was prepared and placed in a

	closed bottle. A correspondent pointed out that this formulation is similar to the method of preparing tetranitromethane, a sensitive explosive.
	Chem. Eng. News **38** (43): 56 (1960); **38** (46): 5 (1960).
Acetone and Sulfuric Acid	Acetone will decompose violently when brought in contact with mixed sulfuric-nitric acids, especially if the reaction is in a confined or a narrow-mouthed container.
	Ind. Eng. Chem. **51:** 59A (April 1959).
Acetylene	Concentrated nitric acid on acetylene gives trinitromethane, which melts at 15¡ C and is explosive in the liquid state.
	Kirk and Othmer **9:** 430-2 (1947).
Acrolein	See ACROLEIN plus Nitric Acid.
Acrylonitrile	See ACRYLONITRILE plus Nitric Acid.
Allyl Alcohol	See ALLYL ALCOHOL plus Nitric Acid.
Allyl Chloride	See ALLYL CHLORIDE plus Nitric Acid.
2-Aminoethanol	See 2-AMINOETHANOL plus Nitric Acid.
Ammonia	Ammonia gas burns in an atmosphere of nitric acid vapor.
	Mellor **8:** 219 (1946-1947).
	See NITRIC ACID plus Diborane.
Ammonium Hydroxide	Mixing 70% nitric acid and 28% ammonium hydroxide in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
	Mellor **8, Supp. 1:** 349 (1964).
Aniline	Aniline ignites spontaneously in the presence of red fuming nitric acid.
	Kit and Evered, pp. 238-42 (1960).
	A self-flammable fuel is prepared by adding a hydrocarbon to a mixture of concentrated nitric acid and an oxidation catalyst. The hydrocarbon contains a combustion initiator made up of aniline, dimethyl aniline, xylidene, and iron

pentacarbonyl.

Aniline, p. 85 (1964).

Aromatic amines (e.g., aniline or toluidine) in triethylamine solution are ignited rapidly by red fuming nitric acid at temperatures of minus 76¡ or lower.

Aero. Tech. Note **3884** (1956).

Brennstoff-Chem. **46** (4): 117-24 (1965). *Chem. Abst.* **51:** 3961d (1957); **63:** 4067h (1965).

See also NITRIC ACID plus Diborane.

Anion Exchange Resins	If hydroxyl-form anion exchange resins are contacted by nitric acid solutions of excessive strength (e.g. 6 molar), rapid heating and resulting gaseous degradation products can pressurize and damage the ion-exchange vessel.
	Van Slyke (1967). *Reactor Fuel Process.* **7** (4): 297-303 (Fall 1964). *AEC Research and Devel. Report, B N WL*-476 (January 1967).
Anion Exchange Resins and Dichromate	Dichromate loadings as low as 0.05 grams per cubic centimeter of resin in contact with 7 molar nitric acid can cause a runaway reaction.
	Ignition temperature is 92¡ C and decreases with increasing dichromate loading.
	AEC Research and Devel. Report BNWL-**144** (August 1965).
Antimony	See ANTIMONY plus Nitric Acid.
Arsine	Fuming nitric acid reacts explosively with arsine.
	Mellor **9:** 56 (1946-1947).
Bismuth	See BISMUTH plus Nitric Acid.
Boron	See BORON plus Nitric Acid.
Boron Decahydride	See BORON DECAHYDRIDE plus Nitric Acid.
Boron Phosphide	See BORON PHOSPHIDE plus Nitric Acid.

Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Nitric Acid.
n-Butyraldehyde	See n-BUTYRALDEHYDE plus Nitric Acid.
Calcium Hypophosphite	See CALCIUM HYPOPHOSPHITE plus Nitric Acid.
Carbon	See CARBON plus Nitric Acid.
Cesium Carbide	See CESIUM CARBIDE plus Nitric Acid.
4-Chloro-2-Nitroaniline	See 4-CHLORO-2-NITROANILINE plus Nitric Acid.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Chlorosulfonic Acid	See CHLOROSULFONIC ACID plus Nitric Acid.
Cresol	See CRESOL plus Nitric Acid.
Cumene	See CUMENE plus Nitric Acid.
Cupric Nitride	See CUPRIC NITRIDE plus Nitric Acid.
Cuprous Nitride	See CUPROUS NITRIDE plus Sulfuric Acid.
Cyanides	This mixture produces an explosive reaction.
	Scott (1967).
Cyclic Ketones	The cyclic ketones are far more susceptible to violent reaction than are the corresponding cyclic alcohols.
	Chem. Eng. News **37** (35): 48 (Aug. 31, 1959).
Cyclohexanol	Cyclohexanol and nitric acid can react at room temperature to form a violently explosive material.
	Chem. & Ind. **1971:** (19) (1971).
Cyclohexanone	Acid burns resulted from the violent reaction of nitric acid with cyclohexanone.
	Dept. of Commerce PB Report **73591.**
Diborane	Mixtures of fuming nitric acid and any of the following are self-igniting: diborane, aniline, terpenes, furfuryl alcohol, and ammonia.
	Mellor **8, Supp. 2:** 341 (1967).
2,6-Di-t-Butylphenol	These ingredients, reacted in a medium of acetic acid, form 2,6-di-t-butyl-4-nitrophenol. Two grams of this nitro

	compound exploded violently after warming on a steam bath for 2-3 minutes. (Possibly a polynitro derivative was the explosive.)
	ASESB Expl. Report **24** (1961).
Diisopropyl Ether	See DIISOPROPYL ETHER plus Nitric Acid.
Epichlorohydrin	See EPICHLOROHYDRIN plus Nitric Acid.
Ethyl Alcohol	Stirring a mixture of concentrated nitric acid and ethyl alcohol results in a reaction that starts slowly and accelerates to an explosion.
	Becker (1965).
	A solution of 190-proof ethyl alcohol plus nitric acid (15 per cent), being used to etch bismuth, decomposed vigorously and sprayed the surrounding area.
	Chem. Eng. News **27:** 1396 (1949).
	See SILVER plus Ethyl Alcohol and Nitric Acid.
m-Ethylaniline	m-Ethylaniline ignites spontaneously in the presence of red fuming nitric acid.
	Kit and Evered, pp. 238-42 (1960).
Ethylene Diamine	See ETHYLENE DIAMINE plus Nitric Acid.
Ethyleneimine	See ETHYLENEIMINE plus Nitric Acid.
5-Ethyl-2-Methyl	These materials were placed in a small auto-clave
Pyridine	and heated and stirred for 40 minutes. The emergency vent was opened due to a sudden pressure rise. A violent explosion occurred 90 seconds later.
	R.L. Frank, *Chem. Eng. News* **30:** 3348 (1952).
5-Ethyl-2-Picoline	See 5-ETHYL-2-PICOLINE plus Nitric Acid.
Ethyl Phosphine	See BROMINE plus Ethyl Phosphine.
Ferrous Oxide	See FERROUS OXIDE plus Nitric Acid.
Fluorine	See FLUORINE plus Nitric Acid.
Furfuryl Alcohol	Furfuryl alcohol is ignited immediately by concentrated nitric acid.

	MCA Case History **193** (1952).
	See also NITRIC ACID plus Diborane.
Germanium	See GERMANIUM plus Nitric Acid.
Glyoxal	Mixing 70% nitric acid and glyoxal in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrazine	See HYDRAZINE plus Air.
	See HYDRAZINE plus Nitric Acid.
Hydrazoic Acid	See HYDRAZOIC ACID plus Nitric Acid.
Hydrogen Iodide	See HYDROGEN IODIDE plus Nitric Acid.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Nitric Acid.
Hydrogen Selenide	See HYDROGEN SELENIDE plus Nitric Acid.
Hydrogen Sulfide	See HYDROGEN SULFIDE plus Nitric Acid.
Hydrogen Telluride	Cold fuming nitric acid ignites hydrogen telluride, sometimes explosively.
	Pascal **10:** 505 (1931-1934).
Indane and Sulfuric Acid	See INDANE plus Nitric Acid and Sulfuric Acid.
Isoprene	See ISOPRENE plus Nitric Acid.
Ketones and Hydrogen Peroxide	See KETONES plus Nitric Acid and Hydrogen Peroxide.
Lactic Acid and Hydrofluoric Acid	A mixture of 5 parts lactic acid, 5 parts nitric acid, 2 parts water, and 1 part hydrofluoric acid being stored in a plastic bottle ruptured with explosive force.
	Scott (1967). *NSC Newsletter Aero. Sec.* (May 1967).
Lithium	See LITHIUM plus Nitric Acid.
Lithium Silicide	See LITHIUM SILICIDE plus Nitric Acid.
Magnesium	See MAGNESIUM plus Nitric Acid.

Magnesium Phosphide	See MAGNESIUM PHOSPHIDE plus Nitric Acid.
Magnesium-Titanium Alloy	See TITANIUM-MAGNESIUM ALLOY plus Nitric Acid.
Manganese	See MANGANESE plus Nitric Acid.
Mesitylene	During oxidation of mesitylene with nitric acid in an autoclave at 115¡ C to give 3,5-dimethyl benzoic acid a violent explosion occurred. The reaction was attributed to local overheating, formation of a trinitro compound 1,3,5-tri(nitromethyl) benzene, and to violent decomposition of the latter. Smaller scale preparations with better temperature control were uneventful. Wilma et al, *Angew. Chem. Intern, Ed. Engl.* **74:** 465 (1962).
Mesityl Oxide	See MESITYL OXIDE plus Nitric Acid.
2-Methyl-5-Ethylpyridine	*Chem. Eng. News* **51** (34) 142 (1973).
4-Methylcyclohexanone	The oxidation by nitric acid of 4-methylcyclohexanone to form a dicarboxylic acid resulted in a violent explosion. The methylcyclohexanone was added gradually to the mixture held at 69 to 77¡ C. After an hour of this procedure, the mixture exploded. *Chem. Eng. News* **37** (35): 48 (1959).
Neodymium Phosphide	See NEODYMIUM PHOSPHIDE plus Nitric Acid.
Nitrobenzene	Mixtures of nitric acid and nitrobenzene are detonable, depending on the amount of water present. *Chem. Eng. News* **41** (37):89 (1963).
Oleum	See OLEUM plus Nitric Acid.
Organic Matter	Nitric acid ignites spontaneously with some organic compounds, such as furfuryl alcohol and butyl mercaptan. S.V. Gunn, *J. Am. Rocket Soc.* **22:** 33 (1952). Barrere & Moutet, *Symposium Comb.* **(Fifth):** 170-81 (1954).
Phosphine	See PHOSPHINE plus Nitric Acid.

Phosphonium Iodide	See PHOSPHONIUM IODIDE plus Nitric Acid.
Phosphorus	See PHOSPHORUS plus Nitric Acid.
Phosphorus Tetratriiodide	See PHOSPHORUS TETRATRIIODIDE plus Nitric Acid.
Phosphorus Trichloride	See PHOSPHORUS TRICHLORIDE plus Nitric Acid.
Phthalic Acid	See PHTHALIC ANHYDRIDE plus Nitric Acid.
Phthalic Anhydride	See PHTHALIC ANHYDRIDE plus Nitric Acid.
Potassium Hypophosphite	See POTASSIUM HYPOPHOSPHITE plus Nitric Acid.
Propiolactone (beta-)	See PROPIOLACTONE (beta-) plus Nitric Acid.
Propylene Oxide	See PROPYLENE OXIDE plus Nitric Acid.
Pyridine	See PYRIDINE plus Nitric Acid.
Rubidium Carbide	See RUBIDIUM CARBIDE plus Nitric Acid.
Selenium	See SELENIUM plus Nitric Acid.
Selenium Iodophosphide	See SELENIUM IODOPHOSPHIDE plus Nitric Acid.
Silver and Ethyl Alcohol	See SILVER plus Ethyl Alcohol and Nitric Acid.
Sodium	See SODIUM plus Nitric Acid.
Sodium Azide	See SODIUM AZIDE plus Nitric Acid.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Nitric Acid.
Stibine	See STIBINE plus Nitric Acid.
Sulfamic Acid	See SULFAMIC ACID plus Nitric Acid.
Sulfuric Acid and Glycerides	Sulfuric acid, nitric acid and fat were placed in a tightly closed container. Within 10 minutes, the container exploded.

	Chem. Eng. News **51** (31): 32 (1973).
Terpenes	See NITRIC ACID plus Diborane.
Tetraboron Decahydride	See TETRABORON DECAHYDRIDE plus Nitric Acid.
Thiocyanates	See THIOCYANATES plus Nitric Acid.
Thiophene	See THIOPHENE plus Nitric Acid.
Titanium	See TITANIUM plus Nitric Acid.
Titanium Alloy	See TITANIUM ALLOY plus Nitric Acid.
Titanium-Magnesium Alloy	See TITANIUM-MAGNESIUM ALLOY plus Nitric Acid.
Toluene and Sulfuric Acid	If conditions are not properly controlled, the reaction of toluene with nitric acid is extremely violent especially in the presence of sulfuric acid, which takes up the water formed. Part of the hazard is from the formation of nitrocresols, which react and decompose violently on further nitration.
	Urbanski **1:** 139, 931 (1964).
Toluidine	See NITRIC ACID plus Aniline.
Triazine	Nitrolysis of triazine with 99% nitric acid in a trifluoroacetic anhydride solvent caused a violent explosion at 36¡ C.
	Rolston (1972).
Unsymmetrical Dimethyl Hydrazine	See UNSYMMETRICAL DIMETHYL HYDRAZINE plus Hydrogen Peroxide.
	Also see UNSYMMETRICAL DIMETHYL-HYDRAZINE plus Nitric Acid, Nitrogen Tetroxide, and Sulfuric Acid.
Uranium	See URANIUM plus Nitric Acid.
Uranium-Neodymium Alloy	See URANIUM-NEODYMIUM ALLOY plus Nitric Acid.
Uranium-Neodymium-	See URANIUM-NEODYMIUM-ZIRCONIUM

Zirconium Alloy	ALLOY plus Nitric Acid.
Vinyl Acetate	See VINYL ACETATE plus Nitric Acid.
Vinylidene Chloride	See VINYLIDENE CHLORIDE plus Nitric Acid.
Zinc	See ZINC plus Nitric Acid.
Zirconium-Uranium Alloys	See ZIRCONIUM-URANIUM ALLOYS plus Nitric Acid.

NITRIC OXIDE NO

Aluminum	See ALUMINUM plus Carbon Disulfide.
Boron	See BORON plus Nitrous Oxide.
Carbon Disulfide	A mixture of nitric oxide with the vapor of carbon disulfide gives a green luminous flame.
	Mellor **8:** 436 (1946-1947).
	These compounds react explosively with emission of light.
	Mellor **8, Supp. 2:** 232 (1967).
Chlorine Monoxide	See CHLORINE MONOXIDE plus Nitric Oxide.
Chromium	See CHROMIUM plus Nitric Oxide.
Fluorine	See FLUORINE plus Nitric Oxide.
Fuels	Nitric oxide will burn with nearly all fuels which will burn with air.
	Symposium Comb. **(Fourth):** 420 (1952).
Hydrocarbons	See NITRIC OXIDE plus Fuels.
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Ozone	See OZONE plus Nitric Oxide.
Phosphine	See PHOSPHINE plus Nitric Oxide.
Phosphorus	See PHOSPHORUS plus Nitric Oxide.
Rubidium Carbide	See RUBIDIUM CARBIDE plus Sulfur Dioxide.
Sodium Monoxide	See SODIUM MONOXIDE plus Nitric Oxide.

Unsymmetrical Dimethylhydrazine	This mixture ignites on sparking. *Mellor* **8, Supp. 2:** 234 (1967).
Uranium	See URANIUM plus Nitric Oxide.

NITRIDES

(See specific nitrides as primary entries or see under other reactants)

NITRILES

Lithium Aluminum Hydride and Water	See LITHIUM ALUMINUM HYDRIDE plus Nitriles and Water.

NITRITES

(See also specific nitrites as primary entries or see under other reactants)

Ammonium Salts	A violent explosion occurs if an ammonium salt is melted with a nitrite salt. *Von Schwartz,* p. 299 (1918).
Cyanides	See CYANIDES plus Chlorates.
Potassium Cyanide	A mixture of the two may cause an explosion. *Pieters,* p. 30 (1957). A molten salt bath containing nitrite salts was carefully cleaned before reuse with cyanide-containing salts. However, when the furnace was reheated, a violent reaction and eruption took place. Presumably a residue of nitrite had remained. *Scott* (1966).

o-NITROANILINE DIAZONIUM SALT $O_2NC_6H_3(NO_2)NNX$

Sodium Bisulfide	See SODIUM SULFIDE plus Diazonium Salts and

	Diazonium Chloride Salts.
Sodium Polysulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.
Sodium Sulfide	See SODIUM SULFIDE plus Diazonium Salts and Diazonium Chloride Salts.

NITROANISOLE $O_2NC_6H_4OCH_3$

(self-reactive)	The explosion of 400 grams of o-nitroanisole during reduction using nickel as a catalyst has been reported.
	J. Am. Chem. Soc. **53:** 2808 (1931).
Hydrogen	See HYDROGEN plus Nitroanisole.

NITROAROMATIC COMPOUNDS

Chlorine Trifluoride	Solutions of nitroaromatic compounds in chlorine trifluoride are extremely sensitive to shock.
	Mellor **2, Supp. 1:** 156 (1956).

NITROBENZENE $C_6H_5NO_2$

Aluminum Chloride	See ALUMINUM CHLORIDE plus Nitrobenzene
and Phenol	and Phenol.
Aniline and Glycerine	See ANILINE plus Nitrobenzene and Glycerine.
Nitric Acid	See NITRIC ACID plus Nitrobenzene.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Nitrobenzene.
Silver Perchlorate	See SILVER PERCHLORATE plus Acetic Acid.

NITROBENZENESULFONIC ACID $O_2NC_6H_4SO_3H$

(self-reactive)	Nitrobenzene sulfonic acid is known to decompose violently at about 200¡ C.
	MCA Case History **1482** (1968).

o-NITROBENZOYLACETIC ACID $O_2NC_6H_4COCH_2COOH$

Thionyl Chloride	See THIONYL CHLORIDE plus o-Nitrobenzoylacetic Acid.

o-NITROBENZOYL CHLORIDE $O_2NC_6H_4COCl$

(self-reactive)	See o-NITROPHENYLACETYL CHLORIDE.

N-NITRO-N'2,4-DINITROPHENYLUREA

$(NO_2)_2C_6H_3NHCONHNO_2$

(self-reactive)	This compound is an explosive of less power than picric acid, but of greater sensitivity to friction and impact. *Chem. Eng. News* **18:** 72 (1940).

NITROETHANE $C_2H_5NO_2$

Calcium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Hydrocarbons	Nitroethane and other nitro compounds are mild oxidizers and should not be heated with easily oxidized hydrocarbons under confinement. *Chem. Eng. News* **30:** 2344 (1952).
Hydroxides	See CALCIUM HYDROXIDE plus Nitroethane.
Inorganic Bases	See CALCIUM HYDROXIDE plus Nitroethane.
Potassium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Sodium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.

NITROFORM $CH(NO_2)_3$

Isopropyl Alcohol	Solutions of 90% nitroform in 10% isopropyl alcohol in polyethylene bottles exploded. Nitroform, especially when the concentration is 50% or greater, dissolves with evolution of heat. This heat is sufficient to initiate the

	reaction.
	ASESB Expl. Report **175.** *MCA Case History* **1010** (1964).

NITROGEN N_2

Lithium	See LITHIUM plus Oxygen.
	See LITHIUM plus Nitrogen.
Neodymium	See NEODYMIUM plus Nitrogen.
Titanium	See TITANIUM plus Nitrogen.

NITROGEN DIOXIDE NO_2; N_2O_4

(See NITROGEN PEROXIDE)

Cyclohexane	See CYCLOHEXANE plus Nitrogen Dioxide.
Fluorine	See FLUORINE plus Nitrogen Dioxide.
Formaldehyde	See FORMALDEHYDE plus Nitrogen Dioxide.

NITROGEN IODIDE NI_3

Ozone	See OZONE plus Nitrogen Iodide.

NITROGEN IODIDES

(self-reactive)	See IODINE plus Ammonium Hydroxide.

NITROGEN PENTOXIDE N_2O_5

Sodium Carbide	See SODIUM CARBIDE plus Nitrogen Pentoxide.

NITROGEN PEROXIDE NO_2; N_2O_4

(See also NITROGEN TETROXIDE)

Acetic Anhydride	This reaction in the attempt to synthesize tetranitromethane

	resulted in a violent explosion.
	Van Dolah (1967).
Aluminum	See ALUMINUM plus Carbon Disulfide.
Ammonia	Solid nitrogen tetroxide reacts explosively with liquid ammonia. With gaseous ammonia, slow reactions start even when cold.
	Comp. Rend. **116:** 756. Parker & Wolfhard, *Symposium Comb.* **(Fourth):** 420 (1952).
	See NITRIC OXIDE plus Ammonia.
Barium Oxide	When nitrogen dioxide is passed over barium oxide (at 200¡ C.) the oxide becomes red-hot and fumes.
	Ann. Chim. et Phys. (2) **2:** 317.
Boron Trichloride	See BORON TRICHLORIDE plus Nitrogen Peroxide.
Carbon Disulfide	Explosives can be prepared from nitrogen dioxide plus carbon disulfide. They can be heated to 200¡ C. without explosion, but can be detonated with mercury fulminate.
	E. Turpin, *German Pat.* 19,676 (1881).
Cesium Acetylene	See CESIUM ACETYLENE CARBIDE plus
Carbide	Nitrogen Dioxide.
Chloroform	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
1,2-Dichloroethane	Nitrogen tetroxide forms explosive mixtures with incompletely halogenated hydrocarbons.
	Turley (1964). *Chem. Eng. News* **42** (47): 53 (1964).
Dichloroethylene	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Ethylene	See NITROGEN TETROXIDE plus Olefins.
Fuels	Nitrogen dioxide burns readily with all fuels which burn in air.
	Parker & Wolfhard, *Symposium Comb.* (**Fourth**): 420 (1952).
	See NITROGEN TETROXIDE plus Organic Matter.
Hydrocarbons	See NITROGEN TETROXIDE plus Fuels.

Iron	See IRON plus Nitrogen Dioxide.
Magnesium	See MAGNESIUM plus Nitrogen Dioxide.
Manganese	See MANGANESE plus Nitrogen Dioxide.
Methylene Chloride	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Olefins	Nitrogen dioxide and olefins form extremely unstable nitrosates or nitrosites. Sabatier & Senderens, *Comp. Rend.* **116:** 756 (1893).
Organic Matter	Mixtures of nitrogen tetroxide and hydrocarbons are high explosives and some combinations are very hazardous.
	Damon (1965).
	See NITROGEN TETROXIDE plus Fuels.
	See NITROGEN TETROXIDE plus Organic Matter.
Ozone	See OZONE plus Nitrogen Dioxide.
Phospham	See PHOSPHAM plus Nitrogen Dioxide.
Phosphorus	See MAGNESIUM plus Nitrogen Dioxide.
Potassium	See MANGANESE plus Nitrogen Dioxide.
Propylene	During an experiment to produce lactic acid by oxidizing propylene with nitrogen tetroxide, a violent explosion occurred. See also NITROGEN TETROXIDE plus Olefins.
	Fawcett (1966). B.B. Brandt, et al., *Khim.*
	Prom. SSSR **3:** 204-10 (1961).
Sodium	See SODIUM plus Nitrogen Peroxide.
Sulfur	See MAGNESIUM plus Nitrogen Dioxide.
Tetrachloroethane	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
(Asymmetrical)	
1,1,1-Trichloroethane	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Trichloroethylene	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Tungsten Carbide	See TUNGSTEN CARBIDE plus Nitrogen Dioxide.

NITROGEN SULFIDE

(See SULFUR NITRIDE)

NITROGEN TETROXIDE N_2O_4

Alcohols	An explosion of these materials killed a research worker in a 1955 accident.
	Mellor **8, Supp. 2:** 264 (1967).
Nitrobenzene	Mixtures of nitrogen tetroxide and nitrobenzene qualify as military explosives.
	Mellor **8, Supp. 2:** 264 (1967).
Petroleum	An explosion of these materials killed 17 workers and devastated a plant in Bodio, Switzerland.
	Mellor **8, Supp. 2:** 264 (1967).
	See NITROGEN TETROXIDE plus Fuels.
	See NITROGEN TETROXIDE plus Organic Matter.
Toluene	A mixture of these chemicals caused an explosion at an industrial plant in Zschornewitz.
	Mellor **8, Supp. 2:** 264 (1967).

NITROGEN TRIBROMIDE NBr_3

Arsenic	See ARSENIC plus Nitrogen Tribromide.
Phosphorus	See ARSENIC plus Nitrogen Tribromide.
	See PHOSPHORUS plus Nitrogen Bromide.

NITROGEN TRICHLORIDE NCl_3

Ammonia	Nitrogen trichloride explodes on contact with concentrated ammonia, arsenic, hydrogen sulfide, nitric oxide, organic matter, ozone, phosphine, phosphorus, potassium cyanide, potassium hydroxide, or selenium.
	H. Davy, *Phil. Trans. Roy. Soc. London* **103:** 242 (1813).

	Comp. Rend. **70:** 539. E. Schneider, *Report Anal. Chem.* **1:** 54 (1881).
Arsenic	See ARSENIC plus Nitrogen Trichloride. See HYPOCHLORITES plus Urea.
Dibutyl Ether	During preparation of nitrogen trichloride by bubbling chlorine into an aqueous solution of ammonium sulfate and 100 ml. of the ether, 50 ml. of the ether-NCl_3 mixture over ammonium sulfate solution was stored in a refrigerator. Five minutes later, the mixture exploded violently.
	Chem. Eng. News **44** (31): 46 (1966).
Grease	Nitrogen trichloride is an explosive substance. Even grease from fingers can cause explosion.
	Ann. Chim. et Phys. (1) **86:** 37.
Hydrogen Sulfide	See NITROGEN TRICHLORIDE plus Ammonia.
Nitric Oxide	See NITROGEN TRICHLORIDE plus Ammonia.
Organic Matter	See NITROGEN TRICHLORIDE plus Ammonia.
Ozone	See NITROGEN TRICHLORIDE plus Ammonia.
	See OZONE plus Nitrogen Trichloride.
Phosphine	See NITROGEN TRICHLORIDE plus Ammonia.
Phosphorus	See NITROGEN TRICHLORIDE plus Ammonia.
Potassium Cyanide	See NITROGEN TRICHLORIDE plus Ammonia.
Potassium Hydroxide	See NITROGEN TRICHLORIDE plus Ammonia.
Selenium	See NITROGEN TRICHLORIDE plus Ammonia.

NITROGEN TRIFLUORIDE NF_3

Ammonia	See HYDROGEN plus Nitrogen Trifluoride.
Carbon Monoxide	See HYDROGEN plus Nitrogen Trifluoride.
Diborane	Studies of nitrogen trifluoride and diborane revealed no interaction at room temperature and 1-8 atmospheres pressure. When the mixtures were handled as liquids at low temperatures, violent explosions occurred, even when

	precautions were made to eliminate OF_2 impurities.
	Lawless and Smith, pp. 34-35 (1968).
Hydrogen	See HYDROGEN plus Nitrogen Trifluoride.
Hydrogen Sulfide	See HYDROGEN plus Nitrogen Trifluoride.
Methane	See HYDROGEN plus Nitrogen Trifluoride.
Tetrafluorohydrazine	Several hundred grams of a crude reaction mixture involving nitrogen trifluoride and tetrafluorohydrazine had been collected in a small stainless steel cylinder. During opening of valves to measure cylinder pressure, the cylinder exploded, killing one man and injuring another.
	MCA Case History **683** (1966).

NITROGEN TRIIODIDE NH_3NI_3

(self-reactive)	Nitrogen triiodide explodes under very slight shock.
	Van Dolah (1966). *Chem. Eng. News* **46** (9): 38 (1968). *Latimer and Hildebrand,* p. 202 (1951).
Acids	Addition of concentrated acids causes nitrogen triiodide to explode.
	Ann. Chim. et Phys. (2) **69:** 88. *J. Am. Chem. Soc.* **10:** 332. *Comp. Rend.* **97:** 526.
Bromine	See BROMINE plus Nitrogen Triiodide.
Chlorine	See BROMINE plus Nitrogen Triiodide.
Hydrogen Sulfide	See BROMINE plus Nitrogen Triiodide.
Ozone	See BROMINE plus Nitrogen Triiodide.

NITROGEN TRIOXIDE N_2O_3

Phosphine	Phosphine gas ignites spontaneously if a trace of nitrogen trioxide is added.
	T. Graham, *Edin. Roy. Soc.* **13:** 88 (1835).

NITROGLYCERIN $C_3H_5(ONO_2)_3$

Ozone	See OZONE plus Nitroglycerin.

NITROMETHANE O_2NCH_3

Aluminum Chloride and Organic Matter	See ALUMINUM CHLORIDE plus Nitromethane and Organic Matter.
Calcium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Nitromethane.
Hexamethylbenzene	See HEXAMETHYLBENZENE plus Nitromethane.
Hydrocarbons	See NITROETHANE plus Hydrocarbons.
Hydroxides	See CALCIUM HYDROXIDE plus Nitroethane.
Inorganic Bases	See CALCIUM HYDROXIDE plus Nitroethane.
Organic Amines	Nitromethane plus organic amines forms sensitive explosive mixtures. *Van Dolah* (1966).
Potassium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Sodium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.

NITROPARAFFINS

Aluminum Chloride and Organic Matter	See ALUMINUM CHLORIDE plus Nitromethane and Organic Matter.
Calcium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Hydrocarbons	See NITROETHANE plus Hydrocarbons.
Hydroxides	See CALCIUM HYDROXIDE plus Nitroethane.
Inorganic Bases	See CALCIUM HYDROXIDE plus Nitroethane.
Potassium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Sodium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.

NITROPENTAMMINE COBALT NITRATE

(See COBALTOUS-PENTAMMINE NITRITO-N NITRATE)

o-NITROPHENOL $HO\text{-}C_6H_4\text{-}2NO_2$

Potassium Hydroxide	See POTASSIUM HYDROXIDE plus o-Nitrophenol.

o-NITROPHENYLACETIC ACID $O_2NC_6H_4CH_2COOH$

Thionyl Chloride	See THIONYL CHLORIDE plus o-Nitrobenzoylacetic Acid.

o-NITROPHENYLACETYL CHLORIDE $O_2NC_6H_4CH_2COCl$

(self-reactive)

Two explosions are reported: In one case, the solvent-free residue decomposed violently, generating black smoke and a red flame. In the other case, the residue exploded as soon as the chloroform solvent was evaporated. A similar finding with o-nitrobenzoyl chloride is referenced.

Chem. Eng. News **42** (13):39 (1964).

Chem. Eng. News **23:** 2394 (1945).

J. Am. Chem. Soc. **68:** 344 (1946).

May and Baker Ltd., *Chem. and Ind.* **39** (1946).

m-NITROPHENYLDIAZONIUM PERCHLORATE

$NO_2C_6H_4N(\equiv N)ClO_4$

(self-reactive)

This compound is very sensitive to heat and shock.

ACS **146:** 205. *Davis* (1943).

NITROPROPANE $CH_3CH_2CH_2NO_2$

Calcium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Hydrocarbons	See NITROETHANE plus Hydrocarbons.
Hydroxides	See CALCIUM HYDROXIDE plus Nitroethane.
Inorganic Bases	See CALCIUM HYDROXIDE plus Nitroethane.
Potassium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.
Sodium Hydroxide	See CALCIUM HYDROXIDE plus Nitroethane.

2-NITROPROPANE $CH_3CHNO_2CH_3$

Chlorosulfonic Acid	See CHLOROSULFURIC ACID plus 2-Nitropropane.
Oleum	See OLEUM plus 2-Nitropropane.

NITROSOPHENOL ONC_6H_4OH

Acids	Nitrosophenol explodes on heating or on addition of concentrated acids. *Beilstein*, p. 600 (1909).

NITROSYL AZIDE ONNNN

(self-reactive)	This unstable yellow compound decomposes even at minus 50¡C. *Mellor* **8, Supp. 2:** 22 (1967).

NITROSYL CHLORIDE ONCl

Acetone	Nitrosyl chloride sealed in a tube with a residue of acetone in the presence of platinum catalyst gave an explosive reaction. *Chem. Eng. News* **35** (43): 60 (1957).
Aluminum	See ALUMINUM plus Nitrosyl Chloride.

NITROSYL FLUORIDE ONF

Boron	See BORON plus Nitrosyl Fluoride.
Halogenated Olefin	Excessive quantities of the two reactants in a reaction vessel caused the vessel to explode.
	MCA Case History **928** (1963).
Phosphorus	See BORON plus Nitrosyl Fluoride.
Silicon	See BORON plus Nitrosyl Fluoride.
Sodium	See SODIUM plus Nitrosyl Fluoride.

NITROSYL PERCHLORATE $ONOClO_3$

(self-reactive)	Decomposition of nitrosyl perchlorate begins just below 100¡C. Above 100¡C (115-120¡C) a low order explosion occurs.
	H. Gerding and W.F. Haak, *Chem. Weekblad* **52:** 282-3 (1956).
Acetone	Nitrosyl perchlorate ignites and explodes with acetone.
	Hoffman & Zedtwitz, *Ann. Chem.* **42:** 2031 (1909).
Amines	Explosions occur with mixtures of nitrosyl perchlorate and primary amines. Hoffman & Zedtwitz, *Ann. Chem.* **42:** 2031 (1909).
Cobalt Pentammine	See PHENYL ISOCYANATE plus Cobalt
Triazo Perchlorate	Pentammine Triazo Perchlorate and Nitrosyl
and Phenyl Isocyanate	Perchlorate.
Diethyl Ether	Nitrosyl perchlorate ignites and explodes with diethyl ether.
	Hoffman & Zedtwitz, *Ann. Chem.* **42:** 2031 (1909).
Metal Salts	The hot reaction of nitrosyl perchlorate with metal salts, which is a way to prepare perchorates, forms salts that are very explosive.
	Kirk and Othmer, *Second Ed.* **5:** 69 (1963).

NITROSYLSULFURIC ACID O=$NOSO_2OH$

Dinitroaniline Hydrochloride	An explosion occurred during the diazotization using nitrosylsulfuric acid which resulted in several fatalities. Subsequent tests have shown that this was due to the high concentration of reactants in the mixture.
	MCA Case History **1763** (1971).

p-NITROTOLUENE $O_2NC_6H_4CH_3$

Sulfuric Acid	para-Nitrotoluene and sulfuric acid exploded at 80¡C.
	Chem. Eng. News **27:** 2504.

NITROUS ACID HNO_2

Phosphine	See PHOSPHINE plus Nitrous Acid.
Phosphorus Trichloride	See PHOSPHORUS TRICHLORIDE plus Nitric Acid.

NITROUS OXIDE N_2O

(self-reactive)	This compound decomposes explosively at high temperatures.
	Mellor **8, Supp. 2:** 207 (1967).
Aluminum	See ALUMINUM plus Carbon Disulfide.
Boron	See BORON plus Nitrous Oxide.
Hydrazine	See NITROUS OXIDE plus Lithium Hydride.
Lithium Hydride	Spontaneous ignition occurs when nitrous oxide and lithium hydride or hydrazine are mixed.
	Mellor **8, Supp. 2:** 214 (1967).
Phenyl-Lithium	See PHENYL-LITHIUM plus Nitrous Oxide.

Phosphine	See PHOSPHINE plus Nitrous Oxide.
Sodium	See SODIUM plus Nitrogen Peroxide.
Tungsten Carbide	See TUNGSTEN CARBIDE plus Nitrogen Dioxide.

NITRYL CHLORIDE O_2NCl

Ammonia	Liquid ammonia reacts violently with nitryl chloride, even at minus 75¡C.
	J. Am. Chem. Soc. **74:** 3408-10 (1952).
	Mellor **8, Supp. 1:** 331 (1964).
Stannic Bromide	The reaction between nitryl chloride and stannic bromide or stannic iodide occurs with violence.
	J. Am. Chem. Soc. **74:** 3408 (1952).
Stannic Iodide	See NITRYL CHLORIDE plus Stannic Bromide.
Sulfur Trioxide	Liquid sulfur trioxide reacts violently with nitryl chloride, even at 75¡C.
	J. Am. Chem. Soc. **74:** 3409 (1952).

NITRYL FLUORIDE O_2NF

Phosphorus	See PHOSPHORUS plus Nitryl Fluoride.
Potassium	See POTASSIUM plus Nitryl Fluoride.

NITRYL PERCHLORATE O_2NOClO_3

Acetone	See NITRYL PERCHLORATE plus Benzene.
Benzene	Nitronium perchlorate reacts with benzene, giving a slight explosion and flash. With acetone and diethyl ether, the reaction produces a sharper explosion.
	Chem. Eng. News **38** (15):5 (1960).
Diethyl Ether	See NITRYL PERCHLORATE plus Benzene.
Organic Matter	Nitryl perchlorate reacts with organic matter with a

	violence ranging from slight explosions to sharp detonations accompanied by fire.
	ACS **146:**210. *Can. J. Research* **18** (B):358-62 (1940).

NYLON

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

OLEUM $H_2SO_4SO_3$

Acetic Acid	See ACETIC ACID plus Oleum.
Acetic Anhydride	See ACETIC ANHYDRIDE plus Oleum.
Acetonitrile	See ACETONITRILE plus Oleum.
Acrolein	See ACROLEIN plus Oleum.
Acrylic Acid	See ACRYLIC ACID plus Oleum.
Acrylonitrile	See ACRYLONITRILE plus Oleum.
Allyl Alcohol	See ALLYL ALCOHOL plus Oleum.
Allyl Chloride	See ALLYL CHLORIDE plus Oleum.
2-Aminoethanol	See 2-AMINOETHANOL plus Oleum.
Ammonium Hydroxide	Mixing oleum and 28% ammonium hydroxide in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Aniline	See ANILINE plus Oleum.
n-Butyraldehyde	See n-BUTYRALDEHYDE plus Oleum.
Cresol	See CRESOL plus Oleum.
Cumene	See CUMENE plus Oleum.
Dichloroethyl Ether	See DICHLOROETHYL ETHER plus Oleum.
Diethylene Glycol Monomethyl Ether	See DIETHYLENE GLYCOL MONOMETHYL ETHER plus Oleum.

Diisobutylene	See DIISOBUTYLENE plus Oleum.
Epichlorohydrin	See EPICHLOROHYDRIN plus Oleum.
Ethyl Acetate	See ETHYL ACETATE plus Oleum.
Ethylene Cyanohydrin	Mixing oleum and ethylene cyanohydrin in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ethylene Diamine	See ETHYLENE DIAMINE plus Oleum.
Ethylene Glycol	See ETHYLENE GLYCOL plus OLEUM.
Ethylene Glycol	See ETHYLENE GLYCOL MONOETHYL
Monoethyl Ether	ETHER ACETATE plus Oleum.
Acetate	
Ethyleneimine	Mixing oleum and ethyleneimine in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Glyoxal	See GLYOXAL plus Oleum.
Hydrochloric Acid	Mixing oleum and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing oleum and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Isoprene	See ISOPRENE plus Oleum.
Isopropyl Alcohol	Mixing oleum and isopropyl alcohol in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Mesityl Oxide	See MESITYL OXIDE plus Oleum.

Methyl Ethyl Ketone	See METHYL ETHYL KETONE plus Oleum.
Nitric Acid	Mixing oleum and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
2-Nitropropane	Mixing oleum and 2-nitropropane in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Propiolactone (beta-)	Mixing oleum and propiolactone (beta-) in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Propylene Oxide	Mixing oleum and propylene oxide in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Pyridine	Mixing oleum and pyridine in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Oleum.
Styrene Monomer	Mixing oleum and styrene monomer in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Sulfolane	Mixing oleum and sulfolane in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Vinyl Acetate	Mixing oleum and vinyl acetate in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete

	reference.
Vinylidene Chloride	Mixing oleum and vinylidene chloride in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

ORGANIC MATTER

Acetyl Peroxide	See ACETYL PEROXIDE plus Solvents.
Aluminum Chloride and Nitromethane	See ALUMINUM CHLORIDE plus Nitromethanes and Organic Matter.
Ammonium Nitrate	See AMMONIUM NITRATE plus Organic Matter.
Ammonium Perchlorate	See SULFUR plus Ammonium Perchlorate.
Barium Peroxide	See BARIUM PEROXIDE plus Organic Matter.
Benzoyl Peroxide	See BENZOYL PEROXIDE plus Organic Matter.
Boron Trichloride	See BORON TRICHLORIDE plus Nitrogen Peroxide.
Bromates	See BROMATES plus Organic Matter.
Bromine Monofluoride	See BROMINE MONOFLUORIDE plus Water.
Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Acetic Acid.
Bromine Trifluoride	See BROMINE MONOFLUORIDE plus Water.
t-Butyl Peracetate	See t-BUTYL PERACETATE plus Organic Matter.
t-Butyl Perbenzoate	See t-BUTYL PERBENZOATE plus Organic Matter.
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Organic Matter.
Chlorates	See BROMATES plus Organic Matter.
Chloric Acid	See CHLORIC ACID plus Organic Matter. See ANTIMONY plus Chloric Acid.
Chlorine	See BROMINE MONOFLUORIDE plus Water.
Chlorine Dioxide	See CHLORINE DIOXIDE plus Organic Matter.

Chlorine Monoxide	See POTASSIUM plus Chlorine Monoxide.
	See CHLORINE MONOXIDE plus Organic Matter.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Organic Matter.
	See also BROMINE MONOFLUORIDE plus Water.
Chlorine Trioxide	See CHLORINE TRIOXIDE plus Organic Matter.
Chlorosulfonic Acid	See CHLOROSULFURIC ACID plus Organic Matter.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Organic Matter.
Diazomethane	See DIAZOMETHANE (self-reactive).
Diisopropyl Peroxydicarbonate	See DIISOPROPYL PEROXYDICARBONATE plus Organic Matter.
Dioxygen Difluoride	See DIOXYGEN DIFLUORIDE plus Organic Matter.
Fluorine	See FLUORINE plus Neoprene.
	See FLUORINE plus Organic Matter.
Fluorine Perchlorate	See FLUORINE PERCHLORATE plus Organic Matter.
Halogen Fluorides	See BROMINE MONOFLUORIDE plus Water; see individual fluoride plus organic matter.
Hydrogen Peroxide	See HYDROGEN PEROXIDE plus Organic Matter.
Hydrogen Peroxide and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Iodates	See BROMATES plus Organic Matter.
Iodine Heptafluoride	See BROMINE MONOFLUORIDE plus Water.
Iodine Monochloride	See IODINE MONOCHLORIDE plus Organic Matter.
Iodine Pentafluoride	See ARSENIC plus Iodine Pentafluoride.
	See also BROMINE MONOFLUORIDE plus Water.
	See also IODINE PENTAFLUORIDE plus Water.
Iodine Pentoxide	See CARBON plus Iodine Pentoxide.
Liquid Air	See CHARCOAL plus Liquid Air.

Lithium	See LITHIUM plus Organic Matter.
Magnesium Perchlorate	See MAGNESIUM PERCHLORATE plus Organic Matter.
Manganese Heptoxide	See MANGANESE HEPTOXIDE plus Organic Matter.
Mercuric Nitrate	See MERCURIC NITRATE plus Unsaturates; Aromatics.
Nitrate-Nitrite	See ALUMINUM plus Nitrate-Nitrite and Organic Matter.
Nitric Acid	See NITRIC ACID plus Organic Matter.
Nitric Oxide	See NITRIC OXIDE plus Fuels.
Nitroethane	See NITROETHANE plus Hydrocarbons.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Organic Matter.
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia; Grease.
Nitromethane	See NITROMETHANE plus Hydrocarbons.
Nitryl Perchlorate	See NITRYL PERCHLORATE plus Organic Matter.
Oxygen	See OXYGEN plus Clothing.
Ozone	See OZONE plus Organic Matter.
Peracetic Acid	See PERACETIC ACID plus Organic Matter.
Perchlorates	See PERCHLORATES plus Organic Matter.
Perchloric Acid	See PERCHLORIC ACID plus Organic Fibers.
Permanganates and Sulfuric Acid	See PERMANGANATES plus Sulfuric Acid and Benzene.
Permanganic Acid	See PERMANGANIC ACID (self-reactive).
Permonosulfuric Acid	See PERMONOSULFURIC ACID plus Cotton; Organic Matter.
Peroxides	See PEROXIDES plus Organic Matter.
Phosphoric Anhydride and Water	See PHOSPHORIC ANHYDRIDE plus Organic Matter and Water.

Phosphorus Oxychloride	See PHOSPHORUS OXYCHLORIDE plus Organic Matter.
Phosphorus Trichloride	See PHOSPHORUS OXYCHLORIDE plus Organic Matter.
Potassium Oxides	See POTASSIUM plus Air.
Potassium Permanganate	See POTASSIUM PERMANGANATE plus Organic Matter.
Sodium Chlorate	See SODIUM CHLORATE plus Organic Matter.
Sodium Chlorite	See SODIUM CHLORITE plus Organic Matter.
Sodium Peroxide	See SODIUM PEROXIDE plus Organic Matter.
Stannous Nitrate	See STANNOUS NITRATE plus Organic Matter.
Sulfur Monochloride	See SULFUR MONOCHLORIDE plus Organic Matter.

ORGANIC PERCHLORATES

(self-reactive)	Almost any organic perchlorate decomposes when heated. The ammoniacal and aminiacal compounds seem more sensitive than the others. The amine perchlorates have explosion temperatures in the range of 250¡ C to 300¡ C. None explodes below 200¡ C. *ACS* **146:** 204-20 (1960).

ORGANIC SULFIDES RSR

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Organic Sulfides.

OSMIUM Os

Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Oxygen Difluoride	See IRIDIUM plus Oxygen Difluoride.

OSMIUM-AMMINE NITRATES

(self-reactive)	Osmium-ammine nitrates may be impact-sensitive. $Os(NH_3)_4O_2(NO_3)_2$ crystals are very unstable.
	Mellor **15:** 727 (1946-1947).

OSMIUM-AMMINE PERCHLORATES

(self-reactive)	Osmium-ammine perchlorates may be impact-sensitive.
	Mellor **15:** 727 (1946-1947).

OXALIC ACID HOCOCOOH

Furfuryl Alcohol	See FURFURYL ALCOHOL plus Oxalic Acid.
Silver	See SILVER plus Oxalic Acid.
Sodium Chlorite	See SODIUM CHLORITE plus Oxalic Acid.
Sodium Hypochlorite	See SODIUM HYPOCHLORITE plus Oxalic Acid.

OXALYL BROMIDE BrCOCOBr

Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Oxalyl Bromide.

OXALYL CHLORIDE ClCOCOCl

Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Oxalyl Bromide.

OXIDES

(See specific oxides, dioxides, trioxides as primary entries or under other reactants)

OXIDIZING AGENTS

Carbides	See CARBIDES plus Oxidizing Agents.

OXODISILANE $H_3SiSiHO$

Air	Oxodisilane is spontaneously flammable in air.
	Z. Anorg. Chemie **117:** 209. *Hurd*, pp. 36, 73 (1952).

OXOSILANE H_2SiO

Air	Oxosilane is spontaneously flammable in air.
	Z. Anorg. Chemie **117:** 209.
	See also CHLORINE plus Oxomonosilane.
Chlorine	See CHLORINE plus Oxomonosilane.

OXYGEN O_2

Aluminum	See ALUMINUM plus Oxygen.
Aluminum Borohydride	Explosive reaction occurs at temperatures as low as 20¡C. Explosive range: 5% to 90%.
	J. Am. Chem. Soc. **71:** 2950.
Aluminum Hydride	Aluminum hydride is spontaneously flammable in oxygen or air.
	Lockheed, p. 8 (1960).
Beryllium Borohydride	Beryllium borohydride reacts explosively with oxygen or water.
	A. J. Stosick, *Acta Crystallogr.* **5** (1): 15 (1952).
Boron Arsenotribromide	In contact with air or oxygen, this material is readily oxidized, and in most cases ignites spontaneously.
	Mellor **9:** 57 (1946-1947).
Boron Decahydride	Boron decahydride ignites spontaneously when exposed to air or oxygen.

	Mellor **5:** 36 (1946-1947).
Boron Trichloride	Oxygen and boron trichloride react vigorously on sparking.
	Mellor **5:** 131 (1946-1947).
Butane and Nickel Carbonyl	See NICKEL CARBONYL plus n-Butane and Oxygen.
Calcium	See CALCIUM plus Oxygen.
Calcium Phosphide	See SULFUR plus Calcium Phosphide.
Cesium	See CESIUM plus Oxygen.
Cesium Hydride	Cesium hydride ignites in oxygen at room temperature.
	Brauer (1965).
Chlorotrifluoroethylene and Bromine	See CHLOROTRIFLUOROETHYLENE plus Oxygen and Bromine.
Clothing	The normal 2-3 per cent oxygen enrichment of air supplied to an air-supplied suit was upset by failure of the air-oxygen mix valve so that the enrichment was 68-76 per cent. A worker who had disconnected supply and exhaust lines removed his helmet and lighted a cigarette. Apparently a spark from the cigarette lighted his oxygen-saturated underwear and also the pressure suit.
	MCA Case History **884** (1963).
Decaborane	Decaborane is spontaneously flammable in oxygen.
	Chem. Safety Data Sheet **SD 84** (1961).
Diborane	Oxygen and diborane form spontaneously explosive mixtures.
	A. T. Whately and R. N. Pease, *J. Am. Chem. Soc.* **76:** 1997-1999 (1954).
Diethyl Ether	See OXYGEN plus Ethers.
Diphenylethylene	An explosion was observed at the auto-oxidation of diphenylethylene with oxygen under high pressure at low temperature.
	H. Staudinger, *Z. Electrochem.* **31:** 549-52 (1925).

Disilane	Disilane, trisilane, or tetrasilane, when mixed with oxygen or air at ordinary temperatures, ignites or explodes.
	Mellor **6:** 232-4 (1946-1947).
Ethers	In the presence of oxygen or air, ethers form peroxides which may explode spontaneously or when heated.
	Haz. Chem. Data (1966). *MCA Case History* **616** (1960).
	Ethyl ether forms peroxides which may explode when heated to about 100¡C.
	Chem. Safety Data Sheet **SD-29** (1965).
	Isopropyl ether, which had stood on the shelf a long time, exploded when the stuck cap on the bottle was freed.
	MCA Case History **603** (1960).
Germanium	See GERMANIUM plus Oxygen.
Hydrazine	Oxygen and hydrazine form explosive mixtures.
	Mellor **8, Supp. 2:** 72 (1967).
Hydrogen	See HYDROGEN plus Air; Oxygen.
Isopropyl Ether	Isopropyl ether tends to react with oxygen from the air to form unstable peroxides which may detonate with extreme violence. Several incidents are cited.
	NSC Newsletter, Chem. Sec. (May 1966).
	See also OXYGEN plus Ethers.
Lithium	See LITHIUM plus Oxygen.
Nickel Carbonyl and	See NICKEL CARBONYL plus n-Butane
Butane	and Oxygen.
Organic Materials	See OXYGEN plus Clothing.
Oxygen Difluoride and	Violent explosions resulted when a spark was
Water	discharged in a mixture containing 25-70% oxygen difluoride in oxygen over water.
	Mellor **2, Supp. 1:** 191 (1956).
Phosphine	This reaction is explosive at ordinary temperatures.

	Mellor **8, Supp. 3:** 281 (1971).
Phosphorus	See PHOSPHORUS plus Oxygen.
Phosphorus Trifluoride	Phosphorus trifluoride does not burn in air, but if it is mixed with oxygen, the gases explode.
	Comp. Rend. **138:** 789. *Mellor* **8:** 995 (1946-1947).
Phosphorus Trioxide	See PHOSPHORUS TRIOXIDE plus Air.
Polyurethane	In the form of foam, polyurethane, and also polyvinyl chloride, have exploded when saturated with liquid oxygen.
	Ind. Saf. Equip., p. 54 (June 1964).
Polyvinyl Chloride	See OXYGEN plus Polyurethane.
Potassium and Carbon Monoxide	See POTASSIUM plus Carbon Monoxide and Oxygen.
Potassium Peroxide	The reaction of oxygen and potassium peroxide is violent at pressures of oxygen as low as 10 mm.
	Mellor **2, Supp. 3:** 1626 (1963).
Rubidium	See RUBIDIUM plus Oxygen.
Selenium	See SELENIUM plus Oxygen.
Sodium Hydride	Sodium hydride in oxygen ignites at 230¡C.
	Mellor **2:** 483 (1946-1947).
Teflon□ (Polytetrafluoroethylene)	Teflon□ ignited at 1,300¡F. in a 5 psia pure oxygen atmosphere, when used as a 20 AWG wire insulation. Polyolefin insulation ignites at about 1,100¡F. under the same conditions.
	N.A. Aviation (1964).
Tetrafluorohydrazine	An explosive reaction of these two chemicals is likely in the presence of organic matter.
	Mellor **8, Supp. 2:** 113 (1967).
Tetrasilane	See OXYGEN plus Disilane.
Titanium Alloy	See TITANIUM ALLOY plus Oxygen.

1,1,1-Trichloroethane	The sides of a 5,000 psi autoclave were bulged by an explosive reaction between oxygen and 1,1,1-trichloroethane when the pressurized mixture was brought up to 100¡C. and 790 psi and allowed to stand for three hours.
	Chem. Eng. News **35** (43): 60 (1957).
Trichloroethylene	The explosion of an oxygen pipe under pressure (400 psi) in a metallurgical factory was apparently due to the remains of trichloroethylene which was used for the previous cleaning of the pipes. Tests showed it was possible to make a stoichiometric mixture of trichloroethylene and oxygen vapors explode.
	U. Weber, *Chim. Ind. (Paris)* **90** (3): 178-83 (1963).
Trisilane	See OXYGEN plus Disilane.

OXYGEN (**LIQUID**) O_2

Aluminum	See ALUMINUM plus Oxygen.
Asphalt	During transfer of liquid oxygen from a factory reservoir to a tanker truck, some of the liquid leaked from a coupling to the asphalt surface below. When the trucker dropped a hammer on this surface, a violent explosion formed a crater 20 inches square by 4 inches deep in the asphalt and broke windows nearby.
	U. Weber, *Chim. Ind. (Paris)* **90** (3); 178-83 (1963).
Benzene	*Liquid* oxygen (LOX) gives an explosive mixture when combined with benzene.
	Kirschenbaum (1956).
Carbon Monoxide	*Liquid* oxygen gives an explosive mixture when combined with *liquid* carbon monoxide.
	Kirschenbaum (1956).
Carbon Tetrachloride	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Chlorinated Dye Penetrants	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Chlorinated Hydrocarbons	Several halogenated solvents reacted explosively with

	liquid oxygen when ignited with a high energy source: 1,1,1-trichloroethane, methylene chloride, trichloroethylene, chlorinated dye penetrants, and carbon tetrachloride. The carbon tetrachloride exploded only mildly. Behavior of these chemicals is similar with nitrogen tetroxide.
	Chem. Eng. News **43** (24): 41 (1965).
	BM Report Invest. **6766** (1966)
Cyanogen	*Liquid* oxygen gives an explosive mixture when combined with *liquid* cyanogen.
	Kirschenbaum (1956).
Fuels	Liquid oxygen plus ordinary fuels, hydrocarbons, and many other organic compounds are powerful explosives.
	BM Bull. **472** (1949). *Kirschenbaum* (1956).
	MCA Case Histories **824** (1962) and **865** (1963).
	Houghton (1966).
Hydrazine	Spontaneous ignition occurs when these chemicals are mixed.
	Mellor **8, Supp. 2:** 95 (1967).
Hydrocarbons	See OXYGEN (LIQUID) plus Fuels.
Lithium Hydride	*Liquid* oxygen gives an explosive mixture when combined with lithium hydride.
	Kirschenbaum (1956).
Magnesium	See MAGNESIUM plus Oxygen.
Methane	*Liquid* oxygen gives an explosive mixture when combined with liquid methane.
	Kirschenbaum (1956).
Methylene Chloride	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Oil	Traces of oil on the ball bearing of a centrifugal pump reacted with liquid oxygen being transferred by the pump. The heat of reaction vaporized the oxygen and the pump burst from pressurization.

	U. Weber, *Chim. Ind. (Paris)* **90** (3): 178-83 (1963).
Paraformaldehyde	*Liquid* oxygen gives an explosive mixture when combined with paraformaldehyde.
	Kirschenbaum (1956).
Titanium	See TITANIUM plus Oxygen.
1,1,1-Trichloroethane	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Trichloroethylene	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Wood and Charcoal	In a plant manufacturing liquid and gaseous oxygen, spruce wood flooring encased in iron sheeting was charred by an undetected, smoldering fire started by a welding spark. Subsequent leakage of liquid oxygen saturated the charred wood and a violent explosion resulted.
	U. Weber, *Chim. Ind. (Paris)* **90** (3): 178-83 (1963).

OXYGEN DIFLUORIDE OF_2

Aluminum Chloride	A vigorous reaction occurs between oxygen difluoride and aluminum chloride, arsenic trioxide, chronic oxide, or phosphorus pentoxide.
	Mellor **2, Supp. 1:** 192 (1956).
Ammonia	Oxygen difluoride and ammonia react immediately with white fumes.
	Mellor **2, Supp. 1:** 192 (1956).
Arsenic Trioxide	See OXYGEN DIFLUORIDE plus Aluminum Chloride.
Bromine	See BROMINE plus Oxygen Difluoride.
Carbon Monoxide	See HYDROGEN plus Oxygen Difluoride.
Chlorine	See CHLORINE plus Oxygen Difluoride.
Chlorine and Copper	See CHLORINE plus Oxygen Difluoride.
Chromic Oxide	See OXYGEN DIFLUORIDE plus Aluminum Chloride.
Hydrogen	See HYDROGEN plus Oxygen Difluoride.
Hydrogen Sulfide	Oxygen difluoride and hydrogen sulfide explode on

	mixing.
	Mellor **2, Supp. 1:** 192 (1956).
Iodine	See BROMINE plus Oxygen Difluoride.
Iridium	See IRIDIUM plus Oxygen Difluoride.
Methane	See HYDROGEN plus Oxygen Difluoride.
Osmium	See IRIDIUM plus Oxygen Difluoride.
Oxygen and Water	See OXYGEN plus Oxygen Difluoride and Water.
Palladium	See IRIDIUM plus Oxygen Difluoride.
Phosphorus Pentoxide	See OXYGEN DIFLUORIDE plus Aluminum Chloride.
Platinum	See IRIDIUM plus Oxygen Difluoride.
Rhodium	See IRIDIUM plus Oxygen Difluoride.
Ruthenium	See IRIDIUM plus Oxygen Difluoride.
Silica	Liquid oxygen difluoride and 60/80 mesh silica gel at about 254 mm. pressure and -196¡C. exploded. The presence of moisture was suspected.
	A.G. Streng, *Chem. Rev.* **63** (6):607-624 (1963).
	Chem. Eng. News **43** (7):41 (1965); **43** (15):41 (1965).

OZONE O_8

Aniline	Aniline in an atmosphere of ozone forms as one of the products a white, gelatinous explosive compound, ozobenzene.
	Mellor **1:** 911 (1946-1947).
Benzene	Benzene in an atmosphere of ozone forms formic, acetic, oxalic, and other acids as well as a white gelatinous explosive compound called ozobenzene.
	Mellor **1:** 911 (1946-1947). R.W. Murray, *Acc. Chem. Res.* **1**(10): 313 (1968).
Bromine	Severe explosions occur in attempts to form tribromine octoxide from these reactants.

	Mellor **2, Supp. 1:** 748 (1956).
Diallyl Methyl Carbinol and Acetic Acid	See DIALLYL METHYL CARBINOL plus Ozone and Acetic Acid.
Diethyl Ether	A mixture of ether and ozone forms aldehyde and acetic acid and a heavy liquid, ethyl peroxide, which is explosive.
	Mellor **1:** 911 (1946-1947).
Dinitrogen Pentoxide	Mixtures of ozone and dinitrogen pentoxide are flammable or explosive.
	Mellor **8, Supp. 2:** 276 (1967).
Ethylene	Ozone and ethylene react explosively.
	Berichte **38:** 3837.
	Mellor **1:** 911 (1946-1947).
Hydrogen Bromide	These chemicals react instantaneously, exploding except at low pressure of 2-3 mm mercury.
	Mellor **2, Supp. 1:** 736 (1956).
Hydrogen Iodide	The reaction between these chemicals is even more energetic than between ozone and hydrogen bromide.
	Mellor **2, Supp. 1:** 736 (1956).
Nitric Oxide	Mixtures of nitric oxide and ozone explode even when the quantity of ozone is small.
	Mellor **8:** 432 (1946-1947).
	Mixtures of ozone and nitric oxide explode violently at liquid-air temperatures.
	Mellor **8, Supp. 2:** 164 (1967).
Nitrogen Dioxide	Nitrogen dioxide and ozone react with the evolution of light, and often explode.
	Pinkus & Schulthess, *J. Chem. Phys.* **18:** 366 (1920).
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
	A mixture of ozone and nitrogen trichloride will explode.

	Mellor **1:** 911 (1946-1947).
Nitrogen Triiodide	See BROMINE plus Nitrogen Triiodide.
	Ozone and nitrogen triiodide form an explosive mixture.
	Mellor **1:** 911 (1946-1947).
Nitroglycerin	Ozone and nitroglycerin explode on mixing.
	Mellor **1:** 911 (1946-1947).
Organic Liquids	When some organic liquids are dropped into liquid ozone, explosions sometimes result. This phenomenon was observed in ozone that was formed by neutron or gamma-ray excitation of liquid oxygen. Also ozone itself was observed to decompose with small explosions in such an environment.
	F.E. Adley, *Nucl. Sci. Abstr.* **17:** 18 (1962).
Organic Matter	Liquid ozone is particularly likely to explode when it reaches the boiling point of the ozone or when brought in contact with oxidizable substances.
	Mellor **1:** 894 (1946-1947).
Stibine	Stibine and ozone explode at 90¡C.
	Berichte **38:** 3837.
	Mellor **1:** 907 (1946-1947).

PALLADIUM Pd

Aluminum	See ALUMINUM plus Palladium.
Hydrogen and Isopropyl Alcohol	See HYDROGEN plus Palladium and Isopropyl Alcohol.
Oxygen Difluoride	See IRIDIUM plus Oxygen Difluoride.
Sulfur	Sulfur and palladium react with incandescence.
	J. J. Berzelius, *Acad. Handl.* **33:** 175 (1813).

PALLADIUM-AMMINE NITRATES

(self-reactive)	Palladium-ammine nitrates may be impact-sensitive.
	$Pd(NH_3)_2(NO_3)_2$ and Pd $(NH_3)_4(NO_3)_2$ detonate violently when heated.
	Mellor **15:** 685 (1946-1947).

PALLADIUM-AMMINE PERCHLORATES

(self-reactive)	Palladium-ammine perchlorates may be impact-sensitive.
	Mellor **15:** 684 (1946-1947).

PARAFORMALDEHYDE $(HCHO)_n$

Oxygen	See OXYGEN (LIQUID) plus Paraformaldehyde.

PARATHION $(C_2H_5O)_2P(S)OC_6H_4NO_2$

(self-reactive)	When a sample was heated in a small test tube it decomposed and in a few minutes the residue exploded.
	J.B. McPherson and G.A. Johnson, *Agri. Food Chem.* **4** (1): 42 (1956).
Endrin	While a mixture of parathion and endrin were being blended into a petroleum solvent an exothermic reaction occurred which caused some of the solvent to vaporize. The solvent vapor-air mixture exploded. Overheating, possibly caused by mechanical agitation, started the exothermic reaction.
	Doyle (1973).

PENTABORANE (9) B_5H_9

Air	Pentaborane is spontaneously flammable in air.
	Handbook Chem. Phys. (1958). *Sevegin* (1963).

PENTACHLOROETHANE C_2HCl_5

Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Bromoform.

PENTAMETHYLDIALUMINUM HYDRIDE $(CH_3)_3Al_2H(CH_3)_2$

Air	Pentamethyl aluminum hydride is spontaneously flammable in air. *Hurd*, p. 98 (1952).

PENTAMMINOAZIDOCOBALTIC AZIDE $CoN_3(NH_3)_5(N_3)_2$

(See COBALTIC-PENTAMMINE AZIDE)

PENTAMMINOCHLOROCOBALTIC CHLORITE

$Co(NH_3)_5Cl(ClO_2)_2$

(See COBALTIC-PENTAMMINE CHLORITE)

PENTASILVER TRIHYDROXY DIAMIDOPHOSPHATE

(See SILVER DIAMIDOTRIOXYPHOSPHORANE)

PENTOL (3-METHYL-2-PENTEN-4YN-1-OL)

$CH{\equiv}CC(CH_3){=}CHCH_2OH$

Hydrogen	See HYDROGEN plus 1-Pentol.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Pentol.

PERACETIC ACID CH_3COOOH

(See PEROXYACETIC ACID)

"PER" ACIDS (PERFORMIC, PERACETIC, etc.)

Olefins	Reactions between "per" acids and olefins are vigorously exothermic. Means should be provided for dissipation of heat.
	Chem. Eng. News **28:** 418, 3067 (1950).
	See also "PEROXY" ACIDS

PERCAMPHORIC ACID $C_8H_{14}(COOOH)_2$

(See PEROXYCAMPHORIC ACID)

PERCHLORATES

(See also specific perchlorates as primary entries or under other reactants)

Benzene	Certain metal perchlorates recrystallized from benzene or ethyl alcohol can explode spontaneously.
	J. Am. Chem. Soc. **62** (10): 3524 (October 1940).
Calcium Hydride	See BROMATES plus Calcium Hydride.
Charcoal	Perchlorates explode when melted with reducing agents or when projected into red-hot charcoal.
	Berichte **39:** 3146.
Ethyl Alcohol	See PERCHLORATES plus Benzene.
Metals	When perchlorates are mixed with finely divided metals, the mixture may be explosive.
	ACS **146:** 188. *Lab. Govt. Chemist* (1965).
Organic Matter	Perchlorates will render organic matter easily flammable. When perchlorates are mixed with finely divided organic matter, they may be explosive.
	ACS **146:** 188. *Lab. Govt. Chemist* (1965).
Reducing Agents	See PERCHLORATES plus Charcoal.
Strontium Hydride	See BROMATES plus Strontium Hydride.
Sulfur	See SULFUR plus Perchlorates.
Sulfuric Acid	A mixture of the two may cause an explosion.

Pieters, p. 30 (1957).

PERCHLORIC ACID $HClO_4$

(self-reactive)	Anhydrous perchloric acid can decompose explosively at atmospheric pressure. On storage even in the dark, the anhydrous acid becomes discolored owing to decomposition products, e.g. chlorine dioxide, and may explode spontaneously.
	ACS **146:** 190.
	After an animal carcass was dissolved in nitric acid, fat was skimmed off and 125 milliliters of perchloric acid was added. The sample was heated on a hot plate to dryness in a 1-liter beaker after which two samples were placed on a stainless steel steam tray (steam off). When the samples were touched, they exploded.
	Chem. Eng. News. **51** (6): 29 (Feb. 5, 1973).
Acetic Acid	Explosions involving these materials have occurred in electrolytic polishing baths. The violence in some cases approached that of a true high explosive.
	ACS **146:** 193. *Rev. Met.* **46:** 549-60 (1949).
	Mem. Poudres **32:** 179-96 (1950). *Report L.A. Fire Department. NFPA Quarterly* **40** (4): 275-78 (April 1947).
Acetic Acid and	Mixtures of these three ingredients have varying
Acetic Anhydride	degrees of sensitivity to shock. Vapors above the heated mixtures are flammable.
	ACS **146:** 193-4. *Rev Met.* **46:** 549-60 (1949).
	Mem. Poudres **32:** 179-96 (1950).
Acetic Anhydride	An electropolishing mixture of 170 gallons of 68-72% perchloric acid and 70 gallons of acetic anhydride exploded with devastating effect some time after the refrigerative temperature control of the tank had been turned off. A plastic holder had been inserted into the solution just before the explosion.
	ACS **146:** 187. *BM Explos. Div. Rep.* **3034-C-443** (1947).

	The addition of acetic anhydride to an aqueous solution of perchloric acid causes the formation of acetic acid which can react violently with the perchloric acid.
	Rev. Met. **46** (8): 549-560 (1949).
	Mem. Poudres **32:** 179-196 (1950).
Alcohols	The contact of hot, concentrated perchloric acid with alcohols or cellulose is particularly dangerous.
	ACS **146:** 189, 195. E. M. Harris, *Chem. Eng.* **56** (1):116-7 (1949).
Aniline and	Aniline treated with perchloric acid, then
Formaldehyde	formaldehyde, gives a resinous condensation product which burns with explosive violence.
	Aniline, p. 85 (1964). *U. S. Pat.* 2,871,224.
Antimony Compounds	See ANTIMONY COMPOUNDS (trivalent)
(trivalent)	plus Perchloric Acid.
Bismuth	See BISMUTH plus Perchloric Acid.
Cellulose	See PERCHLORIC ACID plus Alcohols.
Charcoal	A drop of anhydrous perchloric acid on charcoal causes a violent explosion.
	ACS **146:** 188.
Dibutyl Sulfoxide	A 70% perchloric acid solution reacts instantly and explosively on contact with dibutyl sulfoxide.
	Wischmeyer (1973).
Diethyl Ether	A drop of anhydrous perchloric acid in ether causes a violent explosion.
	ACS **146:** 188. *Am. Chem. J.* **23:** 444 (1900).
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Perchloric Acid.
Ethyl Alcohol	In mineral analysis the potassium cation is sometimes identified by adding perchloric acid in the presence of ethyl alcohol concentration. Explosions frequently occur that are due to the spontaneous decomposition of ethyl perchlorate formed during concentration and of residual perchloric acid. With methyl alcohol, the reaction is identical except

	that the methyl perchlorate that is formed is very explosive.
	Analyst **80:** 10 (1955).
Fluorine	See FLUORINE plus Perchloric Acid.
Glycerine and Lead Oxide	See LEAD OXIDE plus Glycerine and Perchloric Acid.
Glycol Ethers	Glycol ethers, glycols, ketones, and alcohols undergo violent decomposition in contact with 68-72% perchloric acid.
	ACS **146:** 195. *U.S. Patent* 2,504,119.
Glycols	See PERCHLORIC ACID plus Glycol Ethers.
Hydriodic Acid	Perchloric acid ignites with hydriodic acid.
	Am. Chem. J. **23:** 444 (1900).
Hydrochloric Acid	See HYDROCHLORIC ACID plus Perchloric Acid.
Hydrogen	The explosion temperature of hydrogen-perchloric acid vapor mixtures is lowered from 400 to 215¡ C by the presence of steel particles.
	ACS **146:** 189. *Angew. Chem.* **52:** 616-18 (1939).
Hypophosphites	See HYPOPHOSPHITES plus Perchloric Acid.
Ketones	See PERCHLORIC ACID plus Glycol Ethers.
Methyl Alcohol	See PERCHLORIC ACID plus Ethyl Alcohol.
Nitrogen Iodide	See NITROGEN TRIIODIDE plus Acids.
Nitrosophenol	See NITROSOPHENOL plus Acids.
Organic Matter	Perchloric acid can cause fire or explosion in most organic materials. Example: When bis(2-hydroxyethyl)-terephthalate, being refluxed with 5% perchloric acid in ethyl alcohol, was allowed to go to dryness, there was a violent explosion. A similar mixture, containing also ethylene glycol, flashed brightly after 18 hours refluxing. See also the other organic entries under perchloric acid.
	Wheeler (1969).
Paper	A drop of anhydrous perchloric acid on paper can cause a

	violent explosion.
	ACS **146:** 188.
Phosphorus Pentoxide	See PERCHLORIC ACID plus Sulfuric Acid.
Phosphorus Pentoxide and Chloroform	See PHOSPHORUS PENTOXIDE plus Perchloric Acid and Chloroform.
Sodium Iodide	See SODIUM IODIDE plus Perchloric Acid.
Steel	Explosions may occur when 72 percent perchloric acid is used for determination of chromium in steel. These explosions are apparently due to the formation of mixtures of perchloric acid vapor and hydrogen, catalyzed by the presence of steel particles. The presence of steel burnings lowered the explosion temperatures of such mixtures to 215¡ C. Addition of a little water to keep their boiling temperature at 150 to 160¡ C prevented the formation of explosive gas mixtures.
	ACS **146,** p. 189 (1960).
Sulfoxides	See SULFOXIDES plus Perchloric Acid.
Sulfuric Acid	It is fairly easy to produce the dangerous anhydrous perchloric acid from either its salts or its aqueous solutions by heating with high-boiling acids and dehydrating agents such as sulfuric acid and phosphorus pentoxide.
	NSC Data Sheet **D-311.** *ACS* **146:** 71.
	Pascal **16:** 298 (1931-1934).
Sulfur Trioxide	The reaction of anhydrous perchloric acid with sulfur trioxide is violent and accompanied by the evolution of considerable heat, even when diluted with an inert solvent such as chloroform.
	Pascal **16:** 300-303 (1931-1934).
Wood	A drop of anhydrous perchloric acid on wood fibers or dust causes a violent explosion. See also PERCHLORIC ACID plus Cellulose or plus Paper.
	ACS **146:** 188.
	Gordon, Young & Campbell, *Science* **104:** 353 (1946).

PERCHLORYL FLUORIDE $FClO_3$

Benzene and Aluminum Chloride	During the synthesis of perchloryl benzene by the action of perchloryl fluoride on benzene in the presence of aluminum chloride, there also forms a hazardous nitration product which may explode. The product is apparently nitrochlorobenzene, which is shock-sensitive.
	Chem. Eng. News **38** (4): 62 (1960).
Sodium Methylate	Sodium methylate, as it was being added to a mixture of perchloryl fluoride and methyl alcohol, underwent an explosive reaction with perchloryl fluoride in the vapor phase above the liquid. When the sodium methylate and methyl alcohol were mixed before the addition of perchloryl fluoride, no explosion occurred.
	Chem. Eng. News **37** (28): 60 (1959).

PERCHLORYL FLUOROXIDE $FOClO_3$

(See FLUORINE PERCHLORATE)

PERCHROMATES

Aniline	A mixture of aniline and a perchromate gives rise to an explosive reaction as the temperature is increased.
	RŸst and Ebert, p. 297 (1948).
Pyridine	Heating a mixture of pyridine and a perchromate can lead to an explosion.
	RŸst and Ebert, p. 297 (1948).
Quinoline	Heating a mixture of quinoline and perchromate can produce an explosion.
	RŸst and Ebert, p. 297 (1948).

PERFLUOROPROPIONYL FLUORIDE F_3CCF_2COF

Fluorine	An explosion occurred during the investigation of a new method of forming perfluoropropionyl hypofluorite. The method involved cooling the reactor to minus 50¡ C after which a 50-50 fluorine-nitrogen mixture was added to perfluoropropionyl fluoride. It is possible that a small amount of water, which may have been introduced due to the low temperature, converted some of the perfluoropropionyl fluoride to the perfluoropropionic acid, a precursor for the formation of one of the acyl hypofluorites. The latter are known to be explosive.
	MCA Case History **1045** (1966).
	See FLUORINE plus Perfluropropionyl Fluoride.

PERFLUOROSUCCINAMIDE $F_2NCOCF_2CF_2CONF_2$

Lithium Aluminum Hydride and Water	See LITHIUM ALUMINUM HYDRIDE plus Perfluorosuccinamide and Water.

PERFORMIC ACID OCHOOH

(See PEROXYFORMIC ACID)

PERIODATES $MeIO_4$

(self-reactive)	The metaperiodates ($MeIO_4$) in some cases decompose with explosive violence when strongly heated. Ammonium periodate may explode even on gentle friction, e.g., when touched with a spatula.
	Ellern, p. 288 (1968). *Remy* **1:** 814 (1956).

PERIODIC ACID HIO_4

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Periodic Acid.

PERMANGANATES

(See also specific permanganates as primary entries or see under other reactants)

Acetic Acid	Acetic acid or acetic anhydride can explode with permanganates if not kept cold.
	Von Schwartz, p. 34 (1918).
Acetic Anhydride	See PERMANGANATES plus Acetic Acid.
Sulfuric Acid and	Explosions can occur when permanganates
Benzene	that have been treated with sulfuric acid come in contact with benzene, carbon disulfide, diethyl ether, ethyl alcohol, petroleum, or organic matter.
	Von Schwartz, p. 327 (1918).

PERMANGANIC ACID $HMnO_4$

(self-reactive)	Above 3¡ C permanganic acid is unstable and decomposes explosively. It is a violent oxidant and the following classes of organic chemicals explode into flame on contact with it: alcohols, alkanes, aryl hydrocarbons, greases, cycloalkanes, alkylamines, amides, and ethers. Carbon tetrachloride, chloroform and dichloromethane do not burn.
	J. Am. Chem. Soc. **91** (22): 6200-6201 (1969).
	Chem. Abst. **72:** 17982f (1970).
Ethyl Alcohol	Alcohols should not be mixed with permanganic acid, as they may spontaneously explode.
	Bahme, p. 9 (1961).
Organic Matter	See PERMANGANIC ACID (self-reactive).

PERMONOSULFURIC ACID (**CARO'S ACID**) H_2SO_5

Acetone	Inadvertent addition of acetone to a solution containing permonosulfuric acid resulted in a violent explosion. The permonosulfuric acid had been formed by reaction between hydrogen peroxide and sulfuric acid during an analytical procedure.
	Wood (1966). *NSC Newsletter, Chem. Sec.* (1961). *J. Am.*

	Chem. Soc. **59:** 552-7 (1937).
Alcohols	Permonosulfuric acid in contact with primary or secondary alcohols often produces explosions.
	J. Am. Chem. Soc. **59:** 552 (1937).
Cotton	If 92% permonosulfuric acid is brought in contact with cotton, in a few seconds there is a violent reaction accompanied by a yellow flame.
	Z. Angew. Chem. **22:** 1713.
Manganese Dioxide	The decomposition of 92% permonosulfuric acid is explosive in the presence of smooth or finely divided manganese dioxide or silver.
	Z. Angew. Chem. **22:** 1713.
Organic Matter	Too concentrated permonosulfuric acid in any organic medium may prove dangerous.
	J. Am. Chem. Soc. **59:** 552 (1937).
Platinum	See PLATINUM plus Permonosulfuric Acid.
Silver	See PERMONOSULFURIC ACID plus Manganese Dioxide.

PEROXIDES ROOR

(See specific peroxides or see under other reactants)

Organic Matter	Peroxides may cause ignition of organic materials.
	Lab. Govt. Chemist (1965).
Thiocyanates	See THIOCYANATES plus Oxidizing Agents.

PEROXYACETIC ACID CH_3COOOH

Acetic Anhydride	Acetic anhydride and peracetic acid react readily to form acetyl peroxide which is an extremely sensitive explosive.
	MCA Case History **1795** (1971).
	See also HYDROGEN PEROXIDE plus Acetic Anhydride.

Olefins	See "PER" ACIDS plus Olefins.
Organic Matter	Upon contact with peracetic acid, organic materials can ignite or result in explosions. *Haz. Chem. Data*, p. 214 (1973).

"PEROXY" ACIDS (PERFORMIC, PERACETIC, etc.)

(self-reactive)	Peracids should be handled only in small quantities and with extreme care when pure or very concentrated. Organic peracids, such as peracetic acid, are so unstable that they may explode during distillation, even under reduced pressure. *Kirk and Othmer, Second Ed.* **14:** 809 (1963). *Grignard* **11:** 90 (1935-1954).

PEROXYCAMPHORIC ACID $C_3H_{14}(COOOH)_2$

(self-reactive)	Percamphoric acid explodes when heated rapidly from 80 to 100¡ C. *Chem. Reviews* **45:** 15 (1949).

PEROXYTRICHLOROACETIC ACID $Cl_3CCOOOH$

(self-reactive)	Pertrichloroacetic acid is very unstable. Decomposition products include phosgene, chlorine, hydrochloric acid and carbon monoxide. *Chem. Reviews* **45** (1): 10 (1949).

PEROXYFORMIC ACID OCHOOH

(self-reactive)	Performic acid is an unstable compound capable of undergoing rapid, spontaneous exothermal decomposition at room temperature, even in the absence of foreign substances. It is shock sensitive. *Chem. Eng. News* **28:** 3067 (Sept. 4, 1950).

	Chem. Reviews **45:** 4, 7 (1949).
	Chem. Eng. News **30:** 3041 (1952).
Aluminum	See ALUMINUM plus Performic Acid.
Aniline	Aniline is oxidized violently by performic acid when the acid strength is more than 60% by weight.
	Berichte **48:** 1139 (1915).
Benzaldehyde	Benzaldehyde is oxidized violently by performic acid.
	Berichte **48:** 1139 (1915).
Formaldehyde	Formaldehyde is oxidized violently by concentrated performic acid.
	Berichte **48:** 1139 (1915).
Lead Dioxide	A concentrated solution of performic acid can explode upon contact with powdered lead dioxide.
	Berichte **48:** 1139 (1915).
Magnesium	See MAGNESIUM plus Performic Acid.
Metal Oxides	See METAL OXIDES plus Performic Acid.
Metals	See METAL plus Performic Acid.
Nickel	See NICKEL plus Performic Acid.
Olefins	See "PER" ACIDS plus Olefins.
Phosphorus	See PHOSPHORUS plus Performic Acid.
Sodium Nitride	Sodium nitride can decompose performic acid explosively.
	Berichte **48:** 1139 (1915).
Zinc	See ZINC plus Performic Acid.

PERSULFATES

(See specific persulfates as primary entries or see under other reactants)

PERTRICHLOROACETIC ACID $Cl_3CCOO.OH$

(See PEROXYTRICHLOROACETIC ACID)

PETROLEUM

Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Petroleum.

PHENOL C_6H_5OH

Aluminum Chloride and Nitrobenzene	See ALUMINUM CHLORIDE plus Nitrobenzene and Phenol.
Butadiene	Reaction of the two ingredients, catalyzed by boron trifluoride diethyletherate, and in a petroleum ether solution, pressurized the capped bottle, causing the bottle to explode. *MCA Case History* **790** (1962).
Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Phenol.

PHENOL-FORMALDEHYDE RESIN

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

PHENOLS

Acetaldehyde	See ACETALDEHYDE plus Acid Anhydrides.

b-PHENYLBORACYCLOPENTANE $C_6H_5B(CH_2)_4$

Air	Phenyl cyclotetramethylene borine is spontaneously flammable in air. *Douda* (1966).

PHENYL CHLORIDE

(See CHLOROBENZENE)

PHENYLCHLORODIAZIRINE

(See BENZENEDIAZONIUM CHLORIDE)

PHENYL CYCLOTETRAMETHYLENE BORINE

(See b-PHENYLBORACYCLOPENTANE)

PHENYL DIAZOSULFIDE

(See DIPHENYL DIAZOSULFIDE)

PHENYL DICYCLOPENTADIENYL VANADIUM

(See PHENYLVANADOCENE)

p-PHENYLENEDIAMINE PERCHLORATE $C_6H_4(NH_2)_2•ClO_4$

(self-reactive)	This compound was believed in 1910 to be the most powerful explosive substance known. *ACS* **146:** 213. *Berichte* **43:** 2624-30 (1910).

PHENYLHYDRAZINE $C_6H_5NHNH_2$

Lead Dioxide	See LEAD DIOXIDE plus Phenylhydrazine.

n-PHENYLHYDROXYLAMINE HYDROCHLORIDE

$C_6H_5NHOH•HCl$

(self-reactive)	In an attempt to stabilize some phenylhydroxylamine for safekeeping, 700 grams were made into the hydrochloride, but after it had been in the laboratory about two weeks, it exploded with considerable force. *Wallace* (1966).

PHENYL ISOCYANATE C_6H_5NCO

Cobalt Pentammine Triazo Perchlorate and Nitrosyl Perchlorate.	The reaction mixture was stirred and proceeded normally for 2-3 minutes. When stirring was interrupted, the mixture exploded. *Chem. Eng. News* **46** (8): 39 (1968).

PHENYLLITHIUM C_6H_5Li

Air	Phenyl lithium is spontaneously flammable in air. *Ellern* (1961).
Nitrous Oxide	The reaction of phenyl-lithium produces unstable lithium phenylazoxide as a product. *Mellor* **2, Supp. 2:** 93 (1961).

1-PHENYL-2-METHYL-PROPYL ALCOHOL

(See 2-METHYL-3-PHENYL-1-PROPANOL)

PHENYLSILVER C_6H_5Ag

(self-reactive)	Phenyl silver is explosive at room temperature. *Coates,* p. 173 (1956).

PHENYL SULFIDE SALTS

Diazonium Salts	See DIAZONIUM SALTS plus Thiophenates.

PHENYLVANADOCENE $(C_5H_5)_2VC_6H_5$

Air	Phenyl dicyclopentadienyl vanadium is spontaneously flammable in air.

Zeiss, p. 234 (1960).

PHOSGENE $OCCl_2$

Aluminum	See ALUMINUM plus Phosphorus Trichloride.
tert-Butyl Azidoformate	See tert-BUTYL AZIDOFORMATE plus Phosgene.
2, 4-Hexadiyn-1, 6-Diol	Phosgene and 2, 4-hexadiyn-1, 6-diol react to form 2, 4-hexadiyn-1, 6-bischloroformate, which is a shock-sensitive compound.
	P. E. Driedger and H. V. Isaacson, *Chem. Eng. News* **50** (12): 51 (1972).
Isopropyl Alcohol	See ISOPROPYL ALCOHOL plus Phosgene.
Potassium	See POTASSIUM plus Phosgene.
Sodium	See SODIUM plus Phosgene.

PHOSPHAM PN_2H

Air	Phospham ignites in air at slightly elevated temperatures and burns with a white flame.
	H. Rose, *Ann. Phys.* **52:** 62 (1841).
Cupric Oxide	A mixture of phospham and cupric oxide or mercuric oxide decomposes with incandescence.
	Wohler & Liebig, *Ann. Chem.* **11:** 139 (1834).
Mercuric Oxide	See PHOSPHAM plus Cupric Oxide.
Nitrates	See NITRATES plus Phospham.
Nitrogen Dioxide	Phospham ignites in nitrogen dioxide (nitrogen peroxide) vapors.
	H. Rose, *Ann. Phys.* **24:** 308 (1832).

PHOSPHATES

Magnesium	See MAGNESIUM plus Phosphates.

PHOSPHIDES

(See specific phosphides as primary entries or see under other reactants)

PHOSPHINE PH_3

Air	Dry phosphine is spontaneously flammable in cold air.
	H. Rose, *Ann. Phys.* **14:** 183 (1828). *Z. Anorg. Chemie* **180:** 32. *Handbook Chem. Phys.* **40:** 582 (1958). *MCA Case History* **1066** (1965).
	See also PHOSPHINES plus Air.
Boron Trichloride	See BORON TRICHLORIDE plus Nitrogen Peroxide.
Bromine	See BROMINE plus Phosphine.
Chlorine	See BROMINE plus Phosphine.
Chlorine Monoxide	See CHLORINE MONOXIDE plus Phosphine.
Mercuric Nitrate	See MERCURIC NITRATE plus Phosphine.
Nitric Acid	Phosphine is violently decomposed by concentrated nitric acid, and flame is produced.
	Warm fuming nitric acid, dropped in a container of phosphine gas, produces an explosion.
	T. Graham, *Edin. Roy. Soc.* **13:** 88 (1835).
Nitric Oxide	Phosphine plus nitric oxide can be ignited by the addition of oxygen.
	Berzelius **1, i:** 485 (1825).
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Nitrogen Trioxide	See NITROGEN TRIOXIDE plus Phosphine.
Nitrous Acid	Phosphine gas ignites spontaneously if a trace of nitrous acid is added.
	T. Graham, *Edin. Roy. Soc.* **13:** 88 (1835).
Nitrous Oxide	A mixture of nitrous oxide and phosphine can be exploded by a spark.

	Comp. Rend. **18:** 652.
Oxygen	See OXYGEN plus Phosphine.
Potassium and Ammonia	See POTASSIUM plus Phosphine and Ammonia.
Silver Nitrate	See SILVER NITRATE plus Phosphine.

PHOSPHINES PH_3; P_2H_4; $(P_2H_4)_3$; PxHy

(self-reactive)	The higher phosphines (beyond Diphosphine) decompose rapidly in light at room temperature.
	Mellor **8, Supp. 3:** 274 (1971).
Air	If the P_2H_4 is removed by passing the PH_3 and P_2H_4 through concentrated sulfuric acid, the P_2H_4 does not catch fire in air below 150¡C. The PH_3 is spontaneously flammable in cold air. Solid $(P_2H_4)_3$ ignites at 160¡C.
	Z. Anorg. Chemie **180:** 32. *Handbook Chem. Phys.* **40th Ed.:** 582 (1958).

PHOSPHONITRILE AZIDE-TRIMER

(self-reactive)	This is a highly explosive compound, readily detonated by friction.
	Mellor **8, Supp. 2:** 23 (1967).

PHOSPHONIUM IODIDE PH_4I

Bromates	See BROMATES plus Phosphonium Iodide.
Bromic Acid	Phosphonium iodide ignites at ordinary temperatures in contact with bromic, chloric or iodic acid.
	Ann. Chim. et Phys. (2) **47:** 87.
Chlorates	See PHOSPHONIUM IODIDE plus Bromates.
Chloric Acid	See PHOSPHONIUM IODIDE plus Bromic Acid.

Iodates	See PHOSPHONIUM IODIDE plus Bromates.
Iodic Acid	See PHOSPHONIUM IODIDE plus Bromic Acid.
Nitric Acid	Phosphonium iodide ignites spontaneously when mixed with nitric acid at ordinary temperatures. *Ann. Chim. et Phys.* (2) **47:** 87.
Silver Nitrate	Phosphonium iodide reacts vigorously with dry silver nitrate with development of much heat. *Ann. Chim. et Phys.* (2) **47:** 87.

PHOSPHONIUM PERCHLORATE $2PH_3 \cdot 3HClO_4$

(self-reactive)	Violent explosions have occurred in spite of every precaution. *Helv. Chim. Acta* **17:** 222-4 (1934). This is a very explosive salt and cannot be dried. *Mellor* **8, Supp. 3:** 274 (1971).

PHOSPHORIC ANHYDRIDE P_2O_5

(See PHOSPHORUS PENTOXIDE)

PHOSPHORUS P

Air	White (yellow) phosphorus ignites spontaneously in air — even in a rarefied atmosphere. A. D. Backe, *Schweigger's Jour.* **63:** 478 (1831). *Latimer and Hildebrand*, p. 210 (1940).
Alkaline Hydroxides	Phosphorus boiled with alkaline hydroxides yields mixed phosphines which may ignite spontaneously in air. *Z. Anorg. Chemie* **121:** 73. *Sidgwick* **1:** 729 (1950). See PHOSPHORUS plus Potassium Hydroxide.
Ammonium Nitrate	A mixture of white (or yellow) phosphorus and ammonium

	nitrate can be exploded by percussion.
	J. W. Slater, *Chem. Gaz.* **11:** 329 (1853).
Antimony Pentafluoride	Phosphorus ignites in contact with antimony pentafluoride.
	Mellor **9:** 467 (1946-1947).
Barium Bromate	See PHOSPHORUS plus Bromates.
Barium Chlorate	See PHOSPHORUS plus Bromates.
Barium Iodate	See PHOSPHORUS plus Bromates.
Beryllium	See BERYLLIUM plus Phosphorus.
Boron Triiodide	See BORON TRIIODIDE plus Phosphorus. White or red phosphorus and boron triiodide react with incandescence.
	Mellor **5:** 136 (1946-1947).
Bromates	A combination of finely divided phosphorus with finely divided bromates (also chlorates or iodates) of barium, calcium, magnesium, potassium, sodium, or zinc will explode with heat, percussion, and, sometimes, light friction.
	Mellor **2:** 310 (1946-1947).
Bromine	See BROMINE plus Phosphorus.
Bromine Trifluoride	See ANTIMONY plus Bromine Trifluoride.
Bromoazide	See ANTIMONY plus Bromoazide.
Calcium Bromate	See PHOSPHORUS plus Bromates.
Calcium Chlorate	See PHOSPHORUS plus Bromates.
Calcium Iodate	See PHOSPHORUS plus Bromates.
Cerium	See CERIUM plus Phosphorus.
Cesium	Phosphorus reacts vigorously below 250¡C with any of the following materials: cesium, lithium, potassium, rubidium, sodium, sulfur.
	Mellor **8, Supp. 3:** 228 (1971).
Cesium Acetylene	Cesium acetylene carbide becomes incandescent

Carbide	when warmed in contact with phosphorus.
	Mellor **5:** 848-50 (1946-1947).
Cesium Nitride	See CESIUM NITRIDE plus Air.
Charcoal and Air	Phosphorus sprinkled with animal charcoal ignites at 15.5¡C. in the open air.
	Mellor **8:** 771 (1946-1947).
Chlorates	A mixture of red phosphorus and chlorates bursts into flames after a few moments. Moist chlorates explode on contact with white phosphorus.
	Mellor **2, Supp. 1:** 584 (1956).
	See PHOSPHORUS plus Bromates. See PHOSPHORUS plus Potassium Chlorate.
Chlorine	Phosphorus burns spontaneously in gaseous chlorine.
	Mellor **2:** 92, 95; **9:** 626 (1946-1947).
	Phosphorus (white or yellow) burns in chlorine gas with a pale green light. Red phosphorus reacts with chlorine at ordinary temperatures. Finely divided red phosphorus ignites spontaneously in chlorine at ordinary temperatures.
	Moissan, p. 125 (1900).
	The reaction of phosphorus and chlorine, fluorine, or bromine is highly exothermic.
	All can explode in contact with white phosphorus.
	Mellor **8, Supp. 3:** 228 (1971).
	The reaction of white phosphorus and liquid chlorine is explosive.
	Mellor **2, Supp. 1:** 379 (1956).
Chlorine Dioxide	Phosphorus ignites spontaneously in chlorine dioxide and may explode.
	Mellor **2:** 289 (1946-1947).
Chlorine and Heptane	Flaming occurs when liquid chlorine in heptane is added to red phosphorus at 0¡ C.

	Mellor **2, Supp. 1:** 379 (1956).
Chlorine Monoxide	See POTASSIUM plus Chlorine Monoxide.
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Chlorine Trioxide	Ordinary phosphorus (white or yellow) reacts explosively with chlorine trioxide.
	Ann. Chim. et Phys. (3) **7:** 298.
Chlorosulfonic Acid	Yellow phosphorus reacts feebly with chlorosulfonic acid if cold. At temperatures from 25¡ to 30¡ C., the reaction begins vigorously (with evolution of hydrogen chloride and sulfur dioxide) and ends with an explosion. With red phosphorus a higher temperature is necessary to start the reaction.
	Berichte **15:** 417.
Chromic Acid	See PHOSPHORUS plus Chromium Trioxide.
Chromic Anhydride	See PHOSPHORUS plus Chromium Trioxide.
Chromium Trioxide	Phosphorus reacts explosively with molten chromium trioxide.
	Ann. Chim. et Phys. (6) **5:** 468.
	Mellor **11:** 234 (1946-1947).
Chromyl Chloride	Chromyl chloride explodes with moistened phosphorus. (Light is emitted at the same time.)
	Ann. Chim. et Phys. (2) **31:** 435. *Comp. Rend.* **5:** 753. T. Thomson, *Phil. Trans. Roy. Soc. London* **117:** 195 (1827).
Copper	See COPPER plus Phosphorus.
Cyanogen Iodide	Phosphorus (molten) plus cyanogen iodide reacts with incandescence to produce phosphorus iodide.
	F. Wohler, *Gilbert's Ann.* **69:** 281 (1821).
Fluorine	See FLUORINE plus Phosphorus.
Iodates	See PHOSPHORUS plus Bromates. See PHOSPHORUS plus Potassium Iodate.
Iodine	See IODINE plus Phosphorus.
Iodine Monobromide	Phosphorus reacts violently with molten iodine

	monobromide or iodine monochloride.
	Mellor **8, Supp. 3:** 264.
Iodine Monochloride	See PHOSPHORUS plus Iodine Monobromide.
Iodine Pentafluoride	See ARSENIC plus Iodine Pentafluoride.
Iron	See COPPER plus Phosphorus.
Lanthanum	See CERIUM plus Phosphorus.
Lead Dioxide	When lead dioxide and red phosphorus are ground the mass ignites; with yellow phosphorus, there is an explosion.
	Mellor **7:** 690 (1946-1947).
Lithium	See LITHIUM plus Arsenic. See also PHOSPHORUS plus Cesium.
Lithium Carbide	A mixture of lithium carbide and phosphorus burns if the mixture is warm.
	Mellor **5:** 848 (1946-1947).
Lithium Silicide	Lithium silicide attacks phosphorus, selenium or tellurium with incandescence.
	Mellor **6:** 169 (1946-1947).
Magnesium Bromate	See PHOSPHORUS plus Bromates.
Magnesium Chlorate	See PHOSPHORUS plus Bromates.
Magnesium Iodate	See PHOSPHORUS plus Bromates.
Magnesium Perchlorate	A student was injured by an explosion when he attempted to mix these two chemicals in the laboratory.
	1965 Sum. Serious Acc. (1966).
Manganese	See MANGANESE plus Phosphorus.
Mercuric Oxide	A mixture of mercuric oxide and phosphorus explodes when struck with a hammer and when boiled with water and phosphorus.
	Mellor **4:** 778 (1946-1947).
Mercurous Nitrate	A mixture of mercurous nitrate and phosphorus explodes violently when struck with a hammer.

	Mellor **4:** 987 (1946-1947).
Neodymium	See NEODYMIUM plus Phosphorus.
Nickel	See COPPER plus Phosphorus.
Nitrates	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Nitric Acid	Phosphorus ignites in the vapor of nitric acid and burns with an intense white light.
	Berrere & Moutet, *Symposium Comb.* (**Fifth**)**:** 170-81 (1954).
Nitrogen Bromide	Nitrogen bromide explodes violently in contact with phosphorus.
	Mellor **8, Supp. I, Part 2:** 707 (1964).
Nitrogen Dioxide	See MAGNESIUM plus Nitrogen Dioxide.
Nitrogen Tribromide	See ARSENIC plus Nitrogen Tribromide.
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Nitrosyl Fluoride	See BORON plus Nitrosyl Fluoride.
Nitryl Fluoride	Red phosphorus and nitryl fluoride react at room temperature.
	Mellor **8, Supp. 3:** 264 (1971).
Oxygen	Phosphorus and oxygen or iodine undergo a vigorous reaction at room temperature.
	Mellor **8, Supp. 3:** 228 (1971).
Performic Acid	Red phosphorus is violently oxidized by performic acid.
	Grignard **11:** 179 (1935-1954).
	Berichte **48:** 1139 (1915).
Platinum	See COPPER plus Phosphorus.
Potassium	See PHOSPHORUS plus Cesium.
Potassium Bromate	See PHOSPHORUS plus Bromates.
Potassium Chlorate	If a drop of solution of phosphorus in carbon disulfide is placed on powdered potassium chlorate, an explosion

	occurs as the solvent evaporates.
	R. Bottger, *Repert. Pharm.* **24:** 725 (1875).
	Ellern, p. 50 (1968).
	See also PHOSPHORUS plus Bromates.
Potassium Hydroxide	When phosphorus is boiled with a solution of sodium or potassium hydroxide, phosphine gas is evolved which is spontaneously flammable.
	Mellor **8:** 804-5 (1946-1947).
	See PHOSPHORUS plus Alkaline Hydroxides.
Potassium Iodate	If red or white phosphorus is mixed with potassium iodate and moistened with a few drops of water, the mixture reacts violently, sometimes explosively.
	J. Am. Chem. Soc. **49:** 9 (1927).
	See also PHOSPHORUS plus Bromates.
Potassium Nitride	Potassium nitride unites with sulfur or phosphorus when heated, forming a highly flammable mixture.
	Mellor **8:** 99 (1946-1947).
Potassium	Crystals of potassium permanganate explode
Permanganate	vigorously when ground with phosphorus.
	Mellor **12:** 322 (1946-1947).
Potassium Peroxide	A mixture of phosphorus and potassium peroxide causes fire or explosion.
	Mellor **2:** 490-93 (1946-1947). *Von Schwartz*, p. 328 (1918).
Rubidium	See PHOSPHORUS plus Cesium.
Rubidium Acetylene	Rubidium acetylene carbide ignites in contact
Carbide	with molten sulfur. It becomes incandescent when warmed in contact with phosphorus.
	Mellor **5:** 849 (1946-1947).
Selenium Monochloride	White phosphorus mixed with selenium monochloride explodes.

	Mellor **8, Supp. 3:** 264 (1971).
Selenium Oxychloride	Red phosphorus reacts in the cold with selenium oxychloride evolving light and heat; white phosphorus reacts explosively.
	Mellor **10:** 906 (1946-1947).
Selenium Oxyfluoride	This mixture ignites spontaneously.
	Mellor **8, Supp. 3:** 264 (1971).
Selenium Tetrafluoride	This mixture produces a violent reaction.
	Mellor **8, Supp. 3:** 264 (1971).
Silver Nitrate	A mixture of silver nitrate and phosphorus explodes violently when struck with a hammer.
	Mellor **3:** 470 (1946-1947).
Silver Oxide	When amorphous phosphorus is ground with silver oxide, the mixture ignites.
	Mellor **3:** 377 (1946-1947).
Sodium	See PHOSPHORUS plus Cesium.
Sodium Bromate	See PHOSPHORUS plus Bromates.
Sodium Carbide	Sodium carbide burns vigorously in phosphorus vapor.
	Mellor **5:** 848-50 (1946-1947).
Sodium Chlorate	See PHOSPHORUS plus Bromates.
Sodium Chlorite	Red phosphorus and sodium chlorite react in aqueous suspension in a strongly exothermic manner. The reaction can have a sudden, almost explosive stage.
	Mellor **8, Supp. 3:** 645 (1971).
Sodium Hydroxide	See PHOSPHORUS plus Potassium Hydroxide and PHOSPHORUS plus Alkaline Hydroxides.
Sodium Iodate	See PHOSPHORUS plus Bromates.
Sodium Peroxide	Phosphorus and sodium peroxide react with flame or explosion.
	Mellor **2:** 490-93 (1946-1947). *Von Schwartz,* p. 328 (1918).

Sulfur	When a mixture of sulfur and yellow phosphorus is warmed, the two elements unite in all proportions with vivid combustion and powerful explosions.
	Ann. Chim. et Phys. (1) **4:** 1. *Ann. Chim. et Phys.* (2) **67:** 332. *Comp. Rend.* **96:** 1499, 1771. R. Bottger, *J. Prakt. Chem.* (1) **12:** 357 (1837).
	See PHOSPHORUS plus Cesium.
Sulfur Trioxide	Yellow phosphorus ignites after exposure to the vapor of sulfur trioxide. A piece of phosphorus dropped into liquid sulfur trioxide reduces the latter with violence. When the pieces of phosphorus are large, the heat raises the temperature of the phosphorus sufficiently to cause ignition.
	F. C. Vogel, *Schweigger's Jour.* **4:** 121 (1812).
Sulfuric Acid	Yellow phosphorus ignites when placed in boiling concentrated sulfuric acid.
	A. Oppenheim, *Bull. Soc. Chim.* (2) **1:** 163 (1864).
Thorium	When thorium is heated with phosphorus, they unite with incandescence.
	J. J. Berzelius, *Svenska Akad.*, p. 1 (1829).
Vanadium	This mixture produces an explosive reaction
Oxytrichloride	below 100¡ C with more than small amounts.
	Mellor **8, Supp. 3:** 264 (1971).
Zinc Bromate	See PHOSPHORUS plus Bromates.
Zinc Chlorate	See PHOSPHORUS plus Bromates.
Zinc Iodate	See PHOSPHORUS plus Bromates.
Zirconium	Phosphorus and zirconium react with incandescence when heated in a vacuum.
	Mellor **7:** 114-16 (1946-1947).

PHOSPHORUS CYANIDE P_3CN

Air	This very reactive cyanide ignites in air when touched with

	a warm rod.
	Mellor **8, Supp. 3:** 583 (1971).
Water	Phosphorus cyanide reacts violently with water.
	Mellor **8, Supp. 3:** 583 (1971).

PHOSPHORUS HEXAOXYTETRASULFIDE $P_4O_6S_4$

Water	This sulfide decomposes rapidly in moist air.
	Mellor **8, Supp. 3:** 437 (1971).

PHOSPHORUS ISOCYANATE P_3OCN

Acetaldehyde	Phosphorus isocyanate and acetaldehyde, acetic acid, silver nitrate, or sulfuric acid react violently.
	Mellor **8, Supp. 3:** 585 (1971).
Acetic Acid	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.
Chlorine	See CHLORINE plus Phosphorus Isocyanate.
Silver Nitrate	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.
Sulfuric Acid	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.
Water	The hydrolysis of phosphorus isocyanate is rapid.
	Mellor **8, Supp. 3:** 585 (1971).

PHOSPHORUS OXIDE P_2O_3

(See PHOSPHORUS TRIOXIDE)

PHOSPHORUS PENTACHLORIDE PCl_5

Chlorine Trioxide	See CHLORINE TRIOXIDE plus Phosphorus Pentachloride.
Fluorine	See FLUORINE plus Phosphorus Pentachloride.

Hydroxylamine	See PHOSPHORUS TRICHLORIDE plus Hydroxylamine.
Magnesium Oxide	These materials react with brilliant incandescence.
	Mellor **8:** 1016 (1946-1947).
Phosphorus Trioxide	See PHOSPHORUS TRIOXIDE plus Phosphorus Pentachloride.
Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Phosphorus Pentachloride.
	See SODIUM plus Cobaltous Bromide.
Water	Phosphorus pentachloride reacts violently with water.
	Oldbury Chemicals, p. 9.

PHOSPHORUS PENTASULFIDE P_2S_5

Water	Phosphorus pentasulfide heats spontaneously, and may ignite, in the presence of moisture.
	Haz. Chem. Data (1969).

PHOSPHORUS PENTOXIDE P_2O_5

Ammonia	Reaction of phosphorus pentoxide and ammonia is rapid, contrary to older reports.
	Mellor **8, Supp. 1:** 331 (1964).
	This is a vigorous reaction.
	Mellor **8, Supp. 3:** 403 (1971).
Calcium Oxide	See CALCIUM OXIDE plus Phosphorus Pentoxide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Hydrogen Fluoride	Phosphorus pentoxide unites with hydrogen fluoride vigorously, even at 19.5¡ C.
	G. Gore, *Proc. Roy. Soc.* **17:** 256 (1869).
Oxygen Difluoride	See OXYGEN DIFLUORIDE plus Aluminum Chloride.

Perchloric Acid	See PERCHLORIC ACID plus Sulfuric Acid.
Perchloric Acid and Chloroform	A violent explosion occurs if a solution of perchloric acid in chloroform is poured on phosphorus pentoxide.
	J. Am. Chem. Soc. **23:** 444 (1901).
Potassium	See POTASSIUM plus Phosphorus Pentoxide.
Propargyl Alcohol	Addition of phosphorus pentoxide to propargyl alcohol caused the alcohol to burst into flame.
	Monroe (1966).
Sodium	See POTASSIUM plus Phosphorus Pentoxide.
Sodium Carbonate	See SODIUM CARBONATE plus Phosphorus Pentoxide.
Sodium Hydroxide	See CALCIUM OXIDE plus Phosphorus Pentoxide.
Water	Phosphorus pentoxide reacts violently with water.
	Oldbury Chemicals, p. 9.
Water and Organic Matter	Mixed with water and combustible material, phosphoric anhydride produces great heat and often ignites the combustible material.
	Chem. Safety Data Sheet **SD-23:** 3 (1948).

PHOSPHORUS TETRATRIIODIDE

(See TETRAPHOSPHORUS TRIIODIDE)

PHOSPHORUS TETRAOXYTRISULFIDE $P_4O_4S_3$

Water	The sulfide ignites if moistened with a little water.
	Mellor **8, Supp. 3:** 437 (1971).

PHOSPHORUS TETRATRISELENIDE

(See TETRAPHOSPHORUS TRISELENIDE)

PHOSPHORUS TRIBROMIDE PBr_3

Potassium	See POTASSIUM plus Boron Tribromide.
Ruthenium Tetroxide	See RUTHENIUM TETROXIDE plus Phosphorus Tribromide.
Sodium	See SODIUM plus Phosphorus Tribromide.
	See SODIUM plus Cobaltous Bromide.

PHOSPHORUS TRICHLORIDE PCl_3

Acetic Acid	Several laboratory explosions have occurred using this reaction to form acetyl chloride. Poor heat control probably caused formation of phosphine.
	J. Am. Chem. Soc. **60:** 488 (1938).
Aluminum	See ALUMINUM plus Phosphorus Trichloride.
Chromyl Chloride	See CHROMYL CHLORIDE plus Phosphorus Trichloride.
Diallyl Phosphite and	See DIALLYL PHOSPHITE plus Allyl
Allyl Alcohol	Alcohol and Phosphorus Trichloride.
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
Fluorine	See FLUORINE plus Phosphorus Trichloride.
Hydroxylamine	Ignition occurs when hydroxylamine is mixed with phosphorus trichloride or phosphorus pentachloride.
	Mellor **8:** 290 (1946-1947).
Iodine Monochloride	See IODINE MONOCHLORIDE plus Phosphorus Trichloride.
Lead Dioxide	See LEAD DIOXIDE plus Phosphorus Trichloride.
Nitric Acid	An explosion occurs when phosphorus trichloride is brought in contact with nitric or nitrous acid.
	Comp. Rend. **28:** 86.
Nitrous Acid	See PHOSPHORUS TRICHLORIDE plus Nitric Acid.
Organic Matter	See PHOSPHORUS OXYCHLORIDE plus Organic

	Matter.
Potassium	See POTASSIUM plus Phosphorus Trichloride.
Sodium	See SODIUM plus Phosphorus Trichloride.
Water	The reaction between water and phosphorus trichloride is extremely violent. The reaction may be due to the formation of phosphine or elemental phosphorus. The possible presence of hydrogen may intensify these flashes of fire.
	Chem. Safety Data Sheet **SD-27** (1948).

PHOSPHORUS TRIFLUORIDE PF_3

Diborane	The reaction product of this combination, borane-phosphorus trifluoride compound, is spontaneously flammable in air.
	Mellor **8, Supp. 3:** 442 (1971).
Fluorine	See FLUORINE plus Phosphorus Trifluo ride.
Oxygen	See OXYGEN plus Phosphorus Trifluoride.

PHOSPHORUS TRIFLUORIDE-BORANE COMPOUND H_3BPF_3

(self-reactive)	See PHOSPHOROUS TRIFLUORIDE plus Diborane.

PHOSPHORUS TRIOXIDE P_4O_6

Air	Melted phosphorus trioxide readily ignites in air. When thrown into oxygen (heated to 50-60¡ C.), it instantly ignites with a flame of almost blinding brilliance.
	W.E. Downey, *J. Chem. Soc.* **125:** 347 (1924).
Ammonia	If ammonia is passed over phosphorus trioxide, which has been melted by the warmth of the hand, a somewhat violent reaction occurs and the mass ignites. The reaction is slow if the materials are kept cold.
	Thorpe and Tutton, *J. Chem. Soc.* **59:** 1019 (1891). *Mellor*

	8: 898 (1946-1947).
Arsenic Trifluoride	See ARSENIC TRIFLUORIDE plus Phosphorus Trioxide.
Bromine	See BROMINE plus Phosphorus Trioxide. See also CHLORINE plus Phosphorus Oxide.
Chlorine	See BROMINE plus Phosphorus Trioxide. See also CHLORINE plus Phosphorus Oxide.
Dimethyl Formamide	See DIMETHYL FORMAMIDE plus Phosphorus Trioxide.
Dimethyl Sulfoxide	See DIMETHYL FORMAMIDE plus Phosphorus Trioxide.
Dimethyl Sulfite	See DIMETHYL FORMAMIDE plus Phosphorus Trioxide.
Methanol	See DIMETHYL FORMAMIDE plus Phosphorus Trioxide.
Oxygen	See PHOSPHORUS TRIOXIDE plus Air.
Phosphorus Pentachloride	The reaction between phosphorus trioxide and phosphorus pentachloride is violent at ordinary temperatures.
	Thorpe and Tutton, *J. Chem. Soc.* **57:** 545 (1890).
Sulfur	See SULFUR plus Phosphorus Trioxide.
Sulfur Monochloride	Sulfur monochloride acts with great violence on phosphorus trioxide.
	Thorpe and Tutton, *J. Chem. Soc.* **59:** 1019 (1891). *Mellor* **8:** 898 (1946-1947).
Water	With quantities of phosphorus trioxide exceeding a couple of grams, hot water produces a violent explosion.
	Thorpe and Tutton, *J. Chem. Soc.* **59:** 1019 (1891). *Mellor* **8:** 897 (1946-1947).

PHOSPHORYL BROMODIFLUORIDE $POBrF_2$

Water	See PHOSPHORYL FLUORIDE plus Water.

PHOSPHORYL CHLORIDE $POCl_3$

Boron Triiodide	Phosphoryl chloride and boron triiodide react vigorously.
	Mellor **5:** 136 (1946-1947).
2,5-Dimethylpyrrole and Dimethyl Formamide	See 2,5-DIMETHYLPYRROLE plus Phosphorus Oxychloride and Dimethyl Formamide.
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
Organic Matter	Fibrous organic matter (wood, etc.), when dry, readily absorbs phosphorus oxychloride. When thus absorbed, it may constitute a fire hazard. Both phosphorus oxychloride and phosphorus trichloride are strongly corrosive and may set fire to combustible material.
	Chem. Safety Data Sheet **SD-26** (1948). B. L. Heustis, *Safety Eng.* **54:** 95 (1927).
Sodium	See SODIUM plus Phosphoryl Chloride.
Water	When water reacts with phosphorus oxychloride, there is little warning; first a little bubbling and then a rapid acceleration and pressure increase. Small quantities of phosphorus oxychloride were emptied into a scrap nickel drum containing about 28 pounds of water. After a delay of 15 to 30 minutes, the drum exploded.
	MCA Task Group, POCl (Jan. 19, 1967).
	MCA Case History **1274** (1967). *MCA Case History* **793** (1962). *Chem. Safety Data Sheet* **SD-26** (1948).

PHOSPHORYL CHLORODIFLUORIDE $POClF_2$

Water	See PHOSPHORYL FLUORIDE plus Water.

PHOSPHORYL DIBROMOFLUORIDE $POBr_2F$

Water	See PHOSPHORYL FLUORIDE plus Water.

PHOSPHORYL DICHLOROFLUORIDE $POCl_2F$

Water | See PHOSPHORYL FLUORIDE plus Water.

PHOSPHORYL FLUORIDE POF_3

Water | The hydrolysis of phosphoryl fluoride and the halofluorides (phosphoryl chlorodifluoride, phosphoryl dichlorofluoride, phosphoryl bromodifluoride, and phosphoryl dibromofluoride) is a vigorous reaction.

Mellor **8, Supp. 3:** 458 (1971).

PHTHALIC ACID $HOCOC_6H_4COOH$

Nitric Acid | See PHTHALIC ANHYDRIDE plus Nitric Acid.

PHTHALIC ANHYDRIDE

Nitric Acid | The exothermic nitration of phthalic acid or phthalic anhydride by a fuming nitric acid — sulfuric acid mixture may give mixtures of the potentially explosive phthaloyl nitrates or nitrites or their nitro derivatives. Formation of these compounds may be avoided if the nitrating mixture is extensively diluted with sulfuric acid and if a small (1.5 mole equivalent) of nitric acid is present.

Chem. & Ind. **20:** 790 (1972). *Chem. & Ind.* **17:** 664 (1972).

PICRATES

(See also specific picrates as primary entries and under other reactants.)

Sulfuric Acid	See SULFURIC ACID plus Carbides.

PICRIC ACID $(NO_2)_3C_6H_2OH$

Ammonia	Ammonia and metals with picric acid give results similar to bases.
	Military Explosives.
	See also PICRIC ACID plus Bases.
Bases	Picric acid and bases form explosive salts. The salts with heavy metals (e.g., lead) are very sensitive to primary explosives.
	Davis, pp. 164-68 (1943).
Concrete	Contact between picric acid and concrete floors leads to the formation of more explosion-sensitive salts, such as calcium picrate.
	Urbanski **1:** 518 (1964).
Metals	See PICRIC ACID plus Bases.

PLATINUM Pt

Bromine Trifluoride	Platinum is attacked by bromine trifluoride at
and Potassium	280¡ C in presence of potassium fluoride.
Fluoride	*Mellor* **2, Supp. 1:** 164 (1956).
Hydrogen and Oxygen	See HYDROGEN plus Oxygen and Platinum.
Hydrogen Peroxide	A little platinum black dropped into a hydrogen peroxide solution may cause an explosion.
	Mellor **1:** 936 (1946-1947).
Lithium	See LITHIUM plus Platinum.
Oxygen Difluoride	See IRIDIUM plus Oxygen Difluoride.
Permonosulfuric Acid	The decomposition of 92 per cent permonosulfuric acid is explosive in the presence of smooth or finely divided platinum, manganese dioxide or silver.

Mellor **10:** 483 (1946-1947).

Phosphorus	See COPPER plus Phosphorus.

PLATINIC BROMIDE $PtBr_4$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Platinic Bromide.

PLATINIC CHLORIDE $PtCl_4$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Platinic Bromide.

PLATINOUS HYPOPHOSPHITE $Pt(PH_2O_2)_2$

(self-reactive)	Platinous hypophosphite liberates spontaneously flammable phosphine above 130¡ C. *Mellor* **8:** 890 (1946-1947).

PLATINUM-AMMINE NITRATES

(self-reactive)	Platinum-amine nitrates may be impact-sensitive. $Pt(NH_3)_2NO_3$ and $Pt(NH_3)_4(OH)_2$ $(NO_3)_2$ detonate when heated. *Mellor* **16:** 412 (1946-1947).

PLATINUM-AMMINE PERCHLORATES

(self-reactive)	Platinum-ammine perchlorates may be impact-sensitive. *Mellor* **16:** 412 (1946-1947).

PLUTONIUM Pu

Air	See PLUTONIUM plus Water.
Carbon Tetrachloride	Plutonium metal chips degreased in carbon tetrachloride and allowed to drain for five minutes ignited spontaneously. When the burning chips were inadvertently

	dropped into the carbon tetrachloride container, an explosion resulted.
	Ser. Acc. Series No. **246** (1965).
Water	Pyrophoric products form on plutonium and particularly on certain alloys if they are stored for long periods in closed containers. When a container is opened, spontaneous ignition may occur. Plutonium corrosion is accelerated by atmospheric moisture and a hydride is formed. This corrosion also occurs in moist inert gases. The corrosion products are frequently pyrophoric.
	Wick, pp. 148-152, 331-332, 338 (1967).

PLUTONIUM HYDRIDE PuH_2

Air	Plutonium hydride in some forms is spontaneously flammable in air. See also PLUTONIUM plus Carbon Tetrachloride and PLUTONIUM plus Water.
	Chem. Eng. News **36** (8): 64 (1958).

POLYAMIDE

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

POLYCHLORINATED BIPHENYL

Chlorine	See CHLORINE plus Polychlorinated Biphenyl.

POLYCHLOROPRENE

(See NEOPRENE)

POLYDIMETHYLSILOXANE $[-Si(CH_3)_2O-]_x$

Chlorine	See CHLORINE plus Polypropylene.

POLYETHYLENE

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

POLYISOBUTYLENE $[CH_2{=}C(CH_3)_2]_x$

Silver Peroxide	See SILVER PEROXIDE plus Polyisobutylene.

POLYMETHYLMETHACRYLATE

(See METHYL METHACRYLATE POLYMER)

POLYPHOSPHORYL CHLORIDES

Water	These polymers hydrolyze violently. *Mellor* **8, Supp. 3:** 507 (1971).

POLYPROPYLENE $(CH_2{=}CHCH_3)_x$

Chlorine	See CHLORINE plus Polypropylene.
Potassium Permanganate	See POTASSIUM PERMANGANATE plus Polypropylene.

POLYSULFIDE POLYMERS

Calcium Peroxide	See CALCIUM PEROXIDE plus Polysulfide Polymers.

POLYTETRAFLUOROETHYLENE

(See TETRAFLUOROETHYLENE POLYMER)

POLYURETHANE

Fluorine and Oxygen	See FLUORINE plus Solid Nonmetals and Oxygen.

POLYVINYLCHLORIDE ACETATE

(See VINYL ACETATE-CHLORIDE COPOLYMER)

POTASSIOPHOSPHINE KPH_2

(See POTASSIUM DIHYDROPHOSPHIDE)

POTASSIUM K

(See IODINE plus Lithium)

Acetylene	Molten potassium ignites in acetylene.
	M. Berthelot, *Bull. Soc. Chim.* (2) **5:** 188 (1866).
Air	The oxidation of potassium may proceed so rapidly that the heat generated melts and ignites the metal. This is particularly the case where pressure is applied at ordinary temperatures; the metal then liquefies where the pressure is applied, and takes fire.
	Sidgwick **1** (1950).
	Potassium burns in moist air at room temperature.
	Mellor **2:** 468 (1946-1947).
	Potassium is spontaneously flammable in air at room temperature if the surface of the metal is clean.
	Mellor **2:** 468 (1946-1947).
	The higher oxides of potassium, formed in air, react explosively with pure potassium, sodium, sodium-potassium alloys, and organic matter.
	Mellor **2, Supp. 3:** 1559 (1963).
Aluminum Bromide	A mixture of potassium and any of the following metallic halides produces a strong explosion on impact: aluminum bromide, aluminum chloride, aluminum fluoride, ammonium chlorocuprate, antimony tribromide, antimony trichloride, antimony triiodide, arsenic trichloride, arsenic triiodide, bismuth tribromide, bismuth trichloride, bismuth triiodide, cadmium bromide, cadmium chloride, cadmium iodide, chromium tetrachloride, cupric bromide, cupric

	chloride, cuprous bromide, cuprous chloride, cuprous iodide, manganous chloride, mercuric bromide, mercuric chloride, mercuric fluoride, mercuric iodide, mercurous chloride, nickel bromide, nickel chloride, nickel iodide, silicon tetrachloride, silver fluoride, stannic chloride, stannic iodide (with sulfur), stannous chloride, sulfur dibromide, thallous bromide, vanadium pentachloride, zinc bromide, zinc chloride, and zinc iodide.
	Mellor **2, Supp. 3:** 1571 (1963).
Aluminum Chloride	See POTASSIUM plus Aluminum Bromide.
Aluminum Fluoride	See POTASSIUM plus Aluminum Bromide.
Ammonium Chlorocuprate	See POTASSIUM plus Aluminum Bromide.
Ammonium Bromide	A mixture of potassium and any of the following compounds produces a weak explosion on impact: ammonium bromide, ammonium iodide, cadmium fluoride, chromium trifluoride, manganous bromide, manganous iodide, nickel fluoride, potassium chlorocuprate, silver chloride, silver iodide, strontium iodide, thallous chloride, and zinc fluoride.
	Mellor **2, Supp. 3:** 1571 (1963).
Ammonium Iodide	See POTASSIUM plus Ammonium Bromide.
Ammonium Sulfate and Ammonium Nitrate	A mixture of ammonium sulfate and ammonium nitrate can easily be exploded by potassium or sodium-potassium alloy.
	H. Staudinger, *Z. Elektrokem.* **31:** 549-52 (1925).
Antimony Tribromide	See POTASSIUM plus Aluminum Bromide.
Antimony Trichloride	See POTASSIUM plus Aluminum Bromide.
Antimony Triiodide	See POTASSIUM plus Aluminum Bromide.
Arsenic Trichloride	See POTASSIUM plus Aluminum Bromide.
Arsenic Triiodide	See POTASSIUM plus Aluminum Bromide.
Arsine and Ammonia	Potassium and arsine react vigorously in liquid ammonia at minus 78¡ C. The product reacts vigorously with air.

	Mellor **2, Supp. 3:** 1579 (1963).
Bismuth Tribromide	See POTASSIUM plus Aluminum Bromide.
Bismuth Trichloride	See POTASSIUM plus Aluminum Bromide.
Bismuth Triiodide	See POTASSIUM plus Aluminum Bromide.
Bismuth Trioxide	Potassium reduces heated bismuth trioxide to the metal and the reaction is accompanied by incandescence. Similar results are obtained with sodium.
	Mellor **9:** 649 (1946-1947).
Boric Acid	A mixture of potassium and any of the following compounds may explode on impact: boric acid, copper oxychloride, lead oxychloride, lead peroxide, lead sulfate, silver iodate, sodium iodate, and vanadium oxychloride.
	Mellor **2, Supp. 3:** 1571 (1963).
Boron Tribromide	A mixture of potassium and any of the following halide compounds produces a very violent explosion on impact: boron tribromide, carbon tetrachloride, cobaltous bromide, cobaltous chloride, ferric bromide, ferric chloride, ferrous bromide, ferrous chloride, ferrous iodide, phosphorus pentachloride, phosphorus tribromide and sulfur dichloride.
	Mellor **2, Supp. 3:** 1571 (1963).
Bromine	See BROMINE plus Potassium.
Cadmium Bromide	See POTASSIUM plus Aluminum Bromide.
Cadmium Chloride	See POTASSIUM plus Aluminum Bromide.
Cadmium Fluoride	See POTASSIUM plus Ammonium Bromide.
Cadmium Iodide	See POTASSIUM plus Aluminum Bromide.
Carbon	See POTASSIUM plus Graphite and Potassium Superoxide.
Carbon Dioxide	Mixture of solid forms of potassium and carbon dioxide (as dry ice) explodes when subjected to shock.
	Mellor **2, Supp. 3:** 1568 (1963).
Carbon Disulfide	Heated potassium ignites in the vapor of carbon disulfide. Potassium and carbon disulfide can be exploded by pressure or friction.

	Von Schwartz, p. 327. *Ann. Phys.* **6:** 444 (1826).
Carbon Monoxide and Oxygen	The reaction of potassium and carbon monoxide forms an explosive carbonyl compound, potassium carbonyl, which reacts violently with oxygen.
	Mellor **2, Supp. 3:** 1567 (1963).
	See also SODIUM CARBONYL plus Air.
Carbon Tetrachloride	Potassium and its alloys form explosive mixtures with carbon tetrachloride.
	H.N. Gilbert, *Chem. Eng. News* **26:** 2604 (1948).
	See POTASSIUM plus Boron Tribromide.
Charcoal	Both charcoal and graphite react vigorously with liquid potassium.
	Mellor **2, Supp. 3:** 1566 (1963).
Chlorinated Hydrocarbons	Potassium and its alloys form explosive mixtures with chlorinated hydrocarbons.
	H. N. Gilbert, *Chem. Eng. News* **26:** 2604 (1948).
Chlorine	Potassium burns spontaneously in dry chlorine.
	Mellor **2:** 469 (1946-1947).
Chlorine Monoxide	Mere contact of chlorine monoxide gas with paper, caoutchouc (India rubber), turpentine, sulfur, potassium, phosphorus, charcoal, arsenic, or antimony is attended by a violent explosion.
	Mellor **2:** 241 (1946-1947).
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Chloroform	The alkali metals react explosively with chloroform, dichloromethane, and methyl chloride.
	See LITHIUM plus Chloroform.
	Z. Electrochem. **31:** 549 (1925).
Chromium Tetrachloride	See POTASSIUM plus Aluminum Bromide.

Chromium Trifluoride	See POTASSIUM plus Ammonium Bromide.
Chromium Trioxide	Sodium or potassium reacts with chromium trioxide with incandescence.
	Mellor **11:** 237 (1946-1947).
Cobaltous Bromide	See POTASSIUM plus Boron Tribromide.
Cobaltous Chloride	See POTASSIUM plus Boron Tribromide.
Copper Oxychloride	See POTASSIUM plus Boric Acid.
Cupric Bromide	See POTASSIUM plus Aluminum Bromide.
Cupric Chloride	See POTASSIUM plus Aluminum Bromide.
Cupric Oxide	Cupric oxide is reduced to metallic copper when heated with potassium at a temperature below its melting point. The reaction proceeds with vivid incandescence.
	Berichte **24.**
Cuprous Bromide	See POTASSIUM plus Aluminum Bromide.
Cuprous Chloride	See POTASSIUM plus Aluminum Bromide.
Cuprous Iodide	See POTASSIUM plus Aluminum Bromide.
Dichloromethane	See POTASSIUM plus Chloroform.
Ethylene Oxide	Ethylene oxide is dangerously reactive with metallic potassium.
	Chem. Safety Data Sheet **SD-38:** 11 (1951).
	See ETHYLENE OXIDE plus Acids and Bases.
Ferric Bromide	See POTASSIUM plus Boron Tribromide.
Ferric Chloride	See POTASSIUM plus Boron Tribromide.
Ferrous Bromide	See POTASSIUM plus Boron Tribromide.
Ferrous Chloride	See POTASSIUM plus Boron Tribromide.
Ferrous Iodide	See POTASSIUM plus Boron Tribromide.
Fluorine	Potassium burns spontaneously in dry fluorine.
	Mellor **2:** 469 (1946-1947).
Graphite	See POTASSIUM plus Charcoal.

Graphite and Air	See POTASSIUM plus Graphite and Potassium Superoxide.
Graphite and Potassium Superoxide	Potassium superoxide forms on the surface of either solid or molten potassium metal. Attempts to extinguish burning potassium with powdered graphite have resulted in violent explosions.
	Chem. Abst. **63** (1): 424 (July 5, 1965).
	Mellor **2, Supp. 3:** 1566 (1963).
Hydrogen Iodide	Potassium burns momentarily in hydrogen iodide; the flame then goes out.
	M. Ribalkin, *Bull. Acad. St. Petersbourg* (2) **1:** 279 (1889).
	A very violent explosion results when a mixture of potassium and hydrogen iodide is struck by a hammer.
	Mellor **2, Supp. 3:** 1563 (1963).
Hydrogen Peroxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Iodine	See IODINE plus Potassium.
	See IODINE plus Lithium.
Iodine Monobromide	Potassium in contact with molten iodine monobromide creates a strong explosion.
	Mellor **2, Supp. 3:** 1563 (1963).
Iodine Monochloride	Potassium explodes in contact with iodine monochloride, but the reaction of sodium is very slow.
	A. Vogel, *Kastner's Arch.* **10:** 119 (1827).
	Berichte **31:** 892.
	Mellor, **2, Supp. 1:** 501 (1956).
	Mellor, **2, Supp. 3:** 1563 (1963).
Iodine Pentafluoride	A mixture of iodine pentafluoride and potassium or sodium (molten) will explode.
	Mellor **2:** 114 (1946-1947).
Lead Oxychloride	See POTASSIUM plus Boric Acid.

Lead Peroxide	See POTASSIUM plus Boric Acid.
Lead Sulfate	See POTASSIUM plus Boric Acid.
Maleic Anhydride	See ALKALI METALS plus Maleic Anhydride.
Manganous Bromide	See POTASSIUM plus Ammonium Bromide.
Manganous Chloride	See POTASSIUM plus Aluminum Bromide.
Manganous Iodide	See POTASSIUM plus Ammonium Bromide.
Mercuric Bromide	See POTASSIUM plus Aluminum Bromide.
Mercuric Chloride	See POTASSIUM plus Aluminum Bromide.
Mercuric Fluoride	See POTASSIUM plus Aluminum Bromide.
Mercuric Iodide	See POTASSIUM plus Aluminum Bromide.
Mercurous Chloride	See POTASSIUM plus Aluminum Bromide.
Mercurous Oxide	Molten sodium or potassium decomposes mercurous oxide with slight explosion.
	J. B. Senderens, *Bull. Soc. Chim.* (3)**6:** 802 (1891).
Methyl Chloride	See POTASSIUM plus Chloroform.
Molybdenum Trioxide	Molybdenum trioxide is reduced by either potassium or sodium with incandescence.
	Z. Anorg. Chemie **190:** 270.
Nickel Bromide	See POTASSIUM plus Aluminum Bromide.
Nickel Chloride	See POTASSIUM plus Aluminum Bromide.
Nickel Fluoride	See POTASSIUM plus Ammonium Bromide.
Nickel Iodide	See POTASSIUM plus Aluminum Bromide.
Nitrogen Dioxide	Potassium ignites in nitrogen dioxide at ordinary temperatures.
	Mellor **8:** 544 (1946-1947).
	See also MANGANESE plus Nitrogen Dioxide.
Nitryl Fluoride	Heated potassium metal burns with a lilac flame in vapor of nitryl fluoride.
	Mellor **2, Supp. 3:** 1566 (1963).

Peroxides	See ANTIMONY plus Sodium Peroxide.
Phosgene	Mixture of potassium and phosgene explodes when subjected to shock.
	Mellor **2, Supp. 3:** 1568 (1963).
Phosphine and	Potassium and phosphine react in liquid
Ammonia	ammonia to form potassium dihydrophosphide, a spontaneously flammable solid.
	Mellor **8, Supp. 3:** 283 (1971).
Phosphorus	See PHOSPHORUS plus Cesium.
Phosphorus	See POTASSIUM plus Boron Tribromide.
Pentachloride	
Phosphorus Pentoxide	When phosphorus pentoxide is warmed with potassium or sodium, the mixture becomes incandescent.
	H. Davy, *Phil. Trans. Roy. Soc. London* **102:** 405 (1812).
Phosphorus Tribromide	See POTASSIUM plus Boron Tribromide.
Phosphorus	Potassium burns vigorously in the vapor of
Trichloride	phosphorus trichloride.
	H. Davy, *Phil. Trans. Roy. Soc. London* **100:** 231 (1810); **101:** 1 (1811).
Potassium	See POTASSIUM plus Ammonium Bromide.
Chlorocuprate	
Potassium Oxides	See POTASSIUM plus Air.
Potassium Ozonide	Potassium in contact with the following oxides causes an explosive reaction: potassium ozonide, potassium peroxide, potassium superoxide.
	Mellor **2, Supp. 3:** 1577 (1963).
Potassium Peroxide	Potassium peroxide oxidizes many metals with incandescence; e.g., potassium, arsenic, antimony, tin, zinc, and copper.
	Mellor **2:** 490-3 (1946-1947).

	See POTASSIUM plus Potassium Ozonide.
Potassium Superoxide	Potassium metal sometimes forms an orange-yellow coating of tetroxide, even under mineral oil. A 2 cc. lump of such potassium, while being sliced with a stainless steel knife, suddenly exploded and burned.
	Short (1966). *Health & Safety Info.* **257** (March 31, 1967).
	Potassium superoxide scale being chipped off metallic potassium was driven into the underlying metal, and caused a violent explosion.
	H. N. Gilbert, *Chem. Eng. News* **26:** 2604 (1948).
	See POTASSIUM plus Potassium Ozonide.
Selenium	See SELENIUM plus Potassium.
Selenium Monochloride	When potassium is added to selenium monochloride at ordinary temperatures, the mixture explodes violently.
	Mellor **10:** 896 (1946-1947).
	Mellor **2, Supp. 3:** 1564 (1963).
Selenium Oxychloride	When potassium is brought in contact with selenium oxychloride in the cold, a violent explosion occurs.
	Mellor **10:** 908 (1946-1947).
Silicon Tetrachloride	See POTASSIUM plus Aluminum Bromide.
Silver Bromide	See SODIUM plus Silver Bromide.
Silver Chloride	See SODIUM plus Silver Bromide.
	See POTASSIUM plus Ammonium Bromide.
Silver Fluoride	See SODIUM plus Silver Bromide.
	See POTASSIUM plus Aluminum Bromide.
Silver Iodate	See POTASSIUM plus Boric Acid.
Silver Iodide	See SODIUM plus Silver Bromide.
	See POTASSIUM plus Ammonium Bromide.

Sodium Iodate	See POTASSIUM plus Boric Acid.
Sodium Nitrite and Ammonia	Solutions of potassium and sodium nitrite in liquid ammonia form disodium nitrite, which is very reactive and easily explosive.
	Mellor **2, Supp. 3:** 1566 (1963).
Sodium Peroxide	Sodium peroxide oxidizes potassium with incandescence.
	Mellor **2:** 490-93 (1946-1947).
Stannic Chloride	See POTASSIUM plus Aluminum Bromide.
Stannic Iodide and Sulfur	See POTASSIUM plus Aluminum Bromide.
Stannic Oxide	Stannic oxide is reduced by potassium or sodium at gentle heat and the reaction is accompanied by incandescence.
	Mellor **7:** 401 (1946-1947).
Stannous Chloride	See POTASSIUM plus Aluminum Bromide.
Strontium Iodide	See POTASSIUM plus Ammonium Bromide.
Sulfur	Vapors of potassium and sulfur react with chemiluminescence at 300¡ C and low pressures.
	Mellor **2, Supp. 3:** 1564 (1963).
Sulfur Dibromide	See POTASSIUM plus Aluminum Bromide.
Sulfur Dichloride	See POTASSIUM plus Boron Tribromide.
Tellurium	See TELLURIUM plus Potassium.
Tetrachloroethane	See SODIUM plus Tetrachloroethane.
Thallous Bromide	See POTASSIUM plus Aluminum Bromide.
Thallous Chloride	See POTASSIUM plus Ammonium Bromide.
Thiophosphoryl Fluoride	See SODIUM plus Thiophosphoryl Fluoride.
Titanium Tetrachloride	During the reduction of titanium tetrachloride to titanium metal with potassium, an explosion occurred. Prior to the explosion, the system was heated to 90¡C.

	Waller and Mandell (1967).
Vanadium Oxychloride	See POTASSIUM plus Boric Acid.
Vanadium Pentachloride	See POTASSIUM plus Aluminum Bromide.
Water	At 20¡C. the heat of reaction is adequate to ignite the hydrogen liberated.
	Mellor **2:** 469 (1946-1947).
	Mellor **2, Supp. 3:** 1560 (1963).
Zinc Bromide	See POTASSIUM plus Aluminum Bromide.
Zinc Chloride	See POTASSIUM plus Aluminum Bromide.
Zinc Fluoride	See POTASSIUM plus Ammonium Bromide.
Zinc Iodide	See POTASSIUM plus Aluminum Bromide.

POTASSIUM ACETYLIDE KC≡H

Carbon Dioxide	When potassium acetylene carbide is warmed with carbon dioxide, the mass becomes incandescent.
	Mellor **5:** 849-50 (1946-1947).
Chlorine	See CHLORINE plus Potassium Acetylene Carbide.
Sulfur Dioxide	Potassium acetylene carbide reacts with sulfur dioxide at ordinary temperatures and it becomes incandescent.
	Mellor **5:** 849 (1946-1947).

POTASSIUM ACI-NITROACETATE $K_2O_2N{=}CHCHO$

Water	Dipotassium nitroacetate exploded when the dry salt was moistened with a little water.
	Chem. Eng. News **27:** 1473.

POTASSIUM ACI-NITROMETHYLIDE KCH_2NO_2

(See SODIUM NITROMETHANE)

POTASSIUM AMIDE KNH_2

Water	Potassium amide reacts vigorously with water and may be accompanied by ignition.
	Mellor **8:** 255 (1946-1947).

POTASSIUM AZIDE KN_3

Carbon Disulfide	See CARBON DISULFIDE plus Azides.
Manganese Dioxide	See MANGANESE DIOXIDE plus Potassium Azide.

POTASSIUM AZIDODISULFATE KSO_3OSO_2NNN

Water	This reaction is an explosive one.
	Mellor **8, Supp. 2:** 36 (1967).

POTASSIUM BICARBONATE $KHCO_3$

Monoammonium Phosphate	See SODIUM BICARBONATE plus Monoammonium Phosphate.

POTASSIUM BOROHYDRIDE

(See POTASSIUM TETRAHYDROBORATE)

POTASSIUM BROMATE $KBrO_3$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.

Lead Acetate	During an attempt to make lead bromate, an explosion occurred that caused two deaths.
	Mellor **2, Supp. 1:** 770 (1956).
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Selenium	See SELENIUM plus Potassium Bromate.
Sulfur	See SULFUR plus Bromates.

POTASSIUM BROMIDE KBr

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.

POTASSIUM tert.-BUTOXIDE $KOC(CH_3)_3$

Acetic Acid	See ACETONE plus Potassium Tert.-Butoxide.
Acetone	See ACETONE plus Potassium Tert.-Butoxide.
Butyl Acetate	See ACETONE plus Potassium Tert.-Butoxide.
Carbon Tetrachloride	See ACETONE plus Potassium Tert.-Butoxide.
Chloroform	See ACETONE plus Potassium Tert.-Butoxide.
Diethyl Sulfate	See ACETONE plus Potassium Tert.-Butoxide.
Dimethyl Carbonate	See ACETONE plus Potassium Tert.-Butoxide.
Epichlorohydrin	See ACETONE plus Potassium Tert.-Butoxide.
Ethyl Acetate	See ACETONE plus Potassium Tert.-Butoxide.
Ethyl Alcohol	See ACETONE plus Potassium Tert.-Butoxide.
Isopropyl Alcohol	See ACETONE plus Potassium Tert.-Butoxide.
Methyl Alcohol	See ACETONE plus Potassium Tert.-Butoxide.
Methylene Chloride	See ACETONE plus Potassium Tert.-Butoxide.
Methyl Ethyl Ketone	See ACETONE plus Potassium Tert.-Butoxide.

Methyl Isobutyl Ketone	See ACETONE plus Potassium Tert.-Butoxide.
Propyl Alcohol	See ACETONE plus Potassium Tert.-Butoxide.
Propyl Formate	See ACETONE plus Potassium Tert.-Butoxide.
Sulfuric Acid	See ACETONE plus Potassium Tert.-Butoxide.

POTASSIUM CARBIDE K_2C_2

Water	Potassium carbide may react explosively on contact with water. *Bahme*, p. 27 (1961).

POTASSIUM CARBONATE K_2CO_3

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Nitric Acid.

POTASSIUM CARBONYL KCO

Air	See SODIUM CARBONYL plus Air.
Oxygen	See POTASSIUM plus Carbon Monoxide and Oxygen.
Water	See SODIUM CARBONYL plus Air.

POTASSIUM CHLORATE $KClO_3$

Aluminum	See ALUMINUM plus Bromates.
Ammonia	Gaseous ammonia, mixed with air reacts so vigorously with potassium chlorate that the reaction may become dangerous. *Mellor* **8:** 217 (1946-1947).
Ammonium Chloride	In the manufacture of signaling smokes this combination is hazardous because of metathetical interaction to form unstable ammonium perchlorate. *Ellern*, p. 155 (1968).

	See POTASSIUM CHLORATE plus Ammonium Salts.
Ammonium Salts	The reaction of potassium chlorate with ammonium salts is violent.
	Mellor **2, Supp. 1:** 586 (1956).
Ammonium Sulfate	The mixture of potassium chlorate and ammonium sulfate decomposes with incandescence when heated.
	Mellor **2:** 702 (1946-1947).
Antimony Trisulfide	A mixture of potassium chlorate and antimony trisulfide can be exploded by an electric spark.
	Mellor **9:** 523 (1946-1947).
Arsenic	See ARSENIC plus Bromates.
Barium Hypophosphite	A mixture of equal parts of these materials, previously dried at 100¡ C., burns in open air with great rapidity. When the mixture is confined, an explosion will result. The mixture is very sensitive to shock and friction.
	Mellor **8:** 881 (1946-1947).
Barium Sulfide	See BARIUM SULFIDE plus Potassium Chlorate.
Boron	See BORON plus Potassium Chlorate.
Calcium Hypophosphite	See CALCIUM HYPOPHOSPHITE plus Potassium Chlorate.
Calcium Sulfide	See BARIUM SULFIDE plus Lead Dioxide.
Carbon	See CARBON plus Bromates.
Charcoal	See CHLORATES plus Organic Matter.
Chromium	See CHROMIUM plus Potassium Chlorate.
Copper	See COPPER plus Bromates.
Copper Phosphide	See COPPER PHOSPHIDE plus Potassium Chlorate.
Gallic Acid	Gallic acid, potassium chlorate and red gum (Formula 156) is a pyrotechnic whistle composition.
	Ellern, p. 183 (1968).
Germanium	See GERMANIUM plus Potassium Nitrate.

Hydrogen Iodide	Molten potassium chlorate ignites in hydrogen iodide.
	Mellor **2:** 204 (1946-1947).
Magnesium	See MAGNESIUM plus Potassium Chlorate.
Magnesium, Copper Sulfate (anhydrous), Ammonium Nitrate and Water	See MAGNESIUM plus Copper Sulfate (anhydrous), Ammonium Nitrate, Potassium Chlorate and Water.
Manganese Dioxide	See CHLORATES plus Manganese Dioxide.
Mercury Tetratriphosphide	See MERCURY TETRATRIPHOSPHIDE plus Air.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Acids (Dibasic)	See CHLORATES plus Organic Acids.
Organic Matter	See BROMATES plus Organic Matter. See also CHLORATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Potassium Chlorate.
	See PHOSPHORUS plus Bromates.
Silver Sulfide	A violent reaction occurs when silver sulfide is heated with potassium chlorate.
	Mellor **3:** 447 (1946-1947).
Sodium Amide	A mixture of sodium amide and potassium chlorate explodes.
	Mellor **8:** 258 (1946-1947).
Sulfur	See SULFUR plus Bromates. See CHLORATES plus Organic Matter.
	See SULFUR plus Potassium Chlorate.
Sulfur Dioxide	If a drop of a solution of sulfur dioxide in ether or alcohol is added to powdered potassium chlorate, a reaction ensues and the mass explodes.
	Mellor **2:** 311 (1946-1947).
Sulfuric Acid	These materials may react to cause fires and possible explosions.

	Mellor **2:** 315 (1946-1947).
Thiocyanates	See THIOCYANATES plus Chlorates.
Titanium	See TITANIUM plus Potassium Chlorate.
Zinc	See ZINC plus Chlorates.
Zirconium	See ZIRCONIUM plus Potassium Chlorate.

POTASSIUM CHLORIDE KCl

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Potassium Permanganate and Sulfuric Acid	See POTASSIUM PERMANGANATE plus Sulfuric Acid and Potassium Chloride.

POTASSIUM CYANIDE KCN

Chlorates	See POTASSIUM CYANIDE plus Sodium Chlorate.
Nitrites	See NITRITES plus Potassium Cyanide.
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Sodium Chlorate	Chlorates plus potassium cyanide explode when heated.
	Von Schwartz, p. 323 (1918). *Pieters,* p. 30 (1957).

POTASSIUM DICHROMATE $K_2Cr_2O_7$

Acetone and Sulfuric Acid	See ACETONE plus Sulfuric Acid and Potassium Dichromate.
Hydrazine	Potassium dichromate or sodium dichromate reacts explosively with hydrazine.
	Mellor **11:** 234 (1946-1947).
Hydroxylamine	A drop of anhydrous hydroxylamine on powdered potassium dichromate produces a violent explosion.
	Mellor **8:** 293 (1946-1947).

POTASSIUM DIHYDROPHOSPHIDE KPH_2

(self-reactive)	See POTASSIUM plus Phosphine and Ammonia.

POTASSIUM FERRICYANIDE $K_3Fe(CN)_6$

Ammonia	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Potassium Ferricyanide.

POTASSIUM FERROCYANIDE $K_4Fe(CN)_6 \cdot 3H_2O$

Cupric Nitrate	See CUPRIC NITRATE plus Potassium Ferrocyanide.

POTASSIUM FLUORIDE KF

Platinum and Bromine Trifluoride	See PLATINUM plus Bromine Trifluoride and Potassium Fluoride.

POTASSIUM GRAPHITE KC_8; KC_{24}

Air	Potassium graphite is spontaneously flammable in air.
	Brauer (1965).

POTASSIUM HEXAHYDROALUMINATE K_3AlH_6

(self-reactive)	A sample of this hydride over a period of months oxidized or hydrolized. The product of this reaction when scraped with a metal spatula exploded violently. Cesium hexahydroaluminate behaves similarly.
	Chem. Eng. News **47** (1): 9 (1969).

POTASSIUM HYDRIDE KH

Air	Potassium hydride is spontaneously flammable in air.
	Coates, p. 161 (1956). *Ellern* (1961).
Chlorine	See CHLORINE plus Potassium Hydride.
Fluorine	See CHLORINE plus Potassium Hydride.

POTASSIUM HYDROXIDE KOH

(See also SODIUM HYDROXIDE)

Acetic Acid	See ACETIC ACID plus Potassium Hydroxide.
Acrolein	See SODIUM HYDROXIDE plus Acrolein.
Acrylonitrile	See SODIUM HYDROXIDE plus Acrylonitrile.
Calcium Carbide and Chlorine	See DICHLOROACETYLENE plus Air.
Chlorine Dioxide	A piece of potassium hydroxide causes liquid chlorine dioxide to explode.
	Mellor **2:** 289 (1946-1947).
Chlorine and Hydrogen Peroxide	See CHLORINE plus Hydrogen Peroxide and Potassium Hydroxide.
Chloroform and Methyl Alcohol	See SODIUM HYDROXIDE plus Chloroform and Methyl Alcohol.
1,2-Dichloroethylene	The reaction produces chloroacetylene, which is explosive and spontaneously flammable in air. It is highly toxic.
	Rutledge, p. 134 (1968).
	See also SODIUM plus 1,2-Dichloroethylene.
Maleic Anhydride	See SODIUM HYDROXIDE plus Maleic Anhydride.
N-Methyl-N-Nitroso Urea and Methylene Chloride	See N-METHYL-N-NITROSO UREA plus Potassium Hydroxide and Methylene Chloride.

Nitroethane	See CALCIUM HYDROXIDE plus Nitroethane.
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Nitromethane	See CALCIUM HYDROXIDE plus Nitroethane.
Nitroparaffins	See CALCIUM HYDROXIDE plus Nitroethane.
o-Nitrophenol	Molten ortho nitrophenol reacts violently with potassium hydroxide (commercial 85% pellets).
	Pouwels (1972).
Nitropropane	See CALCIUM HYDROXIDE plus Nitroethane.
N-Nitrosomethylurea	A reaction between n-nitrosomethylurea and potassium hydroxide in n-butyl ether resulted in an explosion due to the formation of diazomethane.
	Schwab (1972).
Nitrosomethyl Urea and Methylene Chloride	See NITROSOMETHYL UREA plus Potassium Hydroxide and Methylene Chloride.
Phosphorus	See PHOSPHORUS plus Alkaline Hydroxides and PHOSPHORUS plus Potassium Hydroxide.
Potassium Persulfate and Water	See POTASSIUM PERSULFATE plus Potassium Hydroxide and Water.
Sodium Azide and Benzoyl Chloride	See SODIUM AZIDE plus Benzoyl Chloride and Potassium Hydroxide.
Tetrachloroethane	When solid potassium hydroxide and tetrachloroethane are heated, a spontaneously flammable gas, chloroacetylene, is formed.
	Bahme, p. 33 (1961).
Tetrahydrofuran	See TETRAHYDROFURAN plus Potassium Hydroxide.
Trichloroethylene	See SODIUM HYDROXIDE plus Trichloroethylene.
Water	See POTASSIUM OXIDE plus Water.

POTASSIUM HYPOBORATE $K_4B_2O_4$

(self-reactive)	Potassium hypoborate is a stronger, more violent reducing agent than potassium hypophosphite. *Mellor* **5:** 37 (1946-1947).

POTASSIUM HYPOPHOSPHITE KH_2PO_2

(self-reactive)	Potassium hypophosphite decomposes when heated, forming phosphine, a spontaneously flammable gas. *Mellor* **8:** 881 (1946-1947).
Nitric Acid	Potassium hypophosphite explodes when evaporated with nitric acid. *Mellor* **8:** 882 (1946-1947).

POTASSIUM IODATE KIO_3

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Potassium Iodate.
Sulfur	See SULFUR plus Bromates.

POTASSIUM IODIDE KI

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Fluorine Perchlorate	See FLUORINE PERCHLORATE plus Potassium Iodide.

POTASSIUM MERCURICYANIDE

(See POTASSIUM TRICYANOMERCURATE)

POTASSIUM NITRATE KNO_3

Antimony	See ANTIMONY plus Potassium Nitrate.
Antimony Trisulfide	A mixture of potassium nitrate and antimony trisulfide explodes at a red heat.
	Mellor **9:** 524 (1946-1947).
Arsenic	See ARSENIC plus Potassium Nitrate.
Arsenic Disulfide	Arsenic disulfide forms explosive nixtures when mixed with potassium nitrate.
	Mellor **9:** 270 (1946-1947).
Barium Sulfide	See BARIUM SULFIDE plus Lead Dioxide.
Boron	See BORON plus Potassium Nitrate.
Boron Phosphide	See BORON PHOSPHIDE plus Nitric Acid.
Calcium Sulfide	See BARIUM SULFIDE plus Lead Dioxide.
Charcoal	Charcoal and potassium nitrate make a pyrotechnic mixture.
	Ellern, p. 378 (1968).
Copper Phosphide	See COPPER PHOSPHIDE plus Potassium Nitrate.
Fluorine	See FLUORINE plus Potassium Nitrate.
Germanium	See GERMANIUM plus Potassium Nitrate.
Germanium Sulfide	See GERMANIUM SULFIDE plus Potassium Nitrate.
Sodium Acetate	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).
Sodium Hypophosphite	A mixture of potassium nitrate and sodium hypophosphite constitutes a powerful explosive.
	Mellor **8:** 881 (1946-1947).

Sodium Peroxide and Dextrose	See SODIUM PEROXIDE plus Dextrose and Potassium Nitrate.
Sulfur and Arsenic Trisulfide	See SULFUR plus Potassium Nitrate and Arsenic Trisulfide.
Titanium	See TITANIUM plus Potassium Chlorate.
Titanium Disulfide	See TITANIUM DISULFIDE plus Potassium Nitrate.
Trichloroethylene	See TRICHLOROETHYLENE plus Potassium Nitrate.
Zinc	See ZINC plus Potassium Nitrate.
Zirconium	See ZIRCONIUM plus Potassium Nitrate.

POTASSIUM p-NITROBENZENE-DIAZOSULFONATE
$O_2N\text{-}C_6H_4\text{-}4\text{-}N{=}NSO_3K$

(self-reactive)

While a chemist was examining some crystals of potassium p-nitrobenzene-diazosulfonate with a loupe, the entire 10-gram batch, which was on a sheet of filter paper, exploded. The crystals were probably the "labile" form (potassium p-nitrobenzene-syn-diazosulfonate) and would have in time converted to the "stable" form.

Crucible **58** (9): 147 (1973).

POTASSIUM NITRIDE K_3N

Air

Potassium nitride generally ignites spontaneously when exposed to air.

Mellor **8:** 99 (1946-1947).

Phosphorus

See PHOSPHORUS plus Potassium Nitride.

POTASSIUM NITRITE KNO_2

Ammonium Sulfate

When a little ammonium sulfate is added to fused potassium nitrite, a vigorous reaction occurs attended by flame.

	Mellor **2:** 702 (1946-1947).
Boron	See BORON plus Potassium Nitrite.

POTASSIUM OXIDE K_2O

Water	The oxides of sodium or potassium react with water vigorously and with enough evolution of heat to cause boiling and spattering of hot caustic solution.
	Chem. Safety Data Sheets **SD-9, SD-10** (1947).

POTASSIUM OXIDES KxOy

Potassium	See POTASSIUM plus Air.
Sodium	See POTASSIUM plus Air.
Sodium-Potassium Alloy	See POTASSIUM plus Air.
Organic Matter	See POTASSIUM plus Air.

POTASSIUM OZONIDE KO_3

Potassium	See POTASSIUM plus Potassium Ozonide.
Sodium	See SODIUM plus Potassium Ozonide.
Water	Both potassium ozonide and potassium superoxide react explosively with water. Both are too unstable to be isolated.
	Mellor **2, Supp. 3:** 1631 (1963).

POTASSIUM PERCHLORATE $KClO_4$

Aluminum and Magnesium	See ALUMINUM plus Magnesium and Potassium Perchlorate.
Charcoal	See PERCHLORATES plus Charcoal.

Fluorine	See FLUORINE plus Potassium Perchlorate.
Magnesium	See MAGNESIUM plus Potassium Perchlorate.
Nickel and Titanium	See NICKEL plus Titanium and Potassium Perchlorate.
Reducing Agents	See PERCHLORATES plus Charcoal.
Sulfur	See SULFUR plus Potassium Perchlorate.

POTASSIUM PERMANGANATE $KMnO_4$

Aluminum Carbide	See ALUMINUM CARBIDE plus Potassium Permanganate.
Antimony	See ANTIMONY plus Potassium Permanganate.
Arsenic	See ANTIMONY plus Potassium Permangnate.
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Potassium Permanganate.
Glycerol	Contact between the two may produce an explosion.
	Pieters, p. 30 (1957).
Hydrogen Peroxide	Potassium permanganate can produce an explosion when brought into contact with very concentrated hydrogen peroxide.
	Haz. Chem. Data, p. 230 (1973).
Hydrogen Trisulfide	See HYDROGEN TRISULFIDE plus Potassium Permanganate.
Hydroxylamine	When solid hydroxylamine is brought into contact with solid potassium permanganate, there is produced immediately a white flame.
	Mellor **8:** 294 (1946-1947).
Organic Matter	An explosive reaction can occur when solid, finely divided potassium permanganate comes in contact with organic substances.
	Pascal 16: 1041 (1931-1934). *Pieters,* p. 28 (1957). *Haz. Chem. Data,* p. 230 (1973).

Phosphorus	See PHOSPHORUS plus Potassium Permanganate.
Polypropylene	Potassium permanganate being conveyed through a polypropylene tube ignited the tube.
	MCA Case History **1842** (1972).
Sulfur	See SULFUR plus Potassium Permanganate.
Sulfuric Acid	An explosion occurred when concentrated sulfuric acid was mixed with crystalline potassium permanganate in a vessel containing moisture. Manganese heptoxide was formed, which is explosive at 70¡ C.
	Delhez (1967).
	J. R. Archer, *Chem. Eng. News* **26:** 205 (1948). Permanganate anhydride, Mn_2O_7, forms in the course of the reaction of concentrated sulfuric acid with crystallized potassium permanganate at low temperature (minus 20¡ C). An oily liquid forms under the layer of sulfuric acid that is very unstable and detonates when the temperature is increased (70¡ C).
	RŸst and Ebert, p. 29 (1948). *Pieters,* p. 28 (1957). *Gallais,* pp. 696, 697 (1957).
Sulfuric Acid and	When potassium permanganate is dissolved in
Organic Matter	95% sulfuric acid, a green solution of permanganyl sulfate is formed. This solution will oxidize most organic compounds and, if the solution is strongly concentrated, explosion may accompany the oxidation.
	Waller and Mandell (1967).
Sulfuric Acid and	An attempt to prepare permanganyl chloride,
Potassium Chloride	MnO_3Cl, by adding cautiously, concentrated sulfuric acid to an intimate mixture of potassium permanganate and potassium chloride kept at 0¡C in clean all-glass apparatus resulted in a violent explosion.
	Delhez (1967).
Titanium	See TITANIUM plus Potassium Chlorate.

POTASSIUM PEROXIDE K_2O_2

(See also SODIUM PEROXIDE)

Air	See POTASSIUM PEROXIDE plus Water.
Antimony	See POTASSIUM plus Potassium Peroxide.
Arsenic	See POTASSIUM plus Potassium Peroxide.
Oxygen	See OXYGEN plus Potassium Peroxide.
Potassium	See POTASSIUM plus Potassium Peroxide and POTASSIUM plus Potassium Tetroxide.
Water	Potassium peroxide is very reactive, and can explode in air or water.
	Mellor **2, Supp. 3:** 1577 (1963).

POTASSIUM PERSULFATE $K_2S_2O_3$

Potassium Hydroxide	Potassium persulfate plus a little potassium
and Water	hydroxide and water ignited a polythene (polyethylene) liner of a container by simultaneous release of heat and oxygen.
	MCA Case History **1155** (1955).

POTASSIUM PHOSPHIDE K_3P

Water	Potassium phosphide reacts with water to form spontaneously flammable phosphine.
	Van Wazer (1958).

POTASSIUM SILICIDE K_2Si_2

Acids	See POTASSIUM SILICIDE plus Water.
Air	Potassium silicide is spontaneously flammable in air and may explode.
	Ellern (1961).

Water	Potassium silicide ignites spontaneously on contact with water or dilute acids.
	Brauer (1965).
	See also CESIUM SILICIDE plus Water.

POTASSIUM SULFATE K_2SO_4

Aluminum	See ALUMINUM plus Sulfates.

POTASSIUM SUPEROXIDE KO_2

Ethyl Alcohol	To dispose of a piece of sodium-potassium waste, it was placed in a glove box, which was then purged with argon for 10 minutes. When 10 ml of alcohol was added to the waste, an immediate pressure rise caused the glove to burst and flame issued from the port. Also, a highly oxidized sphere of potassium was cut in two and one half was dropped into a dish of alcohol; an immediate explosion shattered the dish. Potassium superoxide was considered the cause of both incidents.
	Health and Safety Inf. **251** (March 31, 1967).
Graphite	Potassium superoxide forms on the surface of either solid or molten potassium metal. Attempts to extinguish burning potassium with powdered graphite have resulted in violent explosions.
	Chem. Abst. **63:** 424 (1965).
Oil	Stainless steel pots containing traces of sodium-potassium alloy were immersed in oil to await cleaning. During removal of the lid from one pot, an explosion occurred that was attributed to long-term formation of potassium superoxide, which reacted with the oil when it was disturbed.
	Health and Safety Inf. **251** (March 31, 1967).
Potassium	See POTASSIUM plus Potassium Superoxide.
Selenium Monochloride	See SELENIUM MONOCHLORIDE plus Potassium Superoxide.

Sodium	See SODIUM plus Potassium Ozonide.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Potassium Superoxide.
Water	See POTASSIUM OZONIDE plus Water.

POTASSIUM TETRACHLOROCUPRATE K_2CuCl_4

Potassium	See POTASSIUM plus Ammonium Bromide.

POTASSIUM TETRAETHYNYLNICKELATE $K_4[Ni(CCH)_4]$

Air	Tetraacetenyl nickel tetrapotassium is spontaneously flammable in air. *Kaufman* (1961).

POTASSIUM TETRAHYDROBORATE

Air	Potassium borohydride burns quietly in air. *Lab. Govt. Chemist* (1965).

POTASSIUM TETRAPEROXYCHROMATE $K_3Cr(OO)_4$

(self-reactive)	Potassium triperchromate decomposes explosively at 178¡ C. The impure salt is explosive. *Mellor* **11:** 356 (1946-1947).

POTASSIUM TETROXIDE K_2O_4

(See POTASSIUM SUPEROXIDE KO_2)

POTASSIUM TRICYANOMERCURATE $KHg(CN)_3$

Ammonia	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).

PRASEODYMIUM Pr

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

PROPANE $CH_3CH_2CH_3$

Chlorine Dioxide	See CHLORINE DIOXIDE plus Butadiene.

PROPANE-1,2-DIAMINE PERCHLORATE

$CH_3CH(NH_2)CH_2NH_2 \bullet (ClO_4)_2$

(self-reactive)	This compound is an explosive that exceeds the power and brisance of TNT.
	ACS **146:** 206. *Chem. Reviews* **44:** 419-45 (1949).

PROPANE-1,3-DIAMINE PERCHLORATE

$CH_2(NH_2)CH_2CH_2NH(ClO_4)_2$

(self-reactive)	This compound is an explosive that exceeds the power and brisance of TNT.
	ACS **146:** 206. *Chem. Reviews* **44:** 419-45 (1949).

1-PROPANETHIOL C_3H_7SH

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus 1-Propanethiol.
	See CALCIUM HYPOCHLORITE plus Mercaptan.

PROPARGYL ALCOHOL

(See 2-PROPYN-1-OL)

PROPARGYL BROMIDE

(See 3-BROMO-1-PROPYNE)

PROPARGYL CHLORIDE

(See 3-CHLORO-1-PROPYNE)

PROPIOLACTONE (beta-)

2-Aminoethanol	See 2-AMINOETHANOL plus Propiolactone.
Ammonium Hydroxide	Mixing propiolactone (beta-) and 28% ammonium hydroxide in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Aniline	See ANILINE plus Propiolactone.
Chlorosulfonic Acid	Mixing propiolactone (beta-) and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Ethylene Diamine	See ETHYLENE DIAMINE plus Propiolactone (beta-).
Ethyleneimine	See ETHYLENEIMINE plus Propiolactone (beta-).
Hydrochloric Acid	Mixing propiolactone (beta-) and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete

	reference.
Hydrofluoric Acid	Mixing propiolactone (beta-) and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing propiolactone (beta-) and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	See OLEUM plus Propiolactone (beta-).
Pyridine	See PYRIDINE plus Propiolactone (beta-).
Sodium Hydroxide	See SODIUM HYDROXIDE plus Propiolactone (beta-).
Sulfuric Acid	Mixing propiolactone (beta-) and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

PROPYL ALCOHOL $CH_3CH_2CH_2OH$

Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

PROPYLENE $H_3CCH{=}CH_2$

Nitrogen Dioxide	See NITROGEN TETROXIDE plus Olefins.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Propylene.
Nitrous Oxide	See NITROUS OXIDE plus Propylene.

1,2-PROPYLENEDIAMINE DIPERCHLORATE

(See PROPANE-1,2-DIAMINE PERCHLORATE)

1,3-PROPYLENEDIAMINE DIPERCHLORATE

(See PROPANE-1,3-DIAMINE PERCHLORATE)

PROPYLENE DICHLORIDE

(See 1,2-DICHLOROPROPANE)

PROPYLENE OXIDE

Ammonium Hydroxide	Mixing propylene oxide and 28% ammonium hydroxide in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Chlorosulfonic Acid	Mixing propylene oxide and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrochloric Acid	Mixing propylene oxide and hydrochloric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing propylene oxide and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing propylene oxide and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete

	reference.
Oleum	See OLEUM plus Propylene Oxide.
Sulfuric Acid	Mixing propylene oxide and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

PROPYL FORMATE C_3H_7OCHO

Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.

PROPYLLITHIUM C_3H_7Li

Air	Propyl lithium is spontaneously flammable in air. *Ellern* (1961).

PROPYL PERCHLORATE $C_3H_7ClO_4$

(self-reactive)	See METHYL PERCHLORATE (self-reactive).

PROPYLSILANE $C_3H_7SiH_3$

Air	Propyl silane is spontaneously flammable in air. *Kaufman* (1961).

PROPYNE $CH_3C{=}CH$

(self-reactive)	Methyl acetylene can decompose explosively at 4.5-5.6 atmospheres pressure. *Rutledge*, p. 13 (1968).

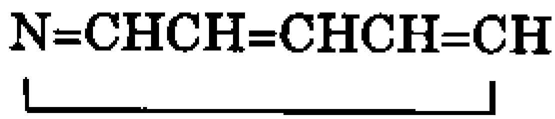
2-PROPYN-1-OL $CH{\equiv}CCH_2OH$

Phosphorus Pentoxide	See PHOSPHORUS PENTOXIDE plus Propargyl Alcohol.

PROSILOXANE

(See OXOSILANE)

PYRIDINE



Chlorosulfonic Acid	Mixing pyridine and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Chromium Trioxide	See CHROMIC ANHYDRIDE plus Pyridine.
Maleic Anhydride	See MALEIC ANHYDRIDE plus Pyridine.
Nitric Acid	Mixing pyridine and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	See OLEUM plus Pyridine.
Perchromates	See PERCHROMATES plus Pyridine.
Propiolactone (beta-)	Mixing pyridine and propiolactone (beta-) in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Silver Perchlorate	See SILVER PERCHLORATE plus Acetic Acid. See SILVER PERCHLORATE plus Toluene.
Sulfuric Acid	Mixing pyridine and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete

reference.

PYRIDINIUM PERCHLORATE $(C_5H_6N)ClO_4$

(self-reactive)

This salt may explode violently in contact with metals.

Mellor **2, Supp. 1:** 603 (1956).

Pyridine perchlorate decomposes or explodes when heated above 335¡ C. The kindling temperature is lowered by the addition of ammonium perchlorate.

ACS **146:** 213 (1960). *Chemiker.Ztg.* **74:** 139-40 (1950).

3-PYRIDYLDIAZONIUM FLUOROBORATE $NC_5H_4N(\equiv N)BF_4$

(self-reactive)

Following a procedure described in the literature for the preparation of this salt, several grams were spread on aluminum foil to dry. A small portion was removed to determine its decomposition point in a glass capillary. It exploded at 47¡ C. The remaining material exploded while sitting on the aluminum foil.

Chem. Eng. News **45** (41): 44 (1967); **45** (51):**8** (1967).

QUICKLIME CaO

(See CALCIUM OXIDE)

QUINOLINE

Perchromates

See PERCHROMATES plus Quinoline.

RARE EARTH HYDRIDES

Air and Water	The hydrides of the rare earths are stable in dry air, but ignite in moist air.
	Hampel, pp. 407-8 (1961).

RARE EARTH METALS

Air	The rare earth metals ignite in air at 302 to 356¡ F., but lanthanum ignites at 824 to 860¡ F. With oxide impurities present, however, the rare earth metals are pyrophoric on cutting and filing.
	Hampel, pp. 407-8 (1961).
Halogens (Vapor)	Rare earth metals burn vigorously in halogen vapors above 392¡ F.
	Hampel, pp. 407-8 (1961).

RHENIUM Re

Flourine	Rhenium and fluorine react readily at 125¡ C.
	Mellor **2, Supp. 1:** 64 (1956).

RHODIUM Rh

Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Oxygen Difluoride	See IRIDIUM plus Oxygen Diflouride.

RHODIUM-AMMINE NITRATES

(self-reactive)	Rhodium-ammine nitrates may be impact-sensitive. $Rh(NH_3)_5I(NO_3)_2$ crystals explode when heated.
	Mellor **15:** 590 (1946-1947).

RHODIUM-AMMINE PERCHLORATES

(self-reactive)	Rhodium-ammine perchlorates may be impact-sensitive.
	Mellor **15:** 590 (1946-1947).

RHODIUM TETRABROMIDE $RhBr_4$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.

RUBBER

Chlorine	See CHLORINE plus Rubber.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Rubber.
Iodine Monochloride	See IODINE MONOCHLORIDE plus Organic Matter.
Lithium	See LITHIUM plus Organic Matter.

RUBBER (LS-53 and LS-63)

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

RUBIDIUM Rb

Air	Rubidium is spontaneously flammable in air at room temperature if the surface of the metal is clean.
	Mellor **2:** 468 ff. (1946-1947).
Chlorine	See CESIUM plus Chlorine.
Oxygen	Rubidium burns spontaneously in dry oxygen.
	Mellor **2:** 468 (1946-1947).
Phosphorus	See PHOSPHORUS plus Cesium.
Water	At 20¡ C., the heat of reaction is adequate to ignite the hydrogen liberated.
	Mellor **2:** 469 (1946-1947). Bahme, p. 11 (1961).

RUBIDIUM ACETYLIDE RbC≡CH

Arsenic	See ARSENIC plus Rubidium Acetylene Carbide.
Bromine	See BROMINE plus Rubidium Acetylene Carbide.
Chlorine	See BROMINE plus Rubidium Acetylene Carbide.
Cupric Oxide	Cupric oxide is reduced vigorously and with incandescence by rubidium acetylene carbide. *Mellor* **5:** 850 (1946-1947).
Fluorine	See BROMINE plus Rubidium Acetylene Carbide.
Hydrochloric Acid	Rubidium acetylene carbide burns with slightly warm hydrochloric acid or with molten sulfur. *Mellor* **5:** 849 (1946-1947).
Iodine	See BROMINE plus Rubidium Acetylene Carbide.
Lead Oxide	Rubidium acetylene carbide explodes on contact with lead oxide (at 350¡ C.). *Mellor* **5:** 849 (1946-1947).
Manganese Dioxide	Manganese dioxide is reduced by rubidium acetylene carbide at elevated temperatures with incandescence and sometimes explosively. *Mellor* **5:** 850 (1946-1947).
Phosphorus	See PHOSPHORUS plus Rubidium Acetylene Carbide.
Sulfur	See RUBIDIUM ACETYLENE CARBIDE plus Hydrochloric Acid.
Sulfuric Acid	Rubidium acetylene carbide burns with sulfuric acid. *Mellor* **5:** 849 (1946-1947).

RUBIDIUM AZIDE RbN_3

(self-reactive)	Rubidium azide decomposes at 321¡ C. *Mellor* **8, Supp. 2:** 43 (1967).
Carbon Disulfide	See CARBON DISULFIDE plus Azides.

RUBIDIUM CARBIDE Rb_2C_2

Arsenic	See ARSENIC plus Rubidium Carbide.
Arsenic Oxide	If warmed, rubidium carbide will burn with arsenic oxide.
	Mellor **5:** 848 (1946-1947).
Boron	See SILICON plus Rubidium Carbide.
Bromine	See BROMINE plus Rubidium Carbide.
Hydrochloric Acid	Rubidium carbide ignites in contact with hydrochloric acid unless the acid is dilute.
	Mellor **5:** 848 (1946-1947).
Iodine	See IODINE plus Cesium Carbide.
Lead Oxide	If warmed, rubidium carbide will burn with lead oxide.
	Mellor **5:** 848 (1946-1947).
Nitric Acid	A mixture of nitric acid and rubidium carbide will explode.
	Mellor **5:** 848 (1946-1947).
Nitric Oxide	See RUBIDIUM CARBIDE plus Sulfur Dioxide.
Selenium	See SELENIUM plus Rubidium Carbide.
Silicon	See SILICON plus Rubidium Carbide.
Sulfur Dioxide	Rubidium carbide ignites on warming in sulfur dioxide or nitric oxide vapor.
	Mellor **5:** 848 (1946-1947).

RUBIDIUM CHLORIDE RbCl

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.

RUBIDIUM HYDRIDE RbH

Acetylene	If moisture is present, rubidium hydride reacts vigorously with acetylene, even at minus 60¡ C.
	Mellor **2:** 483 (1946-1947).

Water	Rubidium hydride ignites on contact with moist air.
	Hurd, pp. 36-37 (1952).

RUBIDIUM NITRIDE Rb_3N

Air	Rubidium nitride burns in air.
	Mellor **8:** 8, 99, 101 (1946-1947).

RUBIDIUM PHOSPHIDE Rb_3P

Water	Rubidium phosphide reacts instantaneously with water or moist air to yield spontaneously flammable phosphine.
	Van Wazer (1958).

RUBIDIUM SILICIDE Rb_2Si_2

Water	See CESIUM SILICIDE plus Water.

RUTHENIUM Ru

Oxygen Difluoride	See IRIDIUM plus Oxygen Difluoride.

RUTHENIUM TETROXIDE RuO_4

Charcoal	Ruthenium tetroxide (gas) in contact with activated charcoal reacted violently.
	Scott (1963).
Phosphorus Tribromide	Ruthenium tetroxide and phosphorus tribromide undergo a vigorous exothermic reaction.
	Mellor **8, Supp. 3:** 521 (1971).

SAMARIUM Sm

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.
1,1,2-Trichlorotrifluoroethane	A commercial mixer/mill was demolished and a technician was injured as a result of an explosion which occurred when an attempt was made to grind 20 grams of samarium in approximately 20 cc of 1,1,2-trichlorotrifluoroethane. Subsequent investigation revealed that the explosion was caused by the generation of fresh metal surface in the presence of the chlorinated halocarbon.
	Wischmeyer (1970). *NSC Newsletter, R & D Sec.* (Aug. 1970).

SELENIUM Se

Barium Carbide	A mixture of barium carbide and selenium heated to 150¡ C. becomes incandescent.
	Mellor **5:** 862 (1946-1947).
Bromine Pentafluoride	See ARSENIC plus Bromine Pentafluoride.
Calcium Carbide	Calcium carbide and selenium vapor react with incandescence.
	Mellor **5:** 862 (1946-1947).
Chlorates	A moist mixture of selenium and any chlorates but the alkali chlorates becomes incandescent.
	Mellor **2, Supp. 1:** 583 (1956).
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Chromium Trioxide	Selenium reacts violently with chromium trioxide.
	Mellor **11:** 233 (1946-1947).
Fluorine	Selenium unites directly with fluorine in the cold, giving off fumes, and finally the selenium ignites.
	Mellor **10:** 747 (1946-1947).
Lithium Carbide	See SULFUR plus Lithium Carbide.
Lithium Silicide	See PHOSPHORUS plus Lithium Silicide.
Nickel	See NICKEL plus Selenium. See also SULFUR plus

	Nickel.
Nitric Acid	Freshly reduced selenium (from selenium dioxide) reacts vigorously with nitric acid. Trace of organic matter probably influenced the reaction.
	Austin, Newman, and Riley, *J. Chem. Soc.*, p. 391 (1938).
Nitrogen Trichloride	See NITROGEN TRICHLORIDE plus Ammonia.
Oxygen	Burning selenium in oxygen has resulted in explosion, probably due to the presence of organic matter.
	Austin, Newman, and Riley, *J. Chem. Soc.*, p. 391 (1938).
Potassium	A mixture of potassium and selenium ignites; sodium does likewise and is attended by vivid incandescence.
	Mellor **10:** 766-7 (1946-1947).
Potassium Bromate	The reaction is violently explosive.
	Mellor **2, Supp. 1:** 763 (1956).
Rubidium Carbide	The carbide burns in selenium vapor.
	Mellor **5:** 848 (1946-1947).
Silver Bromate	The reaction is violently explosive.
	Mellor **2, Supp. 1:** 766 (1956).
Sodium	See SELENIUM plus Potassium.
Strontium Carbide	See SULFUR plus Strontium Carbide.
Thorium Carbide	Selenium vapor attacks heated thorium carbide with incandescence.
	Mellor **5:** 886 (1946-1947).
Uranium	See URANIUM plus Selenium.
Zinc	See ZINC plus Selenium.

SELENIUM CARBIDE SeC_2

Sulfur	See SULFUR plus Thorium Carbide.

SELENIUM IODOPHOSPHIDE $Se_3P_4I_2$

Nitric Acid	These compounds react explosively.
	Mellor **8, Supp. 3:** 247 (1971).

SELENIUM MONOCHLORIDE Se_2Cl_2

Phosphorus	See PHOSPHORUS plus Selenium Monochloride.
Potassium	See POTASSIUM plus Selenium Monochloride.
Potassium Superoxide	Selenium monochloride and potassium superoxide react very violently.
	Mellor **10:** 897 (1946-1947).
Sodium Peroxide	Sodium peroxide reacts violently with the evolution of light when it is treated with selenium monochloride.
	Mellor **10:** 897 (1946-1947.)

SELENIUM OXYCHLORIDE $SeOCl_2$

Phosphorus	See PHOSPHORUS plus Selenium Oxychloride.
Potassium	See POTASSIUM plus Selenium Oxychloride.

SELENIUM OXYFLUORIDE $SeOF_2$

Phosphorus	See PHOSPHORUS plus Selenium Oxyfluoride.

SELENIUM SULFIDE SeS

Silver Oxide	See SILVER OXIDE plus Antimony Trisulfide.

SELENIUM TETRAFLUORIDE SeF_4

Phosphorus	See PHOSPHORUS plus Selenium Tetrafluoride.

SILANE SiH_4

Air	Silicon hydride will ignite in air by slightly raising the temperature or lowering the pressure. *Mellor* **6:** 220 (1946-1947).
Chlorine	See CHLORINE plus Silicon Hydride.

SILANES (SILANE, DISILANE, TRISILANE, etc.)

Air	The first seven to eight members of the series Si_nH_{2n+2} ignite spontaneously in air at room temperature or slightly higher. *Latimer and Hildebrand*, p. 297 (1940). *Z. Anorg. Chemie* **117:** 209. *Mellor* **1:** 376 (1946-1947).

SILICA (SILICON DIOXIDE) SiO_2

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Elements.
Manganese Trifluoride	See MANGANESE TRIFLUORIDE plus Glass.
Oxygen Difluoride	See OXYGEN DIFLUORIDE plus Silica.

SILICATES

Lithium	See LITHIUM plus Carbides.

SILICIDES

(See specific silicides as primary entries or see under other reactants)

SILICOCYN

(See SILICON NITRIDE)

SILICON Si

Alkali Carbonates	When a mixture of amorphous silicon and an alkali carbonate is heated, a vigorous reaction, attended by incandescence, occurs.
	Mellor **6:** 164 (1946-1947).
Aluminum and	A mixture of silicon, aluminum and lead oxide
Lead Oxide	explodes when heated.
	Mellor **7:** 657 (1946-1947).
Calcium	See CALCIUM plus Silicon.
Cesium Carbide	Cesium carbide reacts vigorously when heated with silicon or boron.
	Mellor **5:** 848 (1946-1947).
Chlorine	Silicon burns spontaneously in gaseous chlorine.
	Mellor **2:** 92, 95; **6:** 161; **9:** 626 (1946-1947).
	See ANTIMONY plus Chlorine Trifluoride.
Cobaltic Fluoride	A mixture of silicon powder and cobaltic fluoride glows red on gently warming.
	Mellor **2, Supp. 1:** 64 (1956).
Fluorine	See FLUORINE plus Selenium.
Iodine Pentafluoride	See ARSENIC plus Iodine Pentafluoride.
Manganese Trifluoride	See MANGANESE TRIFLUORIDE plus Glass.
Nitrosyl Fluoride	See BORON plus Nitrosyl Fluoride.
Rubidium Carbide	Rubidium carbide reacts vigorously when heated with silicon or boron.
	Mellor **5:** 848 (1946-1947).
Silver Fluoride	Silicon (powdered) reacts violently with silver fluoride.
	Mellor **3:** 389 (1946-1947).
Sodium-Potassium	The reaction of silicon and sodium-potassium
Alloy	alloy forms sodium silicide, which is spontaneously

	flammable in air.
	Mellor **2, Supp. 2:** 564 (1961).
	See also SODIUM SILICIDE plus Air.

SILICON HYDRIDE

(See SILANE)

SILICON MONOXIDE SiO

Air	Silicon monoxide is spontaneously flammable in air.
	Ellern (1961).

SILICON NITRIDE $(Si_2N_2)_n$

Air	Silicocyn is spontaneously flammable in air.
	Ellern (1961).

SILICON TETRAAZIDE $Si(N_3)_4$

(self-reactive)	Spontaneous explosions have been observed with this compound.
	Mellor **8, Supp. 2:** 50 (1967).
	See BORON TRIAZIDE (self-reactive).

SILICON TETRACHLORIDE $SiCl_4$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

SILICON TETRAMETHYL

(See TETRAMETHYLSILANE)

SILICYLAMINE $(SiH_3)_3N$

(See TRISILICYLAMINE)

SILOXANE $(OSiH_2)_3$

Air	Siloxane is spontaneously flammable in air.
	Ellern (1961).

SILVER Ag

Acetylene	An insoluble, explosive acetylide is formed with silver.
	Von Schwartz, p. 142 (1918); J. K. Luchs, *Phot. Sci. Eng.* **10**(6): 334-7 (1966).
Ammonia	See GOLD plus Ammonia.
Bromoazide	See ANTIMONY plus Bromoazide.
Chlorine Trifluoride	See ALUMINUM plus Chlorine Trifluoride.
Ethyl Alcohol and	When silver is treated with nitric acid in the
Nitric Acid	presence of ethyl alcohol, silver fulminate may be formed, which can be detonated.
	P. M. Hearbjes and J. P. Howtman, *Chem. Weekblad* **38;** J. K. Luchs, *Phot. Sci. Eng.* **10**(6): 334-7 (1966).
Ethyleneimine	Ethyleneimine forms explosive compounds with silver, hence silver solder should not be used to fabricate equipment for handling ethyleneimine.
	Ethyleneimine.
Hydrogen Peroxide	See IRON plus Hydrogen Peroxide. Finely divided silver and a strong hydrogen peroxide solution may explode.
	Mellor **1:** 936 (1946-1947).
Oxalic Acid	Silver is said to be incompatible with oxalic acid and tartaric acid.
	NavAer. 09-01-505 (November 1, 1956).

Permonosulfuric Acid	See PERMONOSULFURIC ACID plus Manganese Dioxide. See PLATINUM plus Permonosulfuric Acid.
Tartaric Acid	See SILVER plus Oxalic Acid.

SILVER AZIDE AgN_3

(self-reactive)	Silver azide decomposes at 250¡ C. It is explosively unstable.
	Mellor **8, Supp. 2:** 43 (1967).
	Silver azide is shock-sensitive when dry and has a detonation temperature of 250¡ C.
	Photo. Sci. & Eng. **10** (6): 334-337 (1966).
	See also AZIDES.
Bromine	See BROMINE plus Silver Azide.
Iodine	See IODINE plus Silver Azide.

SILVER BROMATE $AgBrO_3$

Sulfur	See SULFUR plus Silver Bromate.
Tellurium	See TELLURIUM plus Silver Bromate.

SILVER BROMIDE AgBr

Potassium	See SODIUM plus Silver Bromide.
Sodium	See SODIUM plus Silver Bromide.

SILVER CHLORATE $AgClO_3$

Sulfur	See SULFUR plus Silver Chlorate.

SILVER CHLORIDE AgCl

Aluminum	See ALUMINUM plus Silver Chloride.

Ammonia	When a solution of silver chloride in aqueous ammonia is exposed to air or to heat, a material, probably silver nitride, is formed that is detonated violently by shock.
	Mellor **3:** 382 (1946-1947); J. K. Luchs, *Phot. Sci. Eng.* **10**(6): 334-7 (1966).
	Kite (1973).
Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Barium Chloride.
Potassium	See SODIUM plus Silver Bromide.
	See POTASSIUM plus Ammonium Bromide.
Sodium	See SODIUM plus Silver Bromide.
Sodium Peroxide and	See SODIUM PEROXIDE plus Silver Chloride
Charcoal	and Charcoal.

SILVER CYANIDE AgCN

Fluorine	See FLUORINE plus Silver Cyanide.

SILVER DIAMIDOTRIOXYPHOSPHORANE

$(AgO)_3P(NHAg)_2$

Sulfuric Acid	Pentasilver trihydroxydiamidophosphate explodes on heating, friction, or treatment with concentrated sulfuric acid.
	J. Am. Chem. Soc. **17:** 275 (1895).
	Tetrasilver trihydroxydiaminophosphate ignites when treated with concentrated sulfuric acid.
	Mellor **8:** 705 (1946-1947).

SILVER FLUORIDE AgF

Boron	See BORON plus Silver Fluoride.
Calcium Hydride	When silver fluoride is ground with calcium hydride, the mass becomes incandescent.

	Mellor **3:** 389 (1946-1947).
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Silver Fluoride.
Potassium	See SODIUM plus Silver Bromide.
	See POTASSIUM plus Aluminum Bromide.
Silicon	See SILICON plus Silver Fluoride.
Sodium	See SODIUM plus Silver Bromide.
	See SODIUM plus Aluminum Bromide.

SILVER FLUOROACETYLIDE FC≡CAg

(self-reactive)	See FLUOROACETYLENE (self-reactive).

SILVER FULMINATE AgCNO

(self-reactive)	See SILVER CHLORIDE plus Ammonia. Silver fulminate is shock-sensitive when dry and has a detonation temperature of 175¡ C.
	Photo. Sci. & Eng. **10** (6): 334-337 (1966).

SILVER HALIDES

Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Silver Halides.

SILVER IODATE $AgIO_3$

Potassium	See POTASSIUM plus Boric Acid.

SILVER IODIDE AgI

Potassium	See SODIUM plus Silver Bromide.
	See POTASSIUM plus Ammonium Bromide.
Sodium	See SODIUM plus Silver Bromide.

SILVER NITRATE $AgNO_3$

Acetylene	See MERCURY SALTS plus Acetylene.
Acetylene and Ammonium Hydroxide	Silver acetylide is formed on precipitation of an ammoniacal solution of silver nitrate with acetylene. Silver acetylide is highly explosive in the dry state.
	Sprengstoffe, Waffen u. Munitions (1905); J. K. Luchs, *Phot. Sci. Eng.* **10** (6): 334-7 (1966).
Ammonium Hydroxide	When a mixture of 28% ammonium hydroxid and silver nitrate solution was treated with a small amount of sodium hydroxide, black material precipitated. On being stirred the mixture exploded. The cause was formation of the sensitive silver nitride.
	MCA Case History **1554** (1968).
Arsenic	See ARSENIC plus Silver Nitrate.
Calcium Carbide	A highly sensitive explosive is formed by the addition of calcium carbide to a silver nitrate solution.
	Mellor **5:** 881 ff. (1946-1947); J. K. Luchs,
	Phot. Sci. Eng. **10**(6): 334-7 (1966).
Charcoal	A mixture of charcoal and silver nitrate ignites under impact.
	Mellor **3:** 473 (1946-1947).
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Cuprous Acetylide	See CUPROUS ACETYLIDE plus Silver Nitrate.
Ethyl Alcohol	Alcohols should not be mixed with silver nitrate, an explosive fulminate may be formed.
	Bahme, p. 9 (1961): J. K. Luchs, *Phot. Sci. Eng.* **10** (6): 334-7 (1966).
Magnesium	See MAGNESIUM plus Silver Nitrate.
Phosphine	An explosion occurred when purified phosphine was

	passed rapidly into a concentrated solution of silver nitrate.
	Mellor **3:** 471 (1946-1947).
Phosphonium Iodide	See PHOSPHONIUM IODIDE plus Silver Nitrate.
Phosphorus	See PHOSPHORUS plus Silver Nitrate.
Phosphorus Isocyanate	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.
Plastics	In a study to assess potential shipping and storage containers the relative flammability of various plastics in contact with silver nitrate was examined. All plastics tested were shown to undergo propellant-type burning in the presence of silver nitrate under conditions that might be encountered under fire exposure conditions.
	Coffee (1969).
Sulfur	See SULFUR plus Silver Nitrate.

SILVER NITRIDE Ag_3N

(self-reactive)	Silver nitride can be detonated by shock even if wet. Detonation temperature is 100¡ C.
	Photo. Sci. & Eng. **10** (6): 334-337 (1966).
	Dried silver nitride explodes readily, even from a strong flash of light.
	Mellor **8, Supp. 1:** 155 (1964).

SILVER NITRIDOOSMATE $AgOsNO_3$

(self-reactive)	Silver osmiamate detonates violently at 80¡ C or by percussion.
	Mellor **15:** 728 (1946-1947).

SILVER OXALATE AgOCOCOOAg

(self-reactive)	Newly prepared silver oxalate, that had been oven dried for several days at 50¡ C maximum, was placed in a mechanical mortar-and-pestle type grinder. When the motor was turned on, an explosion occurred that seriously

injured two people. Impact detonation was the probable cause of the detonation. Textbooks indicate that silver oxalate is explosive above 150¡ C and that the explosion hazard is moderate when exposed to heat.

BCISC **44** (175): 19 (1973).

Chlorine — See CHLORINE plus Mercuric Oxide.

SILVER OXIDE Ag_2O

Ammonium Hydroxide — An attempt to dissolve silver oxide (prepared 24 hours previously) in ammonium hydroxide in a stainless steel can caused a muffled explosion which distorted the can; numerous subsequent small explosions occurred in the spots of slurry scattered around the room by the initial explosion. Many similar incidents are also reported.

ASESB Expl. Reports **10** (1960); **172** (1964); **190** (1965). *Health & Safety Inf.* **198** (1964); J. K. Luchs, *Phot. Sci. Eng.* **10**(6): 334-7 (1966). *MCA Case History* **976** (1964).

Antimony Trisulfide — Ignition takes place when silver oxide is ground with various metal sulfides, e.g., those of antimony, mercury, selenium.

Mellor **3:** 377 (1946-1947).

Aqueous Ammonia and Ethyl Alcohol — A mixture of silver oxide plus ethyl alcohol and aqueous ammonia forms the very sensitive silver nitride.

Mellor **8:** 101 (1946-1947); J. K. Luchs, *Phot. Sci. Eng.* **10**(6): 334-7 (1966).

Carbon Monoxide — Carbon monoxide reduces silver oxide energetically and considerable heat is generated.

Mellor **3:** 377 (1946-1947).

Magnesium — A mixture of silver oxide and magnesium heated in a sealed tube causes a reaction which proceeds with explosive violence.

Mellor **3:** 378 (1946-1947).

Mercuric Sulfide — See SILVER OXIDE plus Antimony Trisulfide.

Phosphorus	See PHOSPHORUS plus Silver Oxide.
Selenium Sulfide	See SILVER OXIDE plus Antimony Trisulfide.
Sulfur	See SULFUR plus Silver Oxide.

SILVER PERCHLORATE $AgClO_4$

(self-reactive)	Silver perchlorate filter cake exploded while being pulverized in a mortar.
	ACS **146:** 209.
Acetic Acid	Silver perchlorate-acetic acid solvated salt is liable to explode when struck. Shock-sensitive solvated salts are also formed with silver perchlorate and aniline, benzene, chlorobenzene, glycerol, nitrobenzene, pyridine, and toluene.
	Mellor **2, Supp. 1:** 616 (1956).
Aniline	See SILVER PERCHLORATE plus Acetic Acid.
Benzene	An explosion of silver perchlorate crystallized from benzene has been reported. A similar explosion involving ethyl alcohol was cited.
	S. R. Brinkley, *J. Am. Chem. Soc.* **62:** 3524 (1940). *ACS*-**146:** 209.
	See SILVER PERCHLORATE plus Acetic Acid.
Carbon Tetrachloride and Hydrochloric Acid	The reaction of silver perchlorate with carbon tetrachloride in the presence of a small amount of hydrochloric acid produces trichloromethyl perchlorate, which detonates at 40¡ C.
	Kirk and Othmer, *Second Ed.* **5:** 72 (1963).
	Pascal **16:** 316 (1931-1934).
Chlorobenzene	See SILVER PERCHLORATE plus Acetic Acid.
Ethyl Alcohol	See SILVER PERCHLORATE plus Benzene.
Ethylenediamine	A flask exploded while a chemist was adding ethylenediamine drop-wise to silver perchlorate.

	NSC Newsletter, R & D Sec. (Jan. 1970).
Glycerol	See SILVER PERCHLORATE plus Acetic Acid.
Nitrobenzene	See SILVER PERCHLORATE plus Acetic Acid.
Pyridine	See SILVER PERCHLORATE plus Acetic Acid.
Toluene	See SILVER PERCHLORATE plus Acetic Acid.
	Many "hydrocarbon-metal perchlorate" complexes are explosive, for example, the complexes of benzene, toluene, aniline, pyridine, and dioxane.
	Analyst **80:** 13 (1955).

SILVER PERCHLORATE-ACETIC ACID SOLVATED SALT

$AgClO_4CH_3COOH$

(self-reactive)	See SILVER PERCHLORATE plus Acetic Acid.

SILVER PERMANGANATE $AgMnO_4$

Ammonium Hydroxide	Silver permanganate reacts with ammonium hydroxide to form a complex of the formula $[Ag(NH_3)_2]MnO_4$ which is shock sensitive.
	Pascal **16:** 1062 (1931-1934).
Sulfuric Acid (Vapor)	Moist silver permanganate stored for drying in a desiccator over sulfuric acid under vacuum produced a strong explosion.
	Delhez (1967).

SILVER PEROXIDE Ag_2O_2

Polyisobutylene	An explosion occurred during filling of a container with 2 kilograms of silver peroxide containing 1% by weight of polyisobutylene.
	Arbeitsschutz **6:** 248 (1972).

SILVER PHENYL C_6H_5Ag

(See PHENYL SILVER)

SILVER SALTS

Acetylene	See MERCURY SALTS plus Acetylene.
Nitromethane	See COPPER SALTS plus Nitromethane.

SILVER SULFIDE Ag_2S

Iodine Monochloride	See IODINE MONOCHLORIDE plus Cadmium Sulfide.
Potassium Chlorate	See POTASSIUM CHLORATE plus Silver Sulfide.

SODIUM Na

Air	The ignition temperature of sodium in air depends on size of surface exposed: vapor ignites at room temperature; droplets at about 250¡F; an agitated pool at 400¡F.; a calm pool at 500¡-800¡F. In the absence of moisture and hydrogen, the reaction is insignificant below 1000¡F. *Gracie and Droher* (1960). *Mellor* **2, Supp. 2:** 440 (1961).
Aluminum Bromide	A mixture of sodium and any of the following halide compounds produces a strong explosion on impact: aluminum bromide, aluminum chloride, aluminum fluoride, ammonium chlorocuprate, antimony tribromide, antimony trichloride, antimony triiodide, arsenic trichloride, arsenic triiodide, bismuth tribromide, bismuth trichloride, bismuth triiodide, boron tribromide, cupric chloride, ferrous chloride, iodine monobromide, manganous chloride, mercuric bromide, mercuric chloride, mercuric fluoride, mercuric iodide, mercurous chloride, silicon tetrachloride, silver fluoride, stannic chloride, stannic iodide (with sulfur), stannous chloride, sulfur dibromide, thallous bromide, vanadium pentachloride, and zinc bromide. *Mellor* **2, Supp. 2:** 497 (1961).

Aluminum Chloride	See SODIUM plus Aluminum Bromide.
Aluminum Fluoride	See SODIUM plus Aluminum Bromide.
Ammonium Chlorocuprate	See SODIUM plus Aluminum Bromide.
Ammonium Nitrate	Sodium and ammonium nitrate react through a series of reductions to form a yellow explosive substance believed to be disodium nitrite.
	Mellor **8: Supp. I, Part I,** p. 546 (1964).
Antimony Tribromide	See SODIUM plus Aluminum Bromide.
Antimony Trichloride	See SODIUM plus Aluminum Bromide.
Antimony Triiodide	See SODIUM plus Aluminum Bromide.
Arsenic Trichloride	See SODIUM plus Aluminum Bromide.
Arsenic Triiodide	See SODIUM plus Aluminum Bromide.
Bismuth Tribromide	See SODIUM plus Aluminum Bromide.
Bismuth Trichloride	See SODIUM plus Aluminum Bromide.
Bismuth Triiodide	See SODIUM plus Aluminum Bromide.
Bismuth Trioxide	Sodium reduces the heated trioxide to the metal and the reaction is accompanied by incandescence.
	Mellor **9:** 649 (1946-1947).
Boron Tribromide	See SODIUM plus Aluminum Bromide.
Bromine	Finely divided sodium reacts with bromine with luminescence. The system, solid sodium plus liquid bromine, requires a light mechanical shock to explode it.
	Mellor, **Supp. II, Part I:** 714 (1956). H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925).
	See BROMINE plus Potassium.
Bromoazide	See ANTIMONY plus Bromoazide.
Carbon Dioxide	Molten sodium can be plunged into a carbon dioxide atmosphere without causing a vigorous reaction. But sodium manufacturers warn against using carbon dioxide on fires, because molten sodium burns with increasing

	vigor as the temperature is elevated. Small sodium fires can, however, be covered with solvent, like kerosine, and the resultant kerosine fire can be attacked with carbon dioxide.
	H. N. Gilbert, *Chem. Eng. News* **26:** 2604 (1948). *Metallic Sodium,* p. 19 (1952). *"Ethyl" Sodium,* p. 10 (1954). *Sodium, Plant Scale,* p. 38 (1956).
	An explosive reaction occurs when dry ice and solid sodium are brought together by impact.
	Mellor **2, Supp. 2:** 468 (1961).
Carbon Monoxide and Ammonia	The reaction of sodium and carbon monoxide in liquid ammonia forms sodium carbonyl, which explodes when heated in air.
	Mellor **2, Supp. 2:** 467 (1961).
	See also SODIUM CARBONYL plus Air.
Carbon Tetrachloride	Carbon tetrachloride reacts violently with hot sodium.
	Bahme, p. 12 (1961). *Ellern,* p. 43 (1968).
	See SODIUM plus Carbon Dioxide.
	See SODIUM plus Cobaltous Bromide.
Chlorinated Hydrocarbons	Sodium forms explosive mixtures with chlorinated hydrocarbons.
	H. N. Gilbert, *Chem. Eng. News* **26:** 2604 (1948).
Chlorine	Cold sodium is spontaneously flammable in moist chlorine.
	Mellor **2:** 95, 469 (1946-1947).
	The vapors of sodium and chlorine react with a luminous flame.
	Mellor **2, Supp. 1:** 380 (1956).
Chlorine Trifluoride	See CALCIUM plus Chlorine Trifluoride.
Chloroform	The system, sodium plus chloroform, is shock-sensitive, producing a fairly strong explosion.

	H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925).
	See LITHIUM plus Chloroform.
	See POTASSIUM plus Chloroform.
Chromium Tetrachloride	A mixture of sodium and chromium tetrachloride creates a very violent explosion on impact.
	Mellor **2, Supp. 2:** 497 (1961).
Chromium Trioxide	Sodium or potassium reacts with chromium trioxide with incandescence.
	Mellor **11:** 237 (1946-1947).
Cobaltous Bromide	A very violent explosion results when a mixture of sodium and any of the following is struck with a hammer: cobaltous bromide, carbon tetrachloride, cobaltous chloride, ferric bromide, ferric chloride, ferrous bromide, ferrous iodide, phosphorus pentachloride, phosphorus tribromide, sulfur dichloride.
	Mellor **2, Supp. 2:** 497 (1961).
Cobaltous Chloride	See SODIUM plus Cobaltous Bromide.
Cupric Chloride	See SODIUM plus Aluminum Bromide.
Cupric Oxide	Cupric oxide is reduced when heated with sodium. The reaction proceeds with vivid incandescence.
	Mellor **3:** 138 (1946-1947).
1,2-Dichloroethylene	The addition of sodium, caustic or caustic solutions to 1,2-dichloroethylene or to trichloroethylene may form monochloroacetylene or dichloroacetylene, respectively. The addition of sodium or caustic to tetrachloroethane may form either of the chloroacetylenes, both of which are spontaneously flammable in air. Avoid the contact of the above chlorohydrocarbons with sodium or caustic except under carefully controlled experimental conditions.
	NAVWEPS OP **3237,** p. 28 (1964). *Fire and Accident Prev.* **42** (1956).
Dichloromethane	Sodium and other alkali metals form sensitive explosive mixtures with chloroform, dichloromethane, and methyl chloride.

	H. Staudinger, *Z. Elektrochem.* **31:** 549 (1925).
Ferric Bromide	See SODIUM plus Cobaltous Bromide.
Ferric Chloride	See SODIUM plus Cobaltous Bromide.
Ferrous Bromide	See SODIUM plus Cobaltous Bromide.
Ferrous Chloride	See SODIUM plus Aluminum Bromide.
Ferrous Iodide	See SODIUM plus Cobaltous Bromide.
Fluorine	Sodium burns spontaneously in fluorine.
	Mellor **2:** 469 (1946-1947).
	Mellor **2, Supp. 2:** 450 (1961).
Hydrazine Hydrate	Hydrazine hydrate and sodium develop much heat with the liberation of hydrogen and ammonia. If hydrazine hydrate is added drop by drop to finely granulated sodium, suspended in ether, and the mixture is heated, a white substance is formed, which explodes in air.
	Mellor **8:** 316 (1946-1947).
Hydrochloric Acid	Sodium explodes on contact with hydrochloric acid.
	Mellor **2:** 469 (1946-1947).
Hydrofluoric Acid	An aqueous solution of hydrofluoric acid reacts with sodium with explosive violence.
	Mellor **2:** 469 (1946-1947).
Hydrogen Chloride	Sodium reacts very vigorously with gaseous hydrogen chloride.
	Mellor **2, Supp. 2:** 452 (1961).
Hydrogen Peroxide	See LEAD DIOXIDE plus Hydrogen Peroxide.
Hydrogen Sulfide	A very rapid reaction results when moist gaseous hydrogen sulfide contacts sodium.
	Mellor **2, Supp. 2:** 456 (1961).
Hydroxylamine	Sodium and hydroxylamine (in an ether solution) form sodium hydroxylamine, which is spontaneously flammable in air.
	Mellor **8:** 290 (1946-1947).

Iodine	See IODINE plus Lithium.
Iodine Monobromide	A mixture of sodium and iodine monobromide explodes when struck with a hammer. *Mellor* **2, Supp. 2:** 452 (1961). See also SODIUM plus Aluminum Bromide.
Iodine Monochloride	See POTASSIUM plus Iodine Monochloride. The reaction of sodium and iodine monochloride is vigorous when both materials are molten. *Mellor* **2, Supp. 2:** 451 (1961).
Iodine Pentafluoride	A mixture of iodine pentafluoride and potassium or sodium (molten) will explode. *Mellor* **2:** 114 (1946-1947).
Lead Oxide	Sodium, reduced to a fine state of subdivision, when mixed with lead oxide ignites spontaneously. *Mellor* **7:** 658 (1946-1947).
Maleic Anhydride	See ALKALI METALS plus Maleic Anhydride.
Manganous Chloride	See SODIUM plus Aluminum Bromide.
Mercuric Bromide	See SODIUM plus Aluminum Bromide.
Mercuric Chloride	See SODIUM plus Aluminum Bromide.
Mercuric Fluoride	See SODIUM plus Aluminum Bromide.
Mercuric Iodide	See SODIUM plus Aluminum Bromide.
Mercurous Chloride	See SODIUM plus Aluminum Bromide.
Mercurous Oxide	Molten sodium or potassium decomposes mercurous oxide with a slight explosion. J. B. Senderens, *Bull. Soc. Chim.* (3) **6:** 802 (1891).
Methyl Chloride	Sodium and other alkali metals react explosively with methyl chloride. H. Staudinger, *Z. Elektrochem.* **31:**549-52 (1925).
Molybdenum Trioxide	Molybdenum trioxide is reduced by either potassium or sodium with incandescence.

	Z. Anorg. Chemie **190:** 270 (1930).
Monoammonium Phosphate	An explosive reaction occurred when monoammonium phosphate was used to extinguish a sodium fire. No reactions were experienced when sodium bicarbonate or potassium bicarbonate was used in a sodium fire.
	Bohling (1971).
Nitric Acid	Sodium ignites spontaneously in contact with nitric acid of specific gravity exceeding 1.056.
	Mellor **2:** 470 (1946-1947).
	Mellor **2, Supp. 2:** 452 (1961).
Nitrogen Peroxide	Gaseous sodium reacts with the vapors of nitrogen peroxide and nitrous oxide with marked luminescence at 260¡ C.
	Mellor **2, Supp. 2:** 463 (1961).
Nitrosyl Fluoride	The reaction between nitrosyl fluoride and sodium forms sodium fluoride with incandescence.
	Z. Anorg. Chemie **47:** 190 (1905).
Nitrous Oxide	See SODIUM plus Nitrogen Peroxide.
Phosgene	Vapors of sodium and phosgene react with luminescence at about 260¡ C.
	Mellor **2, Supp. 2:** 470 (1961).
Phosphorus	See PHOSPHORUS plus Cesium.
Phosphorus Pentachloride	Molten sodium may ignite or explode when in contact with phosphorus pentachloride.
	Baudrimant.
	See also SODIUM plus Cobaltous Bromide.
Phosphorus Pentoxide	See POTASSIUM plus Phosphorus Pentoxide.
Phosphorus Tribromide	Metallic sodium merely floats on liquid phosphorus tribromide, losing its metallic lustre; but, if a little water is sprinkled on the surface, there is a violent explosion.

	Z. Anorg. Chemie **41:** 276 (1904).
	See SODIUM plus Cobaltous Bromide.
Phosphorus Trichloride	Phosphorus trichloride explodes at the fusion temperature of sodium.
	Mellor **2:** 470 (1946-1947).
	See also SODIUM plus Phosphoryl Chloride.
Phosphoryl Chloride	Gaseous sodium reacts with the vapors of phosphoryl chloride and phosphorus trichloride with luminescence at 270¡ C.
	Mellor **2, Supp. 2:** 463 (1961).
Potassium Oxides	See POTASSIUM plus Air.
Potassium Ozonide	Sodium in contact with either potassium ozonide or potassium superoxide produces an explosive reaction.
	Mellor **2, Supp. 3:** 1577 (1963).
Potassium Superoxide	See SODIUM plus Potassium Ozonide.
Selenium	Potassium reacts with selenium and is attended by burning; sodium does likewise and is attended by vivid incandescence.
	Mellor **10:** 766-7 (1946-1947).
	The reaction of sodium and selenium is luminescent above 300¡ C at low pressure.
	Mellor **2, Supp. 2:** 455 (1961).
Silicon Tetrachloride	See SODIUM plus Aluminum Bromide.
Silver Bromide	Silver bromide, silver chloride, silver fluoride, and silver iodide form impact-sensitive systems with sodium and other alkali metals.
	H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925).
Silver Chloride	See SODIUM plus Silver Bromide.
Silver Fluoride	See SODIUM plus Silver Bromide.
	See SODIUM plus Aluminum Bromide.

Silver Iodide	See SODIUM plus Silver Bromide.
Sodium Peroxide	The reduction of sodium peroxide by molten sodium at 500¡ C is a very vigorous reaction.
	U.S. AEC Document UCRL-**1864:** 2-23 (1954).
Stannic Chloride	See SODIUM plus Aluminum Bromide.
Stannic Iodide and Sulfur	See SODIUM plus Aluminum Bromide.
Stannic Oxide	Stannic oxide is reduced by sodium or potassium with incandescence.
	Mellor **7:** 401, 418 (1946-1947).
Stannous Chloride	See SODIUM plus Aluminum Bromide.
Sulfur	When sulfur is rubbed with sodium, the reaction proceeds with explosive violence.
	Mellor **2:** 469 (1946-1947).
	Mellor **2, Supp. 2:** 455 (1961).
Sulfur Dibromide	See SODIUM plus Aluminum Bromide.
Sulfur Dichloride	A mixture of sodium and sulfur dichloride explodes when struck with a hammer.
	Mellor **2, Supp. 2:** 460 (1961).
Sulfur Dioxide	Sulfur dioxide reacts violently with sodium near the melting point.
	H. N. Gilbert, *Chem. Eng. News* **26:** 2604 (1948).
	The reaction of sodium and sulfur dioxide is almost as vigorous as that between sodium and water.
	Mellor **2, Supp. 2:** 458 (1961).
Sulfuric Acid	A dilute aqueous solution of sulfuric acid reacts with sodium with explosive violence.
	Mellor **2:** 470 (1946-1947).
	Mellor **2, Supp. 2:** 453 (1961).
Tellurium	A vigorous reaction results when liquid tellurium is poured

	over solid sodium.
	Mellor **2, Supp. 2:** 455 (1961).
Tetrachloroethane	Tetrachloroethane may explode with potassium or sodium. See also SODIUM plus 1,2-Dichloroethylene.
	Chem. Safety Data Sheet **SD-34** (1949).
Thallous Bromide	See SODIUM plus Aluminum Bromide.
Thiophosphoryl	When thiophosphoryl fluoride is passed over a
Fluoride	metal such as heated sodium or potassium, the metal ignites. The residual mass, when treated with water, gives off spontaneously flammable phosphine.
	Mellor **8:** 1072 (1946-1947).
Trichloroethylene	See SODIUM plus 1,2-Dichloroethylene.
Vanadium	See SODIUM plus Aluminum Bromide.
Pentachloride	
Vanadyl Chloride	Sodium and vanadyl chloride react violently when heated to 180¡ C.
	Mellor **2, Supp. 2:** 496 (1961).
Water	At 40¡C. the heat of reaction is adequate to ignite the hydrogen liberated.
	Mellor **2:** 469 (1946-1947).
	See SODIUM plus Carbon Dioxide.
Zinc Bromide	See SODIUM plus Aluminum Bromide.

SODIUM ACETATE CH_3COONa

Fluorine	See FLUORINE plus Sodium Acetate.
Potassium Nitrate	See POTASSIUM NITRATE plus Sodium Acetate.

SODIUM ACETOACETIC ESTER $C_2H_5OCOCH{=}CO(Na)CH_3$

2-Iodo-3,	See 2-IODO-3, 5-DINITROBIPHENYL plus

5-Dinitrobiphenyl	Ethyl Sodio-Acetoacetate.

SODIUM ACETYLIDE NaC≡CH

Bromine	See BROMINE plus Sodium Acetylene Carbide.
Chlorine	See BROMINE plus Sodium Acetylene Carbide.

SODIUM ACI-NITROMETHYLIDE $NaON(CH_2)O$

Water	Sodium or potassium salts of nitromethane exploded when the dry salt was moistened with a little water.
	Chem. Eng. News **28:** 1473 (1950).

SODIUM ALUMINUM HYDRIDE

(See SODIUM TETRAHYDROALUMINATE)

SODIUM AMIDE $NaNH_2$

Chromic Anhydride	When these solids are ground together, a vigorous reaction results.
	Mellor **11:** 234 (1946-1947).
1,1-Diethoxy-2-chloroethane	The reaction in the presence of ammonia produces sodium ethoxyacetylide, which is extremely pyrophoric.
	Rutledge, p. 35 (1968).
Potassium Chlorate	See POTASSIUM CHLORATE plus Sodium Amide.
Water	Sodium amide reacts violently with water and frequently bursts into flame.
	F. W. Bergstrom and W. C. Fernelius, *Chem. Reviews* **12:** 61 (1933).

SODIUM AZIDE NaN_3

(self-reactive)	Sodium azide decomposes at 275¡ C.

	Mellor **8, Supp. 2:** 43 (1967).
Benzoyl Chloride and Potassium Hydroxide	The mixture of sodium azide and benzoyl chloride reacts spontaneously with evolution of heat in a potassium hydroxide solution.
	Mellor **8, Supp. 2:** 55 (1967).
Bromine	See BROMINE plus Silver Azide.
Carbon Disulfide	See CARBON DISULFIDE plus Azides.
Chromyl Chloride	The reaction of sodium azide and chromyl chloride is an explosive one.
	Mellor **8, Supp. 2:** 36 (1967).
Copper	A solution of sodium azide in copper pipe with lead joints formed copper azide and lead azide, both detonating compounds.
	Klotz (1973).
Dibromomalononitrile	these materials react to produce a product that is extremely sensitive to light shock.
	MCA Case History **820** (1962). *ASESB Expl. Report* **89** (1962).
Dimethyl Sulfate	During preparation of methyl azide from reaction of these two chemicals, a violent explosion occurred. Apparently the pH was allowed to fall below 5. At this acidity hydrazoic acid, a powerful explosive, readily forms.
	MCA Case History **887** (1963).
Lead	See SODIUM AZIDE plus Copper.
Nitric Acid	The reaction of sodium azide and strong nitric acid is energetic.
	Mellor **8, Supp. 2:** 315 (1967).

SODIUM BENZYL $C_6H_5CH_2Na$

(See BENZYL SODIUM)

SODIUM BICARBONATE $NaHCO_3$

Monoammonium Phosphate	A self-propagating reaction can occur when either sodium bicarbonate- or potassium bicarbonate-based dry chemical extinguishing agent is mixed with monoammonium phosphate dry chemical extinguishing agent. Moisture will accelerate the reaction. Products are water, ammonia, carbon dioxide and various solid substances. In a fire extinguisher the pressure developed will blow out the valve.
	Fire J. **60** (1):49 (1966).
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Water.

SODIUM BISULFIDE NaHS

m-Chloroaniline Diazonium Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
4-Chloro-o-toluidine Diazonium Chloride	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
o-Nitroaniline Diazonium Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
Diazonium Salts	See DIAZONIUM SALTS plus Thiophenates.

SODIUM BORINATE $NaBH_2O$

(self-reactive)	Sodium hypoborate is a stronger, more violent reducing agent than sodium hypophosphite.
	Mellor **5:** 37 (1946-1947).

SODIUM BROMATE $NaBrO_3$

Aluminum	See ALUMINUM plus Bromates.

Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Lubricant	See BROMATES plus Organic Matter.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

SODIUM BROMIDE NaBr

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.

SODIUM CARBIDE Na_2C_2

Aluminum	See MERCURY plus Sodium Carbide.
Bromine	See BROMINE plus Sodium Carbide.
Carbon Dioxide	Sodium carbide reacts with incandescence when placed in carbon dioxide, chlorine, or sulfur dioxide.
	Von Schwartz, p. 328 (1918).
	Sodium carbide ignites on warming in carbon dioxide.
	Mellor **5:** 848 (1946-1947).
Chlorine	See SODIUM CARBIDE plus Carbon Dioxide.
	See CHLORINE plus Sodium Carbide.
Iron	See MERCURY plus Sodium Carbide.
Lead	See MERCURY plus Sodium Carbide.
Mercury	See MERCURY plus Sodium Carbide.
Nitrogen Pentoxide	Nitrogen pentoxide attacks sodium carbide with incandescence at 150¡ C.
	Mellor **5:** 848-50 (1946-1947).

Phosphorus	See PHOSPHORUS plus Sodium Carbide.
Sulfur Dioxide	See SODIUM CARBIDE plus Carbon Dioxide.
Water	See BROMINE plus Sodium Carbide.
	An explosion of sodium carbide can occur in water if a large excess of carbide is present.
	Mellor **5:** 848 (1946-1947).

SODIUM CARBONATE Na_2CO_3

Aluminum	See ALUMINUM plus Sodium Carbonate.
Fluorine	See FLUORINE plus Carbonates.
Phosphorus Pentoxide	The anhydrous reaction of sodium carbonate and phosphorus pentoxide, initiated by local heating, can generate relatively high temperatures.
	Mellor **8, Supp. 3:** 406 (1971).
Sulfuric Acid	Stratified concentrated sulfuric acid in a reaction tank was suddenly contacted by alkali wash. The violent ensuing reaction caused a geyser of material, propelled by carbon dioxide and steam, to shoot from the manhole of the tank.
	MCA Case History **888** (1963).

SODIUM CARBONYL NaCOCONa

Air	Sodium carbonyl or potassium carbonyl explodes on contact with air or water.
	Mellor **5:** 951-54 (1946-1947).
	See also SODIUM plus Carbon Monoxide and Ammonia.
Water	See SODIUM CARBONYL plus Air.

SODIUM CHLORATE $NaClO_3$

(See also CHLORATES)

Aluminum	See ALUMINUM plus Bromates.

Ammonium	A bulk cargo of sodium chlorate became hot
Thiosulfate	while being transported in a tank that had previously contained ammonium thiosulfate. Under controlled laboratory conditions, a small quantity of ammonium thiosulfate in sodium chlorate could be made to decompose explosively.
	MCA Case History **2019** (April 1974).
Antimony Sulfide	See CHLORATES plus Antimony Sulfide.
Arsenic	See ARSENIC plus Bromates.
Arsenic Trioxide	The two chemicals form a spontaneously flammable mixture.
	Ellern, p. 51 (1968).
Carbon	See CARBON plus Bromates.
Charcoal	See CHLORATES plus Organic Matter.
Copper	See COPPER plus Bromates.
Manganese Dioxide	See CHLORATES plus Manganese Dioxide.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Acids (Dibasic)	See CHLORATES plus Organic Acids (Dibasic).
Organic Matter	Mixtures containing more than 10 per cent sodium chlorate are sufficiently combustible to be hazardous at low relative humidity. Mixtures of sodium chlorate with organic material such as charcoal, sugar, flour or shellac may be ignited by friction or shock.
	Chem. Safety Data Sheet **SD-42** (1951). W. H. Cook, *Can. J. Research* **8:** 509-44 (1933).
	See CHLORATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Potassium Cyanide	See CHLORATES plus Antimony Sulfide. See POTASSIUM CYANIDE plus Sodium Chlorate. See CHLORATES plus Potassium Cyanide.
Sulfur	See SULFUR plus Chlorates. See SULFUR plus Bromates.
Sulfuric Acid	Chlorates when brought in contact with sulfuric acid are

	likely to cause fire or explosions.
	Bahme, p. 29 (1961).
Thiocyanates	See CHLORATES plus Antimony Sulfide.
	See THIOCYANATES plus Chlorates.
Zinc	See ZINC plus Chlorates.

SODIUM CHLORIDE NaCl

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Lithium	See LITHIUM plus Sodium Chloride.

SODIUM CHLORITE $NaClO_2$

(self-reactive)	The trihydrate crystals of sodium chlorite explode on percussion.
	Mellor **2, Supp. 1:** 573 (1956).
Acids	Sodium chlorite and acids react with rapid evolution of spontaneously explosive chlorine dioxide gas. If heated above 347¡ F., the reaction produces adequate heat to become self-sustaining.
	Diox Process (1949).
Organic Matter	A mixture of organic matter and sodium chlorite can be extremely sensitive to heat, impact, or friction.
	Diox Process (1949).
Oxalic Acid	A bleach mix was prepared by placing weighed quantities of the two chemicals in a stainless steel beaker. As water was being added, the mixture fizzed a moment, then exploded. Toxic chlorine dioxide gas was evolved.
	MCA Case History **839** (1962).
Phosphorus	See PHOSPHORUS plus Sodium Chlorite.
Sulfur	See SULFUR plus Sodium Chlorite.

SODIUM CYANIDE NaCN

Nitrates	See NITRATES plus Cyanides.
Nitrites	See CYANIDES plus Chlorates.

SODIUM DICHROMATE $Na_2Cr_2O_7$

Hydrazine	See POTASSIUM DICHROMATE plus Hydrazine.

SODIUM DIOXIDE

(See SODIUM PEROXIDE)

SODIUM ETHOXYACETYLIDE $NaC{\equiv}COC_2H_5$

(self-reactive)	See SODIUM AMIDE plus 1,1-Diethoxy-2-chloroethane.

SODIUM ETHYL C_2H_5Na

(See ETHYL SODIUM)

SODIUM HYDRAZIDE $NaNHNH_2$

Air	Addition of air, or alcohol, or moisture to sodium hydrazide can produce an explosion. *Mellor* **8:** 336 (1946-1947).
Alcohol	See SODIUM HYDRAZIDE plus Air.
Moisture	See SODIUM HYDRAZIDE plus Air.

SODIUM HYDRIDE NaH

Acetylene	If moisture is present, the reaction between sodium hydride and acetylene is vigorous even at minus 60¡ C. *Mellor* **2:** 483 (1946-1947).
Air	Sodium hydride is spontaneously flammable in air if

	moistened with water.
	Von Schwartz, p. 328 (1918).
Chlorine	See CHLORINE plus Sodium Hydride.
Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Sodium Hydride.
Fluorine	See CHLORINE plus Sodium Hydride.
Iodine	See IODINE plus Sodium Hydride.
Oxygen	See OXYGEN plus Sodium Hydride.
Sulfur	See SULFUR plus Sodium Hydride.
Water	Sodium hydride that was accidentally spilled from a polyethylene bag ignited spontaneously on contact with moisture.
	MCA Case History **1587** (1969).

SODIUM HYDROSULFITE $Na_2S_2O_4$

Water	Moist sodium hydrosulfite is likely to ignite upon drying.
	Bahme, p. 95 (1961).

SODIUM HYDROXIDE NaOH

Acetaldehyde	See ACETALDEHYDE plus Sodium Hydroxide.
Acetic Acid	Mixing sodium hydroxide and glacial acetic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Acetic Anhydride	Mixing sodium hydroxide and acetic anhydride in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Acrolein	An extremely violent polymerization reaction of acrolein results from contact with alkaline materials such as sodium

	hydroxide, potassium hydroxide, ammonia, and amines.
	Chem. Safety Data Sheet **SD-85** (1961).
	Mixing sodium hydroxide and acrolein in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Acrylonitrile	Violent polymerization takes place in the presence of concentrated caustic (e.g., sodium hydroxide, potassium hydroxide).
	Haz. Chem. Data (1966).
Allyl Alcohol	See ALLYL ALCOHOL plus Sodium Hydroxide.
Allyl Chloride	In contact with dry sodium hydroxide, hydrolysis may take place producing allyl alcohol.
	Ventrone (1971).
Aluminum	See ALUMINUM plus Sodium Hydroxide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Chloroform and	When 1 gram of sodium hydroxide was added
Methyl Alcohol	to a mixture of 1 ml methanol and 1 ml chloroform, an exothermic reaction occurred. Potassium hydroxide and other alkalies may replace sodium hydroxide as a reactant.
	J. S. Snyder, *Fawcett and Wood*, p. 302 (1965).
Chlorohydrin	Mixing sodium hydroxide and chlorohydrin in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Chloronitrotoluenes	Inadvertent contamination of mixed chloronitrotoluenes by sodium hydroxide in a feed line caused an exothermic reaction with runaway pressure build-up and eventual explosion of the processing apparatus.
	Queener (1966). *ASESB Expl. Report* **130** (1963).
Chlorosulfonic Acid	Mixing sodium hydroxide and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.

	Flynn and Rossow (1970). See Note under complete reference.
1,2-Dichloroethylene	See SODIUM plus 1,2-Dichloroethylene.
Ethylene Cyanohydrin	Mixing sodium hydroxide and ethylene cyanohydrin in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Glyoxal	Mixing sodium hydroxide and glyoxal in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrochloric Acid	Mixing sodium hydroxide and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing sodium hydroxide and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Hydroquinone	Crude hydroquinone was pumped into a sodium hydroxide storage tank by mistake. The hydroquinone liquor at 85¡C decomposed rapidly in the presence of the sodium hydroxide resulting in overflow of the tank and evolution of a considerable amount of heat.
	Wischmeyer (1969).
Maleic Anhydride	The presence of a residue of weak sodium hydroxide solution in a pressure vessel caused maleic anhydride to decompose in a runaway explosive reaction.
	Chem. Haz. Info. Series **C-71:** 5 (1960).
	Alkali and other alkaline earth compounds such as potassium, lithium, calcium, barium and magnesium compounds, as well as amines and other nitrogen

	compounds will cause explosive decomposition of maleic anhydride.
	MCA Case History **622** *and Suppl. to* **622** (1960).
	Vogler, Cecil, and Koerner, *J. Chem. Eng. Data* **8** (4): 620-3 (1963).
Nitric Acid	Mixing sodium hydroxide and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitroethane	See CALCIUM HYDROXIDE plus Nitroethane.
Nitromethane	See CALCIUM HYDROXIDE plus Nitroethane.
Nitroparaffins	See CALCIUM HYDROXIDE plus Nitroethane.
Nitropropane	See CALCIUM HYDROXIDE plus Nitroethane.
Oleum	Mixing sodium hydroxide and oleum in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Pentol (3-Methyl-2-	Pentol, being fractionated under high vacuum,
Penten-4-yn-1-ol)	was accidentally contacted by caustic cleaning solution and a violent explosion resulted.
	MCA Case History **363.** *Chem. Process (Chicago)* **27:** 111 (1964).
Phosphorus	See PHOSPHORUS plus Alkaline Hydroxide.
Phosphorus Pentoxide	See CALCIUM OXIDE plus Phosphorus Pentoxide.
Propiolactone (beta-)	Mixing sodium hydroxide and propiolactone (beta-) in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Sulfuric Acid	Mixing sodium hydroxide and 96% sulfuric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete

	reference.
Tetrachlorobenzene and Methyl Alcohol	In the manufacturing of the sodium salt of trichlorophenol, sodium hydroxide, methyl alcohol and tetrachlorobenzene were heated. During the heating process, the pressure suddenly increased rapidly and an explosion occurred.
	MCA Guide for Safety, Appendix 3 (1972).
Tetrahydrofuran	See TETRAHYDROFURAN plus Potassium Hydroxide.
Trichloroethylene	When heated, trichloroethylene and sodium hydroxide or potassium hydroxide form explosive mixtures of dichloroacetylene.
	Chem. Safety Data Sheet **SD-14** (1956).
	The presence of alkylamines as a stabilizer in commercial trichloroethylene furnishes a catalyst that accelerates this reaction.
	MCA Case History **495.** *Fire and Accident Prev.* **42** (June 8, 1956).
	A pail of trichloroethylene dumped into a tank of caustic caused a fireball and eruption of the contents.
	MCA Case History **1065** (1965).
	See SODIUM plus 1,2-Dichloroethylene.
Water	Sodium hydroxide in contact with water may generate enough heat to ignite adjacent combustible materials.
	Haz. Chem. Data (1966).

SODIUM HYDROXYLAMINE NH_2ONa

Air	Sodium hydroxylamine is spontaneously flammable in air.
	Mellor **8:** 290 (1946-1947).

SODIUM HYPOBROMITE NaOBr

Acetone	See ACETONE plus Sodium Hypobromite.
Cupric Salts	Solutions of sodium hypobromite are decomposed by powerful catalytic action of cupric ions, even as impurities.
	Mellor **2, Supp. 1:** 751 (1956).

SODIUM HYPOCHLORITE NaOCl

(See also HYPOCHLORITES)

(self-reactive)	Anhydrous sodium hypochlorite is very explosive.
	Merck Index, p. 960 (1968).
Amines	See CALCIUM HYPOCHLORITE plus Amines.
Ammonium Acetate	Decomposition of sodium hypochlorite takes place within a few seconds with the following salts: ammonium acetate, ammonium carbonate, ammonium nitrate, ammonium oxalate, and ammonium phosphate.
	Mellor **2, Supp. 1:** 550 (1956).
Ammonium Carbonate	See SODIUM HYPOCHLORITE plus Ammonium Acetate.
Ammonium Nitrate	See SODIUM HYPOCHLORITE plus Ammonium Acetate.
Ammonium Oxalate	See SODIUM HYPOCHLORITE plus Ammonium Acetate.
Ammonium Phosphate	See SODIUM HYPOCHLORITE plus Ammonium Acetate.
Cellulose	See SODIUM HYPOCHLORITE plus Oxalic Acid.
Ethyleneimine	See ETHYLENEIMINE plus Sodium Hypochlorite.

SODIUM HYPOPHOSPHITE $NaPH_2O_2$

(self-reactive)	Explosions can occur when hot sodium hypophosphite solution is evaporated.
	Mellor **8:** 881 (1946-1947).
Air	Sodium hypophosphite decomposes when heated, forming

	phosphine, a spontaneously flammable gas.
	Mellor **8:** 881 (1946-1947).
	Mellor **8, Supp. 3:** 623 (1971).
Chlorates	See CHLORATES plus Sodium Hypophosphite.
Nitrates	See CHLORATES plus Sodium Hypophosphite.
Potassium Nitrate	See POTASSIUM NITRATE plus Sodium Hypophosphite.
Sodium Nitrate	See SODIUM NITRATE plus Sodium Hypophosphite.

SODIUM IODATE $NaIO_3$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Hydrogen Peroxide	Iodates decompose hydrogen peroxide catalytically.
	Mellor **1:** 940 (1946-1947).
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See ORGANIC MATTER plus Bromates.
Phosphorus	See PHOSPHORUS plus Bromates.
Potassium	See POTASSIUM plus Boric Acid.
Sulfur	See SULFUR plus Bromates.

SODIUM IODIDE NaI

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Potassium Bromide.
Perchloric Acid	Perchloric acid ignites in contact with sodium iodide.
	J. Am. Chem. Soc. **23:** 444 (1901).

SODIUM METHYL CH_3Na

(See METHYL SODIUM)

SODIUM METHYLATE

(See SODIUM METHOXIDE)

SODIUM METHOXIDE $NaOCH_3$

Chloroform	Too rapid addition of sodium methylate to a mixture of chloroform and methanol initiated an uncontrolled exothermic reaction between the chloroform and the methylate that terminated in a violent explosion.
	MCA Case History **693** (1961).
Methyl Azide and	See METHYL AZIDE plus Dimethyl Malonate
Dimethyl Malonate	and Sodium Methylate.
Perchloryl Fluoride	See PERCHLORYL FLUORIDE plus Sodium Methylate.
Water	Sodium methylate ignites in moist air.
	Wischmeyer (1966).

SODIUM MONOXIDE Na_2O

Nitric Oxide	Sodium monoxide and nitric oxide react vigorously above 100¡ C.
	Mellor **2, Supp. 2:** 629 (1961).

SODIUM NITRATE $NaNO_3$

Antimony	See ANTIMONY plus Potassium Nitrate.
Barium Rhodanide	See BARIUM RHODANIDE plus Sodium Nitrate.
Boron Phosphide	See BORON PHOSPHIDE plus Nitric Acid.
Cyanides	See NITRATES plus Cyanides.
Sodium Hypophosphite	A mixture of sodium nitrate and sodium hypophosphite constitutes a powerful explosive.

	Mellor **8:** 831 (1946-1947).
Sulfur and Charcoal	See SULFUR plus Sodium Nitrate and Charcoal.

SODIUM NITRIDE Na_3N

Air	The reactivity of sodium nitride resembles that of sodium metal.
	Mellor **8, Supp. 1:** 154 (1964).
Performic Acid	See PERFORMIC ACID plus Sodium Nitride.

SODIUM NITRITE $NaNO_2$

Ammonium Salts	A violent explosion occurs if an ammonium salt is melted with a nitrite salt.
	Von Schwartz, p. 299 (1918).
Cellulose	Sodium nitrite at 460¡F in contact with the fiber drums in which it is shipped undergoes a vigorous decomposition reaction producing a propellant-type burning until the carton is consumed.
	Wheeler (1969).
Cyanides	See CYANIDES plus Chlorates.
Lithium	See LITHIUM plus Sodium Nitrite.
Potassium and	See POTASSIUM plus Sodium Nitrite and
Ammonia	Ammonia.
Sodium Thiosulfate	When a sodium nitrite and thiosulfate mixture was heated to evaporate to dryness, a violent explosion occurred.
	Mellor **10:** 501 (1946-1947).

SODIUM NITROMETHANE

(See SODIUM ACI-NITROMETHYLIDE)

SODIUM-o-NITROPHENYL SULFIDE $NaSC_6H_4NO_2$

(self-reactive)	Methanol solutions of o-nitrothiophenol and sodium methoxide were mixed and evaporated under reduced pressure, dissolved in xylene and methanol and re-evaporated. As the flask was removed from the evaporator, it exploded.
	Chem. & Ind. **6:** 257 (Feb. 5, 1966).

SODIUM-o-NITROTHIOPHENATE

(See SODIUM-o-NITROPHENYL SULFIDE)

SODIUM OXIDE Na_2O

Water	See POTASSIUM OXIDE plus Water.

SODIUM OZONIDE NaO_3

Acids	Acids initiate a fast decomposition of sodium ozonate.
	Mellor **2, Supp. 2:** 641 (1961).
Water	Water initiates a fast decomposition of sodium ozonate.
	Mellor **2, Supp. 2:** 641 (1961).

SODIUM PERCHLORATE $NaClO_4$

Ammonium Nitrate	A mixture of these chemicals is used as an explosive.
	Mellor **2, Supp. 1:** 608 (1956).
Calcium Hydride	See BROMATES plus Calcium Hydride.
Charcoal	See PERCHLORATES plus Charcoal.
Magnesium	See MAGNESIUM plus Potassium Perchlorate.
Reducing Agents	See PERCHLORATES plus Charcoal.
Strontium Hydride	See BROMATES plus Calcium Hydride.

SODIUM PEROXIDE Na_2O_2

Acetic Acid	Acetic acid or acetic anhydride can explode with sodium peroxide if not kept cold.
	Von Schwartz, p. 321 (1918).
Acetic Anhydride	See SODIUM PEROXIDE plus Acetic Acid.
Aluminum	See ALUMINUM plus Sodium Peroxide.
Aluminum and	See ALUMINUM plus Sodium Peroxide and
Carbon Dioxide	Carbon Dioxide.
Ammonium Persulfate	See AMMONIUM PERSULFATE plus Sodium Peroxide.
Aniline	Sodium peroxide or potassium peroxide is spontaneously flammable with aniline, benzene, organic matter such as paper and wood, and diethyl ether. Mixtures with charcoal, glycerine, certain oils, and phosphorus burn or explode.
	Mellor **2:** 490-93 (1946-1947). *Von Schwartz,* p. 328 (1918).
Antimony	See ANTIMONY plus Sodium Peroxide.
Arsenic	See ARSENIC plus Sodium Peroxide.
Benzene	See SODIUM PEROXIDE plus Aniline.
Boron Nitride	See BORON NITRIDE plus Sodium Peroxide.
Calcium Carbide	When a mixture of sodium peroxide and calcium carbide (powdered) is exposed to damp air, spontaneous combustion occurs. The mixture explodes when heated.
	Mellor **2:** 490 ff. (1946-1947).
Charcoal	See SODIUM PEROXIDE plus Aniline.
Copper	See COPPER plus Sodium Peroxide.
Dextrose and	A micro Parr calorimeter exploded when the
Potassium Nitrate	wrong proportions of these ingredients were used. The intended mixture was 4.0 g sodium peroxide, 0.2 g dextrose, and 0.2 g potassium nitrate; actual proportions were 0.35 g, 2.59 g, and 0.2 g respectively. There was insufficient sodium peroxide to dissolve decomposition

	gases, hence a rapid temperature and pressure build-up caused the Parr bomb to burst.
	Tennessee Eastman (1967).
Diethyl Ether	See SODIUM PEROXIDE plus Aniline.
Glycerine	See SODIUM PEROXIDE plus Aniline.
Hexamethylene-tetramine	Sodium peroxide will ignite numerous organic compounds, e.g., hexamethylenetetramine, when the mixture is moistened.
	Ellern, p. 46 (1968).
	See also SODIUM PEROXIDE plus Aniline.
	See also SODIUM PEROXIDE plus Organic Matter.
Hydrogen Sulfide	See HYDROGEN SULFIDE plus Sodium Peroxide.
Magnesium	See MAGNESIUM plus Sodium Peroxide.
Magnesium and Carbon Dioxide	See MAGNESIUM plus Sodium Peroxide and Carbon Dioxide.
Manganese Dioxide	The catalyzed decomposition of sodium peroxide with manganese dioxide may be violent.
	Mellor **2, Supp. 2:** 635 (1961).
Organic Matter	When sodium peroxide is mixed with combustible materials, explosive mixtures may be formed. See also SODIUM PEROXIDE plus Aniline.
	Mellor **2:** 490 (1946-1947). *Ellern*, p. 46 (1968).
Phosphorus	See PHOSPHORUS plus Sodium Peroxide.
	See SODIUM PEROXIDE plus Aniline.
Potassium	See POTASSIUM plus Sodium Peroxide.
Selenium Monochloride	See SELENIUM MONOCHLORIDE plus Sodium Peroxide.
Silver Chloride and Charcoal	A mixture of sodium peroxide, silver chloride, and charcoal ignites spontaneously.
	Mellor **3:** 401 (1946-1947).

Sodium	See SODIUM plus Sodium Peroxide.
Sulfur Monochloride	A violent reaction results on mixing sodium peroxide and sulfur monochloride. *Mellor* **2, Supp. 2:** 634 (1961).
Tin	See TIN plus Sodium Peroxide.
Zinc	See ZINC plus Sodium Peroxide.

SODIUM PHOSPHIDE Na_3P

Water	In contact with water or damp air, sodium phosphide evolves phosphine, which is spontaneously flammable in air. *Lab. Govt. Chemist* (1965). *Van Wazer* (1958).

SODIUM PHOSPHINAMIDE $NaNHPH_2$

(self-reactive)	Sodium amino phosphide is spontaneously flammable in air. *Lehman and Wilson*, p. 50 (1949).

SODIUM POLYSULFIDE Na_2S_x

m-Chloroaniline Diazonium Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
4-Chloro-o-toluidine Diazonium Chloride Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
o-Nitroaniline Diazonium Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.

SODIUM-POTASSIUM ALLOY NaK

(See also the reactions listed separately under SODIUM and POTASSIUM)

Ammonium Sulfate and Ammonium Nitrate	See POTASSIUM plus Ammonium Sulfate and Ammonium Nitrate.
Bromoform	Mixtures of sodium-potassium alloy and bromoform, tetrachloroethane, or pentachloroethane can explode on standing at room temperature. They are especially sensitive to impact. *Mellor* **2, Supp. 2:** 563 (1961).
Carbon Dioxide	Solid carbon dioxide with sodium-potassium alloy will explode under a slight impact. H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925). *Mellor* **2, Supp. 2:** 563 (1961).
Carbon Tetrachloride	If carbon tetrachloride is placed on sodium-potassium alloy, a light impact will cause a violent explosion. Chloroform, dichloromethane, or methyl chloride in contact with sodium-potassium alloy is similarly impact-sensitive. H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925). *Ellern,* p. 43 (1968). Addition of a small amount of carbon tetrachloride to the alloy with a trace of kerosine and carbonaceous residue resulted in a violent explosion after a few moments. *Bozich* (1966). *Mellor* **2, Supp. 2:** 563 (1961). See also SODIUM-POTASSIUM ALLOY plus Water.
Chloroform	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride. See LITHIUM plus Chloroform.
Dichloromethane	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride.
Diiodomethane	Sodium-potassium alloy reacts explosively with diiodomethane. *Ellern,* p. 43 (1968).

Mercuric Oxide	Red mercuric oxide causes a violent explosion with sodium-potassium alloy when struck lightly; the yellow oxide does so at a much lighter blow.
	H. Staudinger, *Z. Elektrochem.* **31:** 549-52 (1925).
Methyl Chloride	See SODIUM-POTASSIUM ALLOY plus Carbon Tetrachloride.
Methyl Dichloride	The mixture of sodium-potassium alloy and methyl dichloride detonates strongly if struck.
	Mellor **2, Supp. 2:** 563 (1961).
Oxalyl Bromide	A mixture of sodium-potassium alloy and either oxalyl bromide or oxalyl chloride explodes violently.
	Mellor **2, Supp. 2:** 564 (1961).
Oxalyl Chloride	See SODIUM-POTASSIUM ALLOY plus Oxalyl Bromide.
Pentachloroethane	See SODIUM-POTASSIUM ALLOY plus Bromoform.
Potassium Oxides	See POTASSIUM plus Air.
Potassium Superoxide	While 100 gallons of sodium-potassium was being transferred and filtered into a receiver tank, the waste oxide accumulating on the filter was periodically scraped into drums. Drops of hot liquid NaK fell into one drum receiving the oxide waste, and a serious explosion occurred. Potassium superoxide was considered the essential ingredient of the explosive mixture.
	Health and Safety Inf. **251** (March 31, 1967).
Silicon	See SILICON plus Sodium-Potassium Alloy.
Silver Halides	Sodium-potassium alloys have exploded violently on contact with silver halides.
	Ellern, p. 43 (1968).
Sodium Bicarbonate	See SODIUM-POTASSIUM ALLOY plus Water.
Teflon	Sealing tape made of Teflon (polytetrafluoroethylene or polyhexafluoroethylene) burned vigorously in contact with sodium-potassium alloy in a helium atmosphere.
	Scott (1966).

Tetrachloroethane	See SODIUM-POTASSIUM ALLOY plus Bromoform.
1,1,1-Trichloroethane	A pipe- and solenoid-valve assembly used to transfer NaK had been purged with nitrogen, then flushed with water. Trichloroethane, used subsequently to remove traces of water, contacted a hidden residue of NaK in one valve and an explosion ensued.
	Inf. Exchange Bull. **1:** 2 (1961).
Trichlorotrifluoroethane	When two drops of the trichlorotrifluoroethane were added to NaK, there was a violent explosion.
	Pancner (1966).
Water	Sodium-potassium alloy undergoes a violent reaction with certain extinguishing agents: water, sodium bicarbonate, carbon tetrachloride.
	Mellor **2, Supp. 2:** 564 (1961).

SODIUM SILICATE $NaSiO_3$

Fluorine	See FLUORINE plus Sodium Silicate.

SODIUM SILICIDE Na_2Si_2

Air	Sodium silicide in powder form is spontaneously flammable in air.
	Ellern (1968).
Water	See CESIUM SILICIDE plus Water.

SODIUM SULFATE Na_2SO_4

Aluminum	See ALUMINUM plus Sulfates.

SODIUM SULFIDE Na_2S

Carbon	See CARBON plus Sodium Sulfide.
m-Chloroaniline	See SODIUM SULFIDE plus Diazonium and

Diazonium Salt	Diazonium Chloride Salts.
4-Chloro-o-toluidine Diazonium Chloride Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
Diazonium Salts and Diazonium Chloride Salts	In the preparation of mercaptans, the slow addition of the diazonium chloride salt of 4-chloro-o-toluidine or o-nitroaniline or m-chloroaniline to sodium sulfide, sodium bisulfide or sodium polysulfide solutions will result in explosions even at 5¡C. *Chem. Eng. News* **23:** 1247 (1945). Hodgson, *Chem. & Ind.*, p. 362 (1945).
Diazonium Salts	See DIAZONIUM SALTS plus Thiophenates.
N, N-Dichloromethyl Amine	See N, N-DICHLOROMETHYL AMINE plus Sodium Sulfide.
o-Nitroaniline Diazonium Salt	See SODIUM SULFIDE plus Diazonium and Diazonium Chloride Salts.
Water	Moist sodium sulfide is spontaneously flammable upon drying in air. *Brauer* (1965).

SODIUM SUPEROXIDE NaO_2

(self-reactive)	Sodium superoxide violently evolves oxygen above 250¡ C. *Mellor* **2, Supp. 2:** 639 (1961).
Water	The reaction of sodium superoxide and water is fast and vigorous, liberating oxygen. *Mellor* **2, Supp. 2:** 639 (1961).

SODIUM TETRAHYDROALUMINATE $NaAlH_4$

Tetrahydrofuran	A violent explosion occurred during the preparation of

sodium aluminum hydride from sodium and aluminum in a medium of tetrahydrofuran. Localized heating in the reaction vessel was the suspected trigger mechanism.

Chem. Eng. News **39** (40): 57 (1961).

Water

On coming in contact with water sodium aluminum hydride ignites or explodes.

NSC Nat. Safety News **77** (2): 37-40 (1958).

SODIUM TETRAHYDROBORATE $NaBH_4$

Air

Sodium borohydride burns quietly in air.

Lab. Govt. Chemist (1965).

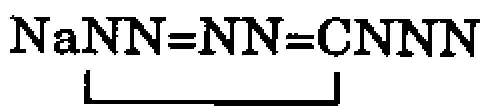
SODIUM TETRAPEROXYCHROMATE $Na_3Cr(OO)_4$

(self-reactive)

Sodium triperchromate decomposes explosively at 115¡ C.

Mellor **11:** 356 (1946-1947).

SODIUM TETRAZOLYL-5-AZIDE



(self-reactive)

Sodium tetrazolyl-5-azide is a shock-sensitive compound.

Chem. Eng. News **43** (52): 29, 30 (Dec. 27, 1965).

SODIUM THIOSULFATE $Na_2S_2O_3$

Sodium Nitrite

See SODIUM NITRITE plus Sodium Thiosulfate.

STAINLESS STEEL (**302**)

Fluorine	See FLUORINE plus Metals.

STANNIC BROMIDE $SnBr_4$

Nitryl Chloride	See NITRYL CHLORIDE plus Stannic Bromide.

STANNIC CHLORIDE $SnCl_4$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.
Turpentine	Stannic chloride reacts with turpentine, producing heat and sometimes flame.
	Mellor **7:** 430-46 (1946-1947).

STANNIC IODIDE SnI_4

Nitryl Chloride	See NITRYL CHLORIDE plus Stannic Bromide.
Potassium and Sulfur	See POTASSIUM plus Aluminum Bromide.
Sodium and Sulfur	See SODIUM plus Aluminum Bromide.

STANNIC OXIDE SnO_2

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Arsenic Trioxide.
Hydrogen Trisulfide	See HYDROGEN TRISULFIDE plus Stannic Oxide.
Magnesium	See MAGNESIUM plus Stannic Oxide.
Potassium	See POTASSIUM plus Stannic Oxide.
Sodium	See POTASSIUM plus Stannic Oxide.

STANNIC SULFIDE SnS_2

Cadmium Chlorate	Tin sulfides react with incandescence with chlorates of cadmium, magnesium, or zinc.

	Mellor **Supp. II, Part I:** 584 (1956).
Chloric Acid	Tin sulfides and concentrated solutions of chloric acid react with incandescence.
	Mellor **Supp. II, Part I:** 584 (1956).
Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Magnesium Chlorate	See STANNIC SULFIDE plus Cadmium Chlorate.
Zinc Chlorate	See STANNIC SULFIDE plus Cadmium Chlorate.

STANNOUS CHLORIDE $SnCl_2$

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Stannous Chloride.
Calcium Carbide	A mixture of stannous chloride and calcium carbide can be ignited with a match, and the reaction proceeds with incandescence.
	Mellor **7:** 430 (1946-1947).
Ethylene Oxide	See ETHYLENE OXIDE plus Aluminum Oxide. See ETHYLENE OXIDE plus Acids and Bases.
Hydrazine Hydrate	Hydrazine hydrate reacts with stannous chloride to give a compound, stannous dihydrazinechloride. When this compound is heated, it decomposes explosively.
	Mellor **7:** 430 (1946-1947).
Nitrates	See NITRATES plus Stannous Chloride.
Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

STANNOUS FLUORIDE $SnFl_2$

Chlorine	See CHLORINE plus Stannous Fluoride.

STANNOUS NITRATE $Sn(NO_3)_2$

Organic Matter (flour)	In a flour-bleaching plant, dust found to contain tin nitrate was believed responsible for a violent decomposition

	explosion.
	J. Soc. Chem. Ind. **41:** 423-24R (1922).

STANNOUS OXIDE SnO

Sulfur Dioxide	When stannous oxide is heated in an atmosphere of sulfur dioxide, the reaction is attended by incandescence.
	Mellor **7:** 388 (1946-1947). Hammick, J.
	Chem. Soc. **III:** 379 (1917).

STANNOUS SULFIDE SnS

Cadmium Chlorate	Tin sulfides react with incandescence with chlorates of cadmium, magnesium, or zinc.
	Mellor **Supp. II, Part I:** 584 (1956).
Chloric Acid	Tin sulfides and concentrated solutions of chloric acid react with incandescence.
	Mellor **Supp. II, Part I:** 584 (1956).
Chlorine Monoxide	See CHLORINE MONOXIDE plus Calcium Phosphide.
Magnesium Chlorate	See STANNOUS SULFIDE plus Cadmium Chlorate.
Zinc Chlorate	See STANNOUS SULFIDE plus Cadmium Chlorate.

STEEL

Perchloric Acid	See PERCHLORIC ACID plus Steel.
Sulfuric Acid	See IRON plus Sulfuric Acid.

STIBINE SbH_3

Ammonia	An explosion occurs if stibine is heated with ammonia or chlorine.
	Mellor **9:** 397 (1946-1947).

Chlorine	See STIBINE plus Ammonia.
Nitric Acid	Stibine and concentrated nitric acid explode.
	Mellor **9:** 397 (1946-1947).
Ozone	See OZONE plus Stibine.

STRONTIUM ALLOYS

Acids	Alloys containing a substantial proportion of strontium react violently with acids.
	Lab. Govt. Chemist (1965).
Water	Alloys containing a substantial proportion of strontium rapidly decompose water. The heat of reaction is sufficient that the evolved hydrogen may ignite.
	Lab. Govt. Chemist (1965).

STRONTIUM CARBIDE SrC_2

Selenium	See SULFUR plus Strontium Carbide.
Sulfur	See SULFUR plus Strontium Carbide.

STRONTIUM CHLORATE $Sr(ClO_3)_2$

Acids	See CHLORATES plus Acids. See SODIUM CHLORATE plus Sulfuric Acid.

STRONTIUM CHLORIDE $SrCl_2$

2-Furan Percarboxylic Acid	See 2-FURAN PERCARBOXYLIC ACID (self-reactive).

STRONTIUM HYDRIDE SrH_2

Bromates	See BROMATES plus Strontium Hydride.

Chlorates	See BROMATES plus Strontium Hydride.
Perchlorates	See BROMATES plus Strontium Hydride.

STRONTIUM IODIDE SrI_2

Potassium	See POTASSIUM plus Ammonium Bromide.

STRONTIUM PHOSPHIDE Sr_3P_2

Bromine	See BROMINE plus Strontium Phosphide.
Chlorine	See CHLORINE plus Strontium Phosphide.
Fluorine	See FLUORINE plus Strontium Phosphide.

STYRENE MONOMER $CH_2{=}CHC_6H_5$

Chlorosulfonic Acid	Mixing styrene monomer and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	See OLEUM plus Styrene Monomer.
Sulfuric Acid	Mixing styrene monomer and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

SULFAMIC ACID HSO_3NH_2

Chlorine	See CHLORINE plus Sulfamic Acid.
Nitric Acid	Fuming nitric acid combined with sulfamic acid causes violent release of nitrous oxide. *Mellor* **8, Supp. 2:** 316 (1967).

SULFATES

(See also specific sulfates as primary entries or under other reactants)

Aluminum	See ALUMINUM plus Sulfates.
Magnesium	See MAGNESIUM plus Sulfates.

SULFIDES

(See specific sulfides as primary entries or under other reactants)

SULFOLANE

Chrosoulfonic Acid	Mixing sulfolane and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Oleum	See OLEUM plus Sulfolane.

SULFOXIDES

Perchloric Acid	The dialkyl sulfoxides form salts with perchloric acid. The lower members of the series are unstable, hydrolyze readily, and are explosive when dry.
	Chem. Abst. **44:** p. 3935d (1950).

SULFUR S

Aluminum	See ALUMINUM plus Nitrates.
Aluminum and Niobium Oxide	See ALUMINUM plus Niobium Oxide and Sulfur.
Ammonia	The reaction of ammonia with specially prepared sulfur

	may form explosive sulfur nitride.
	Mellor **8, Supp. 1:** 330 (1964).
Ammonium Nitrate	Ammonium nitrate mixed with sulfur or with metal powders can be exploded by shock.
	Kirk and Othmer **8:** 644. *Federoff* **1:** A-146.
Ammonium Perchlorate	Mixtures of ammonium perchlorate with sulfur, powdered metals, or carbonaceous materials are impact-sensitive.
	Haz. Chem. Data (1966).
Barium Bromate	See SULFUR plus Bromates.
Barium Carbide	A mixture of barium carbide and sulfur heated to 150¡C. becomes incandescent.
	Mellor **5:** 862 (1946-1947).
Barium Chlorate	See SULFUR plus Bromates. See SULFUR plus Chlorates.
	A mixture of sulfur and barium chlorate ignites at about 108¡ — 111¡C.
	Mellor **2, Supp. 1:** 583 (1956).
Barium Iodate	See SULFUR plus Bromates.
Boron	See BORON plus Sulfur.
Bromates	A combination of finely divided sulfur and finely divided bromates (also chlorates or iodates) of barium, calcium, magnesium, potassium, sodium, or zinc will explode with heat, percussion, and sometimes, light friction.
	Mellor **2:** 310 (1946-1947).
	Mellor **2, Supp. 1:** 763 (1956).
Bromine Pentafluoride	See ARSENIC plus Bromine Pentafluoride.
Bromine Trifluoride	See ANTIMONY plus Bromine Trifluoride.
Calcium	See CALCIUM plus Sulfur.
Calcium, Vanadium Oxide and Water	See CALCIUM plus Vanadium Oxide, Sulfur, and Water.

Calcium Bromate	See SULFUR plus Bromates.
Calcium Carbide	Calcium carbide reacts incandescently with sulfur vapor at 500¡C. *Mellor* **5:** 862 (1946-1947).
Calcium Chlorate	See SULFUR plus Bromates. See SULFUR plus Chlorates.
Calcium Hypochlorite	A mixture of damp sulfur and calcium hypochlorite produced a brilliant crimson flash with scattering of molten sulfur. No heat is necessary. Equal parts of sulfur and bleach powder produced an explosion when heated in a closed vessel. *Halane — Prelim. Info. Sheet. Mellor* **2:** 254-62 (1946-1947). *Chem. Eng. News* **46**(28):9 (1968).
Calcium Iodate	See SULFUR plus Bromates.
Calcium Phosphide	Calcium phosphide reacts with sulfur or oxygen incandescently at about 300¡C. *Mellor* **8:** 841 (1946-1947).
Cesium Nitride	See CESIUM NITRIDE plus Air.
Charcoal	Powdered sulfur is spontaneously flammable when mixed with lampblack or freshly calcined charcoal. *Von Schwartz,* p. 328 (1918).
Chlorates	A mixture of sulfur and barium chlorate, calcium chlorate, magnesium chlorate, potassium chlorate, sodium chlorate, or zinc chlorate may liberate oxygen and heat explosively. *Chem. Eng. News* **30:** 3210 (1952). *Von Schwartz,* p. 323 (1918). A mixture of chlorates and sulfur will explode. *Von Schwartz,* p. 328 (1918). *Ellern,* p. 47 (1968). See also SULFUR plus Bromates.
Chlorates and Copper	The sulfur-plus-chlorate explosion is remarkably spontaneous in the presence of copper ion or copper, e.g., in the form of bronze screen, even at room temperature. *Ellern,* p. 304 (1968).

Chlorine Dioxide	A piece of sulfur or sugar takes fire spontaneously in chlorine dioxide and may produce an explosion. *Mellor* **2:** 289 (1946-1947).
Chlorine Monoxide	See POTASSIUM plus Chlorine Monoxide.
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Chromic Anhydride	Sulfur and chromic anhydride ignite when heated and can explode. *Mellor* **10:** 102, 132-34; **11:** 232 (1946-1947).
Chromium Trioxide	See SULFUR plus Chromic Anhydride.
Chromyl Chloride	Flowers-of-sulfur moistened with chromyl chloride ignites spontaneously. *Mellor* **11:** 394-96 (1946-1947).
Fluorine	See FLUORINE plus Selenium.
Hydrocarbons	Even small percentages of hydrocarbons in contact with molten sulfur generate hydrogen sulfide and carbon disulfide, which may accumulate in explosive concentrations. *NAS-USCG Advis. Com.* (1966). *BM Report Invest.* **6185** (1963).
Indium	See INDIUM plus Sulfur.
Iodates	See SULFUR plus Bromates.
Iodine Pentafluoride	See ARSENIC plus Iodine Pentafluoride.
Iodine Pentoxide	See CARBON plus Iodine Pentoxide.
Lead Chlorate	A mixture of sulfur and lead chlorate ignites at about 63¡ — 67¡C. *Mellor* **2, Supp. 1:** 583 (1956). See also SULFUR plus Chlorates.
Lead Chlorite	A mixture of sulfur and lead chlorite will explode. *Von Schwartz,* p. 328 (1918).
Lead Dioxide	A mixture of sulfur and lead dioxide will explode.

	Von Schwartz, p. 328 (1918).
Lithium	See LITHIUM plus Sulfur.
Lithium Carbide	Lithium carbide burns in the vapor of sulfur or selenium.
	Mellor **5:** 848 (1946-1947).
Magnesium Bromate	See SULFUR plus Bromates.
Magnesium Chlorate	See SULFUR plus Bromates.
Magnesium Iodate	See SULFUR plus Bromates.
Mercuric Nitrate	An explosion occurred in the use of mercuric nitrate for determining sulfur in Ball's reaction.
	Chem. Eng. News **26:** 3300 (1948).
Mercuric Oxide	When mercuric oxide is heated with sulfur in a retort, a violent explosion results.
	Mellor **4:** 777 (1946-1947).
Mercurous Oxide	Mixture of the pulverized materials will ignite from light impact.
	J. B. Senderens, *Bull. Soc. Chim.* (3) **6:** 802 (1891).
Nickel	Powdered nickel heated with sulfur or selenium reacts with incandescence.
	Mellor **15:** 148,151 (1946-1947).
Nitrogen Dioxide	See MAGNESIUM plus Nitrogen Dioxide.
Palladium	See PALLADIUM plus Sulfur.
Perchlorates	All inorganic perchlorates can form mixtures with sulfur that will explode on impact.
	ACS **146:** 211-12. *BM Report Invest.* **4169** (1948).
Phosphorus	See PHOSPHORUS plus Sulfur.
Phosphorus Trioxide	The reaction is violent; small quantities should be used to avoid an explosion.
	Chem. Eng. News **27:** 2144 (1949).
	Mellor **8, Supp. 3:** 436 (1971).

Potassium	See POTASSIUM plus Aluminum Bromide.
	See POTASSIUM plus Sulfur.
Potassium Bromate	See SULFUR plus Bromates.
Potassium Chlorate	See SULFUR plus Bromates.
	A mixture of sulfur and potassium chlorate ignites at about 160¡ — 162¡C.
	Mellor **2, Supp. 1:** 583 (1956).
	See also SULFUR plus Chlorates.
Potassium Iodate	See SULFUR plus Bromates.
Potassium Nitrate and Arsenic Trisulfide	A mixture of these ingredients is a known pyrotechnic formulation.
	Ellern, p. 135 (1968).
Potassium Nitride	See PHOSPHORUS plus Potassium Nitride.
Potassium Perchlorate	This mixture, used in flashcrackers, can be exploded by a moderately strong impact.
	ACS **146:** 211. *Davis. BM Report Invest.* **4169** (1948).
Potassium Permanganate	When powdered sulfur is heated with potassium permanganate, an explosion may occur.
	Mellor **12:** 319 (1946-1947).
Rubidium Acetylene Carbide	See RUBIDIUM ACETYLENE CARBIDE plus Hydrochloric Acid.
	See PHOSPHORUS plus Rubidium Acetylene Carbide.
Selenium Carbide	See SULFUR plus Thorium Carbide.
Silver Bromate	An explosive reaction occurs in the presence of water.
	Mellor **2, Supp. 1:** 766 (1956).
Silver Chlorate	A mixture of sulfur and silver chlorate ignites at about 74¡C.
	Mellor **2, Supp. 1:** 583 (1956).

	See also SULFUR plus Chlorates.
Silver Nitrate	A mixture of silver nitrate and sulfur explodes when struck with a hammer.
	Mellor **3:** 469 (1946-1947).
Silver Oxide	When finely divided sulfur is ground with silver oxide, the mixture ignites.
	Mellor **3:** 376 (1946-1947).
Sodium	See SODIUM plus Sulfur.
Sodium Bromate	See SULFUR plus Bromates.
Sodium Chlorate	See SULFUR plus Bromates.
Sodium Chlorite	Solid sulfur will ignite if mixed with solid sodium chlorite and moistened.
	Mellor **2, Supp. 1:** 572 (1956).
Sodium Hydride	Sodium hydride reacts vigorously with sulfur vapor.
	Mellor **2:** 483 (1946-1947).
Sodium Iodate	See SULFUR plus Bromates.
Sodium Nitrate	The familiar black powder explosion begins
and Charcoal	with the reaction, sulfur-plus-sodium-nitrate, which produces the energy to initiate the carbon-plus-sodium-nitrate explosion.
	Trans. Faraday Soc. **55** (12):2221-8 (1959).
Sodium and Stannic Iodide	See SODIUM plus Aluminum Bromide.
Strontium Carbide	Strontium carbide mixed with selenium and heated to 500¡C., or exposed to sulfur vapor at 500¡C., becomes incandescent.
	Mellor **5:** 852 (1946-1947).
Sulfur Dichloride	See SODIUM plus Cobaltous Bromide.
Thallic Oxide	See THALLIC OXIDE plus Antimony Sulfide.
Thorium	Thorium when heated with sulfur reacts vigorously with incandescence.

	Mellor **7:** 208 (1946-1947).
Thorium Carbide	Sulfur vapor attacks heated thorium carbide or selenium carbide with incandescence.
	Mellor **5:** 885-87 (1946-1947).
Tin	The reaction between tin and sulfur is vigorous and accompanied by incandescence.
	Mellor **7:** 328 (1946-1947).
Uranium	See URANIUM plus Selenium.
Zinc	Powdered zinc and sulfur react explosively when warmed.
	Mellor **4:** 476 (1946-1947).
Zinc Bromate	See SULFUR plus Bromates.
Zinc Chlorate	See SULFUR plus Bromates.
Zinc Iodate	See SULFUR plus Bromates.

SULFUR DIBROMIDE SBr_9

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

SULFUR DICHLORIDE SCl_2

Aluminum	See ALUMINUM plus Carbon Disulfide.
Ammonia	The reaction product of sulfur dichloride and ammonia is a powerful detonating compound, sulfur nitride.
	Mellor **8:** 624 (1946-1947).
Potassium	See POTASSIUM plus Boron Tribromide.
Sodium	See SODIUM plus Cobaltous Bromide.
	See SODIUM plus Sulfur Dichloride.

SULFUR DIOXIDE SO_2

Acrolein	See ACROLEIN plus Sulfur Dioxide.
Aluminum	See ALUMINUM plus Carbon Disulfide.
Cesium Acetylene Carbide	See CESIUM ACETYLENE CARBIDE plus Sulfur Dioxide.
Cesium Monoxide	See CESIUM MONOXIDE plus Sulfur Dioxide.
Chlorates	See CHLORATES plus Sulfur Dioxide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Ammonia.
Chromium	See CHROMIUM plus Sulfur Dioxide.
Ferrous Oxide	See FERROUS OXIDE plus Sulfur Dioxide.
Fluorine	See FLUORINE plus Sulfur Dioxide.
Lithium Acetylene Carbide Diammino	See LITHIUM ACETYLENE CARBIDE DIAMMINO plus Carbon Dioxide.
Manganese	See MANGANESE plus Sulfur Dioxide.
Potassium Acetylene Carbide	See POTASSIUM ACETYLENE CARBIDE plus Sulfur Dioxide.
Potassium Chlorate	See POTASSIUM CHLORATE plus Sulfur Dioxide.
Rubidium Carbide	See RUBIDIUM CARBIDE plus Sulfur Dioxide.
Sodium	See SODIUM plus Sulfur Dioxide.
Sodium Carbide	See SODIUM CARBIDE plus Carbon Dioxide.
Stannous Oxide	See STANNOUS OXIDE plus Sulfur Dioxide.

SULFUR HEXAFLUORIDE SF_6

Disilane	See DISILANE plus Sulfur Hexafluoride.

SULFURIC ACID H_2SO_4

Acetic Anhydride	See ACETIC ANHYDRIDE plus Sulfuric Acid.
Acetone Cyanhydrin	See ACETONE CYANHYDRIN plus Sulfuric Acid.

Acetone and Nitric Acid	See NITRIC ACID plus Acetone and Sulfuric Acid.
Acetone and Potassium Dichromate	See ACETONE plus Sulfuric Acid and Potassium Dichromate.
Acetonitrile	See ACETONITRILE plus Sulfuric Acid.
Acrolein	See ACROLEIN plus Sulfuric Acid.
Acrylonitrile	See ACRYLONITRILE plus Sulfuric Acid.
Acrylonitrile and Water	See ACRYLONITRILE plus Sulfuric Acid and Water.
Alcohols and Hydrogen Peroxide	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Allyl Alcohol	See ALLYL ALCOHOL plus Sulfuric Acid.
Allyl Chloride	See ALLYL CHLORIDE plus Sulfuric Acid.
	Allylchloride may polymerize violently under conditions involving an acid catalyst, such as sulfuric acid, ferric chloride, aluminum chloride, Lewis acids, and Ziegler type catalysts (initiators).
	Ventrone (1971).
2-Aminoethanol	See 2-AMINOETHANOL plus Sulfuric Acid.
Ammonium Hydroxide	Mixing 96% sulfuric acid and 28% ammonia in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Ammonium Triperchromate	See AMMONIUM TRIPERCHROMATE plus Sulfuric Acid.
Aniline	See ANILINE plus Sulfuric Acid.
Bromates and Metals	See CHLORATES plus Acids and Metals.
Bromine Pentafluoride	See BROMINE PENTAFLUORIDE plus Nitric Acid.
n-Butyraldehyde	See n-BUTYRALDEHYDE plus Sulfuric Acid.

Carbides	Sulfuric acid (concentrated) is extremely hazardous in contact with carbides, chlorates, fulminates, picrates and powdered metals.
	Chem. Safety Data Sheet **SD-20** (1963).
	Haz. Chem. Data (1966).
Cesium Acetylene Carbide	See CESIUM ACETYLENE CARBIDE plus Sulfuric Acid.
Chlorates	See SULFURIC ACID plus Carbides.
	See CHLORATES plus Acids.
	See CHLORATES plus Sulfuric Acid.
Chlorates and Metals	See CHLORATES plus Acids and Metals.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Nitric Acid.
Chlorosulfonic Acid	See CHLOROSULFURIC ACID plus Sulfuric Acid.
Cuprous Nitride	See CUPROUS NITRIDE plus Sulfuric Acid.
Diisobutylene	See DIISOBUTYLENE plus Sulfuric Acid.
Dimethylbenzylcarbinol and Hydrogen Peroxide	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Epichlorohydrin	See ETHYLENE CYANOHYDRIN plus Sulfuric Acid.
	See EPICHLOROHYDRIN plus Sulfuric Acid.
Ethyl Alcohol and Hydrogen Peroxide	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Ethylene Cyanohydrin	See ETHYLENE CYANOHYDRIN plus Sulfuric Acid.
Ethylene Diamine	See ETHYLENE DIAMINE plus Sulfuric Acid.
Ethylene Glycol	See ETHYLENE GLYCOL plus Sulfuric Acid.
Ethylenimine	See ETHYLENIMINE plus Sulfuric Acid.
Fulminates	See SULFURIC ACID plus Carbides.

Hydrochloric Acid	See HYDROCHLORIC ACID plus Sulfuric Acid.
Hydrofluoric Acid	See HYDROFLUORIC ACID plus Sulfuric Acid.
Iodine Heptafluoride	See IODINE HEPTAFLUORIDE plus Sulfuric Acid.
Indane and Nitric Acid	See INDANE plus Nitric Acid and Sulfuric Acid.
Iron	See IRON plus Sulfuric Acid.
Isoprene	See ISOPRENE plus Sulfuric Acid.
Lithium Silicide	See LITHIUM SILICIDE plus Sulfuric Acid.
Mercuric Nitride	See MERCURIC NITRIDE plus Sulfuric Acid.
Mesityl Oxide	See MESITYL OXIDE plus Sulfuric Acid.
Metals (Powdered)	See SULFURIC ACID plus Carbides.
Nitric Acid and Glycerides	See NITRIC ACID plus Sulfuric Acid and Glycerides.
p-Nitrotoluene	See p-NITROTOLUENE plus Sulfuric Acid.
Pentasilver Trihydroxy-diaminophosphate	See PENTASILVER TRIHYDROXYDIAMINOPHOSPHATE plus Sulfuric Acid.
Perchlorates	See PERCHLORATES plus Sulfuric Acid.
Perchloric Acid	See PERCHLORIC ACID plus Sulfuric Acid.
Permanganates and Benzene	See PERMANGANATES plus Sulfuric Acid and Benzene.
1-Phenyl-2-methyl-propyl Alcohol and Hydrogen Peroxide	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.
Phosphorus	See PHOSPHORUS plus Sulfuric Acid.
Phosphorus Isocyanate	See PHOSPHORUS ISOCYANATE plus Acetaldehyde.

Picrates	See SULFURIC ACID plus Carbides.
Potassium Tert.-Butoxide	See ACETONE plus Potassium Tert.-Butoxide.
Potassium Chlorate	See POTASSIUM CHLORATE plus Sulfuric Acid.
Potassium Permanganate	See POTASSIUM PERMANGANATE plus Sulfuric Acid.
Potassium Permanganate and Potassium Chloride	See POTASSIUM PERMANGANATE plus Sulfuric Acid and Potassium Chloride.
Potassium Permanganate and Water	See POTASSIUM PERMANGANATE plus Sulfuric Acid and Water.
Propiolactone (beta-)	See PROPIOLACTONE (beta-) plus Sulfuric Acid.
Propylene Oxide	See PROPYLENE OXIDE plus Sulfuric Acid.
Pyridine	See PYRIDINE plus Sulfuric Acid.
Rubidium Acetylene Carbide	See RUBIDIUM ACETYLENE CARBIDE plus Sulfuric Acid.
Silver Permanganate	See SILVER PERMANGANATE plus Sulfuric Acid.
Sodium	See SODIUM plus Sulfuric Acid.
Sodium Carbonate	See SODIUM CARBONATE plus Sulfuric Acid.
Sodium Chlorate	See SODIUM CHLORATE plus Sulfuric Acid. See CHLORATES plus Acids.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Sulfuric Acid.
Steel	See IRON plus Sulfuric Acid.
Styrene Monomer	See STYRENE MONOMER plus Sulfuric Acid.
Toluene and Nitric Acid	See NITRIC ACID plus Toluene and Sulfuric Acid.
Vinyl Acetate	See VINYL ACETATE plus Sulfuric Acid.

Water	During sulfonation of mononitrobenzene by
	fuming sulfuric acid, a leak from an internal cooling coil permitted water to enter the tank.
	A violent eruption occurred due to the heat of solution.
	MCA Case History **944** (1963).
Zinc Chlorate	See ZINC CHLORATE plus Sulfuric Acid.
	See CHLORATES plus Acids.

SULFUR MONOCHLORIDE S_2Cl_2

Chromyl Chloride	See CHROMYL CHLORIDE plus Sulfur Monochloride.
Organic Matter	Sulfur chloride is strongly corrosive and can set fire to organic materials.
	B.L. Huestis, *Safety Eng.* **54:** 95 (1927).
Phosphorus Trioxide	See PHOSPHORUS TRIOXIDE plus Sulfur Monochloride.
Sodium Peroxide	See SODIUM PEROXIDE plus Sulfur Monochloride.
Water	The mixing of sulfur chloride and water can be dangerous.
	Chem. Safety Data Sheet **SD-77** (1960).

SULFUR NITRIDE S_4N_4

(self-reactive)	Sulfur nitride detonates violently on impact.
	Mellor **8:** 624 (1946-1947).
Air	Disulfur dinitride explodes when above 30¡C in air.
	Brauer (1965).
Barium Chlorate	Nitrogen sulfide and barium chlorate form very explosive crystals.
	Berichte **38:** 2659.

SULFUR TRIOXIDE SO_3

Dioxygen Difluoride	See DIOXYGEN DIFLUORIDE plus Sulfur Trioxide.
Lead Oxide	See LEAD OXIDE plus Sulfur Trioxide.
Nitryl Chloride	See NITRYL CHLORIDE plus Sulfur Trioxide.
Perchloric Acid	See PERCHLORIC ACID plus Sulfur Trioxide.
Phosphorus	See PHOSPHORUS plus Sulfur Trioxide.
Tetrafluorethylene	The reaction of sulfur trioxide in excess with tetrafluoroethylene causes explosive decomposition to carbonyl fluoride and sulfur dioxide. *Chem. Eng. News* **49** (22): 3 (1971).

SULFURYL CHLORIDE SO_2Cl_2

(See also THIONYL CHLORIDE)

Lead Dioxide	Reaction between sulfuryl chloride and lead dioxide can take place with explosive violence. *Mellor* **10:** 676 (1946-1947).

TANTALUM Ta

Air	Tantalum, thorium, titanium, and zirconium (powdered and dry) ignited when a glass container of the powder was thrown at a wall with force sufficient to break the container. *Chem. Eng. News* **30:** 3210 (1952).
Bromine Trifluoride	See NIOBIUM plus Bromine Trifluoride.
Fluorine	See FLUORINE plus Tantalum.

TANTALUM PENTOXIDE Ta_2O_5

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Bismuth Pentoxide.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Lithium	See LITHIUM plus Tantalum Pentoxide.

TARTARIC ACID HOOC.CHOHCHOHCO.OH

Silver	See SILVER plus Oxalic Acid.

TEFLON□ (**POLYTETRAFLUOROETHYLENE**) $(CF_2=CF_2)_x$

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.
Oxygen	See OXYGEN plus Teflon□
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Teflon□

TELLURIUM Te

Cadmium	See ZINC plus Selenium.
Chlorine	See CHLORINE plus Tellurium.
Chlorine Fluoride	Tellurium is attacked by chlorine fluoride with incandescence. *Mellor* **11:** 26 (1946-1947).
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Fluorine	See FLUORINE plus Tellurium.
Lithium Silicide	See PHOSPHORUS plus Lithium Silicide.
Potassium	When tellurium and potassium are warmed in an atmosphere of hydrogen, combination occurs with incandescence. *Mellor* **11:** 40 (1946-1947).
Silver Bromate	A vigorous reaction occurs in the presence of moisture. *Mellor* **2, Supp. 1:** 766 (1956).
Sodium	See SODIUM plus Tellurium.
Zinc	See ZINC plus Selenium.

TELLURIUM DIETHYL $(C_2H_5)_2Te$

(See DIETHYL TELLURIDE)

TELLURIUM HYDROPENTACHLORIDE

(See TELLURIUM TETRACHLORIDE HYDROCHLORIDE)

TELLURIUM TETRACHLORIDE HYDROCHLORIDE $TeCl_4•HCl$

Ammonia	Tellurium hydropentachloride reacts with ammonia to produce a substance which detonates when heated, possibly nitrogen telluride. *Mellor* **11:** 101 (1946-1947).

TERBIUM Tb

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

TERPENES

Nitric Acid	See NITRIC ACID plus Diborane.

TETRAACETENYL NICKEL TETRAPOTASSIUM

(See POTASSIUM TETRAETHYNYLNICKELATE)

TETRABORANE (6) B_4H_6

Nitric Acid	The mixture of tetraboron decahydride and nitric acid is explosive. *Mellor* **5:** 36 (1946-1947).

TETRABORANE (10) B_4H_{10}

Air	See OXYGEN plus Boron Decahydride. This hydride ignites or explodes on exposure to air.
	Mellor **5:** 36 (1946-1947).
Nitric Acid	A mixture of boron decahydride and concentrated nitric acid explodes.
	Mellor **5:** 36 (1946-1947).
Oxygen	See OXYGEN plus Boron Decahydride.

TETRACHLOROBENZENE $Cl_4C_6H_2$

Sodium Hydroxide and Methyl Alcohol	See SODIUM HYDROXIDE plus Tetrachlorobenzene and Methyl Alcohol.

TETRACHLORODIBORANE B_2Cl_4

Air	Diboron tetrachloride is spontaneously flammable in air.
	Douda (1966). *Chem. Abst.* **49:** 2240d (1955).

TETRACHLOROETHANE (sym-) $Cl_2CHCHCl_2$

2, 4-Dinitrophenyl Disulfide	See 2, 4-DINITROBENZENE SULFENYLCHLORIDE (self-reactive).
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Potassium	See SODIUM plus Tetrachloroethane.
Potassium Hydroxide	See POTASSIUM HYDROXIDE plus Tetrachloroethane.
Sodium	See SODIUM plus Tetrachloroethane.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Bromoform.

TETRACHLOROETHYLENE $CCl_2{=}CCl_2$

Barium	See BARIUM plus Trichlorotrifluoroethane.

Beryllium	See BERYLLIUM plus Carbon Tetrachloride.
Lithium	See LITHIUM plus Trichlorotrifluoroethane.

TETRAFLUOROETHYLENE $CF_2=CF_2$

Iodine Pentafluoride and Limonene	See IODINE PENTAFLUORIDE plus Tetrafluoroethylene and Limonene
Sulfur Trioxide	See SULFUR TRIOXIDE plus Tetrafluoroethylene.

TETRAFLUOROETHYLENE POLYMER

Fluorine	See FLUORINE plus Solid Metals and Oxygen.

TETRAFLUOROHYDRAZINE F_2NNF_2

Nitrogen Trifluoride	See NITROGEN TRIFLUORIDE plus Tetrafluorohydrazine.
Oxygen	See OXYGEN plus Tetrafluorohydrazine.

TETRAFLUOROMETHANE CF_4

Aluminum	See ALUMINUM plus Dichlorodifluoromethane.

1,2,3,4-TETRAHYDROCARBAZOLE

$$(C_6H_4NHC_6H_8)$$

Acrylonitrile

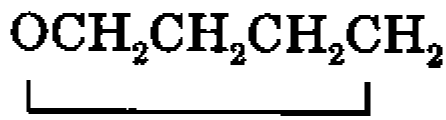
The reaction of 1,2,3,4-tetrahydrocarbazole with acrylonitrile, initiated by benzyl-tremethyl-ammonium hydroxide, is described in

J. Am. Chem. Soc. **72:** 4313 (1960). For a run, eight times the literature scale of the initiator was added at 0¡C, the ice bath removed, the reaction flask placed on the steam bath and the steam turned on. After 30-60 seconds an explosion shattered the apparatus.

BCISC **39** (156): 36 (1968). *Wischmeyer* (1970).

NSC Newsletter, R & D Sec. (Feb. 1970).

TETRAHYDROFURAN



Air

Purified tetrahydrofuran should not be stored for more than a few months after its container has been opened if it contains no oxidation inhibitor. In this case, it is potentially explosive because of peroxide formation.

NSC Newsletter, Chem. Sec. (Nov. 1964).

Lithium Aluminum Hydride

Fire can occur when tetrahydrofuran is used as a solvent for lithium aluminum hydride. Peroxides of tetrahydrofuran or their reaction products probably caused a vigorous reaction with lithium aluminum hydride, and subsequent fire.

MCA Guide for Safety, Appendix 3 (1972).

Potassium Hydroxide

Using potassium hydroxide to dry impure tetrahydrofuran, which can contain peroxides, is hazardous. Serious explosions can occur. This reaction will also occur with sodium hydroxide.

NSC Newsletter, Chem. Sec. (March 1967).

Wischmeyer (1967).

Sodium Aluminum Hydride

See SODIUM ALUMINUM HYDRIDE plus Tetrahydrofuran.

Sodium Hydroxide

See TETRAHYDROFURAN plus Potassium Hydroxide.

TETRAIODOETHYLENE $I_2HC=CHI_2$

Iodine Pentafluoride	See IODINE PENTAFLUORIDE plus Tetraiodoethylene.

TETRAMETHYLAMMONIUM CHLORITE $(CH_3)_4NH_4ClO_2$

(self-reactive)	Tetramethylammonium chlorite explodes on percussion.
	Mellor **2, Supp. 1:** 573 (1956).

TETRAMETHYLDIALUMINUM $(CH_3)_2HAl_2H(CH_3)_2$

Air	Tetramethyl dialuminum is spontaneously flammable in air.
	Hurd, p. 98 (1952).

TETRAMETHYLDIARSINE $(CH_3)_2As_2(CH_3)_2$

Air	Tetramethyl diarsine ignites spontaneously in dry air.
	Brauer (1965). *Douda* (1966).
Chlorine	See CHLORINE plus Tetramethyl Diarsine.

TETRAMETHYLDIBORANE $H(CH_3)_2B_2(CH_3)_2H$

Air	Tetramethyl diborane is spontaneously flammable in air.
	Lehman and Wilson, p. 50 (1949).

TETRAMETHYLDIGALLINE $(CH_3)_2Ga_2(CH_3)_2$

Air	Tetramethyl digalline is spontaneously flammable in air.
	Douda (1966).

TETRAMETHYLDISTIBINE $(CH_3)_2Sb_2(CH_3)_2$

Air	Tetramethyl distibine is spontaneously flammable in air.

Coates, p. 156 (1956).

TETRAMETHYLSILICANE $Si(CH_3)_4$

Air | Tetramethyl silicane is spontaneously flammable in air. *Douda* (1966).

TETRAMETHYLSILANE $Si(CH_3)_4$

(See TETRAMETHYL SILICANE)

TETRAMMINOCUPRIC CHLORATE $Cu(NH_3)_4(ClO_3)_2$

(See CUPRIC-TETRAMMINE CHLORATE)

TETRAMMINOCUPRIC PERCHLORATE $Cu(NH_3)_4(ClO_4)_2$

(See CUPRIC-TETRAMMINE PERCHLORATE)

TETRAMMINODIAZIDOCOBALTIC AZIDE $Co(N_3)_2(NH_3)_4N_3$

(See COBALTIC-TETRAMMINE AZIDE)

TETRAMMINOZINC CHLORATE $Zn(NH_3)_4(ClO_3)_2$

(See ZINC-TETRAMMINE CHLORATE)

TETRAMMINOZINC PERCHLORATE $Zn(NH_3)_4(ClO_4)_2$

(See ZINC-TETRAMMINE PERCHLORATE)

TETRANITROMETHANE $C(NO_2)_4$

(self-reactive) | This compound is a weak, but highly sensitive explosive.

	Van Dolah (1967).
Hydrocarbons	Hydrocarbons exposed to tetranitromethane form exceedingly sensitive explosives.
	Van Dolah (1967).

TETRAPHENYLDIARSINE $(C_6H_5)_2As_2(C_6H_5)_2$

Air	Tetraphenyl diarsine is spontaneously flammable in air.
	Ellern (1961).

TETRAPHOSPHORUS TRIIODIDE P_4I_3

Nitric Acid	Concentrated nitric acid attacks phosphorus tetratriiodide vigorously, accompanied by flame.
	Comp. Rend. **141:** 257.

TETRAPHOSPHORUS TRISELENIDE P_4Se_3

Air	Phosphorus tetratriselenide ignites when warmed in air.
	Z. Anorg. Chemie **30:** 258.

TETRASILANE Si_4H_{10}

Air	See TRISILANE plus Air; also SILANES plus Air.
Carbon Tetrachloride	Carbon tetrachloride reacts more vigorously on trisilane and tetrasilane than on disilane.
	Mellor **6:** 224 (1946-1947).
Oxygen	See OXYGEN plus Disilane.

TETRASILVER TRIHYDROXYDIAMINOPHOSPHATE

(See SILVER DIAMIDOTRIOXYPHOSPHORANE)

TETRYL $(NO_2)_3C_6H_2N(CH_3)NO_2$

Hydrazine	See HYDRAZINE plus Tetryl.

THALLIC NITRATE TRIHYDRATE Tl $(NO_3)_3$•$3H_2O$

Formic Acid and Vanillin	A violent reaction occurred when a small amount of vanillin was added to thallium trinitrate trihydrate (up to 50%) in 90% formic acid.
	Dean (1973).

THALLIC OXIDE Tl_2O_3

Antimony Sulfide	A mixture of thallic oxide and antimony sulfide or sulfur explodes when ground in a mortar.
	Mellor **5:** 421, 434 (1946-1947).
Sulfur	See THALLIC OXIDE plus Antimony Sulfide.

THALLIUM Tl

Fluorine	See FLUORINE plus Thallium.

THALLIUM TRIMETHYL $(CH_3)_3Tl$

(See TRIMETHYL THALLIUM)

THALLOUS AMIDE $TlNH_2$

Acids	Thallium amide explodes with dilute acids or water.
	Mellor **8:** 2, 5, 70, 261 (1946-1947).
Water	See THALLIUM AMIDE plus Acids.

THALLOUS AZIDE TlN_3

(self-reactive)	Thallous azide decomposes at 334¡C. It is almost as unstable as the copper salt.
	Mellor **8, Supp. 2:** 43 (1967).

THALLOUS BROMIDE TlBr

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

THALLOUS CHLORIDE TlCl

Fluorine	See FLUORINE plus Thallous Chloride.
Potassium	See POTASSIUM plus Ammonium Bromide.

THALLOUS NITRIDE Tl_3N

(self-reactive)	See THALLIUM NITRIDE plus Water.
Acids	Thallium nitride explodes with dilute acids or water.
	Mellor **8:** 2, 5, 70, 271 (1946-1947).
Water	Thallium nitride explodes with great violence when subjected to shock or heat, or when treated with water or dilute acids.
	Mellor **8:** 262 (1946-1947).

THALLOUS PHOSPHIDE Tl_3P

Air	This salt ignites if heated in air.
	Mellor **8, Supp. 3:** 312 (1971).

THERMITE

(See ALUMINUM plus Iron Oxide.)

THIANTHRENE PERCHLORATE

$$(C_6H_4S_2C_6H_4)\cdot HClO_4$$

(self-reactive)	A new batch of 1-2 grams of thianthrene perchlorate exploded violently while being transferred from a sintered glass filter to a Petri dish. *BCISC **40** (158): 17 (1969).*

THIOCYANATES RSCN

Chlorates	Thiocyanates and chlorates or nitrates explode when fused. If intimately mixed, the mixture explodes at a temperature of 750¡F., or when touched by flame or sparks. *Von Schwartz,* pp. 299-300 (1918). See also CHLORATES plus Antimony Sulfide.
Nitrates	See THIOCYANATES plus Chlorates.
Nitric Acid	When thiocyanate solution was introduced into a pipeline containing nitric acid, an explosion ruptured the line. *MCA Case History* **853** (1962).
Organic Peroxides	See THIOCYANATES plus Oxidizing Agents.
Oxidizing Agents	Caution should be exercised in treating a thiocyanate with an oxidizing agent such as a peroxide since such mixtures have been known to explode. *Kharasch* Vol. 1, p. 312 (1961).
Peroxides	See THIOCYANATES plus Oxidizing Agents.
Potassium Chlorate	See THIOCYANATES plus Chlorates.
Sodium Chlorate	See THIOCYANATES plus Chlorates.

THIODIGLYCOL $(HOCH_2CH_2)_2S$

Hydrogen Peroxide and Acetone	Thiodiglycol was being oxidized with an excess of hydrogen peroxide using acetone as a solvent. At the conclusion the acetone and excess hydrogen peroxide were removed under vacuum in a steam bath. After about 15 minutes of heating on a steam bath, a violent explosion occurred.
	MCA Case History 223 (1962).

THIONYL CHLORIDE $OSCl_2$

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.
2, 4-Hexadiyn-1, 6-Diol	Thionyl chloride and 2, 4-hexadiyn-1, 6-diol reacting in dimethyl formamide forms 2, 4-hexadiyn-1, 6-bischlorosulfite which is shock sensitive and decomposes violently upon distillation.
	P.E. Driedger and H.V. Isaacson, *Chem. Eng. News* **50** (12): 51 (1972).
o-Nitrobenzoylacetic Acid	o-Nitrobenzoylacetic acid reacted with thionyl chloride to produce the corresponding nitrobenzoylacetyl chloride, which decomposed violently after removal of solvent by distillation. A similar reaction hazard exists for o-nitrophenylacetic acid plus thionyl chloride.
	W.D. Bonner and C.O. Hurd, *J. Am. Chem. Soc.* **68:** 344 (1946).
o-Nitrophenylacetic Acid	See THIONYL CHLORIDE plus o-Nitrobenzoylacetic Acid.
Water	A flexible stainless hose that was being used for thionyl chloride transfer ruptured when contaminated with water. Water reacts with thionyl chloride, liberating hydrogen chloride and sulfur dioxide gases.
	Wischmeyer (1972).

THIOPHENATES

(See PHENYL SULFIDE SALTS)

THIOPHENE

Nitric Acid	A mixture of the two may cause an explosion.
	Pieters, p. 30 (1957).

THIOPHOSPHORYL FLUORIDE SPF_3

Air	Thiophosphoryl fluoride is spontaneously flammable in air; under proper conditions, it is spontaneously explosive.
	Mellor **8:** 1072 (1946-1947).
Potassium	See SODIUM plus Thiophosphoryl Fluoride.
Sodium	See SODIUM plus Thiophosphoryl Fluoride.

THIOUREA $S{=}C(NH_2)_2$

Acrolein	See ACROLEIN plus Sulfur Dioxide.

THORIUM Th

Air	See TANTALUM plus Air.
Chlorine	Thorium, when heated with chlorine, reacts vigorously with incandescence.
	Mellor **7:** 208 (1946-1947).
Phosphorus	See PHOSPHORUS plus Thorium.
Sulfur	See SULFUR plus Thorium.

THORIUM CARBIDE ThC_2

Air	When heated in air, thorium carbide readily burns with incandescence.
	Mellor **5:** 885-87 (1946-1947).
Selenium	See SELENIUM plus Thorium Carbide.
Sulfur	See SULFUR plus Thorium Carbide.

THORIUM HYDRIDE ThH_4

Air	Thorium hydride explodes if heated in the presence of air.
	Mellor **7:** 207-8 (1946-1947).

THORIUM NITRIDE Th_3N_4

Air	Thorium nitride burns in air with incandescence.
	Mellor **8:** 121-22 (1946-1947).
Water	Thorium nitride hydrolyzes vigorously.
	Mellor **8, Supp. 1:** 182 (1964).

THORIUM OXYSULFIDE ThOS

Air	Thorium oxysulfide ignites spontaneously in air.
	Mellor **7:** 240 (1946-1947).

THORIUM PHOSPHIDE Th_3P_4

Acids	Thorium phosphide reacts with acids to release spontaneously flammable phosphine.
	Mellor **8, Supp. 3:** 348 (1971).

THULIUM Tm

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

TIN Sn

(For tin compounds see STANNIC and STANNOUS compounds)

Bromine	The violent reaction between these chemicals is controlled in halocarbon solutions.
	Mellor **2, Supp. 1:** 715 (1956).
Bromine Trifluoride	Tin and bromine trifluoride react violently.
	Mellor **2, Supp. 1:** 164 (1956).
Chlorine	When heated in chlorine, tin reacts, producing light and much heat.
	Mellor **7:** 436 (1946-1947).
	Mellor **2, Supp. 1:** 380 (1956).
Chlorine Trifluoride	See ALUMINUM plus Chlorine Trifluoride.
Cupric Nitrate	In the presence of water, cupric nitrate and tin foil, on prolonged and intimate contact, will produce flaming and sparking.
	Ellern, p. 46 (1968).
Potassium Peroxide	See POTASSIUM plus Potassium Peroxide.
Sodium Peroxide	Sodium peroxide oxidizes tin with incandescence.
	Mellor **2:** 490-93 (1946-1947).
Sulfur	See SULFUR plus Tin.

TITANIUM Ti

Air	Most finely divided forms of titanium are flammable in air. See also TITANIUM DICHLORIDE plus Air and TANTALUM plus Air.
	NSC Data Sheet **485.** *BM Report Invest.* **6516** (1964). *BM Report Invest.* **4835** (1951).

Bromine Trifluoride	See MOLYBDENUM plus Bromine Trifluoride.
Carbon Dioxide	Titanium burns in carbon dioxide above 550¡C.
	NSC Data Sheet **485.**
Cupric Oxide	Titanium reacts violently with cupric oxide or lead oxide when heated.
	Mellor **7:** 20 (1946-1947).
Fluorine	See FLUORINE plus Titanium.
Lead Oxide	See TITANIUM plus Cupric Oxide.
Nickel and Potassium Perchlorate	See NICKEL plus Titanium and Potassium Perchlorate.
Nitric Acid	The residue from the reaction of titanium with red fuming nitric acid exploded violently when the flask was touched.
	Allison (1969).
Nitrogen	Titanium burns vigorously in free nitrogen above 802¡C.
	NSC Data Sheet **485**.
Oxygen	*Liquid* oxygen gives a detonable mixture when combined with powdered titanium.
	Kirschenbaum (1956).
Potassium Chlorate	When titanium is heated with potassium chlorate, potassium nitrate or potassium permanganate, an explosion occurs.
	Mellor **7:** 20 (1946-1947).
Potassium Nitrate	See TITANIUM plus Potassium Chlorate.
Potassium Permanganate	See TITANIUM plus Potassium Chlorate.
Steam	Titanium at red heat, 704¡C., decomposes steam. The hydrogen evolved burns or explodes.
	NSC Data Sheet **485.**
Trichloroethylene	It has been determined experimentally that a mixture of

	titanium powder with trichloroethylene or with trichlorotrifluoroethane will flash or spark on heavy impact.
	ASESB Pot. Incid. **39** (1968).
Trichlorotrifluoroethane	See TITANIUM plus Trichloroethylene.

TITANIUM ALLOY

Nitric Acid	Extreme caution is urged in handling of all titanium alloys exposed to red fuming nitric acid since the reaction may cause an explosion.
	Chem. Eng. News **31:** 3320 (1953).
Oxygen	A titanium alloy tank containing liquid oxygen exploded during a laboratory experiment. Contamination might have triggered the reaction. An explosion hazard may exist in the use of titanium with either gaseous or liquid oxygen.
	MCA Case History **988** (1964). *Jolicoeur* (1966).

TITANIUM CARBIDE TiC

Air	As micron-sized titanium carbide was being removed from a ball mill, a cloud of the dust ignited.
	MCA Case History **618** (1960).

TITANIUM DICHLORIDE $TiCl_2$

Air	Titanium dichloride is highly flammable in air at room temperature. In inert gases, titanium dichloride converts to titanium tetrachloride plus very finely divided titanium metal, which can ignite on subsequent exposure to air.
	NSC Data Sheet **485.**

TITANIUM DIOXIDE TiO_2

Lithium	See LITHIUM plus Titanium Dioxide.

TITANIUM DISULFIDE TiS_2

Potassium Nitrate	A mixture of titanium disulfide and potassium nitrate detonated when heated.
	Mellor **7:** 91 (1946-1947).

TITANIUM-MAGNESIUM ALLOY

Nitric Acid	The residue from the reaction of titanium-magnesium alloy with red-fuming nitric acid may be detonated by friction, heat, or shock.
	Chem. Eng. News **31:** 3320 (1953).

TITANIUM TETRACHLORIDE $TiCl_4$

Potassium	See POTASSIUM plus Titanium Tetrachloride.

TOLUENE $C_6H_5CH_3$

Nitric Acid and Sulfuric Acid	See NITRIC ACID plus Toluene and Sulfuric Acid.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus Toluene.
Silver Perchlorate	See SILVER PERCHLORATE plus Acetic Acid.
	See SILVER PERCHLORATE plus Toluene.

TOLUIDINE $CH_3(C_6H_4)NH_2$

Nitric Acid	See NITRIC ACID plus Aniline.

TOLYL CHLORIDE $C_6H_5CH_2Cl$

Dimethyl Sulfoxide	See DIMETHYL SULFOXIDE plus Acyl Halides.

TRIALLYL PHOSPHATE $(CH_2{=}CHCH_2O)_3PO$

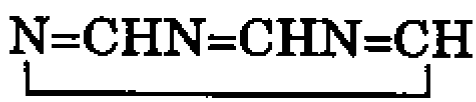
(self-reactive) An explosion occurred on distilling triallyl phosphate prepared from phosphorus oxychloride, allyl alcohol and pyridine. The toluene solution of the product, washed with sodium carbonate and with pyrogallol added, exploded violently while being distilled under vacuum at 135¡C.

W.T. Dye, G.E. Ham, *Chem. Eng. News* **28:** 3452 (1950).

TRIAMMINOTRIAZIDOCOBALT $Co(N_3)_3(NH_3)_3$

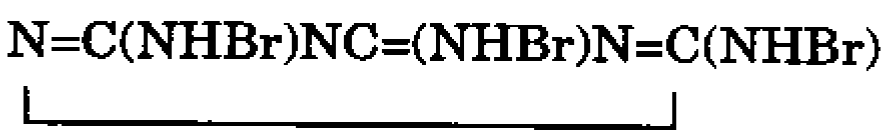
(See COBALTIC-TRIAMMINE AZIDE)

TRIAZINE



Nitric Acid See NITRIC ACID plus Triazine.

TRI-n-BROMOMELAMINE



Ally Alcohol See ALLYL ALCOHOL plus Tri-n-Bromomelamine.

TRIBROMONEOPENANOL (Sym) $(BrCH_{2-})_3COH$

Ethyl Acetoacetate and Zinc See ETHYL ACETOACETATE plus Tribromoneopentyl Alcohol and Zinc.

TRIBROMOTRIETHOXYDIALUMINUM $Al_2Br_3(OC_2H_5)_3$

Air	See TRIBROMOTRIETHOXYDIALUMINUM plus Ethyl Alcohol.
Ethyl Alcohol	Aluminum sesquibromide ethylate explodes on contact with ethyl alcohol or water. It is also pyrophoric.
	Chem. Eng. Progs. **62** (9): 128 (1968).
Water	See TRIBROMOTRIETHOXYDIALUMINUM plus Ethyl Alcohol.

TRIBROMOTRIMETHYLDIALUMINUM $(CH_3)_3Al_2Br_3$

Air	Trimethyl tribromo dialuminum is spontaneously flammable in air.
	Douda (1966).
Water	Trimethyl tribromo dialuminum reacts violently with water.
	Rose (1961).

TRIBUTYLALUMINUM $(C_4H_9)_3Al$

Air	Tri-n-butyl aluminum is spontaneously flammable in air.
	Rose (1961).

TRIBUTYLBORANE $(C_4H_9)_3B$

Air	Tri-n-butyl borane, if spread over a large area, ignites spontaneously in air.
	W.H. Johnson et al., *J. Res. Nat. Bur. Stand.* **62** (1): 49 (1959).

TRIBUTYLPHOSPHINE $P(C_4H_9)_3$

Air	Tributyl phosphine is spontaneously flammable in air.
	A.B. Steele and J.J. Duggan, *Chem. Eng.* **66:** 160 (April

	1969).

2,6,-N-TRICHLOROBENZOQUINONIMINE $OC_6H_2(Cl)_2NCl$

(self-reactive)	See 2,6-DIBROMO-N-CHLOROBENZOQUINONIMINE (self-reactive).

1,1,1-TRICHLOROETHANE CCl_3CH_3

Acetone	See ACETONE plus Methyl Chloroform.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Oxygen	See OXYGEN plus 1,1,1-Trichloroethane.
Oxygen (Liquid)	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Sodium	See SODIUM plus 1,2-Dichloroethylene.
Sodium Hydroxide	See SODIUM plus 1,2-Dichloroethylene.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus 1,1,1-Trichloroethane.

TRICHLOROETHYLENE $Cl_2C{=}CHCl$

Aluminum	See ALUMINUM plus Trichloroethylene.
Barium	See BARIUM plus Trichlorotrifluoroethane.
Nitrogen Tetroxide	See NITROGEN TETROXIDE plus 1,2-Dichloroethane.
Lithium	See LITHIUM plus Trichlorotrifluorethane.
Magnesium	See MAGNESIUM plus Trichloroethylene.
Oxygen (Liquid)	See OXYGEN (LIQUID) plus Chlorinated Hydrocarbons.
Oxygen	See OXYGEN plus Trichloroethylene.
Potassium Hydroxide	See SODIUM HYDROXIDE plus Trichloroethylene.
Potassium Nitrate	A batch of 3257 grams of boron, 9362 grams of potassium nitrate, 989 grams of laminac, and 500 grams of trichloroethylene had been mixing for 5 minutes, when an

	explosion occurred.
	MCA Guide for Safety, Appendix 3 (1972).
Sodium	See SODIUM plus 1,2-Dichloroethylene.
Sodium Hydroxide	See SODIUM HYDROXIDE plus Trichloroethylene. See also SODIUM plus 1,2-Dichloroethylene.
Titanium	See TITANIUM plus Trichloroethylene.

TRICHLOROETHYLSILANE $C_2H_5SiCl_3$

Water	Ethyltrichlorosilane reacts violently with water.
	Title 46 (1970).

1,1,1-TRICHLORO-2-FLUOROETHANE CCl_3CH_2F

Barium	See BARIUM plus Trichlorotrifluoroethane.

TRICHLOROFLUOROMETHANE $CFCl_3$

Aluminum	See ALUMINUM plus Chlorofluorohydrocarbons. See also ALUMINUM plus Dichlorodifluoromethane.
Lithium	See LITHIUM plus Trichlorotrifluoroethane.

TRICHLOROMELAMINE $C_3N_3(NHCl)_3$

Acetone	See HEXACHLOROMELAMINE plus Organic Contaminants.
Ammonia	See HEXACHLOROMELAMINE plus Organic Contaminants.
Aniline	See HEXACHLOROMELAMINE plus Organic Contaminants.
Diphenylamine	See HEXACHLOROMELAMINE plus Organic Contaminants.
Turpentine	See HEXACHLOROMELAMINE plus Organic

	Contaminants.

TRICHLOROMETHYL PERCHLORATE $Cl_3C(ClO_4)$

(self-reactive)	See SILVER PERCHLORATE plus Carbon Tetrachloride and Hydrochloric Acid.

TRICHLOROMETHYLSILANE CH_3SiCl_3

Water	Methyl trichlorosilane evolves white fumes with moist air. It reacts violently with water with the evolution of heat and white acid fumes.
	Title 46 (1970).

TRICHLOROTRIETHYLDIALUMINUM $(C_2H_5)_3Al_2Cl_3$

Air	Ethyl aluminum sesquichloride is spontaneously flammable in air.
	Douda (1966).
Benzene and Allyl Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Carbon Tetrachloride	See ALUMINUM TRIETHYL plus Carbon Tetrachloride.
Toluene and Allyl Chloride	See ALLYL CHLORIDE plus Benzene and Ethyl Aluminum Dichloride.
Water	Ethyl aluminum sesquichloride reacts violently with water.
	Rose (1961).

1,1,2-TRICHLOROTRIFLUOROETHANE CCl_3CF_3

Aluminum	See ALUMINUM plus Chlorofluorohydrocarbons.
	See also ALUMINUM plus Dichlorodifluoromethane.
Barium	See BARIUM plus Trichlorotrifluoroethane.

Lithium	See LITHIUM plus Trichlorotrifluoroethane.
Samarium	See SAMARIUM plus 1,1,2-Trichlorotrifluoroethane.
Sodium-Potassium Alloy	See SODIUM-POTASSIUM ALLOY plus Trichlorotrifluoroethane.
Titanium	See TITANIUM plus Trichloroethylene.

TRICHLOROTRIMETHYLDIALUMINUM $(CH_3)_3Al_2Cl_3$

Air	Methyl aluminum sesquichloride ignites instantly in air.
	Rose (1961).

TRICHLOROVINYLSILANE $Si(CH_2{=}CH)Cl_3$

Water	Vinyl trichloro silane reacts violently with water or moist air.
	Title 46 (1970).

TRIDECANAL $C_{12}H_{25}CHO$

Air	Tridecyl aldehyde is spontaneously flammable in air.
	A.B. Steele and J.J. Duggan, *Chem. Eng.* **66:** 160 (April 1969).

TRIETHYLALUMINUM $Al(C_2H_5)_3$

Air	Triethyl aluminum is spontaneously flammable in air and explodes violently in water.
	Von Schwartz, p. 321 (1918). *Kirk and Othmer, Second Ed.* **2:** 38 (1963). *MCA Case History* **819** (1962).
Carbon Tetrachloride	When mixtures of triethyl aluminum sesquichlorides in carbon tetrachloride that had been prepared with ice cooling were permitted to warm to room temperature, they first darkened, then exploded violently. The reaction is believed due to increased concentration of aluminum triethyl, which subsequently reacted with the carbon

	tetrachloride.
	H. Reinheckel, *Angew. Chem. Inter. Ed. Engl.* **3:** 65 (1964).
Dimethylformamide	See DIMETHYLFORMAMIDE plus Triethyl Aluminum.
Halogenated Hydrocarbons	Violent reactions may occur when aluminum alkyls are exposed to halogenated hydrocarbons.
	Kirk and Othmer, *Second Ed.* **2:** 38 (1963).
Triethyl Borine and Air	A mixture of 15% triethyl aluminum and 85% triethyl borine is pyrophoric.
	Rocketdyne Rept., Hypergol, p. 3 (1961).
Water	See TRIETHYL ALUMINUM plus Air.

TRIETHYLALUMINUM DIETHYL ETHERATE

$4(C_2H_5)_3Al \cdot 3(C_2H_5)_2O$

Diethyl Ether and Air	A mixture of triethyl aluminum diethyl etherate and diethyl ether is spontaneously flammable in air.
	Douda (1966).

TRIETHYL ALUMINUM SESQUICHLORIDE

(See TRICHLOROTRIETHYLDIALUMINUM)

TRIETHYL ANTIMONY

(See TRIETHYLSTIBINE)

TRIETHYLARSINE $As(C_2H_5)_3$

Air	Triethyl arsine is spontaneously flammable in air.
	Von Schwartz, p. 322 (1918).

TRIETHYLBISMUTHINE $(C_2H_5)_3Bi$

Air	Triethyl bismuthine is spontaneously flammable in air.
	Ellern, pp. 24-25 (1968).

TRIETHYLBORANE $(C_2H_5)_3B$

Air	Triethyl borine is spontaneously flammable in air.
	Douda (1966). *Ripley* (1966).
Triethyl Aluminum and Air	See TRIETHYL ALUMINUM plus Triethyl Borine and Air.

TRIETHYLDIBORANE $(C_2H_5)_3B_2H_3$

Air	Triethyl diborane is spontaneously flammable in air.
	Douda (1966).

TRIETHYL ETHOXY DIPHOSPHINYL OXIDE

$(C_2H_5)_2POP(C_2H_5)(OC_2H_5)$

Air	Triethyl ethoxy diphosphinyl oxide is spontaneously flammable in air.
	Kaufman (1961).

TRIETHYLGALLIUM $(C_2H_5)_3Ga$

Air	Triethyl gallium is spontaneously flammable in air.
	Ellern, pp. 24-25 (1968).

TRIETHYLINDIUM $(C_2H_5)_3In$

Air	Triethyl indium is spontaneously flammable in air.
	Douda (1966).

TRIETHYLSTIBINE $Sb(C_2H_5)_3$

Air	Triethyl antimony is spontaneously flammable in air. *Von Schwartz,* p. 322 (1918).

TRIETHYLSTIBINE SULFATE $Sb(C_2H_5)_3SO_4$

Air	Triethyl antimony sulfate is spontaneously flammable in air. *Bahme,* p. 25 (1961).

(TRIFLUOROMETHYL) PHOSPHINE F_3CPH_2

Air	Trifluoromethyl phosphine is spontaneously flammable in air. *Douda* (1966).

TRIFLUORONITROANILINE $F_3C_6H(NO_2)N{=}NOH$

(self-reactive)	The recrystallized compound, which had been made from trifluoronitroaniline, hydrochloric acid and sodium nitrite, exploded violently on impact. *MCA Guide for Safety,* Appendix 3 (1972).

TRIFLUOROPROPYL METHYL POLYSILOXANE

(See METHYL (TRIFLUOROPROPYL) POLYSILOXANE)

TRIHYDRAZINOCADMIUM CHLORATE $Cd(N_2H_4)_3(ClO_3)_2$

(See CADMIUM-TRIHYDRAZINE CHLORATE)

TRIHYDRAZINOCADMIUM PERCHLORATE

$Cd(H_2NNH_2)_3(ClO_4)_2Cd$

(See CADMIUM-TRIHYDRAZINE PERCHLORATE)

TRIHYDRAZINOCOBALTOUS CHLORATE $CO(N_2H_4)_3(ClO_3)_2$

(See COBALTOUS-TRIHYDRAZINE CHLORATE)

TRIHYDRAZINONICKEL CHLORATE $Ni(N_2H_4)_3(ClO_3)_2$

(See NICKEL-TRIHYDRAZINE CHLORATE)

TRIHYDRAZINONICKEL NITRATE $Ni(NO_3).3H_2NNH_2$

(See NICKEL-TRIHYDRAZINE NITRATE)

TRIISOBUTYLALUMINUM $(CH_3CHCH_3CH_2)_3Al$

Acids	Tri-iso-butyl aluminum reacts violently with acids, alcohols, amines, halogens, and water.
	Rose (1961).
Air	Tri-iso-butyl aluminum is spontaneously flammable in air.
	Rose (1961).
Alcohols	See TRI-iso-BUTYL ALUMINUM plus Acids.
Amines	See TRI-iso-BUTYL ALUMINUM plus Acids.
Halogens	See TRI-iso-BUTYL ALUMINUM plus Acids.
Water	See TRI-iso-BUTYL ALUMINUM plus Acids.

TRIMANGANESE TETROXIDE Mn_3O_4

Fluorine	See FLUORINE plus Trimanganese Tetroxide.

TRIMETHYLALUMINUM $Al(CH_3)_3$

Air	Trimethyl aluminum is spontaneously flammable in air and explodes violently in water. *Von Schwartz,* p. 321 (1918).
Halogenated Hydrocarbons	See TRIETHYL ALUMINUM plus Halogenated Hydrocarbons.
Water	See TRIMETHYL ALUMINUM plus Air.

TRIMETHYL ALUMINUM BROMIDE

(See DIBROMOTRIMETHYLALUMINUM)

TRIMETHYLALUMINUM DIETHYL ETHERATE

$(CH_3)_3Al{\bullet}(C_2H_5)_2O$

Diethyl Ether	A mixture of trimethyl aluminum diethyl
and Air	etherate and diethyl ether is spontaneously flammable in air. *Douda* (1966).

TRIMETHYLALUMINUM DIMETHYL ETHERATE

$(CH_3)_3Al{\bullet}(CH_3)_2O$

Air	Trimethyl aluminum dimethyl etherate is spontaneously flammable in air. *Douda* (1966).

TRIMETHYLAMINE OXIDE PERCHLORATE $(CH_3)_3NO{\bullet}HClO_4$

(self-reactive)	Trimethylamine oxide perchlorate explodes when heated or struck. *ACS* **146:** 213. *Berichte* **43:** 2624-30 (1910).

TRIMETHYL ANTIMONY

(See TRIMETHYLSTIBINE)

TRIMETHYL ANTIMONY SULFATE

(See TRIMETHYLSTIBINE SULFATE)

TRIMETHYL ARSENIC

(See TRIMETHYLARSINE)

TRIMETHYLARSINE $As(CH_3)_3$

Air	Trimethyl arsenic is spontaneously flammable in air. *Von Schwartz,* p. 322 (1918).

TRIMETHYLBISMUTHINE $(CH_3)_3Bi$

Air	Trimethyl bismuthine is spontaneously flammable in air. *Coates,* p. 161 (1956).

TRIMETHYLBORANE $B(CH_3)_3$

Air	Trimethyl borine is spontaneously flammable in air. *Douda* (1966).

TRIMETHYL CHLOROSILANE

(See CHLOROTRIMETHYLSILANE)

TRIMETHYLDIALUMINUM HYDRIDE $(CH_3)_2HAl_2H_2CH_3$

Water	Trimethyl dialuminum hydride reacts vigorously with water yielding methane and hydrogen, which ignite spontaneously.

Hurd, p. 98 (1952).

TRIMETHYLDIBORANE $(CH_3)_3B_2H_3$

Air	Trimethyl diborane is spontaneously flammable in air.
	Lehman and Wilson, p. 53 (1949).

TRIMETHYLGALLIUM $(CH_3)_3Ga$

Air	Trimethyl gallium is spontaneously flammable in air.
	Douda (1966).

TRIMETHYLPHOSPHINE $(CH_3)_3P$

Air	Trimethyl phosphine ignites spontaneously and burns violently in air.
	R.A. Zingaro and R.E. McGlothlin, *J. Chem. Eng. Data* **8** (2): 227 (1963).

TRIMETHYL PHOSPHITE $(CH_3O)_3P$

Magnesium Perchlorate	See MAGNESIUM PERCHLORATE plus Trimethyl Phosphite.

TRIMETHYLSTIBINE $Sb(CH_3)_3$

Air	Trimethyl antimony is spontaneously flammable in air.
	Von Schwartz, p. 322 (1918).

TRIMETHYLSTIBINE SULFATE $(CH_3)_3SbSO_4$

Air	Trimethyl antimony sulfate is spontaneously flammable in air.

Bahme, p. 25 (1961).

TRIMETHYLTHALLIUM $(CH_3)_3Tl$

Air — Trimethyl thallium is spontaneously flammable in air.

Douda (1966).

TRINITROETHANOL $(NO_2)_3CCH_2OH$

(self-reactive) — Explosions were encountered during the distillation of trinitroethanol.

J. Am. Chem. Soc. **72:** 5329 (1950).

TRINITROMETHANE $(NO_2)_3CH$

(self-reactive) — Explosions were encountered during the distillation of trinitromethane.

J. Am. Chem. Soc. **72:** 5329 (1950).

See also NITRIC ACID plus Acetylene.

TRIPHENYLALUMINUM $(C_6H_5)_3Al$

Water — Triphenyl aluminum reacts explosively with water.

Rose (1961).

TRIPHENYL TUNGSTEN-TRIS(PHENYL LITHIUM)-TRI-(DIETHYL) ETHER)

(See LITHIUM HEXAPHENYLTUNGSTATE ETHERATE)

TRIPROPYLALUMINUM $Al(C_3H_7)_3$

Air — Tripropyl aluminum is spontaneously flammable in air and explodes violently in water.

	Von Schwartz, p. 321 (1918).
Halogenated Hydrocarbons	See TRIETHYL ALUMINUM plus Halogenated Hydrocarbons.
Water	See TRIPROPYL ALUMINUM plus Air.

TRIPROPYL ANTIMONY

(See TRIPROPYLSTIBINE)

TRIPROPYLBORANE $(C_3H_7)_3B$

Air	Tripropylborane is spontaneously flammable in air.
	Douda (1966).

TRIPROPYLINDIUM $(C_3H_7)_3In$

Air	Tripropyl indium is spontaneously flammable in air.
	Douda (1966).

TRIPROPYLSTIBINE $(C_3H_7)_3Sb$

Air	Tripropyl antimony is spontaneously flammable in air.
	Ellern, pp. 24-25 (1968).

TRISILANE Si_3H_8

Air	In air, trisilane and tetrasilane explode. See also SILANES plus Air.
	Mellor **6:** 224 (1946-1947).
Carbon Tetrachloride	Carbon tetrachloride reacts more vigorously on trisilane and tetrasilane than on disilane.
	Mellor **6:** 224 (1946-1947).

Oxygen	See OXYGEN plus Disilane.

TRISILYLAMINE $(SiH_3)_3N$

Air	Trisilylamine is spontaneously flammable in air.
	Mellor **8:** 262 (1946-1947).

TRISILYLARSINE $(SiH_3)_3As$

Air	Trisilyl arsine is spontaneously flammable in air.
	Douda (1966).

TRISILYLPHOSPHINE $(SiH_3)_3P$

(self-reactive)	This is a spontaneously flammable liquid.
	Mellor **8, Supp. 3:** 283 (1971).
Air	The liquid ignites spontaneously in air.
	Ellern, p. 22 (1968). *Douda* (1966).

1,3,5-TRIS(NITROMETHYL)BENZENE $C_6H_3(CH_2NO_2)_3$

(self-reactive)	See NITRIC ACID plus Mesitylene.

TRIS(TRIFLUOROMETHYL)PHOSPHINE $(CF_3)_3P$

Air	Tristrifluoromethyl phosphine is spontaneously flammable in air.
	Douda (1966). *Handbook Chem. Phys.*, p. **C-428** (1970-1971).

TRIS(TRIMETHYLSILYL)PHOSPHINE $[(CH_3)_3Si]_3P$

Air	Tristrimethyl silyl phosphine is spontaneously flammable

	in air.
	Def. Res. and Eng., p. 247 (1963).

TRITOLYLAMINE PERCHLORATE $(CH_3C_4H_6)_3NHClO_4$

(self-reactive)	Tritolylamine perchlorate explodes above 123¡C.
	ACS **146:** 213. *Berichte* **43:** 2624-30 (1910).

TRIVINYL ANTIMONY $(CH_2{=}CH)_3Sb$

Air	Trivinyl antimony is spontaneously flammable in air.
	Zeiss, p. 92 (1960).

TRIVINYLBISMUTHINE $(CH_2{=}CH)_3Bi$

Air	Trivinyl bismuthine is spontaneously flammable in air.
	Zeiss, p. 129 (1960).

TROPYLIUM PERCHLORATE $(C_7H_7)ClO_4$

(self-reactive)	An 80-gram sample of tropylium perchlorate heaped in a transfer funnel exploded violently when it was touched by a glass rod.
	Angew. Chem. Intern. Ed. Engl. **1** (7): **465** (1962).

TUNGSTEN W

Bromine Trifluoride	See MOLYBDENUM plus Bromine Trifluoride.
Chlorine Trifluoride	See ANTIMONY plus Chlorine Trifluoride.
Fluorine	See FLUORINE plus Tungsten.
Iodine Pentafluoride	See ARSENIC plus Iodine Pentafluoride.
Lead Dioxide	See MOLYBDENUM plus Lead Dioxide.

TUNGSTEN CARBIDE WC

Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Mercuric Iodide.
Fluorine	See FLUORINE plus Tungsten Carbide.
Nitrogen Dioxide	Tungsten carbide burns with incandescence if heated to dull redness in either nitrous oxide or nitrogen dioxide.
	Mellor **5:** 890 (1946-1947).
Nitrous Oxide	See TUNGSTEN CARBIDE plus Nitrogen Dioxide.

TUNGSTEN DIOXIDE WO_2

Chlorine	See CHLORINE plus Tungsten Dioxide.

TUNGSTEN TRIOXIDE WO_3

Chlorine Trifluoride	The reaction between tungsten trioxide and chlorine trifluoride is accompanied by incandescence.
	Mellor **11:** 730 (1946-1947).
	See also CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Lithium	See LITHIUM plus Tungsten Trioxide.

TURPENTINE

Calcium Hypochlorite	See CALCIUM HYPOCHLORITE plus Turpentine.
Chlorine	See CHLORINE plus Hydrocarbons.
Chromic Anhydride	See CHROMIC ANHYDRIDE plus Naphthalene.
Chromyl Chloride	See CHROMYL CHLORIDE plus Acetone.
Hexachloromelamine	See HEXACHLOROMELAMINE plus Organic Contaminants.
Stannic Chloride	See STANNIC CHLORIDE plus Turpentine.
Trichloromelamine	See HEXACHLOROMELAMINE plus Organic

	Contaminants.

TYGON□

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

UNSYMMETRICAL DIMETHYLHYDRAZINE

(See uns-DIMETHYLHYDRAZINE)

URANIUM U

Air	Clean uranium turnings or chips oxidize readily in air. If confined in a container without air movement, they can ignite spontaneously. Moisture increases this reactivity.
	Scott (1970).
Carbon Tetrachloride	An explosion occurred when liquid carbon tetrachloride was used in an attempt to extinguish a small fire involving about a half pound of uranium.
	Allison (1969).
Chlorine	See CHLORINE plus Uranium.
Fluorine	See FLUORINE plus Uranium.
Nitric Acid	Nitric acid can react with uranium with explosive violence.
	Katz and Rabinowitch (1951).
	Freshly cleaned uranium turnings in a stainless steel beaker were covered with hot water and nitric acid to bring the concentration to 4 to 6 normal. When cold rinse water was turned on, an explosion accompanied by a flash, ejected the turnings from the beaker.
	Serious Acc. Series **250** (1965).
Nitric Oxide	Uranium ignites in warm nitric oxide.
	Mellor **12:** 31-2 (1946-1947).
Selenium	Uranium reacts with incandescence with hot selenium or sulfur (boiling).

	Mellor **12:** 31-2 (1946-1947).
Sulfur	See URANIUM plus Selenium.
Water	Uranium turnings and fines stored out of doors in a closed container under water or water-soluble oil will hydride and eventually ignite during hot weather.
	Scott (1970).

URANIUM BOROHYDRIDE

(See URANIUM TETRAHYDROBORATE)

URANIUM CARBIDE

(See URANIUM DICARBIDE)

URANIUM DICARBIDE UC_2

Air	Uranium dicarbide ignites if powdered in a mortar.
	Mellor **5:** 890 (1946-1947).
Bromine	See BROMINE plus Uranium Dicarbide.
Chlorine	See BROMINE plus Uranium Dicarbide.
Fluorine	See BROMINE plus Uranium Dicarbide.
Water	Uranium dicarbide (at dull-red heat) reacts with steam with incandescence.
	Mellor **5:** 890 (1946-1947).

URANIUM DIOXIDE UO_2

Air	Uranium oxide is spontaneously flammable in air.
	Brauer (1965).

URANIUM HYDRIDE UH_3

Air	Uranium hydride is spontaneously flammable in air.
	J. Zehr, *Staub* **22** (11): 494-508 (1962). *Brauer* (1965).

URANIUM-NEODYMIUM ALLOY

Nitric Acid	Explosive or violent reactions have occurred during or subsequent to pickling of the alloy with nitric acid.
	Allison (1969).

URANIUM-NEODYMIUM-ZIRCONIUM ALLOY

Nitric Acid	Explosive or violent reactions have occurred during or subsequent to pickling of the alloy with nitric acid.
	Allison (1969).

URANIUM NITRIDE UN

Air	Uranium nitride is spontaneously flammable in air.
	J. Zehr, *Staub* **22** (11): 494-508 (1962).

URANIUM OXIDES UO_2;UO_3;U_3O_8

Bromine Trifluoride	See BROMINE TRIFLUORIDE plus Uranium Oxides.

URANIUM PHOSPHIDE U_3P_4

Hydrochloric Acid	Uranium phosphide reacts with hydrochloric acid to release spontaneously flammable phosphine.
	Mellor **8, Supp. 3:** 349 (1971).

URANIUM TETRAHYDROBORATE $U(BH_4)_3$

Air	Uranium borohydride is spontaneously flammable in air.
	H.I. Schlesinger et al, *J. Am. Chem. Soc.* **75:** 219-223

(1953).

URANYL PERCHLORATE $UO_2(ClO_4)_2$

Ethyl Alcohol	Attempts at recrystallization from ethyl alcohol resulted in an explosion. *Mellor* **2, Supp. 1:** 617 (1956).

p-URAZINE

(self-reactive)	While a chemist was manipulating the material in a glass container, an explosion occurred that shattered the container. The material that exploded was probably a nitrogen-containing byproduct. *MCA Case History* **144** (1966).

UREA $(NH_2)_2CO$

Gallium Perchlorate	See GALLIUM PERCHLORATE plus Urea.
Hypochlorites	See HYPOCHLORITES plus Urea.

VANADIUM V

Bromine Trifluoride	See MOLYBDENUM plus Bromine Trifluoride.
Chlorine	See CHLORINE plus Vanadium.
Lithium	See LITHIUM plus Vanadium.

VANADIUM OXYDICHLORIDE $VOCl_2$

Potassium	See POTASSIUM plus Boric Acid.

VANADIUM OXYTRICHLORIDE $VOCl_3$

Phosphorus	See PHOSPHORUS plus Vanadium Oxytrichloride.

VANADIUM PENTACHLORIDE VCl_5

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

VANADIUM PENTOXIDE V_2O_5

Calcium, Sulfur and Water	See CALCIUM plus Vanadium Oxide, Sulfur, and Water.
Chlorine Trifluoride	See CHLORINE TRIFLUORIDE plus Aluminum Oxide.
Lithium	See LITHIUM plus Vanadium Pentoxide.

VANADIUM SESQUIOXIDE V_2O_3

Air	Vanadium sesquioxide is spontaneously flammable in air. *Ellern* (1961).

VANILLIN $CH_3O(HO)C_6H_3CHO$

Thallium Trinitrate Trihydrate and Formic Acid	See THALLIUM TRINITRATE TRIHYDRATE plus Formic Acid and Vanillin.

VEGETABLE GLUES

Aluminum	See ALUMINUM plus Nitrates.

VINYL ACETATE $CH_2{=}CHOCOCH_3$

2-Aminoethanol	See 2-AMINOETHANOL plus Vinyl Acetate.
Chlorosulfonic Acid	Mixing vinyl acetate and chlorosulfonic acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Ethylene Diamine	See ETHYLENE DIAMINE plus Vinyl Acetate.
Ethyleneimine	Mixing vinyl acetate and ethyleneimine in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Hydrochloric Acid	Mixing vinyl acetate and 36% hydrochloric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Hydrofluoric Acid	Mixing vinyl acetate and 48.7% hydrofluoric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Nitric Acid	Mixing vinyl acetate and 70% nitric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.
Oleum	See OLEUM plus Vinyl Acetate.
Peroxides	Vinyl acetate in contact with peroxides may polymerize violently. *Haz. Chem. Data* (1966).
Sulfuric Acid	Mixing vinyl acetate and 96% sulfuric acid in a closed container caused the temperature and pressure to increase. *Flynn and Rossow* (1970). See Note under complete reference.

VINYL ACETATE-CHLORIDE COPOLYMER

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

VINYL AZIDE $CH_2{=}CHN_3$

(self-reactive)	A sample of vinyl azide in a distilling flask with a ground glass joint exploded when the joint was rotated.
	R.H. Wiley and J. Moffat, *J. Org. Chem.* **22:** 995 (1957).

VINYL CHLORIDE $CH_2{=}CHCl$

Air	An unstable polyperoxide is apparently formed in vinyl chloride through oxidation by atmospheric oxygen in the presence of any of a variety of contaminants. Storage under these conditions for a long period increases the concentration of unstable polyperoxide to hazardous levels.
	MCA Case History **1551** (1969).

VINYLIDENE CHLORIDE $CH_2{=}CCl_2$

(self-reactive)	A coating of vinylidene chloride polymer on the inside of a 2-inch pipe exploded when the pipe touched a fitting on a tank car.
	MCA Case History **1172** (1966).
Chlorosulfonic Acid	Mixing vinylidene chloride and chlorosulfonic acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.
Nitric Acid	Mixing vinylidene chloride and 70% nitric acid in a closed container caused the temperature and pressure to increase.
	Flynn and Rossow (1970). See Note under complete reference.

Oleum	See OLEUM plus Vinylidene Chloride.

VINYL TRICHLORO SILANE

(See TRICHLOROVINYLSILANE)

VITON A□

Fluorine	See FLUORINE plus Solid Nonmetals and Oxygen.

WAX, DRAWING

Chlorine	See CHLORINE plus Polypropylene.

XANTHATES

Diazonium Salts	See DIAZONIUM SALTS plus Thiophenates.

XENON HEXAFLUORIDE XeF_6

Water	Xenon hexafluoride reacted with water to form explosive xenon trioxide. *Health & Safety Inf.* **181** (1964). *Chem. Eng. News* **13:** 45-6 (1963). *J. Am. Chem. Soc.* **85:** 816 (1963).

2(X, Y-XYLYL)ETHANOL $(CH_3)_2C_6H_3CH_2CH_2OH$

Hydrogen Peroxide and Sulfuric Acid	See ALCOHOLS plus Hydrogen Peroxide and Sulfuric Acid.

YTTERBIUM Yb

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

YTTRIUM Yt

Air	See RARE EARTH METALS plus Air.
Halogens	See RARE EARTH METALS plus Halogens.

ZIEGLER-TYPE CATALYSTS

Allyl Chloride	See SULFURIC ACID plus Allyl Chloride.

ZINC Zn

Acids	Zinc powder or dust in contact with acids evolves hydrogen. The heat of reaction is sufficient that the hydrogen may ignite. *Lab. Govt. Chemist* (1965).
Ammonium Nitrate	The two substances are mixed intimately and wetted with 3 or 4 drops of water. After a short time, a violent reaction occurs with evolution of steam and zinc oxide. *Greaves* (1967). *Mellor* **8, Supp. 1:** 546 (1964). See also AMMONIUM NITRATE plus Metals (powdered).
Barium Dioxide	See MAGNESIUM plus Barium Nitrate, Barium Dioxide and Zinc.
Barium Nitrate	See MAGNESIUM plus Barium Nitrate, Barium Dioxide and Zinc.
Cadmium	See ZINC plus Selenium.
Carbon Disulfide	A mixture of zinc and carbon disulfide reacts with incandescence. *Mellor* **4:** 476-90 (1946-1947).
Chlorates	A mixture of powdered zinc and an oxidizing agent such as potassium chlorate can be exploded by percussion. *Mellor* **4:** 480 (1946-1947).

Chlorine	Zinc burns in moist chlorine.
	Mellor **4:** 476 (1946-1947).
Chlorine Trifluoride	See ALUMINUM plus Chlorine Trifluoride.
Chromic Anhydride	A violent reaction or flaming is likely in the reaction of chromic anhydride and zinc dust.
	Mellor **11:** 237 (1946-1947).
Ethyl Acetoacetate and Tribromoneopentyl Alcohol	See ETHYL ACETOACETATE plus Tribromoneopentyl and Zinc.
Fluorine	See FLUORINE plus Zinc.
Hydrazine Mononitrate	When hydrazine mononitrate is heated in contact with zinc, copper and most other metals as well as oxides, sulfides, nitrides and carbides, a flaming decomposition occurs at temperatures a little above its melting point.
	Mellor **8:** 327 (1946-1947).
Hydroxylamine	Hydroxylamine is reduced when heated with zinc dust; sometimes the mixture merely ignites; other times, it explodes.
	Mellor **8:** 290 (1946-1947).
Lead Azide	See COPPER plus Lead Azide.
Magnesium, Barium Nitrate and Barium Dioxide	See MAGNESIUM plus Barium Nitrate, Barium Dioxide and Zinc.
Manganese Chloride	Zinc powder reacts explosively when heated with manganese chloride.
	Mellor **4:** 479 (1946-1947).
Nitric Acid	When concentrated nitric acid is poured on molten zinc, the reaction proceeds with incandescence.
	Mellor **4:** 476-90 (1946-1947).
Performic Acid	Powdered zinc can decompose performic acid violently, causing an explosion.

	Berichte **48:** 1139 (1915).
Potassium Chlorate	See ZINC plus Chlorates.
Potassium Nitrate	Powdered zinc and potassium nitrate explode if heated.
	Mellor **7:** 116 (1946-1947).
Potassium Peroxide	See POTASSIUM plus Potassium Peroxide.
Selenium	The reaction between zinc and selenium or tellurium is accompanied by incandescence (cadmium less so).
	Mellor **4:** 480 (1946-1947).
Sodium Chlorate	See ZINC plus Chlorates.
Sodium Peroxide	Sodium peroxide oxidizes zinc with incandescence.
	Mellor **2:** 490-93 (1946-1947).
Sulfur	See SULFUR plus Zinc.
Tellurium	See ZINC plus Selenium.
Water	Zinc powder or dust in contact with water or damp air evolves hydrogen. The heat of reaction is sufficient that the hydrogen may ignite.
	Haz. Chem. Data p. 171 (1966).
	Lab. Govt. Chemist (1965).
Zinc Peroxide	See ALUMINUM plus Zinc Peroxide.

ZINC AMIDE $Zn(NH_2)_2$

Hydrazine	The action of an ethereal solution of hydrazine on zinc diamide or diethyl zinc, gives a product, zinc hydrazine, which explodes at 70¡C.
	Mellor **8:** 315 (1946-1947).

ZINC BENZENEDIAZONIUM CHLORIDE $C_6H_5\text{-}N{=}NClZnCl_2$

(self-reactive)	Zinc benzenediazonium chloride had been washed in dry acetone and had been stored in a vacuum desiccator 15 hours when it exploded.

	Chem. & Ind. p. 58-9 (1956).

ZINC BROMATE $Zn(BrO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

ZINC BROMIDE $ZnBr_2$

Potassium	See POTASSIUM plus Aluminum Bromide.
Sodium	See SODIUM plus Aluminum Bromide.

ZINC CHLORATE $Zn(ClO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Antimony Sulfide	See CHLORATES plus Antimony Sulfide. See also METAL SULFIDES plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Arsenic Sulfide	See CHLORATES plus Arsenic Sulfide. See also METAL SULFIDES plus Bromates.
Carbon	See CARBON plus Bromates.
Charcoal	Zinc chlorate and charcoal (or finely divided organic matter) form mixtures which may ignite or explode. Such ignition or explosion may be caused by friction, percussion, or shock. *U.S. Army Ord. Safety Man.* (1951).

	See also CHLORATES plus Organic Matter.
Copper	See COPPER plus Bromates.
Copper Sulfide	See COPPER SULFIDE plus Cadmium Chlorate.
Manganese Dioxide	See CHLORATES plus Manganese Dioxide.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Acids (Dibasic)	See CHLORATES plus Organic Acids.
Organic Matter	See ZINC CHLORATE plus Charcoal. See ALUMINUM plus Bromates.
	See CHLORATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Stannic Sulfide	See STANNIC SULFIDE plus Cadmium Chlorate. See METAL SULFIDES plus Bromates.
Stannous Sulfide	See STANNOUS SULFIDE plus Cadmium Chlorate. See METAL SULFIDES plus Bromates.
Sulfur	See SULFUR plus Bromates. See CHLORATES plus Organic Matter.
Sulfuric Acid	Zinc chlorate in contact with concentrated sulfuric acid is likely to cause fires and explosions.
	Bahme, p. 29 (1961).
	See CHLORATES plus Acids.

ZINC CHLORIDE $ZnCl_2$

Potassium	See POTASSIUM plus Aluminum Bromide.

ZINC CYANIDE $Zn(CN)_2$

Magnesium	See MAGNESIUM plus Cadmium Cyanide.

ZINC DIALKYLS

Air	These compounds are spontaneously flammable in air.

	Von Schwartz, p. 329 (1918).

ZINC DIETHYL

(See DIETHYL ZINC)

ZINC DIPROPYL $(C_3H_7)_2Zn$

(See DIPROPYL ZINC)

ZINC DIVINYL $(CH_2CH)_2Zn$

(See DIVINYL ZINC)

ZINC FLUORIDE ZnF_2

Potassium	See POTASSIUM plus Ammonium Bromide.

ZINC-HYDRAZINE CHLORATE

(self-reactive)	This compound detonates when struck but is less sensitive than tetramminiozinc chlorate. *Mellor* **2, Supp. 1:** 592 (1956).

ZINC IODATE $Zn(IO_3)_2$

Aluminum	See ALUMINUM plus Bromates.
Arsenic	See ARSENIC plus Bromates.
Carbon	See CARBON plus Bromates.

ZINC IODIDE ZI_2

Potassium	See POTASSIUM plus Alumium Bromide.

ZINC NITRATE $Zn(NO_3)_2$

Carbon	See CARBON plus Zinc Nitrate.
Copper	See COPPER plus Bromates.
Metal Sulfides	See METAL SULFIDES plus Bromates.
Organic Matter	See BROMATES plus Organic Matter.
Phosphorus	See PHOSPHORUS plus Bromates.
Sulfur	See SULFUR plus Bromates.

ZINC OXIDE ZnO

Chlorinated Rubber	Reaction between zinc oxide and chlorinated rubber in a large batch resulted in a violent explosion that wrecked a manufacturing building. *Chem. Eng. News* **40** (36): 79 (1962).
Magnesium	See MAGNESIUM plus Beryllium Oxide.

ZINC PEROXIDE ZnO_2

Aluminum	See ALUMINUM plus Zinc Peroxide.
Zinc	See ALUMINUM plus Zinc Peroxide.

ZINC PHOSPHIDE Zn_3P_2

Water	Moisture reacts with zinc phosphide with production of phosphine, a spontaneously flammable gas. *Oldbury Chemicals.*

ZINC SULFIDE ZnS

Iodine Monochloride	See IODINE MONOCHLORIDE plus Cadmium Sulfide.

ZINC-TETRAMMINE CHLORATE $Zn(NH_3)_4(ClO_3)_2$

(self-reactive)	This compound detonates when struck.
	Mellor **2, Supp. 1:** 592 (1956).

ZINC-TETRAMMINE PERCHLORATE $Zn(NH_3)_4(ClO_4)_2$

(self-reactive)	This compound detonates when struck but is less sensitive than tetramminiozine chlorate.
	Mellor **2, Supp. 1:** 592 (1956).

ZIRCONIUM Zr

Air	See TANTALUM plus Air.
Alkali Hydroxides	When a mixture of alkali hydroxide and zirconium is heated, the liberated oxygen reacts explosively with the zirconium.
	Mellor **7:** 116 (1946-1947).
Alkali Metal Chromates	See ZIRCONIUM plus Alkali Metal Salts.
Alkali Metal Dichromates	See ZIRCONIUM plus Alkali Metal Salts.
Alkali Metal Molybdates	See ZIRCONIUM plus Alkali Metal Salts.
Alkali Metal Salts	Chromates, dichromates, sulfates, molybdates and tungstates of lithium, sodium, potassium, rubidium and cesium will react violently, even explosively, with an excess of zirconium powder and yield the impure metal.
	Ellern, p. 249 (1968). *Mellor* **2: Supp. II and III.**
Alkali Metal Sulfates	See ZIRCONIUM plus Alkali Metal Salts
Alkali Metal Tungstates	See ZIRCONIUM plus Alkali Metal Salts.

Borax	A mixture of hydrated borax and zirconium explodes when heated. *Mellor* **7:** 116 (1946-1947).
Carbon Tetrachloride	An explosion occurred when zirconium sponge was placed in a beaker of carbon tetrachloride. *Allison* (1969).
Cupric Oxide	Zirconium explodes violently with cupric oxide or lead oxide. *Mellor* **7:** 116 (1946-1947).
Lead	See LEAD plus Zirconium.
Lead Oxide	See ZIRCONIUM plus Cupric Oxide.
Phosphorus	See PHOSPHORUS plus Zirconium.
Potassium Chlorate	When heated, potassium chlorate reacts with zirconium with slight explosions. *Mellor* **7:** 116 (1946-1947).
Potassium Nitrate	A mixture of powdered zirconium and potassium nitrate explodes when heated above the melting temperature. *Mellor* **7:** 116 (1946-1947).

ZIRCONIUM BOROHYDRIDE

(See ZIRCONIUM TETRAHYDROBORATE)

ZIRCONIUM CARBIDE ZrC

Air	Zirconium carbide in the form of a fine powder is spontaneously flammable in air. *Rose* (1961).

ZIRCONIUM DIBROMIDE $ZrBr_2$

Air	Zirconium dibromide is spontaneously flammable in air.

Douda (1966).

ZIRCONIUM DICARBIDE ZrC_2

Bromine	See BROMINE plus Zirconium Dicarbide.
Chlorine	See BROMINE plus Zirconium Dicarbide.
Fluorine	See BROMINE plus Zirconium Dicarbide.
Iodine	See BROMINE plus Zirconium Dicarbide.

ZIRCONIUM DIHYDRIDE ZrH_2

Air — When heated in air, zirconium dihydride burns with incandescence.

Mellor **7:** 116 (1946-1947).

ZIRCONIUM TETRACHLORIDE $ZrCl_4$

Lithium — See LITHIUM plus Chromium Trichloride.

ZIRCONIUM TETRAHYDROBORATE $Zr(BH_4)_4$

Air — Zirconium borohydride is spontaneously flammable in air.

Gaylord, p. 58 (1956).

ZIRCONIUM-URANIUM ALLOY

Nitric Acid — Contact of etched or cleaned zirconium-uranium alloy with nitric acid results in a mild explosion.

Allison (1969).

NFPA 495

1996 Edition

Explosive Materials Code

1996 Edition

This edition of NFPA 495, *Explosive Materials Code,* was prepared by the Technical Committee on Explosives and acted on by the National Fire Protection Association, Inc. at its Annual Meeting held May 20-23, 1996, in Boston, MA. It was issued by the Standards Council on July 18, 1996, with an effective date of August 9, 1996, and supersedes all previous editions.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

This document has been submitted to ANSI for approval.

Origin and Development of NFPA 495

This code was originally issued in 1912 under the title *Suggested State Law to Regulate the*

Manufacture, Storage, Sale, and Use of Explosives. The second edition was issued in 1941 by the Committee on Laws and Ordinances and retitled *Suggested Explosives Ordinance for Cities*. Later, the document was designated as NFPA 495L.

After being assigned to the Committee on Chemicals and Explosives, a new edition was issued in 1959. This was retitled as the *Code for the Manufacture, Transportation, Storage, and Use of Explosives and Blasting Agents* and redesignated as NFPA 495.

Following the reorganization of the committee in 1960, the responsibility for amendments to NFPA 495 was assigned to the Sectional Committee on Explosives. This committee reported to the Correlating Committee of the Committee on Chemicals and Explosives. Revised editions were issued in 1962, 1965, 1967, 1968, 1969, and 1970. A new edition was issued in 1972, with the document title revised to *Code for the Manufacture, Transportation, Storage, and Use of Explosive Materials*. A subsequent edition followed in 1973.

Following the issuance of the 1973 edition, the Sectional Committee on Explosives was redesignated as a Technical Committee. In 1976, the committee began a detailed review intended to amend requirements to eliminate conflicts with the regulations promulgated by the various federal agencies concerned with explosive materials (e.g., U.S. Bureau of Alcohol, Tobacco, and Firearms, U.S. Mine Safety and Health Administration, and U.S. Department of Transportation). This effort resulted in the 1982 edition, which was subsequently followed by a new edition in 1985. In 1990, the document was again revised and the title changed to *Explosive Materials Code*. The 1992 edition incorporated various technical and editorial amendments.

The latest edition, issued in 1996, incorporates changes in the classification of explosives to conform with recent U.S. Department of Transportation "Hazardous Materials Regulations," which in turn are based on United Nations Recommendations on the Transport of Dangerous Goods. The 1996 edition also includes technical and editorial amendments.

Technical Committee on Explosives

J. Edmund Hay, *Chair*
U.S. Bureau of Mines, PA

W. S. Chang, Bureau of Explosives Lab, NJ

John A. Conkling, Chestertown, MD

C. James Dahn, Safety Consulting Engr Inc., IL

Paul W. Dickinson, Defense Logistics Agency, CO

Thomas P. Dowling, Inst. of Makers of Explosives, DC
Rep. Inst. of Makers of Explosives

Frank H. Fenton, III, The Township of Northampton, PA

Richard L. Fischer, Mine Safety & Health Admin., CO

Mark A. Fry, Mark A. Fry & Assoc., Inc., NJ

Charles C. Gardner, Hercules Inc., VA

Kenneth L. Kosanke, Pyrolabs, CO

William J. Maurits, U.S. DOD Explosives Safety Board, VA

Larry J. McCune, U.S. Bureau of Alcohol, Tobacco & Firearms, DC

John G. Robert, Industrial Risk Insurers, CT
Rep. Industrial Risk Insurers

Robert A. VanDuzer, SAAMI, PA
Rep. Sporting Arms & Ammunition Mfrs. Inst., Inc.

Alternates

Michael S. Katich, Defense Logistics Agency, CO
(Alt. to P. W. Dickinson)

Roger N. Prescott, Austin Powder Co., OH
(Alt. to T. P. Dowling)

Lon D. Santis, U.S. Bureau of Mines, PA
(Alt. to J. E. Hay)

David S. Shatzer, U.S. Bureau of Alcohol, Tobacco & Firearms, DC
(Alt. to L. J. McCune)

Nonvoting

Glen E. Gardner, U.S. Occupational Safety & Health Admin., DC

Charles Schultz, U.S. Dept. of Transportation, DC

Terence P. Smith, U.S. Dept. of Labor, DC
(Alt. to G. E. Gardner)

David G. Trebisacci, NFPA Staff Liaison

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents safeguarding against the fire and life hazards associated with explosives and related materials during their manufacture, storage, transportation and use. The sale and use of fireworks and model rockets are the responsibility of the Technical Committee on Pyrotechnics.

NFPA 495
Explosive Materials Code

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 11 and Appendices D and F.

Chapter 1 General

1-1 Scope.

1-1.1

This code shall apply to the manufacture, transportation, storage, sale, and use of explosive materials.

1-1.2

This code shall not apply to the transportation of explosive materials where under the jurisdiction of the U.S. Department of Transportation (DOT). It shall apply, however, to state and municipal supervision of compliance with "Hazardous Materials Regulations," U.S. Department of Transportation, Title 49, *Code of Federal Regulations*, Parts 100-199.

1-1.3

This code shall not apply to the transportation and use of military explosives by federal or state military agencies, nor shall it apply to the transportation and use of explosive materials by federal, state, or municipal agencies while engaged in normal or emergency performance of duties.

1-1.4

This code shall not apply to the manufacture of explosive materials under the jurisdiction of the U.S. Department of Defense. This code also shall not apply to the distribution of explosive materials to or storage of explosive materials by military agencies of the United States, nor shall it apply to arsenals, navy yards, depots, or other establishments owned by or operated by or on behalf of the United States.

1-1.5

This code shall not apply to pyrotechnics such as flares, fuses, and railway torpedoes. It also shall not apply to fireworks and pyrotechnic special effects as defined in NFPA 1123, *Code for Fireworks Display*; NFPA 1124, *Code for the Manufacture*, *Transportation*, *and Storage of Fireworks*; and NFPA 1126, *Standard for the Use of Pyrotechnics before a Proximate Audience*.

1-1.6

This code shall not apply to model and high power rocketry as defined in NFPA 1122, *Code for Model Rocketry*; NFPA 1125, *Code for the Manufacture of Model Rocket and High Power Rocket Motors*; and NFPA 1127, *Code for High Power Rocketry*.

1-1.7

This code shall not apply to the use of explosive materials in medicines and medicinal agents in the forms prescribed by the United States Pharmacopeia or the National Formulary.

1-2 Purpose.

This code is intended to provide reasonable safety in the manufacture, storage, transportation, and use of explosive materials.

1-3 Equivalency.

The authority having jurisdiction shall be permitted to authorize alternate provisions to those in this code to meet unusual conditions, provided such alternate provisions are of substantially equivalent degrees of safety and security.

1-4 Definitions.

The following definitions shall apply for the purposes of this code.

Acceptor. A charge of explosives or blasting agent receiving an impulse from an exploding donor charge.

Ammonium Nitrate. A chemical compound represented by the formula NH_4NO_3.

ANFO (Ammonium Nitrate Fuel Oil Mixture). A blasting agent (Explosive 1.5D) that contains no essential ingredients other than prilled ammonium nitrate and fuel oil.

Approved. Acceptable to the authority having jurisdiction.

NOTE: The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

NOTE: The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

Binary Explosive. A blasting explosive formed by mixing or combining two plosophoric materials (e.g., ammonium nitrate and nitromethane).

Blast Area. The area including the blast site and the immediate adjacent area within the influence of flying rock, missiles, and concussion.

Blaster. A person qualified to be in charge of and responsible for the loading and firing of a blast.

Blasting Agent.* A material or mixture intended for blasting that meets the requirements of the DOT "Hazardous Materials Regulations," as set forth in Title 49, *Code of Federal Regulations*, Parts 173.56, 173.57, and 173.58, Explosive 1.5D.

Blast Site.* The area where explosive material is handled during loading of the blasthole, including 50 ft (15.2 m) in all directions from the perimeter formed by loaded holes. A minimum of 30 ft (9.1 m) can replace the 50-ft (15.2-m) requirement if the perimeter for loaded holes is marked and separated from nonblast site areas by a barrier. The 50-ft (15.2-m) or 30-ft (9.1-m) distance requirements, as applicable, apply in all directions along the full depth of the blasthole. In underground mines, at least 15 ft (4.6 m) of a solid rib, pillar, or broken rock can be substituted for the 50-ft (15.2-m) distance.

Bulk Mix. A mass of explosive material prepared for use in bulk form without packaging.

Bulk Mix Delivery Equipment. Equipment (usually a motor vehicle with or without a mechanical delivery device) that transports explosive materials in bulk form for mixing or loading directly into boreholes, or both.

Bullet-Resistant Construction.* Refers to magazine walls or doors, constructed to resist penetration of a bullet of 150-grain M2 ball ammunition having a nominal muzzle velocity of 2700 fps (824 mps) when fired from a 0.30-caliber rifle from a distance of 100 ft (30.5 m) perpendicular to the wall or door.

Bullet-Sensitive Explosive Material. Explosive material that can be detonated by 150-grain M2 ball ammunition having a nominal muzzle velocity of 2700 fps (824 mps) when fired from a 0.30-caliber rifle at a distance of 100 ft (30.5 m), measured perpendicularly. The test material is at a temperature of 70°F to 75°F (21°C to 24°C) and is placed against a $^{1}/_{2}$-in. (12.7-mm) steel plate.

Cap-Sensitive Explosive Material.* Any explosive material that can be detonated by means of a No. 8 blasting cap or its equivalent.

Composite Propellant. A mixture consisting of an elastomeric-type fuel and an oxidizer. Composite propellants are used in gas generators and rocket motors.

Detonating Cord. A flexible cord containing a center core of high explosive used to detonate other explosives.

Detonator. Any device containing an initiating or primary explosive that is used for initiating detonation. A detonator is not permitted to contain more than 10 g of total explosive material per unit, excluding ignition or delay charges. The term includes, but is not limited to, electric detonators of the instantaneous and delay types, detonators for use with safety fuses, detonating cord delay connectors, and nonelectric detonators of the instantaneous and delay types that consist of a detonating cord, a shock tube, or any other replacement for electric leg wires.

Donor. An exploding charge producing an impulse that impinges upon an explosive acceptor charge.

Emulsion Explosive. An explosive material that consists of a slurry of substantial amounts of ammonium nitrate dissolved in water droplets surrounded by an oil-like material.

Explosive.* Any chemical compound, mixture, or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord, and igniters.

The term includes any material determined to be within the scope of Title 18, *United States Code*, Chapter 40, "Importation, Manufacture, Distribution and Storage of Explosive Materials," and also includes any material classified as an explosive by the U.S. Department of Transportation, "Hazardous Materials Regulations," 49 CFR, Parts 100-199.

Explosive-Actuated Device. Any tool or special mechanized device that is actuated by explosive materials. The term does not include propellant-actuated devices (*see definition of Propellant-Actuated Device)*. Examples of explosive-actuated devices are jet-tappers and jet perforators.

Explosive Material. Any explosive, blasting agent, emulsion explosive, water gel, or detonator.

Fire Extinguisher Rating. A rating set forth in NFPA 10, *Standard for Portable Fire Extinguishers*. This rating is identified on an extinguisher by a number (e.g., 5, 20, 70), indicating relative effectiveness, followed by a letter (e.g., A, B, C, or D) indicating the class or classes of fires for which the extinguisher has been found to be effective.

Fire-Resistant. Construction designed to provide reasonable protection against fire. For exterior walls of magazines constructed of wood, this is defined as the fire resistance equivalency provided by sheet metal of not less than 26 gauge.

Flash Point.* The lowest temperature at which vapors from a volatile combustible substance ignite in air when exposed to flame.

Fuel. Any substance that reacts with the oxygen in the air or with the oxygen yielded by an oxidizer to produce combustion.

Hardwood. Any close-grained wood such as oak, maple, ash, or hickory that is free from loose knots, wind shakes, or similar defects.

High Explosive Materials. Explosive materials that are characterized by a very high rate of reaction, high pressure development, and the presence of a detonation wave.

Highway. Any public street, public alley, or public road.

Inhabited Building. Any building or structure regularly used in whole or part as a place of human habitation. The term includes any church, school, store, railway passenger station, airport passenger terminal, and any other building or structure where people are accustomed to congregate or assemble. The term does not include any building or structure occupied in connection with the manufacture, transportation, storage, or use of explosive materials.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed. Equipment, materials, or services included in a list published by an organization acceptable to the authority having jurisdiction and concerned with evaluation of products or services that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services and whose listing states either that the equipment, material, or service meets identified standards or has been tested and found suitable for a specified purpose.

NOTE: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

Low Explosive Material. Explosive material that is characterized by deflagration or a low rate of reaction and the development of low pressure.

Magazine. A building or structure, other than an explosives manufacturing building, approved for the storage of explosive materials.

Manufacturing. Mixing, blending, extruding, assembling, disassembling, chemical synthesis, and other functions involved in making a product or device that is intended to explode.

Mass Detonate (Mass Explode). Simultaneous detonation or explosion of the total amount or a substantial amount of a quantity of explosive material caused by the explosion of a unit or part of the explosive material.

Misfire. A charge of explosive material that fails to detonate completely after initiation.

Motor Vehicle. Any self-propelled vehicle, truck, tractor, semitrailer, or truck-trailer combination used for the transportation of freight over public highways.

Nonelectric Delay Device. A detonator with an integral delay element used in conjunction with and capable of being initiated by a detonating impulse.

Oxidizing Material.* Any solid or liquid that readily yields oxygen or other oxidizing gas or that readily reacts to oxidize combustible material.

Person. Any individual, firm, copartnership, corporation, company, association, or joint stock association, including any trustee, receiver, assignee, or personal representative thereof.

Plosophoric Materials. Two or more unmixed, commercially manufactured prepackaged chemical ingredients (including oxidizers, flammable liquids or solids, or similar ingredients) that are *not* classified as explosives but that, where mixed or combined, form a blasting explosive.

Plywood. Exterior grade plywood.

Primer. A unit, package, or cartridge of explosive material used to initiate other explosives or blasting agents and that contains (1) a detonator, or (2) a detonating cord to which is attached a detonator designed to initiate the cord.

Propellant. An explosive that normally functions by deflagration and is used for propulsion purposes. It is classified by the U.S. Department of Transportation, "Hazardous Materials Regulations" as 1.1 (Class A) or 1.3 (Class B), depending on its susceptibility to detonation.

Propellant-Actuated Device. Any tool or special mechanized device or gas generator system that is actuated by a propellant or that releases or directs work through a propellant charge.

Public Conveyance. Any railroad car, streetcar, ferry, cab, bus, airplane, or other vehicle that carries passengers for hire.

Railway. Any steam, electric, diesel electric, or other railroad or railway that carries passengers for hire on a particular line or branch in the vicinity of an explosives storage or manufacturing facility.

Semiconductive Hose. Any hose with an electrical resistance sufficient to limit the flow of stray electric currents to safe levels, yet not high enough to prevent the relaxation of static electric charges to ground. Any hose having a resistance of no more than 2.0 megohms over its entire length and a resistance of no less than 1000 ohms/ft (3280 ohms/m) meets this definition.

Sensitivity. A characteristic of an explosive material, classifying its ability to detonate upon receiving an external impulse such as impact shock, flame, or other influence that can cause explosive decomposition.

Shock Tube. A small diameter plastic tube used for initiating detonators. It contains only a limited quantity of reactive material so that the energy that is transmitted through the tube by means of a detonation wave is guided through and confined within the walls of the tube.

Small Arms Ammunition. Any shotgun, rifle, or pistol cartridge and any cartridge for propellant-actuated devices. This definition does not include military ammunition containing bursting charges or incendiary, tracer, spotting, or pyrotechnic projectiles.

Small Arms Ammunition Primers. Small percussion-sensitive explosive charges encased in a cap and used to ignite propellant powder.

Smokeless Propellants. Solid propellants, commonly referred to as smokeless powders, used in small arms ammunition, cannons, rockets, or propellant-actuated devices.

Softwood. Any coarse-grained wood such as fir, hemlock, spruce, or pine that is free from loose knots, wind shakes, or similar defects.

Special Industrial Explosives Device. Explosive-actuated devices and propellant-actuated devices.

Special Industrial Explosive Material.* Shaped materials, sheet forms, and various other extrusions, pellets, and packages of high explosives used for high-energy-rate forming, expanding, and shaping in metal fabrication and for dismemberment and reduction of scrap metal.

Steel. General purpose, hot- or cold-rolled, low carbon steel, such as ASTM A 366, S*pecifications for Commercial Quality Cold-Rolled Carbon Steel Sheets*, or equivalent.

Theft-Resistant. Construction designed to deter illegal entry into facilities for the storage of explosive material.

Two-Component Explosive. See Binary Explosive.

Water Gel.* Any explosive or blasting agent that contains a substantial portion of water.

Weather-Resistant. Construction designed to offer reasonable protection against weather.

Chapter 2 Security and Safety of Explosive Materials

2-1 Basic Requirements.

2-1.1

No attempt shall be made to fight a fire that cannot be contained or controlled before it reaches explosive materials. In such cases, all personnel shall be evacuated immediately to a safe location, and the area shall be guarded from entry by spectators or intruders.

2-1.2

The local fire department and other local emergency response agencies shall be notified of the location of all magazines and shall be notified of any changes in location.

2-1.3

The manufacture of any explosive material, as defined by this code, shall be prohibited unless such manufacture is authorized by federal license and is conducted in accordance with recognized safe practices.

Exception: This requirement shall not apply to hand loading of small arms ammunition prepared for personal use and not for resale.

2-1.4

The manufacture of explosive materials shall be prohibited where such manufacture presents an undue hazard to life or property.

2-1.5

The authority having jurisdiction shall be permitted to restrict the quantity of explosive materials that is handled at any location.

2-1.6

All explosive materials and any newly developed and unclassified explosive materials shall meet the license and permit requirements of this chapter.

Exception: This requirement shall not apply to stocks of small arms ammunition and components thereof, to the extent that they are covered by the provisions of Title 18, United States Code, Chapter 44, "Gun Control Act of 1968."

2-1.7

A person intending to engage in business as an importer of, a manufacturer of, or dealer in explosive materials shall obtain a federal license in accordance with Title 18, *United States Code*, "Organized Crime Control Act of 1970," in Chapter 40.

2-1.8

This chapter is intended to supplement existing federal laws and regulations. Therefore, any person who possesses a license or permit under Title 18, *United States Code,* Chapter 40, that properly covers the activities of such person shall not be required to obtain a permit under this chapter.

2-1.9

All normal access roads to explosive storage magazines shall be posted with the following warning sign:

DANGER

NEVER FIGHT EXPLOSIVE FIRES

EXPLOSIVES ARE STORED ON THIS SITE

CALL ___________________

The sign shall be weather-resistant with a reflective surface and lettering at least 2 in. (50 mm) high.

2-1.10

Placarding shall only apply to Type 5 magazines as defined by Title 27, *Code of Federal Regulations*, Part 55 (Bureau of Alcohol, Tobacco, and Firearms).

2-2 Permit Requirements.

2-2.1

No person shall be in possession of explosive materials, or conduct an operation or activity requiring the use of explosive materials, or perform or supervise the loading and firing of explosive materials without first obtaining the proper permit.

2-2.2

Explosive materials shall not be sold, given, delivered, or transferred to any person not possessing a valid permit.

2-2.3

Every person conducting an operation or activity that uses explosive materials shall obtain a permit to use explosive materials and shall be responsible for the results and consequences of any loading or firing of explosive materials. Such person also shall ensure that loading and firing are performed or supervised by a person possessing a permit to blast.

Exception: Laboratories engaged in testing explosive materials, other than where conducting test blast explosions, shall require only a permit to use.

2-3 Permit Classes.

2-3.1 Permit to Use.

Before a person conducts an operation or activity that uses explosive materials, that person shall obtain a permit to use, which provides authorization to purchase, possess, store, and use such materials.

2-3.2 Permit to Blast.

Before a person supervises and performs the loading and firing of explosive materials, that person shall obtain the appropriate permit to blast, as specified in Table 2-3.2:

Table 2-3.2 Classifications for Permit to Blast

Class	Category	Blasting Permitted
A	Unlimited	All types of blasting
B	General aboveground	All phases of blasting operations in quarries, open pit mines, and aboveground construction
C	General underground	All phases of blasting operations in underground mines, shafts, tunnels, and drifts
D	Demolition	All phases of blasting in demolition projects
E	Seismic	All phases of blasting in seismic prospecting
F	Agriculture	All phases of blasting in agriculture, but limited to not more than 50 lb (22.7 kg) per blast
G	Special	Special blasting as described on the permit

2-4 Requirements for Blaster's Permit.

2-4.1

The applicant for an initial permit to supervise and perform the loading and firing of explosive materials, as specified in 2-3.2, shall demonstrate adequate training and experience in the use of explosive materials in the class authorized by the specific permit for which application is made.

2-4.2

Each applicant shall pass a qualifying examination. The examination may be written, oral, or by such other means as necessary to determine that the applicant is competent to conduct blasting operations and to perform the duties of a blaster.

2-4.3

Any holder of a permit to blast who is convicted of a violation of any explosives law or regulation shall be required to pass a qualifying examination as a condition of retention of the permit.

2-4.4

Any person whose permit to blast has been revoked shall be required to pass a qualifying examination as a condition of reinstatement of the permit.

2-4.5

Any person whose permit to blast has lapsed for a period of 1 year or longer shall be required to pass a qualifying examination as a condition of renewal of the permit.

2-5 Posting of Permits.

2-5.1 Permit to Use.

A copy of the permit shall be posted at each place of operation.

2-5.2 Permit to Blast.

A copy of the permit shall be carried by the permit holder during blasting operations.

2-5.3

Permit holders shall take every reasonable precaution to protect their permits from loss, theft, defacement, destruction, or unauthorized duplication. Any such occurrence shall be reported immediately to the issuing authority.

2-6 Permit Restrictions.

2-6.1

No permit shall be permitted to be assigned or transferred.

2-6.2

No permit shall be issued to a person under 21 years old.

2-6.3

Permits shall be dated and numbered and shall be valid for no longer than 3 years from the date of issue.

2-7 Denial or Revocation of Permits.

2-7.1

A permit for the possession and use of explosive materials shall be denied or revoked for any of the following reasons:

(a) Noncompliance with any order of the issuing authority within the time specified by such order;

(b) Proof that the permit applicant or holder is under indictment for, or has been convicted of, a crime punishable by imprisonment for a term exceeding 1 year;

(c) The applicant or holder is a fugitive from justice;

(d) The applicant or holder is an unlawful user of, or is addicted to, narcotics or dangerous drugs;

(e) The applicant has been adjudicated as mentally defective;

(f) Proof that the permit applicant or holder advocates, or knowingly belongs to, any organization or group that advocates violent overthrow of or violent action against any federal, state, or local government;

(g) Proof that the permit applicant or holder suffers from a mental or physical defect that would interfere with the safe handling of explosives; or

(h) Violation by the permit applicant or holder of any provision of any explosives law or regulation, or proof that false information was provided or a misrepresentation was made to obtain the permit by the applicant or holder.

2-7.2

In any case in which the issuing authority denies or revokes a permit, the issuing authority shall notify the permit applicant or holder promptly. Such notification shall specify the basis for denial or revocation of the permit and shall state that, upon written request by the applicant or holder, a hearing before the issuing authority is to be held within 10 days after the date of the request.

2-7.3

In cases where a hearing is held, the issuing authority shall state its findings and conclusions in writing and shall transmit a copy to the applicant or former permit holder promptly.

2-7.4

Upon notice of the revocation of any permit, the former permit holder shall surrender the revoked permit and all copies thereof to the issuing authority immediately.

2-8 Record Keeping and Reporting.

2-8.1

A holder of a permit to use shall keep a record of all transactions or operations involving explosive materials. Such record shall be retained for 5 years and shall be made available to the issuing authority upon request.

2-8.2

An accumulation of invoices, sales slips, delivery tickets or receipts, or similar records representing individual transactions shall be considered to satisfy the requirements for record keeping, provided they include the signature of the receiver of the explosive materials.

2-8.3

A holder of a permit to blast shall keep a daily record of all explosive materials received and fired or otherwise disposed of by the permit holder. Such records shall be retained for 5 years and shall be made available to the issuing authority upon request.

2-8.4

A holder of a permit shall notify the issuing authority promptly of any change in address.

2-8.5*

The loss, theft, or unlawful removal of explosive materials shall be reported within 24 hours to the Bureau of Alcohol, Tobacco, and Firearms; to the permit-issuing authority; and to the local law enforcement agency.

2-8.6

Accidents involving explosive material that cause a lost-time injury or property damage shall be reported immediately to the authority having jurisdiction.

2-9 Applications and Renewals.

2-9.1

An application for a permit or for renewal of a permit shall be made to the issuing authority on forms provided by the authority and shall contain such information as is required.

2-9.2

Where an application for renewal is filed with the issuing authority before expiration of the current permit, the renewal shall become effective upon expiration of the current permit. No renewal permit shall be issued more than 30 days prior to the expiration date of the current permit.

2-9.3

An application for renewal filed after the expiration date of the current permit shall be considered an application for a new permit.

Chapter 3 Blasting Agents

3-1 Scope.

3-1.1

Unless otherwise specified in this chapter, blasting agents shall be transported, stored, and used in the same manner as other explosive materials.

3-1.2

Water gels, slurries, and emulsion explosives shall not be subject to the requirements of this chapter. (*See Chapter 4*.)

3-2 Fixed Location Mixing.

3-2.1

Buildings or other facilities used for mixing blasting agents shall be located, in relation to inhabited buildings, passenger railroads, and public highways, in accordance with the American Table of Distances. (*See Table 6-4.1*.)

3-2.2

In determining the distance separating inhabited buildings, passenger railroads, or public highways from potential explosions, the sum of all masses that could propagate (i.e., are closer than the distances specified in Table 6-4.2) from either individual or combined donor masses shall be included. However, where ammonium nitrate is included, only 50 percent of its weight shall be used due to its reduced blast effect.

3-2.3

Buildings used for the mixing of blasting agents shall comply with the requirements of this subsection, unless otherwise specifically approved by the authority having jurisdiction.

3-2.3.1 Buildings shall be constructed of noncombustible materials or of sheet metal on wood studs.

3-2.3.2 Floors shall be of concrete or other noncombustible material. They shall be constructed without open floor drains and without piping into which molten materials could flow and become confined in the event of fire.

3-2.3.3 All fuel oil storage facilities shall be separated from the mixing building and located so that the oil drains away from the mixing plant building if the tank ruptures.

3-2.3.4 The mixing building shall be well ventilated.

3-2.3.5 Heating units that do not depend on the combustion of fuel shall be permitted to be used within the mixing building where properly designed and located. All direct sources of heat shall be provided exclusively from units located outside of the mixing building.

3-2.3.6 Internal combustion engines used to generate electrical power shall be located outside of the mixing building or shall be ventilated and isolated properly by a firewall. The engine exhaust system shall be located so that any spark emission cannot endanger any materials in or adjacent to the mixing building.

3-2.4

Equipment used for mixing blasting agents shall comply with the requirements of this subsection.

3-2.4.1 The design of the mixer shall minimize the possibility of frictional heating, compaction, and confinement. All bearings and drive assemblies shall be mounted outside the mixer and protected against the accumulation of dust. All surfaces shall be accessible for cleaning.

3-2.4.2 Mixing and packaging equipment shall be constructed of materials compatible with the blasting agent composition.

3-2.4.3 Means shall be provided to prevent the flow of fuel oil to the mixer in case of fire. In gravity flow systems, an automatic spring-loaded shutoff valve with a fusible link shall be installed.

3-2.5

The requirements of this subsection shall apply where mixing and handling blasting agent compositions.

3-2.5.1 Oxidizers of small particle size, such as crushed ammonium nitrate prills or fines, shall be handled with special care, due to the possibility of their greater sensitivity.

3-2.5.2 No hydrocarbon liquid fuel with a flash point lower than that of No. 2 fuel oil [i.e., 125°F (51.7°C) minimum or legal minimum] shall be used.

Exception: Fuel oils with flash points no lower than 100°F (37.8°C) shall be permitted to be used at ambient air temperatures below 45°F (7.2°C).

3-2.5.3 Reclaimed crankcase oil shall be permitted to be used, provided each new supply of oil is checked for its compliance with 3-2.5.2.

3-2.5.4 Metal powders, such as aluminum, shall be kept dry and shall be stored in containers or bins that are moisture-resistant and weathertight. Solid fuels shall be handled so that dust explosion hazards are minimized.

3-2.5.5 Peroxides or chlorates shall not be used.

3-2.5.6 The requirements of 3-2.5.3, 3-2.5.4, and 3-2.5.5 shall not apply to compositions that have been tested, classified, and approved by the Associate Administrator for Hazardous Materials Safety in accordance with the provisions of Title 49, *Code of Federal Regulations*.

3-2.6

All electrical switches, controls, motors, and lights located in the mixing room shall comply with NFPA 70, *National Electrical Code*®, Article 502.

Exception: This requirement shall not apply to electrical wiring and equipment located outside the mixing building.

3-2.7

The frame of the mixer and all other equipment that are used shall be electrically bonded and grounded.

3-2.8

Safety precautions at mixing plants shall include the following requirements:

(a) Floors shall have no drains or piping into which molten materials could flow and become confined during a fire.

(b) The floors and equipment of the mixing and packaging rooms or areas shall be cleaned thoroughly on a regular basis to prevent accumulations of oxidizers, fuels, and sensitizers.

(c) The entire building shall be cleaned thoroughly on a regular basis to prevent the excessive accumulation of dust.

(d) Smoking, matches, open flames, spark-producing devices, and firearms shall not be permitted inside of or within 50 ft (15.25 m) of any building or facility used for the mixing of blasting agents.

Exception: Firearms shall be permitted to be carried by authorized guards where approved by the authority having jurisdiction.

(e) The area surrounding the mixing plant shall be kept clear of brush, dried grass, leaves, and other materials for a distance of at least 25 ft (7.63 m).

(f) Empty ammonium nitrate bags shall be disposed of daily in a safe manner.

(g) No welding or open flames shall be permitted in or around the mixing or storage area.

Exception: Where the equipment and the area have been completely washed down and all oxidizing material has been removed.

(h) Before welding on or making repairs to hollow shafts, all oxidizing material shall be removed from the outside and inside of the shaft, and the shaft shall be vented with a minimum $^{1}/_{2}$-in. (13-mm) diameter opening.

(i) Other explosive materials shall not be stored inside of or within 50 ft (15.25 m) of any building or facility used for mixing blasting agents.

3-3 Bulk Mixing and Delivery Vehicles.

3-3.1

The provisions of Section 3-3 shall apply to all bulk mixing and delivery vehicles. The requirements of 3-2.5 also shall apply to bulk delivery and mixing vehicles.

3-3.2

The body of a vehicle for mixing and delivering blasting agents in bulk shall comply with the following requirements:

(a) The body shall be constructed of noncombustible materials.

(b) Vehicles used to transport bulk, premixed blasting agents shall have covered bodies.

(c) All moving parts of the mixing system shall be designed so that heat buildup is prevented. Shafts or axles that make contact with the product shall have outboard bearings with a minimum 1-in. (25.4-mm) clearance between the bearings and the outside of the product container. Attention shall be given to adequate clearance on all moving parts.

(d) The bulk delivery vehicle shall be strong enough to carry the load without difficulty and shall be in good mechanical condition.

3-3.3

Operation of bulk delivery vehicles shall comply with the following requirements:

(a) Vehicles transporting blasting agents shall be driven by and shall be in the charge of only those drivers who are at least 21 years old, who are capable, careful, and reliable, and who possess a valid motor vehicle operator's license. Drivers shall be familiar with all traffic regulations, applicable federal and state regulations pertaining to explosive materials, and the requirements of this code.

(b) The vehicle operator shall be trained in the safe operation of the vehicle and shall be knowledgeable of its mixing, conveying, and related equipment. The operator shall be familiar with the commodities being delivered and the general procedures for handling emergencies.

(c) No person shall be permitted to ride upon, drive, load, or unload a vehicle containing blasting agents while smoking or while under the influence of intoxicants, narcotics, or other dangerous drugs.

(d) Vehicles transporting blasting agents shall be in safe operating condition at all times.

(e) No person shall smoke, carry matches or any flame-producing device, or carry any firearms while in or around bulk vehicles effecting the mixing, transfer, or down-the-hole loading of blasting agents at or near the blasting site.

(f) Caution shall be exercised in moving the vehicle within the blasting area to avoid driving the vehicle over or dragging hoses over firing lines, cap wires, or explosive materials. The driver shall obtain the assistance of a second person to guide the driver's movements while moving the vehicle.

(g) Material shall not be mixed while in transit.

3-3.4

Pneumatic loading from bulk delivery vehicles into blast holes primed with electric blasting caps or other static-sensitive systems shall comply with the following requirements:

(a) A positive grounding device shall be used to prevent the accumulation of static electricity.

(b) A semiconductive discharge hose shall be used.

(c) A qualified person shall evaluate all systems to determine that they adequately dissipate static electricity under potential field conditions.

3-3.5

Repairs to bulk delivery vehicles shall comply with the following requirements:

(a) No welding or open flames shall be used on or around any part of the delivery equipment until all oxidizing material has been removed and the equipment has been washed down completely.

(b) Before welding on or making repairs to hollow shafts, all oxidizing material shall be removed from the outside and inside of the shaft, and the shaft shall be vented with a minimum $^1/_2$-in. (13-mm) diameter opening.

3-4 Bulk Storage Bins.

3-4.1

The bin shall be a Type 5 magazine and shall be waterproof.

3-4.2*

The bin, including supports, shall be constructed of compatible materials and shall be adequately supported and braced to withstand the combination of all loads, including impact forces arising from product movement within the bin and accidental contact between vehicles and the support legs of the bin.

3-4.3

The bin discharge gate shall be designed to provide a closure tight enough to prevent leakage of the stored product. Provision also shall be made for locking the discharge gate.

3-4.4

Bin-loading manways or access hatches shall be hinged or otherwise attached to the bin and shall be designed to allow locking.

3-4.5

Any electrically driven conveyors for loading or unloading bins shall comply with the requirements of NFPA 70, *National Electrical Code*. They shall be designed to minimize damage from corrosion.

3-4.6

Bins containing blasting agents shall be located in accordance with Table 6-4.1 with respect to inhabited buildings, passenger railroads, and public highways.

3-4.7

Bins containing blasting agents shall be located in accordance with Tables 6-4.1 and 6-4.2 with respect to the storage of other blasting agents or explosives.

3-4.8

Bins containing ammonium nitrate shall be separated from the storage of blasting agents and explosives in accordance with Table 6-4.2.

3-4.9

Good housekeeping shall be maintained in the vicinity of any bin containing ammonium nitrate or other blasting agent. This shall include keeping weeds and other combustible materials cleared within 25 ft (7.63 m) of the bin. Accumulations of spilled product shall be prevented.

3-5 Storage of Blasting Agents and Supplies.

3-5.1

Blasting agents and oxidizers used for the mixing of blasting agents shall be stored in accordance with the following requirements:

(a) Blasting agents or ammonium nitrate stored with other explosive materials shall be stored in accordance with the requirements of Section 3-5. The total mass of the blasting agents and $^{1}/_{2}$ of the mass of ammonium nitrate shall be included where computing the total quantity of explosive materials for determining separation distance requirements.

(b) Blasting agents stored entirely separate from other explosive materials shall be stored in a Type 5 magazine or a magazine of higher classification (i.e., lower number).

(c) Magazines in which blasting agents are stored shall be constructed so that there are no open floor drains or piping into which molten materials can flow and become confined in the event of fire.

(d) Semitrailer and trailer vans used for highway or on-site transportation of blasting agents shall be permitted to be used for temporary storage of these materials, provided they are located in accordance with Table 6-4.1 with respect to inhabited buildings, passenger railways, and public highways, and in accordance with Table 6-4.2 with respect to each other. Trailers and semitrailers shall be provided with substantial means for locking, and the doors shall be kept locked.

Exception: Where stocks of blasting agents are actually being placed or removed, the doors of trailers and semitrailers shall not be required to be locked.

3-5.2

Piles of ammonium nitrate and warehouses containing ammonium nitrate shall be separated adequately from readily combustible fuels.

3-5.3

Caked oxidizer, either in bags or in bulk, shall not be loosened by blasting.

3-5.4

Every magazine used for the storage of blasting agents shall be under the supervision of a competent person who shall be at least 21 years old.

3-6 Transportation of Packaged Blasting Agents.

3-6.1

Where blasting agents are transported in the same vehicle with other explosive materials, all the requirements of Chapter 5 shall be met.

3-6.2

Vehicles transporting blasting agents shall be driven by and shall be in the charge of only those drivers who are at least 21 years old, who are capable, careful, and reliable, and who possess a valid motor vehicle operator’s license. The driver shall be familiar with state vehicle and traffic laws.

3-6.3

No matches, firearms, acids, or other corrosive liquids shall be carried in the bed or body of any vehicle carrying blasting agents.

3-6.4

No person shall be permitted to ride upon, drive, load, or unload a vehicle containing blasting agents while smoking or while under the influence of intoxicants, narcotics, or other dangerous drugs.

3-6.5

No person shall transport or carry any blasting agents on any public vehicle carrying passengers for hire.

3-6.6

Vehicles transporting blasting agents shall be in safe operating condition at all times.

3-6.7

Where blasting agents are transported over public highways, the packaging, marking, and labeling of containers of blasting agents shall comply with U.S. Department of Transportation regulations.

3-6.8

Vehicles used for transporting blasting agents on public highways shall be placarded in accordance with U.S. Department of Transportation regulations.

3-7 Use of Blasting Agents.

Persons using blasting agents shall comply with all applicable requirements of Chapters 2 and 7.

Chapter 4 Water Gel and Emulsion Explosive Materials

4-1 Scope.

For the purposes of this chapter, the term "water gel" refers to water gel explosive materials or emulsion explosive materials.

4-2 Types and Classifications.

Water gels shall be classified as Division 1.1D or Division 1.5D Explosives in accordance with U.S. Department of Transportation regulations. They shall be manufactured, transported, stored, and used as specified by this code.

Exception: Where otherwise specified in this chapter.

4-3 Fixed Location Mixing.

4-3.1

Buildings or other facilities used for mixing water gels shall be located in accordance with Table 6-4.1 with respect to inhabited buildings, passenger railroads, and public highways.

In determining the distances separating highways, railroads, and inhabited buildings from potential explosions, as specified in Table 6-4.1, the sum of all masses that can propagate (i.e., that lie at distances less than those specified by Table 6-4.2) from either individual or combined donor masses shall be included. However, where ammonium nitrate is required to be included, only $^1/_2$ of its mass shall be used because of its reduced blast effects.

4-3.2

Buildings used for the mixing of water gels shall comply with the following requirements:

(a) Buildings shall be constructed of noncombustible materials or of sheet metal on wood studs.

(b) Floors shall be of concrete or other noncombustible material. They shall be constructed without open floor drains and without piping into which molten materials could flow and become confined in the event of fire.

(c) Where fuel oil is used, fuel oil storage facilities shall be separated from the mixing plant and located so that the oil will drain away from the mixing building in case of tank rupture.

(d) The mixing building shall be well ventilated.

(e) Heating units that do not depend on the combustion of fuel shall be permitted to be used in the mixing building, where properly designed and located. Direct-fired heating units shall be located outside of the mixing building.

(f) Internal combustion engines used to generate electrical power shall be located outside of the mixing building or shall be isolated by a fire partition and shall be ventilated properly. The engine exhaust system shall be located so that any sparks emission cannot endanger any materials in or adjacent to the mixing building.

Exception: Where otherwise specifically approved by the authority having jurisdiction.

4-3.3

The ingredients used in water gels shall comply with the following requirements:

(a) Ingredients classified as explosives shall be stored as required by Chapter 6.

(b) Nitrate-water solutions shall be stored in tank cars, tank trucks, or fixed tanks without quantity-distance limitations. Spills or leaks that could contaminate combustible materials shall be cleaned immediately.

(c) Metal powders, such as aluminum, shall be kept dry and shall be stored in containers or bins that are moisture-resistant or weathertight.

(d) Ingredients shall not be stored with incompatible materials.

(e) Peroxides or chlorates shall not be used.

4-3.4

Mixing equipment shall meet the following requirements:

(a) The design of the processing equipment, including mixing and conveying equipment, shall be compatible with the materials being handled. The equipment shall be designed to minimize frictional heating, compaction, overloading, and confinement.

(b) Equipment and handling procedures shall be designed to prevent the introduction of foreign objects or material.

(c) Mixers, pumps, valves, and related equipment shall be designed to allow regular and periodic flushing, cleaning, dismantling, and inspection.

(d) All electrical equipment and wiring shall comply with NFPA 70, *National Electrical Code*.

(e) Electric motors and generators shall be provided with suitable overload protection devices. All motors, generators, proportioning devices, and all other electrical enclosures shall be bonded. The grounding conductor to all such equipment shall be effectively bonded to the service-entrance ground connection and to all equipment ground connections in order to provide a continuous path to ground.

4-3.5

Mixing facilities shall meet the following requirements:

(a) The mixing, loading, and ingredient transfer areas where residues and spilled materials can accumulate shall be kept safe. A cleaning and collection system shall be provided for dangerous residues.

(b) A visual inspection of the mixing, conveying, and electrical equipment shall be made daily to ensure that all equipment is in good operating condition. A program of systematic maintenance shall be carried out on a regular schedule.

(c) Heating units that do not depend on the combustion of fuel shall be permitted to be used within the confines of the processing building or area, provided they are equipped with temperature and safety controls and provided they are located away from combustible materials and finished product.

4-4 Bulk Mixing and Delivery Vehicles.

4-4.1

Vehicle design shall meet the following requirements:

(a) Vehicles used for bulk transportation of water gels shall meet the requirements of Chapter 5 and Section 3-6.

(b) Where electrical power is supplied by a self-contained motor-generator located on the vehicle, the generator shall be separated from the discharge point of the water gel.

(c) Processing equipment shall comply with 4-3.3 and 4-3.4.

(d) A positive action parking brake that sets the brakes on at least one axle shall be provided on vehicles equipped with air brakes. This brake shall be used during bulk delivery operations. Where required, wheel chocks shall be used.

4-4.2

Operation of bulk mixing and delivery vehicles shall meet the following requirements:

(a) The vehicle operator shall be trained in the safe operation of the vehicle and shall be knowledgeable of its mixing, conveying, and related equipment. The operator shall be familiar with the commodities being delivered and the general procedures for handling emergencies.

(b) No person shall smoke, carry matches or any flame-producing device, or carry any firearms while in or around bulk vehicles effecting the mixing, transfer, or down-the-hole loading of water gels at or near the blasting site.

(c) Caution shall be exercised in moving the vehicle within the blasting area to avoid driving the vehicle over or dragging hoses over firing lines, cap wires, or explosive materials. The driver shall obtain the assistance of a second person to guide the driver's movements while moving the vehicle.

(d) Material shall not be mixed while in transit.

(e) The location chosen for transferring the water gel or its ingredients from a support vehicle to the borehole-loading vehicle shall be away from the blast hole site where the boreholes are loaded or are in the process of being loaded.

4-5 Storage of Water Gels.

4-5.1

Water gels shall be stored as required by Chapter 6.

4-5.2

Where tests on specific formulations result in a Division 1.2 or Division 1.3 Explosives classification, bullet-resistant magazines shall not be required. (*See 6-2.4*.)

4-5.3

Semitrailer vans, trailer vans, or tanks used for the transportation of water gels shall be permitted for temporary storage of these materials, provided they are located in accordance with Table 6-4.1 with respect to inhabited buildings, passenger railways, and public highways, and in accordance with Table 6-4.2 with respect to each other. Trailers and semitrailers shall be provided with substantial means for locking, and the doors, hatches, and valves shall be kept locked. Locking mechanisms shall be as specified for Type 5 magazines. (*See 6-6.5*.)

Exception: Where stocks of water gels are actually being loaded or removed, the doors of trailers and semitrailers shall not be required to be locked.

Chapter 5 Transportation of Explosive Materials on Highways

5-1 Basic Requirements.

5-1.1

In addition to all other applicable requirements of this code, the transportation of explosive materials shall comply with U.S. Department of Transportation, Title 49, *Code of Federal Regulations*, "Hazardous Materials Regulations," Parts 100-179, and Title 49, *Code of Federal Regulations*, "Motor Carrier Safety Regulations," Part 397.

5-1.2

This chapter shall not apply to the transportation of small arms ammunition and components. (*See Chapter 11*.)

5-1.3

Explosive materials shall not be transported through any prohibited vehicular tunnel or subway or over any prohibited bridge, roadway, or elevated highway.

5-1.4

No person shall smoke or carry matches, flame-producing devices, or unauthorized firearms or cartridges while transporting explosive materials.

5-1.5

No person shall drive, load, or unload a motor vehicle transporting explosive materials in a careless or reckless manner.

5-1.6

Explosive materials shall not be carried or transported in or upon a public conveyance or vehicle carrying passengers for hire.

5-1.7

Explosive materials shall not be transferred from one vehicle to another without informing the local authority having jurisdiction. In the event of breakdown or collision, the local authority having jurisdiction shall be notified promptly to help safeguard such emergencies. Explosive materials shall be transferred from the disabled vehicle to another only where proper and qualified supervision is provided.

5-1.8

Detonators shall not be transported in the same vehicle with other Class 1 materials (Class A or Class B explosives).

Exception: As permitted by the U.S. Department of Transportation in Title 49, Code of Federal Regulations, Part 173.63.

5-2 Transportation Vehicles.

5-2.1

Vehicles used for transporting explosive materials shall be strong enough to carry the load and shall be in good mechanical condition.

5-2.2

Where explosive materials are transported on a vehicle with an open body, a portable magazine, securely fastened to the vehicle body, shall be used to store the explosive materials.

5-2.3

Vehicles used for transporting explosive materials shall have no exposed spark-producing surface on the inside of the body.

Exception: This requirement shall not apply to vehicles transporting blasting agents and oxidizing materials.

5-2.4

The floors of transportation vehicles shall be tight.

5-2.5

Motor vehicles used for transporting any quantity of explosive materials on public highways shall display all placards, lettering, or numbering required by the U.S. Department of Transportation.

5-2.6

Each motor vehicle used for transporting explosive materials shall be equipped with fire extinguishers in accordance with Table 5-2.6.

Table 5-2.6 Number of Extinguishers to Be Used According to Gross Vehicle Weight (GVW)

Trucks less than 14,000 lb (6350 kg)	At least 2 extinguishers having combined capacity of 4-A:20-B,C
Trucks 14,000 lb (6350 kg) or greater and tractor/semi-trailer units	At least 2 extinguishers having combined capacity of 4-A:70-B,C.

5-2.6.1 Only listed fire extinguishers shall be used. Fire extinguishers shall be designed, constructed, and maintained to allow a visual determination that extinguishers are fully charged.

5-2.6.2 Extinguishers shall be located where they are accessible for immediate use.

5-2.6.3 Extinguishers shall be examined and recharged periodically according to manufacturers' recommendations.

5-2.6.4 Where motor vehicles are operated in temperatures below 0°F (−17.8°C), dry chemical extinguishers shall be pressurized with nitrogen.

5-2.7

A motor vehicle used for transporting explosive materials shall be inspected to determine that it is in proper condition. The following items shall be verified:

(a) The fire extinguisher is filled and in working order.

(b) All electrical wiring is completely protected and securely fastened to prevent short-circuiting.

(c) The chassis, motor, oil pan, and body undersides are reasonably clean and free of excess oil and grease.

(d) The fuel tank and fuel lines are secure and free of leaks.

(e) The brakes, lights, horn, windshield wipers, and steering apparatus are functioning properly.

(f) The tires are inflated properly and free of defects.

(g) The vehicle is in the proper condition in every other respect and is acceptable for handling explosive materials.

5-2.8

Tires shall be checked for proper inflation and general condition after every 2 hours or 100 miles (161 km) of travel, whichever occurs first, and at every rest stop. Flat or overheated tires shall be removed from the vehicle immediately. After removal, the tire shall be placed far enough from the vehicle so that a spontaneous ignition of the tire does not endanger the vehicle or its cargo. The tire shall be cooled below the danger of ignition and the problem shall be corrected before it is replaced on the vehicle.

5-3 Operation of Transportation Vehicles.

5-3.1

Vehicles transporting explosive materials shall be driven by and be in the charge of only a properly licensed driver who is physically fit, careful, capable, reliable, and able to read and write the English language and who is not addicted to the use of, or under the influence of, intoxicants, narcotics, or other dangerous drugs.

5-3.2

The driver of a vehicle transporting explosive materials on public highways shall be not less than 21 years old. The driver shall be familiar with traffic regulations, applicable federal and state regulations concerning explosive materials, and the provisions of this chapter.

5-3.3

No vehicle transporting explosive materials shall be parked before reaching its destination, even while attended, on any public street adjacent to or in proximity to any bridge, tunnel, dwelling, building, or place where people work, congregate, or assemble.

Exception: This requirement shall not apply under emergency conditions.

5-3.4

Every motor vehicle transporting any quantity of Class A or B explosives shall, at all times, be attended by a driver or other qualified representative of the motor carrier operating the vehicle. This attendant shall have been made aware of the class of the explosive in the vehicle and its inherent dangers and shall have been instructed in the procedures to be followed in order to protect the public from those dangers. The attendant shall be familiar with the vehicle assigned and shall be provided with the training, necessary means, and authorization to move the vehicle where required.

5-3.5

For the purpose of this chapter, a motor vehicle shall be considered “attended” only when the driver or attendant is physically on or in the vehicle or when the vehicle is within his/her field of vision and the driver can reach it quickly and without interference. “Attended” also shall mean that the driver or attendant is awake, alert, and not engaged in other duties or activities that could divert attention from the vehicle.

Exception No. 1: This requirement shall not apply where communication with public officers or representatives of the shipper, carrier, or consignee or absence from the vehicle to obtain food or provide for physical comfort is necessary.

Exception No. 2: A vehicle carrying explosive materials shall be permitted to be left unattended, provided it is parked in an area where such parking is permitted, such as an area meeting the requirements of NFPA 498, Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives.

5-3.6

No spark-producing metal or tools, oils, matches, firearms, electric storage batteries, flammable materials, acids, oxidizers, or corrosives shall be carried in the body of any motor vehicle transporting explosive materials.

Exception: Where permitted by the U.S. Department of Transportation "Hazardous Materials Regulations."

5-3.7

Vehicles transporting explosive materials shall avoid congested areas and heavy traffic. Where routes through congested areas have been designated by the authority having jurisdiction, such routes shall be followed.

5-3.8

Delivery shall be made only to authorized persons and into authorized magazines or approved temporary storage or handling areas.

Chapter 6 Aboveground Storage of Explosive Materials

6-1 Scope.

6-1.1

Explosive materials shall be kept in magazines meeting the requirements of this chapter.

6-1.2

This chapter shall not apply to the storage of small arms ammunition, propellant-actuated cartridges, small arms ammunition primers, and smokeless propellants. (*See Chapter 11*.)

6-2 Basic Requirements.

6-2.1

All explosive materials not in the process of manufacture, transportation, or use shall be kept in storage magazines.

6-2.2

Ammonium nitrate shall be permitted to be stored in the same magazine with blasting agents. Ammonium nitrate and blasting agents shall be permitted to be stored in the same magazine with other explosive materials. (*See 6-2.3*.)

6-2.2.1 Where ammonium nitrate is stored in the same magazine with blasting agents, the magazine shall be suitable for the storage of blasting agents.

6-2.2.2 Where ammonium nitrate is stored in the same magazine with explosives or with explosives and blasting agents, the magazine shall be suitable for the storage of explosives.

6-2.2.3 In determining the maximum quantity of explosive material that shall be permitted to be placed in a magazine, 1/2 the weight of the ammonium nitrate shall be added to the weight of the explosive material.

6-2.3

Detonators shall be stored in a separate magazine for blasting supplies and shall not be stored in a magazine with other explosive materials.

6-2.4

Explosive materials classified as Division 1.1 or Division 1.2 by the U.S. Department of Transportation shall be stored in Type 1, 2, or 3 magazines.

Exception: Black powder shall be permitted to be stored in a Type 4 magazine or a magazine of *higher classification (i.e., lower type number).*

6-2.5

Division 1.5 explosive materials (blasting agents) shall be permitted to be stored in a Type 5 magazine or a magazine of higher classification (i.e., lower type number).

6-3 Classification and Use of Magazines.

6-3.1

Outdoor magazines shall be classified and used in accordance with Table 6-3.1.

Table 6-3.1 Construction Features and Allowable Storage in Magazines

Classification and Use of Magazines/Construction Features	Magazine Types				
	1	2	3	4	5
Permanent	X			X	X
Portable		X	X	X	X
Bullet-resistant	X	X			
Fire-resistant	X	X	X	X[2]	X[2]
Theft-resistant	X	X	X	X	X[1]
Weather-resistant	X	X	X	X	X
Ventilated	X	X	X	X[2]	X[2]

[1] Each door of a mobile Type 5 magazine shall be equipped with at least one five-tumbler padlock having a $^3/_8$-in. (9.5-mm) case-hardened shackle. The lock shall not be required to be hooded.
[2] Over-the-road trucks or semitrailers used for temporary storage as Type 4 or Type 5 magazines shall not be required to be fire-resistant or ventilated.

Storage in Magazines	Magazine Types				
	1	2	3	4	5
High explosives (1.1 D) (Class A explosives) including dynamites; cap-sensitive emulsions; slurries and water gels; cast boosters	X	X	X		
Black powder (1.1 D) (Class A explosives); defined as	X	X	X	X	

low explosive by the BATF for storage					
Detonators (1.1 B) (Class A explosives)	X	X	X		
Detonating cords (1.1 D, 1.2 D, 1.4 G) (Class A or Class C explosives)	X	X	X		
Detonators (1.4 B, 1.4 S) (Class C explosives)	X	X	X	X	
Safety fuse, electric squibs, igniters, and igniter cord (1.4 G, 1.4 S)	X	X	X	X	
Blasting agents (1.5 D) (blasting agents)	X	X	X	X	X
Propellants (1.3 C) (Class B explosives); defined as low explosive by the BATF for storage	X	X	X	X	

NOTE 1: Detonators that are mass detonating shall not be stored in the same magazine with other explosive materials.
NOTE 2: Detonators that are not mass detonating shall be permitted to be stored with safety fuses, electric squibs, igniters, or igniter cord in Type 1, 2, 3, or 4 magazines.

6-3.2

Indoor magazines used for the storage of 50 lb (22.7 kg) or less of explosive materials in warehouses and in wholesale or retail establishments shall be fire-resistant and theft-resistant and shall be subject to the approval of the authority having jurisdiction.

6-4 Location of Magazines.

6-4.1

All outdoor magazines other than Type 3 shall be located to comply with the American Table of Distances for Storage of Explosives (ADT) or the Table of Distances for Storage of Low Explosives, as applicable. (*See Table 6-4.1 for the American Table of Distances. See Title 27, Code of Federal Regulations, Part 55, for the Table of Distances for Low Explosives*.)

Table 6-4.1 The American Table of Distances for Storage of Explosives
The American Table of Distances is reprinted from IME Safety Library Publication No. 2

with permission of the
Institute of Makers of Explosives, and was revised in June of 1991.

Superscript numerals refer to explanatory footnotes.

Explanatory Notes Essential to the Application of the American Table of Distances for Storage of Explosives

NOTE 1: “Explosive materials” means explosives, blasting agents, and detonators.

NOTE 2: “Explosives” means any chemical compound, mixture, or device, the primary or common purpose of which is to function by explosion. A list of explosives determined to be within the coverage of Title 18, United States Code, Chapter 40, "Importation, Manufacture, Distribution and Storage of Explosive Materials,” is issued at least annually by the Director of the Bureau of Alcohol, Tobacco, and Firearms of the Department of the Treasury. For quantity and distance purposes, detonating cord of 50 grains per foot should be calculated as equivalent to 8 lb (3.7 kg) of high explosives per 1000 ft (305 m). Heavier or lighter core loads should be rated proportionately.

NOTE 3: “Blasting agents” means any material or mixture consisting of fuel and oxidizer, intended for blasting, and not otherwise defined as an explosive, provided that the finished product, as mixed for use or shipment, cannot be detonated by means of a No. 8 test blasting cap where unconfined.

NOTE 4: “Detonator” means any device containing any initiating or primary explosive that is used for initiating detonation. A detonator may not be permitted to contain more than 10 g of total explosives by weight, excluding ignition or delay charges. The term includes, but is not limited to, electric blasting caps of instantaneous and delay types, blasting caps for use with safety fuses, detonating cord delay connectors, and nonelectric instantaneous and delay blasting caps that use detonating cord, shock tube, or any other replacement for electric leg wires. All types of detonators in strengths through No. 8 cap should be rated at $1^1/_2$ lb (0.7 kg) of explosives per 1000 caps. For

strengths higher than No. 8 cap, the manufacturer should be consulted.
NOTE 5: "Magazine" means any building, structure, or container, other than an explosives manufacturing building, approved for the storage of explosive materials.
NOTE 6: "Natural barricade" means natural features of the ground, such as hills, or timber of sufficient density that the surrounding exposures that need protection cannot be seen from the magazine when the trees are bare of leaves.
NOTE 7: "Artificial barricade" means an artificial mound or revetted wall of earth of a minimum thickness of 3 ft (0.9 m).
NOTE 8: "Barricaded" means the effective screening of a building containing explosive materials from the magazine or another building, a railway, or a highway by a natural or an artificial barrier. A straight line from the top of any sidewall of the building containing explosive materials to the eave line of any magazine or other building or to a point 12 ft (3.7 m) above the center of a railway or highway shall pass through such barrier.
NOTE 9: "Inhabited building" means a building regularly occupied in whole or part as a habitation for human beings, or any church, schoolhouse, railroad station, store, or other structure where people are accustomed to assemble, but does not include any building or structure occupied in connection with the manufacture, transportation, storage, or use of explosive materials.
NOTE 10: "Railway" means any steam, electric, or other railroad or railway that carries passengers for hire.
NOTE 11: "Highway" means any public street, public alley, or public road.
NOTE 12: Where two or more storage magazines are located on the same property, each magazine shall comply with the minimum distances specified from inhabited buildings, railways, and highways, and, in addition, they should be separated from each other by not less than the distances shown for "separation of magazines," except that the quantity of explosive materials contained in detonator magazines shall govern with regard to the spacing of said detonator magazines from magazines containing other explosive materials. If any two or more magazines are separated from each other by less than the specified "separation of magazines" distances, such magazines, as a group, shall be considered as one magazine, and the total quantity of explosive materials stored in such group shall be treated as if stored in a single magazine located on the site of any magazine of the group, and shall comply with the minimum specified distances from other magazines, inhabited buildings, railways, and highways.
NOTE 13: Storage in excess of 300,000 lb (136,200 kg) of explosive materials in one magazine generally is not necessary for commercial enterprises.
NOTE 14: This table applies only to the manufacture and permanent storage of commercial explosive materials. It is not applicable to the transportation of explosives or any handling or temporary storage necessary or incident thereto. It is not intended to apply to bombs, projectiles, or other heavily encased explosives.
NOTE 15: Where a manufacturing building on an explosive materials plant site is designed to contain explosive materials, the building shall be located at a distance from inhabited buildings, public highways, and passenger railways in accordance with the American Table of Distances based on the maximum quantity of explosive materials permitted to be in the building at one time.

6-4.2

Blasting agent manufacturing plants and storage of blasting agents and ammonium nitrate shall be located in compliance with the Table of Recommended Separation Distances of Ammonium Nitrate and Blasting Agents (SDT) as well as with the American Table of Distances. (*See Tables 6-4.1 and 6-4.2*.)

Table 6-4.2 Table of Recommended Separation Distances of Ammonium Nitrate and Blasting Agents from Explosives or Blasting Agents[1,6]

Notes to Table of Recommended Separation Distances of Ammonium Nitrate and Blasting Agents from Explosives or Blasting Agents

NOTE 1: Recommended separation distances are to prevent explosion of ammonium nitrate and ammonium nitrate-based blasting agents by propagation from nearby stores of high explosives or blasting agents referred to in the table as the "donor." Ammonium nitrate, by itself, is not considered to be a donor where applying this table. Ammonium nitrate, ammonium nitrate-fuel oil, or combinations thereof are acceptors. If stores of ammonium nitrate are located within the sympathetic detonation distance of explosives or blasting agents, 1/2 the mass of the ammonium nitrate shall be included in the mass of the donor.

NOTE 2: Where the ammonium nitrate or blasting agent, or both, is not barricaded, the distances shown in the table shall be multiplied by 6. These distances allow for the possibility of high velocity metal fragments from mixers, hoppers, truck bodies, sheet metal structures, metal containers, and the like that could enclose the donor. Where storage is in bullet-resistant magazines1 recommended for explosives or where the storage is protected by a bullet-resistant wall, distances and barricade thicknesses in excess of those prescribed in the American Table of Distances are not required.

NOTE 3: The distances in the table apply to ammonium nitrate that passes the insensitivity test prescribed in the definition of ammonium nitrate fertilizer promulgated by the Fertilizer Institute;2 ammonium nitrate failing to pass said test shall be stored at separation distances determined by competent persons and approved by the authority having jurisdiction.

NOTE 4: These distances apply to blasting agents that pass the insensitivity test prescribed in regulations of the U.S. Department of Transportation and the U.S. Department of the Treasury, Bureau of Alcohol, Tobacco, and Firearms.

NOTE 5: Earth, sand dikes, or enclosures filled with the prescribed minimum thickness of earth or sand shall be permitted to be used as artificial barricades. Natural barricades, such as hills or timber of sufficient density that the surrounding exposures that need protection cannot be seen from the donor when the trees are bare of leaves, also shall be permitted to be used.

NOTE 6: For determining the distances to be maintained from inhabited buildings, passenger railways, and public highways, Table 6-4.1, the American Table of Distances for Storage of Explosives, shall be used.

[1]For construction of bullet-resistant magazines, see Appendix C.

[2]*Definition and Test Procedures for Ammonium Nitrate Fertilizer,* Fertilizer Institute, November 1964.

6-4.3

The separation distances provided by the American Table of Distances or the Table of Recommended Separation Distances, or both, shall be used to determine minimum separation of storage facilities for explosives, blasting agents, and ammonium nitrate. The tables to be used shall be as specified in Table 6-4.3.

Table 6-4.3 Application of Separation Distance Tables

Type of Donor	Type of Acceptor	Table	Distances Listed Under
Explosives	Explosives	ATD	Separation of magazines
Explosives	Ammonium nitrate	SDT	Ammonium nitrate
Explosives	Blasting agent	SDT	Blasting agent
Blasting agent	Explosives	ATD	Separation of magazines
Blasting agent	Blasting agent	SDT	Blasting agent
Blasting agent	Ammonium nitrate	SDT	Ammonium nitrate

6-4.4

An indoor magazine shall be located only on a floor that has an entrance at or a ramp to grade level. It shall be located no more than 10 ft (3 m) from the entrance. It shall be located as approved by the authority having jurisdiction to facilitate rapid removal in an emergency.

6-4.5

Two magazines shall be permitted to be located in the same building, provided one magazine is used solely for the storage of detonators in quantities not exceeding 5000. A distance of 10 ft (3 m) shall be maintained between the magazines.

6-4.6

The local fire department and other local emergency response agencies shall be notified of the location of all magazines and shall be notified of any changes in location.

6-4.7

Type 3 magazines shall be located as far away as practicable from neighboring inhabited buildings, railways, highways, and other magazines.

6-4.8

Type 3 magazines shall be attended where explosive materials are stored within. All explosive materials shall be removed to appropriate storage magazines for unattended storage at the end of the work day.

6-4.9

Two Type 3 magazines shall be permitted to be located at a blasting site, provided one magazine is used solely for the storage of detonators.

6-4.10

A Type 5 magazine shall not be located in a residence or dwelling.

6-5 Magazine Construction — Basic Requirements.

6-5.1

Magazines shall be constructed to comply with Section 6-5 or in a manner substantially equivalent to the requirements for safety and security embodied in this section.

6-5.2

The ground in the vicinity of magazine shall be graded so that water drains away from the magazine.

6-5.3

Heated magazines shall be heated by either hot water radiant heating within the magazine building or by indirect warm air heating.

6-5.4

Indirect warm air shall be heated by either hot water or low pressure [15 psig (103 kPa) or less] steam coils located outside the magazine building.

6-5.5

Magazine heating systems shall meet the following requirements:

(a) Radiant heating coils within the building shall be installed so that explosive materials or their containers cannot contact the coils and so that air is free to circulate between the coils and the explosive materials. The surface temperature of the coils shall not exceed 165°F (74°C).

(b) Heating ducts shall be installed so that the hot air discharged from the ducts is not directed against explosive materials or containers.

(c) The heating system shall be controlled so that the ambient temperature of the magazine does not exceed 130°F (54°C).

(d) Any electric fan or pump used in the heating system shall be located outside the magazine, separate from the magazine walls, and shall be grounded.

(e) Any electric motor and any controls for electric heating devices used to heat water or produce steam shall have overload devices and disconnects that comply with NFPA 70, *National Electrical Code*. All electrical switch-gear shall be located at least 25 ft (7.6 m) from the magazine.

(f) Any fuel-fired heating source for the hot water or steam shall be separated from the magazine by a distance of not less than 25 ft (7.6 m). The area between the heating unit and the magazine shall be cleared of all combustible material.

(g) Explosive materials stored in magazines shall be arranged so that uniform circulation of air is ensured.

6-5.6

Where lighting is necessary within the magazine, electric safety flashlights or electric safety lanterns shall be used.

6-5.6.1 Electric lighting shall be permitted to be used within a magazine, provided the installation meets the following requirements:

(a) Junction boxes containing fuses or circuit breakers and electrical disconnects shall be located at least 25 ft (7.6 m) from the magazine.

(b) Disconnects, fuses, and circuit breakers shall be protected by a voltage surge arrester capable of handling 2500 amperes for 0.1 seconds.

(c) All wiring from switches, both inside and outside the magazine, shall be installed in rigid conduit. Wiring leading to the magazine shall be installed underground.

(d) Conduit and light fixtures inside the magazine shall be protected from physical damage by suitable guards or by their location.

(e) Light fixtures shall be suitably enclosed to prevent sparks or hot metal from falling onto the floor or onto material stored in the magazine.

(f) Junction boxes located within the magazine shall have no openings and shall be equipped with close-fitting covers.

(g) Magazines containing explosive materials that could release flammable vapors shall have wiring and fixtures that meet the requirements of NFPA 70, *National Electrical Code*, Article 501.

(h) Lights inside magazines shall not be left on while the magazine is unattended.

6-5.7

There shall be no exposed ferrous metal on the interior of a magazine where it has the potential to contact packages of explosives.

Exception: This requirement shall not apply to Type 5 magazines.

6-6 Magazine Construction — Requirements for Specific Types.

6-6.1 Type 1 Magazines.

A Type 1 magazine shall be a permanent structure, such as a building or igloo, that is bullet-resistant, fire-resistant, theft-resistant, weather-resistant, and ventilated.

(a) Walls and doors shall be bullet-resistant and shall be permitted to be constructed in accordance with any of the specifications in Appendix C.

(b) The roof shall be permitted to be constructed of any type of structurally sound materials that are or have been made fire-resistant on the exterior.

(c)* Where the natural terrain around a Type 1 magazine makes it possible for a bullet to be shot through the roof and ceiling at such an angle that the bullet can strike the explosive materials within, the roof or the ceiling shall be of bullet-resistant construction.

(d) The foundation shall be permitted to be of masonry, wood, or metal and shall be enclosed completely. A wood foundation enclosure shall be covered on the exterior with metal of not less than 26-gauge thickness.

Exception: Openings to provide cross ventilation shall not be required to be enclosed.

(e) The floor shall be constructed of wood or other suitable material. Floors constructed of materials that could cause sparks shall be covered with a nonsparking surface, or the packages of explosive materials shall be placed on pallets of nonsparking material.

(f) Type 1 magazines shall be ventilated to prevent dampness or heating of explosive materials. Ventilation openings shall be screened to prevent the entrance of sparks. Ventilators in sidewalls shall be offset or shielded. Magazines having foundation and roof ventilators, with the air circulating between the sidewalls and floor and between the sidewalls and ceiling, shall have a wood lattice lining or equivalent means to prevent packages of explosive materials from being stacked against the sidewalls and blocking air circulation. A 2-in. (51-mm) air space shall be provided between the sidewalls and the floor.

(g) Each door of a Type 1 magazine shall be equipped with one of the following locking systems:

1. Two mortise locks;

2. Two padlocks in separate hasps and staples;

3. A mortise lock and a padlock;

4. A mortise lock that requires two keys to open; or

5. A three-point lock or an equivalent lock that secures the door to the frame at more than one point.

Padlocks shall be steel, shall have at least five tumblers, and shall have at least a $^{3}/_{8}$-in. (9.5-mm) case-hardened shackle. All padlocks shall be protected by steel hoods installed to discourage the insertion of bolt cutters. Doors secured by a substantial internal bolt shall not require additional locking devices. Hinges and hasps shall be fastened securely to the magazine, and all locking hardware shall be secured rigidly and directly to the door frame.

6-6.2 Type 2 Magazines.

A Type 2 magazine shall be a portable or mobile structure, such as a box, skid-magazine, trailer, or semitrailer that is fire-resistant, theft-resistant, weather-resistant, and ventilated. Where used for outdoor storage, Type 2 magazines also shall be bullet-resistant.

6-6.2.1 Type 2 Outdoor Magazines.

(a) The walls and roof or ceiling shall be constructed in accordance with the provisions of 6-6.1(a), (b), and (c).

(b) Doors shall be of metal, constructed in accordance with the provisions of 6-6.1(a), or shall have a metal exterior with an inner door meeting the provisions of 6-6.1(a).

(c) Floors constructed of ferrous metal shall be covered with a nonsparking surface.

(d) A top-opening magazine shall have a lid that overlaps the sides by at least 1 in. (25.4 mm) when in the closed position.

(e) The magazine shall be supported so that its floor does not directly contact the ground.

(f) Magazines of less than 1 yd^3 (0.766 m^3) shall be fastened securely to a fixed object to prevent theft of the entire magazine.

(g) Hinges, hasps, locks, and locking hardware shall comply with 6-6.1(g).

Exception: Padlocks on vehicular magazines shall not be required to be protected by steel *hoods.*

(h) Whenever a vehicular magazine is left unattended, its wheels shall be removed, its kingpins shall be locked, or it otherwise shall be effectively immobilized.

6-6.2.2 Type 2 Indoor Magazines.

(a) The magazine shall have substantial wheels or casters to facilitate its removal from the building in case of emergency.

(b) The cover of the magazine shall have substantial strap hinges and a means for locking. The magazine shall be kept locked with a five-tumbler padlock or its equivalent.

Exception: The magazine shall be permitted to be unlocked during placement or removal of explosive materials.

(c) The magazine shall be painted red, and the top shall bear the words "Explosives — Keep Fire Away" in white letters at least 3 in. (76 mm) high.

(d) Type 2 indoor magazines constructed of wood shall have sides, bottoms, and covers or doors constructed of 2-in. (51-mm) hardwood that are well braced at corners. The magazines shall be covered with sheet metal of not less than 26 gauge. Nails exposed to the interior of the magazines shall be countersunk.

(e) Type 2 indoor magazines constructed of metal shall be of 12-gauge sheet metal and shall be lined with a nonsparking material. The edges of metal covers shall overlap the side by at least 1 in. (25.4 mm).

6-6.3 Type 3 Magazines.

A Type 3 magazine is a "day box" or portable structure used for the temporary storage of explosive materials. A Type 3 magazine shall be fire-resistant, theft-resistant, and weather-resistant.

(a) The magazine shall be equipped with one steel padlock (which shall not be required to be protected by a steel hood) having at least five tumblers and a case-hardened steel shackle at least $^{3}/_{8}$ in. (9.5 mm) in diameter. Doors shall overlap the sides by at least 1 in. (25.4 mm). Hinges and hasps shall be attached by welding, riveting, or bolting (nuts on inside).

(b) The magazine shall be constructed of not less than 12-gauge [0.1046-in. (2.66-mm)] steel, lined with at least $^{1}/_{2}$-in. (12.7-mm) plywood or $^{1}/_{2}$-in. (12.7-mm) masonite type hardboard.

(c) Type 3 magazines containing explosive materials shall be within line-of-site vision of a blaster.

6-6.4 Type 4 Magazines.

A Type 4 magazine shall be a permanent, portable, or mobile structure such as a building, igloo, box, semitrailer, or other mobile container that is fire-resistant, theft-resistant, and weather-resistant.

6-6.4.1 Type 4 Outdoor Magazine.

(a) A Type 4 outdoor magazine shall be constructed of masonry and wood covered with sheet metal, fabricated metal, or a combination of these materials. Doors shall be metal or wood covered with metal.

(b) Permanent Type 4 magazines shall comply with 6-6.1(d), (f), and (g).

(c) Vehicular Type 4 magazines shall comply with 6-6.2.1(g) and shall be immobilized while unattended, as described in 6-6.2.1(h).

6-6.4.2 Type 4 Indoor Magazine. A Type 4 indoor magazine shall comply with all provisions of 6-6.2.2.

6-6.5 Type 5 Magazines.

A Type 5 magazine shall be a permanent, portable, or mobile structure such as a building, igloo, box, bin, tank, semitrailer, bulk trailer, tank trailer, bulk truck, tank truck, or other mobile container that is theft-resistant. No ventilation shall be required, and ferrous metal shall not be required to be covered with nonsparking material.

6-6.5.1 Type 5 Outdoor Magazine.

(a) A Type 5 permanent outdoor magazine shall be weather-resistant and shall be locked with at least one steel five-tumbler padlock having at least a $^3/_8$-in. (9.5-mm) case-hardened shackle. A hood for the padlock shall not be required.

(b) Hinges and hasps shall be fastened securely to the magazine and all locking hardware shall be secured rigidly and directly to the door frame.

(c) A vehicular Type 5 magazine shall be immobilized while unattended as described in 6-6.2.1(h).

6-6.5.2 Type 5 Indoor Magazine. A Type 5 indoor magazine shall be constructed in accordance with the requirements for Type 5 outdoor magazines.

Exception: A Type 5 indoor magazine shall not be required to be weather-resistant.

6-7 Storage within Magazines.

6-7.1

Magazines shall be supervised by a competent person at all times. This person shall be at least 21 years old and shall be responsible for the enforcement of all safety precautions.

6-7.2

All magazines containing explosive materials shall be opened and inspected at maximum intervals of 3 days to determine whether there has been unauthorized or attempted entry into the magazines or whether there has been unauthorized removal of the magazines or their contents.

6-7.3

Magazine doors shall be kept locked.

Exception: Magazine doors shall be permitted to be unlocked during placement or removal of explosives or during inspection.

6-7.4

Safety rules covering the operations of magazines shall be posted on the interior side of the magazine door.

6-7.5

Where explosive materials are removed from the magazine for use, the oldest stock shall be used first.

6-7.6

Corresponding grades and brands of explosive materials shall be stored together so that brand and grade markings are readily visible. All stocks shall be stored in a manner that allows them to be easily counted and checked.

6-7.7

Containers of explosive materials shall be piled in a stable manner and laid flat with the top side up.

6-7.8

Open containers of explosive materials shall be closed securely before being returned to a magazine. No container without a closed lid shall be permitted to be stored in the magazine. Only fiberboard containers shall be permitted to be opened in the magazine.

6-7.9

Containers of explosive materials other than fiberboard shall not be unpacked or repacked inside or within 50 ft (15.25 m) of a magazine or in close proximity to other explosive materials.

6-7.10

Tools used for opening containers of explosive materials shall be constructed of nonsparking material.

Exception: Metal slitters shall be permitted to be used for opening fiberboard containers.

6-7.11

Magazines shall be used exclusively for the storage of explosive materials, blasting materials, and blasting accessories. Metal tools other than nonferrous transfer conveyors shall not be stored in a magazine containing explosives or detonators.

Exception: Ferrous metal conveyor stands protected by a coat of paint shall be permitted to be stored within a magazine.

6-7.12

Magazine floors shall be regularly swept and kept clean, dry, and free of grit, paper, empty packages, and rubbish. Brooms and other cleaning utensils shall not have any spark-producing metal parts. Sweepings from magazine floors shall be disposed of in accordance with the manufacturers' instructions.

6-7.13

Where any explosive material has deteriorated to the extent that it is in an unstable or dangerous condition or if nitroglycerine or other liquid is leaking from any explosive, the person responsible for the explosives shall contact the manufacturer for assistance immediately. Magazine floors stained with nitroglycerine or other liquid shall be cleaned in accordance with the manufacturers' instructions.

6-7.14

Before making repairs to the interior of a magazine, all explosive materials shall be removed and the floor shall be cleaned.

6-7.15

In making repairs that could result in sparks or fire to the exterior of a magazine, all explosive materials shall be removed.

6-7.16

Explosive materials removed from a magazine undergoing repair shall be placed either in another magazine or at a safe distance from the magazine. They shall be guarded and protected properly. Upon completion of the repairs, they shall be returned to the magazine promptly.

6-8 Miscellaneous Safety Precautions.

6-8.1

Smoking, matches, open flames, spark-producing devices, and firearms shall not be permitted inside of or within 50 ft (15.25 m) of a magazine.

Exception: Firearms carried by authorized guards.

6-8.2

The area around a magazine shall be kept clear of brush, dried grass, leaves, and similar combustibles for a distance of at least 25 ft (7.63 m).

6-8.3

Combustible materials shall not be stored within 50 ft (15.25 m) of magazines.

6-8.4

Explosive materials recovered from blasting misfires shall be stored in a separate magazine until disposal instructions have been received from the manufacturer. Such explosive materials then shall be disposed of in the manner recommended by the manufacturer. Detonators recovered from blasting misfires shall not be reused.

6-8.5

Property on which Type 1 magazines and outdoor magazines of Types 2, 4, and 5 are located shall be posted with signs reading “Explosives — Keep Off.” Such signs shall be located to minimize the possibility that a bullet shot at the sign hits the magazine.

6-8.6

Where Division 1.5 Explosives are stored in an over-the-road trailer Type 5 storage magazine, it shall be placarded with an approved U.S. Department of Transportation placard for Division 1.5 Explosives until it is empty.

Chapter 7 Use of Explosive Materials for Blasting

7-1 Basic Requirements.

7-1.1

All federal, state, and local laws and regulations applicable to obtaining, owning, transporting, storing, handling, and using explosive materials shall be followed.

7-1.2

Explosive materials shall be protected from unauthorized possession and shall not be abandoned.

7-1.3

Explosive materials shall be used only by experienced persons who are familiar with the hazards involved and who hold all required permits.

7-1.3.1 Loading and firing shall be performed or supervised only by a person possessing an appropriate blaster's permit.

7-1.3.2 Trainees, helpers, and other persons who do not hold the required permits shall work only under the supervision of persons holding such permits.

7-1.4

No explosive materials shall be located or stored where they have the potential to be exposed to flame, excessive heat, sparks, or impact.

7-1.4.1 No firearms shall be discharged into or in the vicinity of a vehicle containing explosive materials or into or in the vicinity of a location where explosive materials are being handled, used, or stored.

7-1.4.2 No smoking shall be permitted within 50 ft (15.25 m) of any location where explosives are being handled or used.

7-1.4.3 No person within 50 ft (15.25 m) of any location where explosives are being handled or used shall carry any matches, open light, or other fire or flame.

Exception: This requirement shall not apply to suitable devices for lighting safety fuses.

7-1.5

No person under the influence of intoxicating beverages, narcotics, or other dangerous drugs shall be permitted to handle explosive materials.

7-1.6

No attempt shall be made to fight a fire that cannot be contained or controlled before it reaches explosive materials. In such cases, all personnel shall be evacuated immediately to a safe location, and the area shall be guarded from entry by spectators or intruders.

7-1.7

Unauthorized or unnecessary personnel shall not be present where explosive materials are being handled, used, or stored.

7-1.8

Explosive materials shall be kept in closed containers or packages while being transported between the storage magazine and the blasting site.

Exception: Partial reels of detonating cord shall not be required to be kept in closed containers, unless transported over public highways.

7-1.9

Containers of explosive materials shall not be opened in any magazine or within 50 ft (15.25 m) of any magazine.

Exception: This requirement shall not apply to explosive materials in fiberboard containers.

7-1.10

Nonsparking tools shall be used for opening any package or container of explosive materials.

Exception: Metal slitters shall be permitted to be used for opening fiberboard containers.

7-1.11

No blasting operation shall be performed in a manner contrary to the instructions of the manufacturer of the explosive materials being used.

7-1.12

Where blasting is done in a congested area or in close proximity to a structure, railway, or highway, or any other installation that could be affected, special precautions shall be taken to prevent damage and to minimize earth vibrations and air blast effects. Blasting mats or other protective devices shall be used to prevent fragments from being thrown.

7-1.13

Persons authorized to prepare explosive charges or to conduct blasting operations shall use every reasonable precaution including, but not limited to, warning signals, flags, barricades, mats, or other equally effective means to ensure the safety of the general public and workers.

7-1.14

Surface blasting operations shall be conducted during daylight hours only.

Exception: This requirement shall not apply where approved by the authority having jurisdiction.

7-1.15

Where blasting is conducted in the vicinity of utility lines or rights-of-way, the blaster shall notify the appropriate representatives of the utilities at least 24 hours in advance of blasting, specifying the location and the intended time of such blasting. Verbal notice shall be confirmed with written notice.

Exception: In an emergency situation, this time limit shall be permitted to be waived by the authority having jurisdiction.

7-1.16

Precautions shall be taken to prevent accidental discharge of electric detonators from currents induced by radar and radio transmitters, lightning, adjacent power lines, dust and snow storms, or other sources of extraneous electricity. These precautions shall include:

(a) The posting of signs warning against the use of mobile radio transmitters on all roads within 350 ft (107 m) of blasting operations.

(b)* Observance of the latest recommendations with regard to blasting in the vicinity of radio transmitters or power lines.

(c) The discontinuance of surface use, underground use, and all handling of explosive materials during the approach of and for the duration of an electrical storm. All personnel shall move to a safe location.

(d) Consideration to the fact that lightning has been known to follow steel, piping, and conductive ore into underground mines.

7-1.17

Precautions shall be taken to prevent accidental initiation of nonelectric detonators from stray currents induced by lightning or static electricity.

7-2 Preblast Operations.

7-2.1

During the time that holes are being loaded or are loaded with explosive materials, blasting agents, or detonators, the blast site shall be off limits to all but those persons authorized to engage in the drilling and loading operations or who are otherwise authorized to enter the site. The blast site shall be guarded or barricaded and posted.

7-2.2

Drill holes shall be large enough to allow free insertion of cartridges of explosive materials. Drill holes shall not be collared in bootlegs or in holes that previously contained explosive materials. Holes shall not be drilled where there is a danger of intersecting another hole containing explosive material.

7-2.3

All drill holes shall be inspected and cleared of any obstruction before loading.

7-2.4

Pneumatic loading of blasting agents into blast holes primed with electric detonators or other static-sensitive initiation systems shall comply with the following requirements:

(a) A positive grounding device shall be used for the equipment to prevent the accumulation of static electricity.

(b) A semiconductive discharge hose shall be used.

(c) A qualified person shall evaluate all systems to ensure that they adequately dissipate static charges under field conditions.

7-2.5

Tamping shall be performed only with wooden rods or approved plastic poles having no exposed metal parts.

Exception: Nonsparking metal connectors shall be permitted to be used on jointed tamping poles.

7-2.5.1 Violent tamping shall be avoided.

7-2.5.2 The primer shall not be tamped at any time.

7-2.6

After the loading for a blast is completed and before firing, all excess explosive materials shall be removed from the area and returned to the proper storage facilities.

7-2.7

As soon as practicable after all blast holes are connected, prior to connecting to a source of initiation such as a blasting machine, and continuing until the shot has been fired and subjected to post-blast examination, the blast area shall be guarded or barricaded and posted.

7-3 Initiating Blasts.

7-3.1

Cap and fuse shall not be used to initiate blasts in congested areas or on or adjacent to highways open to traffic.

7-3.2

Where a safety fuse is used, the burning rate shall be determined and in no case shall fuse lengths of less than 120 seconds be used. The detonator shall be attached securely to the fuse with a standard ring-type cap crimper.

7-3.3

Where electric detonators are used, stray current tests shall be made as frequently as necessary. Maximum stray current shall not exceed 0.05 amperes through a 1-ohm resistor, measured at the blast site. Nonelectric initiating systems shall be used unless corrective action is taken to reduce the stray current below the limits indicated in this paragraph.

7-3.4

Electric detonators of different brands shall not be used in the same firing circuit.

7-3.5

All electric blasting circuits and other initiating systems whose continuity can be tested (such as gas detonator initiating systems) shall be tested with a blasting galvanometer or other blast continuity test instrument, as appropriate, that has been designed and approved for the purpose. All electrically initiated blasts shall be made by using blasting machines suitable for the circuitry being fired.

7-3.6

No detonator shall be inserted in explosive materials that do not have a cap well without first making a hole in the cartridge with a proper size nonsparking tool or the appropriate pointed handle of an approved cap crimper.

7-3.6.1 Primers shall not be assembled closer than 50 ft (15.25 m) from any magazine. Primers shall be assembled only when and as necessary for immediate needs.

7-3.6.2 Adequate priming shall be used. If any uncertainty exists regarding the amount of priming necessary, the manufacturer shall be consulted.

7-3.6.3 Primers shall be assembled only at the time of use and as close to the blast site as conditions allow.

7-3.6.4 Where using nonelectric initiation systems:

(a) The selection of the initiation system and the design of the blast shall be under the supervision of the blaster in charge;

(b) The initiation system shall be used in accordance with the manufacturer’s instructions;

(c) The blaster in charge shall conduct a visual check after blast hookup;

(d) The blast layout shall be tested for continuity as recommended by the manufacturer where using a system that can be tested for continuity; and

(e) A double trunk line or closed-loop hookup shall be used where judged to be necessary by the blaster in charge.

7-3.7

Only the person making the lead line connections or the blaster in charge shall fire the blast. All connections shall be made progressively from the borehole back to the initiation point. Blasting lead lines shall remain shunted (shorted) and shall not be connected to the blasting machine or other source of current until the blast is to be fired.

7-3.8

No blast shall be fired until the blaster in charge has made certain that all surplus explosive materials are in a safe place, all persons and equipment are at a safe distance or under sufficient cover, and an adequate warning signal has been given.

7-4 Procedures after Blasting.

7-4.1

No person shall return to the blast area until permitted to do so by the blaster.

7-4.2

The blaster shall allow sufficient time for smoke and fumes to dissipate and for dust to settle before returning to the blast site.

7-4.3

The blaster shall inspect the entire blast site for misfires before allowing other personnel to return to the blast area.

7-5 Misfires.

7-5.1

Where a misfire is found, the blaster shall provide the proper safeguards for excluding all personnel from the blast area. Misfires shall be reported to the supervisor immediately.

7-5.2

No additional work, other than that necessary to remove the hazard, shall be performed. Only those persons needed to do such work shall remain at the blast site.

7-5.3

No attempt shall be made to extract explosive materials from a misfired hole. A new primer shall be inserted, and the hole shall be reblasted.

Exception: Where reblasting presents a hazard, the explosive materials shall be permitted to be washed out with water, or, where the misfire is under water, blown out with air.

7-5.4

Where there are misfires using cap and fuse, all personnel shall stay clear of the blast site for at least 1 hour.

7-5.5

Where there are misfires using other nonelectric detonators (i.e., other than cap and fuse) or using electric detonators, all personnel shall stay clear of the blast site for at least 30 minutes.

7-5.6

Misfires shall be the responsibility of the person in charge of the blasting operation.

7-5.7

Where a misfire is suspected, all initiating circuits (electric or nonelectric) shall be traced carefully and a search made for unexploded charges.

7-5.8

No drilling, digging, or picking shall be permitted until all misfires have been detonated or until the authority having jurisdiction approves the resumption of work.

7-6 Disposal of Explosive Materials.

7-6.1

Empty containers and paper and fiber packing materials that previously contained explosive materials shall be disposed of or reused in an approved manner.

7-6.2

All personnel shall remain at a safe distance from the disposal area.

7-6.3

All explosive materials that are obviously deteriorated or damaged shall not be used and shall be destroyed in accordance with the requirements of 6-7.13.

7-6.4*

In the event that it becomes necessary to destroy any explosives, either because of damage to containers, deterioration, or any other reason, all handling of explosives shall cease and the manufacturer shall be contacted for assistance immediately. The manufacturer's advice shall be followed without deviation.

Chapter 8 Ground Vibration, Airblast, Flyrock

8-1 Ground Vibration.

8-1.1

At all blasting operations, the maximum ground vibration at any dwelling, public building, school, church, or commercial or institutional building adjacent to the blasting site shall not exceed the limitations specified in Table 8-1.1.

Exception: As otherwise authorized or restricted by the authority having jurisdiction.

Table 8-1.1 Peak Particle Velocity Limits

Distance from Blasting Site	Maximum Allowable Peak Particle Velocity[1]
0 ft to 300 ft (0 m to 91.4 m)	1.25 in./sec (31.75 mm/s)

301 ft to 5000 ft (91.5 m to 1524 m)	1.00 in./sec (25.4 mm/s)
5001 ft (1525 m) and over	0.75 in./sec (19 mm/s)

[1]Peak particle velocity shall be measured in three (3) mutually perpendicular directions, and the maximum allowable limits shall apply to each of these measurements.

8-1.2 Frequency Versus Particle Velocity Graphs.

In lieu of Table 8-1.1, a blasting operation shall have the option to use the graphs shown in either Figure 8-1.2(a) or (b) to limit peak particle velocity based upon the frequency of the blast vibration. If either graph in Figure 8-1.2(a) or (b) is used to limit vibration levels, the methods for monitoring vibration and calculating frequency shall be approved by the authority having jurisdiction.

8-1.3 Scaled Distance Equations.

Unless a blasting operation uses a seismograph to monitor a blast to ensure compliance with Table 8-1.1 or Figure 8-1.2(a) or (b), or has been granted special permission by the authority having jurisdiction to utilize a modified scaled distance factor, the operation shall comply with the scaled distance equations shown in Table 8-1.3.

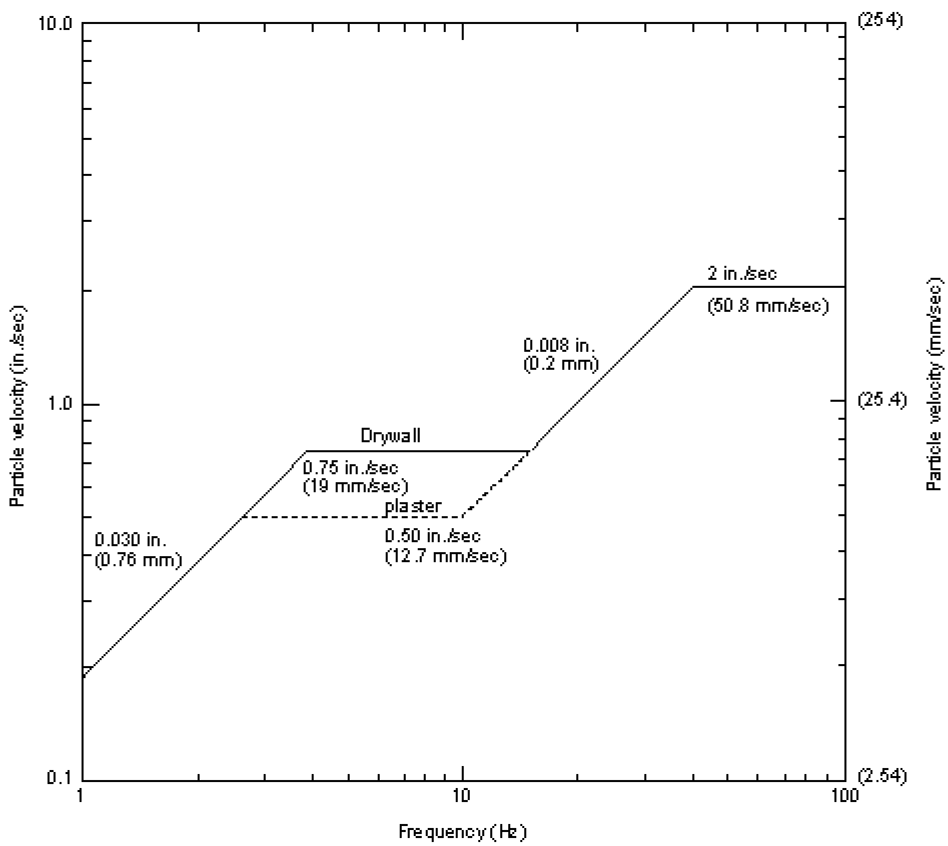

Figure 8-1.2(a) Frequency vs. particle velocity graph.

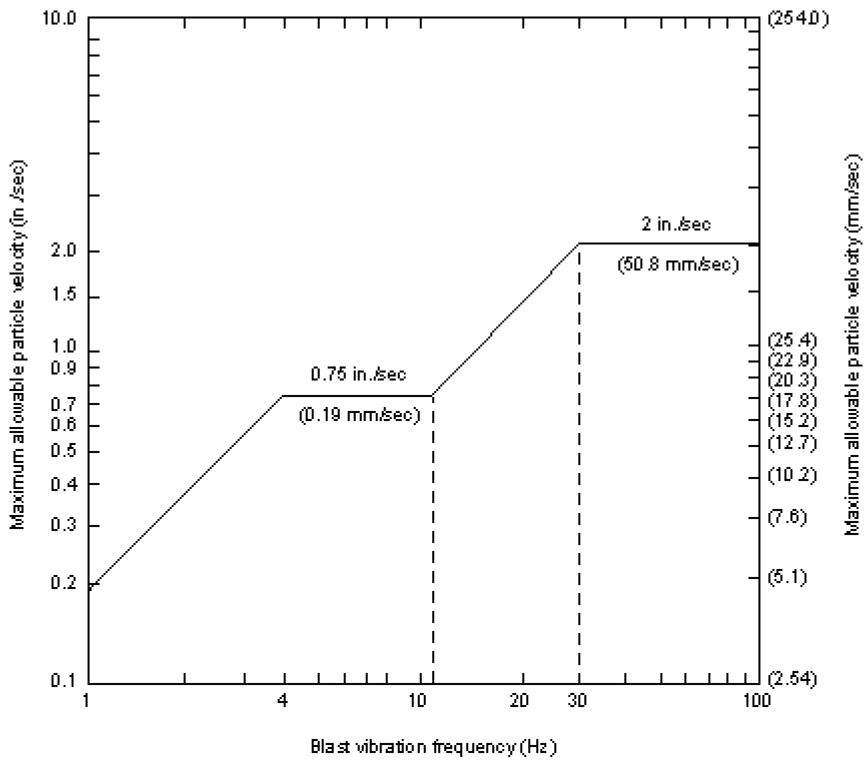

Figure 8-1.2(b) Frequency vs. particle velocity graph.

Table 8-1.3 Scaled Distance Equations

Distance from Blasting Site	Scaled Distance[1] Equation
0 ft to 300 ft (0 m to 91.4 m)	W (lb) = $(D (ft)/50)^2$ [W (kg) = $(D (m)/22.6)^2$]
301 ft to 5000 ft (92 m to 1524 m)	W (lb) = $(D (ft)/55)^2$ [W (kg) = $(D (m)/24.9)^2$]
5001 ft (1525 m) and over	W (lb) = $(D (ft)/65)^2$ [W (kg) = $(D (m)/29.4)^2$]

W = The maximum weight of explosives in pounds (or kilograms) that can be detonated per delay interval of 8 milliseconds or longer.

D = The distance in feet (or meters) from the blast to the nearest dwelling, public building, school, church, or commercial or institutional building not owned, leased, or contracted by the blasting operation, or on property for which the owner has not provided a written waiver to the blasting operation.

[1]To convert English units of scaled distances (ft/lb^2) to metric units (m/kg^2), divide by a factor of 2.21.

8-1.4

Where the blasting operation considers the scaled distance equations of Table 8-1.3 as being too restrictive, the operation shall have the right to petition the authority having jurisdiction to use a modified scaled distance equation. Such a petition shall demonstrate that the use of the modified scaled distance equation would not cause predicted ground vibration that exceeds the peak particle velocity limits specified in Table 8-1.1. Any petition for modification of the scaled distance equations of Table 8-1.3 shall be substantiated thoroughly by seismograph recordings to show that the limitations of Table 8-1.1 cannot be exceeded.

8-2 Airblast.

8-2.1

Airblast at the location of any dwelling, public building, school, church, or commercial or institutional building that is not owned, leased, or contracted by the blasting operation, or on property for which the owner has not provided a written waiver to the blasting operation, shall not exceed the maximum limits specified in Table 8-2.1.

Table 8-2.1 Airblast Limits

Lower Frequency of Measuring System [Hz (± 3 dcb)]	Measurement Level (dcb)
0.1 Hz or lower flat response[1]	134 peak
2 Hz or lower flat response	133 peak
6 Hz or lower flat response	129 peak
C-Weighted slow response[1]	105 peak

[1]Only where approved by the authority having jurisdiction.

8-3 Flyrock.

8-3.1

Flyrock traveling in the air or along the ground shall not be cast from the blast site in an uncontrolled manner that could result in personal injury or property damage.

8-3.2

Flyrock shall not be propelled from the blast site onto property not contracted by the blasting operation or onto property for which the owner has not provided a written waiver to the blasting operation.

8-3.3

Where blasting operations do not conform to 8-3.1 and 8-3.2, the authority having jurisdiction shall require that special precautions be employed to reduce or control flyrock.

Chapter 9 Explosive Materials at Piers and Railway, Truck, and Air Terminals

9-1 Basic Requirements.

9-1.1

Explosive materials shall not be kept in a railway car unless the car, its contents, and methods of loading comply with the regulations of the U.S. Department of Transportation.

Exception: This requirement shall be permitted to be waived in an emergency with the approval of the authority having jurisdiction.

9-1.2

Explosive materials shall not be delivered to any carrier unless the explosives comply in all respects, including marking and packing, to the regulations of the U.S. Department of Transportation.

9-1.3

Every railway car containing explosive materials that has reached its destination, or has stopped in transit so it no longer is considered in interstate commerce, shall remain placarded in accordance with U.S. Department of Transportation regulations.

9-1.4

Any explosive materials at a railway facility, truck terminal, pier, wharf, harbor facility, or airport terminal, whether for delivery to a consignee or forwarded to some other destination, shall be kept in a safe place and isolated as far as practicable and in such a manner that they can be removed easily and quickly.

9-1.5

Truck terminals for explosives vehicles shall meet the requirements of NFPA 498, *Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives*.

9-2 Notifications.

A consignee, having been notified that a shipment of explosives is in the hands of any carrier, shall remove the explosives within 48 hours, excluding Saturdays, Sundays, and holidays, to a storage area meeting the requirements of this code.

9-3 Facilities for Trailer-on-Flatcar and Container-on-Flatcar.

Rail shipments of explosives by trailer-on-flatcar (TOFC) or container-on-flatcar (COFC) shall meet the following requirements:

(a) Shipments by TOFC or COFC shall be unloaded at a nonagency station only where a consignee is present to receive them or where properly locked and secure storage facilities are available. If delivery cannot be made, the shipment shall be taken to the next or nearest agency station for delivery.

(b)* Carriers shall require the consignee to remove TOFC and COFC shipments from the carrier's property within 48 hours after notice of arrival, excluding Saturdays, Sundays, and holidays. If the trailers or containers are not so removed, the carrier shall dispose of the shipment immediately by means of storage, disposal, or, where necessary for safety, destruction under the supervision of a competent person.

(c) If storage is required to comply with 9-3.1(b), it shall be located in an interchange lot meeting the requirements of Chapters 2 and 3 of NFPA 498, *Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives*, or in a location that provides equivalent safety to the public.

(d) Where local conditions make the acceptance, transportation, or delivery of explosive materials unusually hazardous, appropriate local restrictions shall be imposed by the carrier.

(e) All rail carriers shall report complete information on their restrictions regarding the acceptance, delivery, or transportation of explosive materials over any portion of their lines to the Bureau of Explosives of the Association of American Railroads for publication by the Bureau.

(f) Where shipping explosives, regularly scheduled days for receiving trailers and containers for shipment shall be assigned wherever it is practicable to do so.

(g) To enable the carrier to provide suitable flatcars for the shipment of Division 1.1 or Division 1.2 Explosives, the shipper shall give the carrier at least 24 hours notice of the shipments and their destinations.

Exception: Where a regularly scheduled day has been appointed for receipt of trailers and containers for shipment, this notice shall be permitted to be waived by the carrier. In such cases, the shipments shall be delivered on the assigned days in time to allow proper inspection, billing, and loading on that day.

(h) Carriers shall forward shipments promptly within 48 hours after acceptance at the originating point or after receipt at any yard transfer station or interchange point, excluding Saturdays, Sundays, and holidays.

Exception: Where biweekly or weekly service is provided, shipments shall be forwarded on the next train.

(i) The Bureau of Explosives of the Association of American Railroads shall be consulted by rail carriers to determine that the storage facility required by 9-3.1(b) is safe, adequate, and complies with Chapter 2 of NFPA 498, *Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives*.

(j) Cars loaded with explosive materials shall be placed so that they are safe from all probable danger from fire. They shall not be placed under bridges or overhead highway crossings, or in or alongside passenger sheds or stations.

9-4 Designation of Facilities.

The local authority having jurisdiction has the authority to designate the location for, and limit the quantity of, explosive materials that are loaded, unloaded, reloaded, or temporarily retained at any facility within the jurisdiction.

Chapter 10* Plosophoric Materials

10-1 Basic Requirements.

10-1.1

Mixed or combined plosophoric materials shall be transported, stored, and used in the same manner as explosive materials. (*See Chapters 2, 5, 6, and 7*.)

10-1.2

For transportation and storage, individual packages of each plosophoric component shall be packaged in separate shipping containers in compliance with the U.S. Department of Transportation, "Hazardous Materials Regulations," 49 CFR, Parts 100-199.

10-2 Storage.

10-2.1

Plosophoric components shall be stored in separate locked containers. If any component possesses a hazard classification, it shall be stored in a location and manner appropriate to its hazard class.

10-2.2

Plosophoric materials shall be permitted to be stored in the same magazine with explosive materials, provided their total weight is included in the weight of explosives permitted in the magazine in order to comply with the quantity-distance requirements of Table 6-4.1. Storage shall not introduce a hazard due to chemical incompatibility.

10-3 Use.

10-3.1

Where plosophoric materials are mixed or combined at the point of use, the procedures recommended by the manufacturer shall be followed strictly.

10-3.2

Since the mixing or combining of plosophoric components produces an explosive material, the number of packages combined at any one time shall be limited to the number needed for immediate use.

Exception: This requirement shall be permitted to be waived, provided the extra explosive material produced can be handled and stored as such.

10-4 Record Keeping and Reporting.

10-4.1

Dealers in plosophoric materials shall record all transactions on appropriate federal, state, and local forms, as required for transactions with explosive materials.

10-4.2

Thefts of plosophoric materials during transportation, storage, and use shall be reported to the authority having jurisdiction, as required for thefts of explosive materials.

10-4.3

Dealers in plosophoric materials shall require that all purchasers possess a license or permit to use explosive materials. The license or permit number shall be recorded with other records of the sale.

Chapter 11 Small Arms Ammunition and Primers, Smokeless Propellants, and Black Powder Propellants

11-1 Basic Requirements.

11-1.1

In addition to all other applicable requirements of this code, intrastate transportation of small arms ammunition, small arms primers, smokeless propellants, and black powder shall comply with the U.S. Department of Transportation, "Hazardous Materials Regulations," 49 CFR, Parts 100-199.

11-1.2

This chapter shall apply to the users and distribution channels of small arms ammunition, small arms primers, smokeless propellants, and black powder.

11-1.3

This chapter shall not apply to in-process storage and intraplant transportation during manufacture.

11-1.4

This chapter shall apply to the transportation and storage of small arms ammunition and components.

11-1.5

This chapter shall not apply to safety procedures in the use of small arms ammunition and components.

11-2 Small Arms Ammunition.

11-2.1

No restrictions shall be imposed on transportation of small arms ammunition other than those imposed by the U.S. Department of Transportation or by the presence of other hazardous materials.

11-2.2

No quantity limitations shall be imposed on the storage of small arms ammunition in warehouses, retail stores, and other occupancies other than those imposed by the limitations of the storage facility and by public safety regulations.

11-2.3

Small arms ammunition shall be separated from materials classified by the U.S. Department of Transportation as flammable liquids, flammable solids, and oxidizing materials by a distance of 15 ft (4.6 m) or by a fire partition having a fire resistance of at least 1 hour.

11-2.4

Small arms ammunition shall not be stored together with Division 1.1, Division 1.2, or

Division 1.3 Explosives.

Exception: Where the storage facility is suitable for the storage of explosive materials.

11-2.5*

Small arms ammunition that has been exposed to fire or has been damaged by exposure to water shall not be returned to commercial channels for reasons of consumer safety. The manufacturer shall be contacted to obtain recommendations for the disposal of damaged ammunition.

11-3 Smokeless Propellants.

11-3.1

Quantities of smokeless propellants not exceeding 25 lb (11.3 kg) in shipping containers approved by the U.S. Department of Transportation shall be permitted to be transported in a private vehicle.

11-3.2

Quantities of smokeless propellants exceeding 25 lb (11.3 kg), but not exceeding 50 lb (22.7 kg), transported in a private vehicle shall be transported in a portable magazine having wood walls of at least 1-in. (25.4-mm) nominal thickness.

11-3.3

Transportation of more than 50 lb (22.7 kg) of smokeless propellants in a private vehicle shall be prohibited.

11-3.4

Commercial shipments of smokeless propellants in quantities not exceeding 100 lb (45.4 kg) are classified for transportation purposes as flammable solids where packaged in accordance with the U.S. Department of Transportation, "Hazardous Materials Regulations," 49 CFR, Part 173.197, and shall be transported accordingly.

11-3.5

Commercial shipments of smokeless propellants exceeding 100 lb (45.4 kg) or not packaged in accordance with the regulations cited in 11-3.4 shall be transported in accordance with the U.S. Department of Transportation regulations for Class B propellant explosives.

11-3.6

Smokeless propellants shall be stored in shipping containers specified by U.S. Department of Transportation Hazardous Materials Regulations.

11-3.7

Smokeless propellants intended for personal use in quantities not exceeding 20 lb (9.1 kg) shall be permitted to be stored in original containers in residences. Quantities exceeding 20 lb (9.1 kg), but not exceeding 50 lb (22.7 kg), shall be permitted to be stored in residences where kept in a wooden box or cabinet having walls of at least 1 in. (25.4 mm) nominal thickness.

11-3.8

Not more than 20 lb (9.1 kg) of smokeless propellants, in containers of a 1-lb (0.45-kg) maximum capacity, shall be displayed in commercial establishments.

11-3.9

Commercial stocks of smokeless propellants shall be stored as follows:

(a) Quantities exceeding 20 lb (9.1 kg), but not exceeding 100 lb (45.4 kg), shall be stored in portable wooden boxes having walls of at least a 1-in. (25.4-mm) thickness.

(b) Quantities exceeding 100 lb (45.4 kg), but not exceeding 800 lb (363 kg), shall be stored in nonportable storage cabinets having walls of at least a 1-in. (25.4-mm) thickness. Not more than 400 lb (181 kg) shall be permitted to be stored in any one cabinet, and cabinets shall be separated by a distance of an least 25 ft (7.63 m) or by a fire partition having a fire resistance of at least 1 hour.

(c) Quantities exceeding 800 lb (363 kg), but not exceeding 5000 lb (2268 kg), shall be permitted to be stored in a building, provided the following requirements are met:

1. The warehouse or storage room shall not be accessible to unauthorized personnel.

2. Smokeless propellant shall be stored in nonportable storage cabinets having wood walls of at least 1 in. (25.4 mm) thickness and having shelves with no more than 3 ft (0.92 m) of separation between shelves.

3. No more than 400 lb (181 kg) shall be stored in any one cabinet.

4. Cabinets shall be located against the walls of the storage room or warehouse with at least 40 ft (12.2 m) between cabinets.

5. The separation between cabinets shall be permitted to be reduced to 20 ft (6.1 m) where barricades twice the height of the cabinets are attached to the wall, midway between each cabinet. The barricades shall extend at least 10 ft (3 m) outward, shall be firmly attached to the wall, and shall be constructed of $^1/_4$-in. (6.4-mm) boiler plate, 2-in. (51-mm) thick wood, brick, or concrete block.

6. Smokeless propellant shall be separated from materials classified by the U.S. Department of Transportation as flammable liquids, flammable solids, and oxidizing materials by a distance of 25 ft (7.63 m) or by a fire partition having a fire resistance of at least 1 hour.

7. The building shall be protected by an automatic sprinkler system installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

(d) Smokeless propellants not stored in accordance with 11-3.9(a), (b), and (c) shall be stored in a Type 4 magazine constructed and located in accordance with Chapter 6.

11-4 Black Powder.

11-4.1

Black powder shall be transported in accordance with the U.S. Department of Transportation Regulations. (*See also Chapter 5*.)

11-4.2

Black powder shall be stored in shipping containers approved by the U.S. Department of Transportation.

11-4.3

Black powder intended for personal use in quantities not exceeding 20 lb (9.1 kg) shall be permitted to be stored in residences where kept in the original containers and stored in a wooden box or cabinet having walls of at least a 1-in. (25.4-mm) nominal thickness.

11-4.4

No more than 1 lb (0.45 kg) of black powder shall be displayed in commercial establishments.

11-4.5

Commercial stocks stored in buildings in quantities not exceeding 50 lb (22.7 kg) shall be stored in a Type 4 indoor magazine.

11-4.6

Commercial stocks in quantities exceeding 50 lb (22.7 kg) shall be stored in a Type 4 outdoor magazine.

11-4.7

Where smokeless propellants are stored in the same magazine with black powder, the total quantity shall not exceed that permitted for black powder.

11-4.8

Commercial shipments of black powder intended for personal use in small arms shall be permitted to be shipped in quantities not exceeding 50 1b (23 kg), subject to the requirements of the U.S. Department of Transportation, *Exemption Certificate E-8958*.

11-5 Small Arms Primers.

11-5.1

Small arms primers shall be transported or stored in containers approved by the U.S. Department of Transportation.

11-5.2

Transportation of small arms primers shall comply with U.S. Department of Transportation Regulations.

11-5.3

No more than 25,000 small arms primers shall be permitted to be transported in a private vehicle.

11-5.4

No more than 10,000 small arms primers shall be permitted to be stored in residences.

11-5.5

No more than 10,000 small arms primers shall be permitted to be displayed in commercial establishments.

11-5.6

Commercial stocks of small arms primers shall be stored as follows:

(a) Quantities not exceeding 750,000 shall be permitted to be stored in a building where not more than 100,000 are stored in any one pile and where piles are at least 15 ft (4.6 m) apart.

(b) Quantities exceeding 750,000 shall be permitted to be stored in a building, provided the following conditions are met:

1. The warehouse or storage room shall not be accessible to unauthorized personnel.

2. Primers shall be stored in cabinets. No more than 200,000 primers shall be stored in any one cabinet.

3. Shelves in cabinets shall have a vertical separation of at least 2 ft (0.6 m).

4. Cabinets shall be located against the walls of the warehouse or storage room with at least 40 ft (12.2 m) between cabinets.

5. The separation between cabinets shall be permitted to be reduced to 20 ft (6.1 m) where barricades twice the height of the cabinets are attached to the wall, midway between each cabinet. The barricades shall extend at least 10 ft (3 m) outward, shall be firmly attached to the wall, and shall be constructed of $^{1}/_{4}$-in. (6.4-mm) boiler plate, 2-in. (51-mm) thick wood, brick, or concrete block.

6. Primers shall be separated from materials classified by the U.S. Department of Transportation as flammable liquids, flammable solids, and oxidizing materials by a distance of 25 ft (7.63 m) or by a fire partition having a fire resistance of at least 1 hour.

7. The building shall be protected by an automatic sprinkler system installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*.

(c) Small arms primers not stored in accordance with 11-5.6(a) or (b) shall be stored in a magazine meeting the requirements of Chapter 6.

Chapter 12 Referenced Publications

12-1

The following documents or portions thereof are referenced within this code and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-4 Blasting Agent. Such materials or mixtures have been found to be so insensitive that there is little probability of accidental initiation of explosion or of transition from deflagration to detonation. Blasting agents are 1.5D materials, and tests required to classify these materials are specified in the U.S. Department of Transportation, "Hazardous Materials Regulations," Title 49, *Code of Federal Regulations*, Parts 173.56, 173.57, and 173.58.

A-1-4 Blast Site. The word "barrier" means an object or objects that separates, keeps apart, or demarcates in a conspicuous manner by means of cones, a warning sign, or tape.

A-1-4 Bullet-Resistant Construction. Tests to determine bullet-resistance are to be conducted on test panels or empty magazines. The panels or magazines are to resist penetration of 5 out of 5 shots placed independently of each other in an area at least 3 ft × 3 ft (0.9 m × 0.9 m). If hardwood or softwood is used, its water content is not to exceed 15 percent.

Where a magazine roof or ceiling is required to be bullet-resistant, it shall be constructed of materials comparable to the sidewalls or of other materials that can withstand the penetration of bullets fired at an angle of 45 degrees from perpendicular.

A-1-4 Cap-Sensitive Explosive Material. A No. 8 blasting cap contains 0.40 to 0.45 grams of PETN (pentaerythritol tetranitrate) base charge pressed into an aluminum shell having a bottom thickness not greater than 0.03 in. (0.8 mm) to a specific gravity of not less than 1.4 g/cc and primed with standard weights of primer, in accordance with the manufacturer's specifications.

A-1-4 Explosive. A list of explosives determined to be within the scope of Title 18, *United States Code*, Chapter 40, is published at least annually by the Bureau of Alcohol, Tobacco, and Firearms, U.S. Department of the Treasury.

The classification of explosives described in the "Hazardous Materials Regulations" of the U.S. Department of Transportation is provided in Appendix E. These regulations were revised in 1991.

A-1-4 Flash Point. See also NFPA 30, *Flammable and Combustible Liquids Code*.

A-1-4 Oxidizing Material. See NFPA 430, *Code for the Storage of Liquid and Solid Oxidizers*.

A-1-4 Special Industrial Explosive Material. The high explosives used include dynamite, TNT (trinitrotoluene), PETN (pentaerythritol tetranitrate), and RDX (cyclotrimethylenetrinitramine).

A-1-4 Water Gel. Water gels (or slurries) are manufactured with varying degrees of sensitivity to initiation and are classified as Division 1.1D or 1.5D Explosives, as appropriate. Water gels can be sensitized by a material that itself is classified as an explosive material, such as TNT or smokeless powder, or they might not contain any ingredient classified as an explosive. Water gels in this latter category are sensitized using metals such as aluminum or using other fuels.

A-2-8.5 The toll-free telephone number for reporting incidents to the Bureau of Alcohol, Tobacco, and Firearms is 800-800-3855.

A-3-4.2 See NFPA 490, *Code for the Storage of Ammonium Nitrate*, for guidance in choosing compatible materials.

A-6-6.1(c) A bullet-resistant roof may be permitted to be constructed in accordance with any of the specifications in Appendix C. A bullet-resistant ceiling may be permitted to be constructed at the eave line, covering the entire area of the magazine, excluding the necessary ventilation space. Examples of bullet-resistant ceiling construction include:

(a) Any construction meeting the specifications in Appendix C.

(b) A sand tray having a sand depth of at least 4 in. (102 mm).

A-7-1.16(b) For further information, see IME Safety Library Publication No. 20, *Safety Guide for the Prevention of Radio Frequency Radiation Hazards in the Use of Commercial Electric Detonators (Blasting Caps)*.

A-7-6.4 The member companies of the Institute of Makers of Explosives have agreed to supply advice on or assistance in destroying commercial explosives to law enforcement agencies, fire departments, and inspection and regulatory officials, as well as to users of explosives. The manufacturer, if known, should be consulted for assistance. If the manufacturer is not known, a member company of the Institute of Makers of Explosives can provide advice or assistance.

A-9-3(b) The specific requirement is provided in the U.S. Department of Transportation, "Hazardous Materials Regulations," 49 CFR, Part 174.16.

A-10 Plosophoric materials, or plosophors, also are known as two-component or binary explosives.

A-11-2.5 A bulletin on this subject is available from the Sporting Arms and Ammunition Manufacturer’s Institute, Inc., Flintlock Ridge Office Center, 11 Mile Hill Road, Newtown, CT 06470-2359.

Appendix B Recommended Separation Distances of Ammonium Nitrate and Blasting Agents from Explosives or Blasting Agents

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

B-1 Derivation of Table.

B-1.1 The Table of Recommended Separation Distances of Ammonium Nitrate and Blasting Agents from Explosives or Blasting Agents is shown in Table 6-4.2.

B-1.2 A test program sponsored by the Chemical Manufacturers Association and the Institute of Makers of Explosives and conducted by the U.S. Bureau of Mines developed data on the relative sensitivity of ammonium nitrate (AN) and ammonium nitrate/fuel oil (ANFO) to sympathetic detonation. The data then was applied to the American Table of Distances for Storage of Explosives (*see Table 6-4.1*) to produce the table of recommended separation distances for ammonium nitrate and blasting agents from stores of high explosives or other blasting agents.

B-1.3 The American Table of Distances for barricaded storage of explosives has proven adequate through the years; no data developed in this test program suggested the need for modification of the table. However, a factor of 2 has been suggested in the past for increasing the distances from unbarricaded magazines. The results, employing two charge sizes of AN and one of ANFO, yielded ratios of unbarricaded to barricaded distances of 4.2 to 7.4. This averaged to a factor of approximately 6, which was taken to be appropriate. Therefore, unbarricaded stores of AN or ANFO not in bullet-resistant magazines should have six times the separation distances of barricaded stores.

B-1.4 The relative sensitivity of AN and ANFO to dynamite was obtained by examining the relative K factors for 50 percent propagation distances where the cube root of the weight was employed in the following equation:

$$S = KW^{1/3}$$

where:

S = distance in ft

W = weight in lb

This equation allowed the comparison of 1600-lb (726.4-kg) dynamite acceptors with 5400-lb (2451.6-kg) AN and ANFO acceptors; the results of these large charges are believed to be the most reliable available. The ratio of K factors for dynamite and AN was 6.27, which was rounded to 6. The ratio for dynamite and ANFO was 1.6. These factors were applied to the American Table of Distances, thereby reducing the distance for barricaded AN to $^{1}/_{6}$ the corresponding distance for explosives. The corresponding reduction for ANFO was 0.6.

B-1.5 One point should be emphasized: the distances in the table are for the separation of stores only. Since the blast effect from ANFO is not significantly less than from high explosives, the American Table of Distances still should be used for separation from inhabited buildings, passenger railways, and public highways. (The blast effect from AN is about 50 percent of that from high explosives.) Further, the blast effect is not modified significantly by barricades. The American Table of Distances for unbarricaded stores provides an additional factor of safety and should be used.

B-2 Guide to Use of the Table.

B-2.1 A sketch of the location of all potential donor and acceptor materials together with the maximum mass of material to be permitted in that vicinity should be made. (Potential donors are high explosives, blasting agents, and combinations of masses of detonating materials. Potential acceptors are high explosives, blasting agents, and ammonium nitrate.)

B-2.2 Each donor mass should be considered separately in combination with each acceptor mass. If the masses are closer than the table allowance (distances measured between the nearest edges), the combination of masses becomes a new potential donor of weight equal to the total mass. Where individual masses are considered as donors, the distances to potential acceptors should be measured between the edges. Where combined masses within propagating distance of each other are considered as a donor, the appropriate distance to the edge of potential acceptors should be computed as a weighted distance from the combined masses.

The calculation of the weighted distance from combined masses is as follows:

M_2, M_3.. M_n are donor masses to be combined.

M_1 is a potential acceptor mass.

D_{12} is the distance from M_1 to M_2 (edge to edge).

D_{13} is the distance from M_1 to M_3 (edge to edge), etc.

To find the weighted distance [$D_1(_{2,3} \ldots\ldots\ldots\ldots _n)$] from combined masses to M_1, the products of the individual masses and distances are added and the total is divided by the sum of the masses, as follows:

$$D_1(_{2,3}, \ldots\ldots\ldots\ldots _n) = \frac{M_2 \times D_{12} + M_3 \times D_{13} \ldots M_n \times D_{1n}}{M_2 + M_3 \ldots M_n}$$

Propagation is possible where either an individual donor mass is located at less than the tabulated distance from an acceptor or a combined mass is located at less than the weighted distance from an acceptor.

B-2.3 In determining the distances separating highways, railroads, and inhabited buildings from potential explosions (*see Table 6-4.1*), the sum of all masses that can propagate (i.e., lie at distances less than those prescribed in the table) from either individual or combined donor masses is included. However, where the ammonium nitrate is to be included, only 50 percent of its weight shall be used because of its reduced blast effects.

In applying the American Table of Distances to distances from highways, railroads, and inhabited buildings, distances are measured from the nearest edge of potentially explodable material as prescribed in the American Table of Distances, Note 5. (*See Table 6-4.1.*)

B-2.4 When all or part of a potential acceptor comprise Division 1.1 and Division 1.2 Explosives, as defined in DOT regulations, storage in bullet-resistant magazines is required. Safe distances to stores in bullet-resistant magazines can be obtained from the intermagazine distances prescribed in the American Table of Distances.

B-2.5 Barricades are not to have line-of-sight openings between potential donors and acceptors that allow blast or missiles to move directly between masses. [*See Tables B-2.5(a) and (b)*].

Table B-2.5(a)

Example 1	**ANFO Mix Plant (*see* *Figure B-2.5*)**
M_1	100,000 lb Fertilizer AN prills (maximum)
M_2	2500 lb ANFO (maximum)
M_3	80,000 lb ANFO (maximum)
D_{12}	20 ft
D_{23}	20 ft
D_{13}	50 ft

Note: No other stores on site; no barricade exists.
(For SI Units: 1 lb = 0.454 kg; 1 ft = 0.305 m)

Potential Donor	Potential Acceptor	Distance on Site (ft)	Table Distance, Minimum Required (ft)	Propagation Possible?
M_2 (2500 lb)	M_1	20	9 × 6 = 54	Yes
M_2 (2500 lb)	M_3	20	32 × 6 = 192	Yes
M_3 (80,000 lb)	M_1	50	28 × 6 = 168	Yes

M_3 (80,000 lb)	M_2	20	101 × 6 = 606	Yes

Conclusion:

The maximum amount of blasting agent to be considered for public protection at this site is the sum of all masses, reducing Fertilizer AN mass by 50 percent as indicated in B-2.3.

100,000 × 50% =	50,000
	2500
	80,000
	132,500 lb

In accordance with the American Table of Distances, the required separation distance from an inhabited building (unbarricaded) is 2000 ft.

Table B-2.5(b)

Example 2	**ANFO Mix Plant (*see* *Figure B-2.5*)**
M_1	100,000 lb Fertilizer AN prills (maximum)
M_2	2500 lb ANFO (maximum)
M_3	80,000 lb ANFO (maximum)
D_{12}	20 ft
D_{23}	20 ft
D_{13}	50 ft

Note: No other stores on site; a 4-ft (1.2-m) thick earth barricade exists at B (*see Figure B-2.5*).
(For SI Units: 1 lb = 0.454 kg; 1 ft = 0.305 m)

Potential Donor	**Potential Acceptor**	**Distance on Site (ft)**	**Table Distance, Minimum Required (ft)**	**Propagation Possible?**
M_2(2500 lb)	M_1	20	9	No
M_2(2500 lb)	M_3	20	6 × 32 = 192	Yes
M_3(80,000 lb)	M_1	50	28	No

M_3(80,000 lb)	M_2	20	6 × 101 = 606	Yes
Combined $M_2 + M_3$ (82,500 lb)	M_1	49[1]	30	No

[1]Compute weighted distance to combined mass by equation 1:

$$\frac{2500 \times 20 + 80{,}000 \times 50}{2500 + 80{,}000} = 49 \text{ ft}$$

Conclusion:

The maximum amount of blasting agent to be considered for public protection at this site is the sum of M_2 plus M_3, or 82,500 lb (37,455 kg). In accordance with the American Table of Distances, the required separation distance from an inhabited building (unbarricaded) is 2000 ft (610 m). Where a natural or artificial barricade protects the building, the required distance is 1730 ft (528 m).

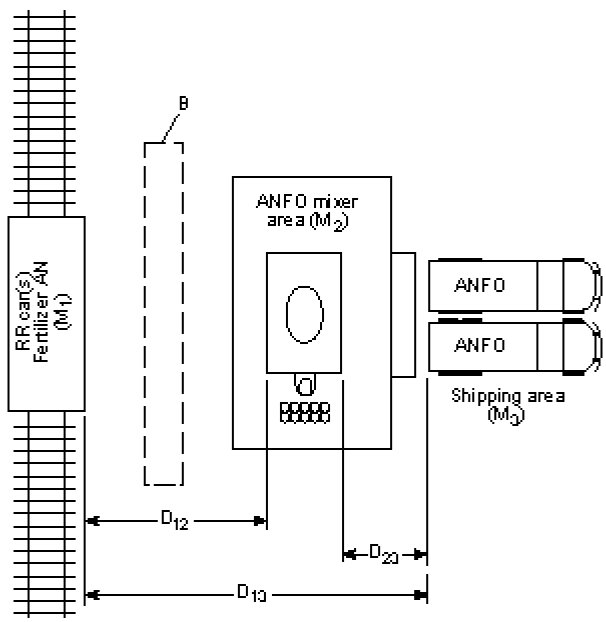

Figure B-2.5 ANFO mix plant.

Appendix C Magazine Construction

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

Magazines constructed in accordance with the following minimum specifications are approved as bullet-resistant (as defined in Chapter 1). All steel and wood dimensions are actual thickness; concrete block and brick dimensions are nominal.

C-1 Steel Exterior.

C-1.1 $^5/_8$-in. (15.9-mm) steel with an interior lining of nonsparking material.

C-1.2 $^1/_2$-in. (12.7-mm) steel with an interior lining of plywood at least $^3/_8$ in. (9.5 mm) thick.

C-1.3 $^3/_8$-in. (9.5-mm) steel lined with one of the following:

(a) 2 in. (50.8 mm) of hardwood;

(b) 3 in. (76.2 mm) of softwood;

(c) $2^1/_4$ in. (57.1 mm) of plywood.

C-1.4 $^1/_4$-in. (6.3-mm) steel lined with one of the following:

(a) 3 in. (76.2 mm) of hardwood;

(b) 5 in. (127 mm) of softwood;

(c) $5^1/_4$ in. (133.3 mm) of plywood;

(d) $1^1/_2$ in. (38.1 mm) of plywood with an intermediate layer of 2 in. (50.8 mm) of hardwood.

C-1.5 $^3/_{16}$-in. (4.8-mm) steel lined with one of the following:

(a) 4 in. (101.6 mm) of hardwood;

(b) 7 in. (177.8 mm) of softwood;

(c) $6^3/_4$ in. (171.5 mm) of plywood;

(d) $^3/_4$ in. (19 mm) of plywood with an intermediate layer of 3 in. (76.2 mm) of hardwood.

C-1.6 $^1/_8$-in. (3.2-mm) steel lined with one of the following:

(a) 5 in. (127 mm) of hardwood;

(b) 9 in. (228.6 mm) of softwood;

(c) $^3/_4$ in. (19 mm) of plywood with an intermediate layer of 4 in. (101.6 mm) of hardwood.

(d) Two layers of $^3/_4$-in. (19-mm) plywood with an intermediate layer of $3^5/_8$ in. (92.1 mm) of well-tamped dry sand or sand/cement mixture.

C-2 Fire-Resistant Exterior. The exterior of any type of fire-resistant material that is structurally sound may be permitted to be constructed with the following:

(a) An interior lining of $^1/_2$-in. (12.7-mm) plywood placed securely against an intermediate 4-in. (101.6-mm) thick layer of solid concrete block, solid brick, or solid concrete.

(b) An interior lining of $^3/_4$-in. (19-mm) plywood; a first intermediate layer of $^3/_4$-in. (19-mm) plywood; a second intermediate layer of $3^5/_8$ in. (92.1 mm) of well-tamped dry sand or sand/cement mixture; a third intermediate layer of $^3/_4$-in. (19-mm) plywood; and a fourth intermediate layer of 2-in. (50.8-mm) hardwood or 14-gauge steel.

(c) An intermediate 6-in. (152.4-mm) space filled with well-tamped dry sand or sand/cement mixture.

C-3 Masonry Exterior.

C-3.1 Standard 8-in. (203.2-mm) concrete block with voids filled with well-tamped dry sand or sand/cement mixture.

C-3.2 Standard 8-in. (203.2-mm) solid brick.

C-3.3 8-in. (203.2-mm) solid concrete.

C-3.4 Two layers of 4-in. (101.6-mm) concrete block.

Appendix D Training and Information Sources

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

D-1 General. This appendix summarizes available training and educational material that provides useful supplementary information regarding explosives.

D-2 IME Educational Materials. Institute of Makers of Explosives, 1120 Nineteenth St. NW, Suite 310, Washington, DC 20036-3605.

D-2.1 Videos.

"Don't Touch," pertaining to blasting cap safety.

"Emergency Instructions," pertaining to first response for transportation accidents involving explosives.

"Storage of Commercial Explosive Material."

D-2.2 Posters. Assorted posters pertaining to blasting cap safety, emergency responses, and other important safety issues.

D-2.3 Publications.

Safety Library Publication No. 1, "Construction Guide for Storage Magazines," June 1986.

Safety Library Publication No. 2, "The American Table of Distances," June 1991.

Safety Library Publication No. 3, "Suggested Code of Regulations for the Manufacture, Transportation, Storage, Sale, Possession, and Use of Explosive Materials," January 1985.

Safety Library Publication No. 4, "Warnings and Instructions for Consumers in Transporting, Storing, Handling and Using Explosive Materials," June 1989.

Safety Library Publication No. 12, "Glossary of Commercial Explosives Industry Terms," February 1991.

Safety Library Publication No. 14, "Handbook for the Transportation and Distribution of Explosive Materials," June 1986.

Safety Library Publication No. 17, "Safety in the Transportation, Storage, Handling, and Use of Explosive Materials," March 1987.

Safety Library Publication No. 20, "Safety Guide for the Prevention of Radio Frequency Radiation Hazards in the Use of Commercial Electric Detonators (Blasting Caps)," December 1988.

Safety Library Publication No. 21, "Destruction of Commercial Explosive Materials," September 1987.

Safety Library Publication No. 22, "Recommendations for the Safe Transportation of Detonators in a Vehicle with Certain Other Explosive Materials," January 1, 1985.

"Guide for the Use of IME 22 Container," July 1991.

D-3 SAAMI Educational Materials. Sporting Arms and Ammunition Manufacturers' Institute, Inc., 555 Danbury Rd., Wilton, CT 06897.

D-3.1 Video.

"Sporting Ammunition and the Firefighter."

D-4 Miscellaneous Reference Materials.

Appendix E U.S. Department of Transportation Proposed Revisions of Explosive Materials Transport Regulations

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

E-1 General. On December 21, 1990, the U.S. Department of Transportation (U.S. DOT) issued a final rule that revised the "Hazardous Materials Regulations" contained in Title 49, *Code of Federal Regulations*, Part 173.57.

These regulations cover the classification, packaging, and shipping of explosives (including blasting agents), oxidizers (ammonium nitrate), flammable liquids, and flammable solids.

Essentially, the U.S. DOT revised the U.S. hazardous materials regulations so that they conform to international regulations, which are based on the *United Nations Recommendations on the Transport of Dangerous Goods.* The revised regulations standardize testing and classification procedures, nomenclature, packaging, labeling, placarding, and handling and eliminate inconsistencies that formerly existed between the U.S. (domestic) and UN (international) standards.

It is likely that the most important change for the user of explosive materials is the elimination of the Class A, B, and C Explosives and Blasting Agents. Under the UN recommendations, all explosive materials are placed under Class 1 Explosives. Class 1 is made up of six divisions that represent the characteristics of the properties and hazards of a particular explosive. The breakdown of Class 1 Explosives into its six divisions is provided in Section E-2.

E-2 Class 1 Explosives.

Division 1.1. Explosives that present a mass explosion hazard.

Division 1.2. Explosives that present a projection hazard but not a mass explosion hazard.

Division 1.3. Explosives that present a fire hazard and either a minor blast hazard or a minor projection hazard, or both, but not a mass explosion hazard.

Division 1.4. Explosive devices that present a minor explosion hazard; no device shall contain more than 25 g (0.9 oz) of a detonating material.

Division 1.5. Very insensitive explosives that present a mass explosion hazard but are so insensitive that there is little probability of initiation or of transition from burning to detonation under normal conditions of transport.

Division 1.6. Extremely insensitive articles that do not have a mass explosion hazard, and articles that demonstrate a negligible probability of accidental initiation or propagation [no applicable hazard class].

The classification code for an explosive consists of the division number followed by the compatibility group letter. Compatibility group letters are used to specify the controls for the transportation and related storage of explosives and to prevent an increase in hazard that might result if certain types of explosives are stored or transported together.

Compatibility groups and classification codes for the various types of explosives are provided in the following tables.

Table E-1 provides compatibility groups and classification codes for substances and articles described in the first column.

Table E-1 also provides the number of classification codes that are possible within each explosive division.

Altogether, there are 35 possible classification codes for explosives.

Table E-2 provides explosives compatibility groups that may be transported on the same vehicle.

For comparative purposes, the classification of explosive materials under the UN recommendations and the former U.S. DOT system is provided in Section E-3.

E-3 UN Classification/Former DOT System.

Division 1.1 Class A Explosives. Dynamite, cast boosters, cap sensitive emulsions, water gels and slurries, Class A detonators.

Division 1.2 Class A or Class B Explosives. Division 1.2 generally contains ammunition or materials that present a projection hazard.

Division 1.3 Class B Explosives. Generally propellants or explosives that present a fire hazard but not a mass detonation hazard.

Division 1.4 Class C Explosives. Class C detonators, safety fuse, and other Class C explosives.

Division 1.5 Blasting Agent. ANFO, noncap-sensitive emulsions, water gels, slurries, and packaged blasting agents.

Division 1.6 No Applicable Class. Currently there are no commercial explosives contained in Division 1.6.

In the UN system, oxidizers and organic peroxides form Class 5 Explosives. Ammonium nitrate, an oxidizer, is classified as 5.1 (Class 5, Division 1). Flammable and combustible liquids (fuel oils) are Class 3, and flammable solids are Class 4.

To determine the proper classification of an explosive (class and division) criteria and test procedures have been set up in the UN recommendations. Through these criteria and tests it can be determined initially whether the material is an explosive and, if so, the hazard division to which it belongs.

In addition to the class and division number, every explosive under the UN recommendations has a proper shipping name and a four-digit identification number. Shipping cases are required to show the proper shipping name and the identification number.

Table E-1 Classification Codes

Description of Substances or Article to be Classified	Compatibility Group	Classification Code
Primary explosive substance	A	1.1A
Article containing a primary explosive substance and not containing two or more effective protective features	B	1.1B 1.2B 1.4B
Propellant explosive substance or other deflagrating explosive substance or article containing such explosive substance	C	1.1C 1.2C 1.3C 1.4C
Secondary detonating explosive substance or black powder or article containing a secondary detonating explosive substance, in each case without means of initiation and without a propelling charge; or article containing a primary explosive substance and containing two or more effective protective features	D	1.1D 1.2D 1.4D 1.5D
Article containing a secondary detonating explosive substance, without means of initiation, with a propelling charge (other than one containing flammable liquid or hypergolic liquid)	E	1.1E 1.2E 1.4E
Article containing a secondary detonating explosive substance, with its means of initiation, with a propelling charge (other than one containing flammable liquid or hypergolic liquid) or without a propelling charge	F	1.1F 1.2F 1.3F 1.4F
Pyrotechnic substance or article containing a pyrotechnic substance, or article containing both an explosive substance and an illuminating, incendiary, tear-producing, or smoke-producing substance (other than a water-activated article or one containing white phosphorus, phosphide or flammable liquid or gel or hypergolic liquid)	G	1.1G 1.2G 1.3G 1.4G
Article containing both an explosive substance and white phosphorus	H	1.2H

		1.3H
Article containing both an explosive substance and flammable liquid or gel	J	1.1J 1.2J 1.3J
Article containing both an explosive substance and a toxic chemical agent	K	1.2K 1.3K
Explosive substance or article containing an explosive substance and presenting a special risk (e.g., due to water activation or presence of hypergolic liquids, phosphides, or pyrophoric substances) needing isolation of each type	L	1.1L 1.2L 1.3L
Articles containing only extremely insensitive detonating substances	N	1.6N
Substance or article packed or designed so that any hazardous effects arising from accidental functioning are limited to the extent that they do not significantly hinder or prohibit fire fighting or other emergency response efforts in the immediate vicinity of the package	S	1.4S

Table E-2 Class 1 (Explosives) Compatibility Groups That May Be Transported on the Same Vehicle.[1]

Compatibility Group	A	B	C	D	E	G	S
A	Yes	No	No	No	No	No	No
B	No	Yes	No*	No*	No*	No	Yes
C	No	No*	Yes	Yes	Yes	No	Yes
D	No	No*	Yes	Yes	Yes	No	Yes
E	No	No*	Yes	Yes	Yes	No	Yes
G	No	No	No	No	No	No	Yes
S	No	Yes	Yes	Yes	Yes	Yes	Yes

Footnotes:

*Detonators 1.4B and 1.4S (Explosive C) and certain detonators 1.4B (Explosive A) that contain no more than one (1) gram of explosives (excluding ignition and delay charges) and are electric detonators (electric blasting caps) with leg wires four (4) ft or longer, or detonators (blasting caps) with empty plastic tubing twelve (12) ft or longer shall be transported on the same vehicle with other Class 1 materials (explosives) of Compatibility Groups B, C, D, E, G, or S, provided the detonators are shipped in accordance with IME-22 specifications.

1 NO detonators shall be transported on the same vehicle with Class 1 materials (explosives) Compatibility Groups C, D, E, and G unless the detonators are shipped in accordance with IME-22 specifications.

Under NO circumstances shall detonators of any compatibility group be shipped with Class 1, Compatibility Group A materials that were previously classified as initiating explosives.

NFPA 496

1993 Edition

Standard for Purged and Pressurized Enclosures for Electrical Equipment

1993 Edition

This edition of NFPA 496, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*, was prepared by the Technical Committee on Electrical Equipment in Chemical Atmospheres and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 16-18, 1992 in Dallas, TX. It was issued by the Standards Council on January 15, 1993, with an effective date of February 12, 1993, and supersedes all previous editions.

The 1993 edition of this document has been approved by the American National Standards Institute.

Origin and Development of NFPA 496

This standard was developed in two parts by the Technical Committee on Electrical Equipment in Chemical Atmospheres. The first part, addressing purged enclosures for electrical equipment in Class I Hazardous (Classified) Locations, was adopted as a tentative standard at the 1966 NFPA Annual Meeting and as an official standard at the 1967 NFPA Annual Meeting. The second part, addressing pressurized enclosures for electrical equipment in Class II Hazardous (Classified) Locations, was tentatively adopted at the 1970 NFPA Annual Meeting and officially adopted at the 1971 NFPA Annual Meeting.

The Technical Committee on Electrical Equipment in Chemical Atmospheres presented a complete revision of the entire standard in 1974. In 1980, the Committee began another complete revision. This work culminated in the 1982 edition.

In 1983, the Technical Committee on Electrical Equipment in Chemical Atmospheres recognized the need for specific requirements applicable to process control analyzers that have internal sources of a flammable or combustible material, such as a direct connection to the process stream. Two chapters were added to address analyzer enclosures and analyzer rooms or buildings. Additional changes were also made to certain existing portions of the text specifically to address problems in interpretation of the existing test. The 1986 edition of NFPA 496 is the result of this effort.

In 1987, the Technical Committee on Electrical Equipment in Chemical Atmospheres recognized a need for editorial revisions to the drawings in Chapter 2 as well as some minor editorial changes in Chapters 2 and 9 and the Appendix. The 1989 edition is the result of this effort.

Beginning in 1990, an adhoc committee consisting of members of the Electrical Equipment in Chemical Atmospheres Committee started a major rewrite of this document to develop a more comprehensive standard and to reduce redundancy in the text. Definitions were added for further clarity, and references to Class III were deleted since the standard did not cover this application and could create some confusion. References to purging were replaced with “pressurizing,” and “protective gas” was introduced as a new term. The requirements based on gross internal volume were deleted and replaced with general and specific requirements for all pressurized enclosures used in Class I and Class II locations. The result of this rewrite is the 1993 edition.

The NFPA Technical Committee on Electrical Equipment in Chemical Atmospheres wishes to gratefully acknowledge the efforts of the Instrument Society of America, through its Committee SP12, in the development of the basic requirements for purged and pressurized enclosures. These efforts resulted in the publishing of ISA S12.4, “Instrument Purging for Reduction of Hazardous

Area Classification." ISA S12.4 was the basis for NFPA 496.

James G. Stallcup, Grayboy Publishing Co., TX

Committee Scope: (1) To develop data on the properties of chemicals enabling proper selection of electrical equipment for use in atmospheres containing flammable gases, vapors, or dusts; (2) to make recommendations for the prevention of fires and explosions through the use of intrinsically safe, continuously purged, pressurized, explosion-proof, or dust-ignition-proof electrical equipment when installed in such chemical atmospheres.

NFPA 496
Standard for
Purged and Pressurized Enclosures for Electrical Equipment

1993 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 8 and Appendix B.

Chapter 1 General

1-1* Scope.

This standard shall apply to purging and pressurizing:

(a) Electrical equipment located in areas classified as hazardous by Article 500 of NFPA 70, *National Electrical Code*,® and

(b) Electrical equipment containing sources of flammable vapors or gases and located in either classified or nonclassified areas, and

(c) Control rooms or buildings located in areas classified as hazardous by Article 500 of NFPA 70, and

(d) Analyzer rooms containing sources of flammable vapors or gases and located in areas classified as hazardous by Article 500 of NFPA 70, *National Electrical Code*.

1-2 Purpose.

This standard is intended to provide information on the methods for purging and pressurizing enclosures to prevent ignition of a flammable atmosphere. Such an atmosphere may be introduced into the enclosure by a surrounding external atmosphere or by an internal source. By these means, electrical equipment that is not otherwise acceptable for a flammable atmosphere may be utilized in accordance with Article 500 of NFPA 70, *National Electrical Code*.

1-3 Applicability.

1-3.1

Chapters 2, 3, and 4 of this standard shall apply to electrical instrument and process control equipment, motors, motor controllers, electrical switchgear, and similar equipment that are installed in Class I or Class II locations and that <u>do not contain an internal source</u> of flammable vapor, gas, or liquid.

1-3.2

Chapter 5 of this standard shall apply to control rooms that are located in Class I or Class II locations and that <u>do not contain an internal source</u> of flammable vapor, gas, or liquid.

1-3.3*

Chapter 6 of this standard shall apply to electrical instrument and process control equipment and similar enclosed equipment, such as a gas chromatograph or a gas analyzer, that <u>do contain an internal source</u> of flammable vapor, gas, or liquid.

1-3.4

Chapter 7 of this standard shall apply to analyzer rooms and buildings.

1-4* Degree of Fire or Explosion Hazard.

There are two degrees of hazard for Class I or Class II locations:

(a) Division 1, or normally flammable, combustible, or ignitible [NFPA 497A, *Recommended Practice for Classification of Class 1 Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, recognizes that an ignitible mixture is likely to be present continuously or intermittently under normal conditions of operation, repair, maintenance, or leakage].

(b) Division 2, or flammable, combustible, or ignitible only under abnormal conditions.

1-5 Definitions.

For the purpose of this standard, the following terms shall have the meanings given below.

Alarm.* A piece of equipment that generates a visual or audible signal that attracts attention.

Analyzer Room or Building. A specific room or building containing analyzers, one or more of which is piped to the process.

Approved. Acceptable to the “authority having jurisdiction.”

NOTE: The National Fire Protection Association does not approve, inspect or certify any installations, procedures, equipment, or materials nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations which is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The “authority having jurisdiction” is the organization, office or individual responsible for “approving” equipment, an installation or a procedure.

NOTE: The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner since jurisdictions and “approval” agencies vary as do their responsibilities. Where public safety is primary, the “authority having jurisdiction” may be a federal, state, local or other regional department or individual such as a fire chief, fire marshal, chief of a fire prevention bureau, labor department, health department, building official, electrical inspector, or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the “authority having jurisdiction.” In many circumstances the property owner or his designated agent assumes the role of the “authority having jurisdiction”; at government installations, the commanding officer or departmental official may be the “authority having jurisdiction.”

Class I, Division 1. A Class I, Division 1 location is a location: (1) in which ignitable concentrations of flammable gases or vapors can exist under normal operating conditions; or (2) in which ignitable concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or (3) in which breakdown or faulty operation of equipment or processes might release ignitable concentrations of flammable gases or vapors and might also cause simultaneous failure of electric equipment. [See Article 500-5(a) of NFPA 70, *National Electrical Code*.]

Class I, Division 2. A Class I, Division 2 location is a location: (1) in which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment; or (2) in which ignitable concentrations of gases or vapors that are normally prevented by positive mechanical ventilation and that might become hazardous through failure or abnormal operation of the ventilating equipment; or (3) that is adjacent to a Class I, Division 1 location and to which ignitable concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided. [See Article 500-5(b) of NFPA 70, *National Electrical Code*.]

Class II, Division 1. A Class II, Division 1 location is a location: (1) in which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitable mixtures; or (2) where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitable mixtures to be produced and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes; or (3) in which combustible dusts of an electrically conductive nature may be present in hazardous quantities. [See Article 500-6(a) of NFPA 70, *National Electrical Code*.]

Class II, Division 2. A Class II, Division 2 location is a location where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitable mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitable by abnormal operation or failure of electrical equipment. [See Article 500-6(b) of NFPA 70, *National Electrical Code*.]

Enclosure Volume. The volume of the empty enclosure without internal equipment.

Ignition-Capable Equipment. Equipment that, under normal operation, produces sparks, hot surfaces, or a flame that can ignite a specific flammable atmosphere.

Ignition Temperature.* The autoignition temperature of a flammable gas or vapor or the lower of either the layer ignition temperature or cloud ignition temperature of a combustible dust.

Indicator. A piece of equipment that shows flows or pressure and is monitored periodically, consistent with the requirement of the application.

Power Equipment. Equipment that utilizes power greater than 2500 VA or switches loads greater than 2500 VA.

Pressurization. The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber.

Pressurizing System.* A grouping of components used to pressurize and monitor a protected enclosure.

Protected Enclosure. The enclosure pressurized by a protective gas.

Protected Equipment. The electrical equipment internal to the protected enclosure.

Protective Gas. The gas used to maintain pressurization or to dilute a flammable gas or vapor.

Protective Gas Supply. The compressor, blower, or compressed gas container that provides the protective gas at a positive pressure. The supply includes inlet (suction) pipes or ducts, pressure regulators, outlet pipes or ducts, and any supply valves not adjacent to the pressurized enclosure.

Purging. The process of supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Specific Particle Density.* The density of individual dust particles, as opposed to the bulk density of the material.

Type X Pressurizing. Reduces the classification within the protected enclosure from Division 1 to nonclassified.

Type Y Pressurizing. Reduces the classification within the protected enclosure from Division 1 to Division 2.

Type Z Pressurizing. Reduces the classification within the protected enclosure from Division 2 to nonclassified.

Ventilated Equipment. Equipment, such as motors, that requires airflow for heat dissipation as well a pressurization to prevent entrance of flammable gases, vapors, or dusts.

Chapter 2 General Requirements for Pressurized Enclosures

2-1 Scope.

This chapter shall apply to enclosures containing electrical equipment that are located in Class I or Class II locations.

2-2 Enclosure.

2-2.1

The protected enclosure, including windows, shall be constructed of material that is not likely to be damaged under the conditions to which it may be subjected.

2-2.1.1 Precautions shall be taken to protect the enclosure from excessive pressure of the protective gas supply.

2-2.1.2 Excess pressure relieving devices, where required to protect in the case of a control failure, shall be designed to prevent escape of sparks or burning material to a Division 1 location.

2-2.2*

All cable and conduit connections to a pressurized enclosure shall be sealed as required in Sections 501-5, 502-5, or 504-70, as applicable, of NFPA 70, *National Electrical Code*.

Exception: Pressurized raceways designed in accordance with Chapter 2 and installed as part of an approved system are not required to be sealed.

2-3 Pressurizing System.

2-3.1*

The protected enclosure shall be constantly maintained at a positive pressure of at least 25 Pa (0.1 in. water) above the surrounding atmosphere during operation of the protected equipment.

2-3.2

If positive pressure is not maintained in a protected enclosure, a suitable device such as an indicator, alarm, cutoff, or interlock switch shall warn the user to take action or shall automatically de-energize power from ignition-capable equipment. The type of device should be dependent upon the type of pressurization used.

2-3.3

An alarm shall be provided to indicate failure of the protective gas supply to maintain the required pressure.

2-3.4

All components that are either not protected by the protective gas or that may be energized in the absence of the protective gas shall be approved for the classified location in which they are installed in the absence of the protective gas.

2-3.5

Adequate instructions shall be provided for the pressurization system to ensure that the system can be used properly and that the enclosure will be protected from excessive pressure.

2-4 Protective Gas System.

2-4.1*

The protective gas shall be essentially free of contaminants or foreign matter and shall contain no more than trace amounts of flammable vapor or gas. All protective gas supplies shall be carefully designed to minimize chances for contamination.

2-4.1.1* Air of normal instrument quality, nitrogen, or other nonflammable gas shall be considered acceptable as a protective gas.

2-4.2

Piping for the protective gas shall be protected against mechanical damage.

2-4.3

If compressed air is used, the compressor intake shall be located in a nonclassified location.

2-4.4*

If the compressor intake line passes through a classified location, it shall be constructed of noncombustible material, designed to prevent leakage of flammable gases, vapors, or dusts into the protective gas, and protected against mechanical damage and corrosion.

2-4.5

The electrical power for the protective gas supply (blower, compressor, etc.) shall be supplied either from a separate power source or from the protected enclosure power supply before any service disconnects to the protected enclosure.

2-4.6

When “double pressurization” is used (e.g., a Division I enclosed area pressurized to a Division 2 classification that contains ignition-capable equipment also protected by pressurization), the protective gas supplies shall be independent.

2-5 Determination of Temperature Marking.

2-5.1*

The temperature identification number (T Code) marked on the enclosure shall represent (under normal conditions) the highest of the following: (1) the hottest enclosure external surface temperature, (2) the hottest internal component surface, or (3) the temperature of the protective gas leaving the enclosure. The actual temperature in degrees Celsius may be marked in place of the T Code wherever the T Code is referenced in this standard.

Exception: Internal components may exceed the marked T Code rating if they comply with one of the following:

(a) The enclosure is marked as required in 2-11.3 with the time period sufficient to permit the component to cool to the marked T Code.

(b) The component is separately housed so that the surface temperature of the housing is below the marked T Code. This housing shall be pressurized or sealed. If the housing can be readily opened, then the housing shall be marked as required in 2-11.3.

(c) The small component has been shown not to be capable of igniting a test gas associated with a lower T Code or will not ignite the flammable vapor, gas. or dust involved.*

2-5.2*

Table 2-5.2 lists the temperature index numbers (T Codes) as defined in Article 500-3(b) of NFPA 70, *National Electrical Code*. These T Codes are based upon a 40°C ambient.

Table 2-5.2 Temperature Identification Numbers (T Codes)

Maximum Temperature		
°C	**°F**	**T Code**
450	842	T1
300	572	T2
280	536	T2A
260	500	T2B
230	446	T2C
215	419	T2D
200	392	T3
180	356	T3A
165	329	T3B
160	320	T3C
135	275	T4
120	248	T4A
100	212	T5
85	185	T6

2-6 Ventilated Equipment.

2-6.1

Discharge of the protective gas from the enclosure shall be to a nonclassified location.

Exception: The discharge may be to a Division 2 location if the equipment does not create ignition-capable particles during normal operation.

2-6.2*

The flow of protective gas shall be sufficient to keep the equipment adequately cooled.

2-7* Power Equipment.

Enclosures containing power equipment shall be of substantially noncombustible construction and shall be reasonably tight. Gaskets shall be permitted.

NOTE: Nonmetallic enclosure flammability ratings of 94 V-0 or 94 5V are considered as substantially noncombustible. (See ANSI/UL94, *Tests for Flammability of Plastic Materials,* for description of flammability ratings.)

2-8* Type Z Pressurization.

2-8.1*

Failure to maintain positive pressure within an individual protected enclosure shall be detected by an alarm or an indicator, but it is not necessary to de-energize the protected equipment.

2-8.2

Any protected enclosure that can be isolated from the protective gas supply shall be equipped with an alarm.

Exception: The protected enclosure shall be permitted to be equipped with an indicator if the isolation is done with a valve(s) that is immediately adjacent to the protected enclosure and the valve(s) is intended for use only during servicing of the protected enclosure. The valve(s) shall be marked as required in 2-11.4.

2-8.3

If an alarm is used:

(a) The alarm shall be located at a constantly attended location.

(b) The alarm actuator shall take its signal from the protected enclosure and shall not be installed between the enclosure and the protective gas supply.

(c) The alarm actuator shall be mechanical, pneumatic, or electrical.

(d) Electrical alarms and electrical alarm actuators shall be approved for the location in which they are installed.

(e) No valves shall be permitted between the alarm actuator and the enclosure.

NOTE: This alarm also satisfies the requirement in 2-3.3 to provide an alarm on the protective gas supply.

2-8.4

If an indicator is used:

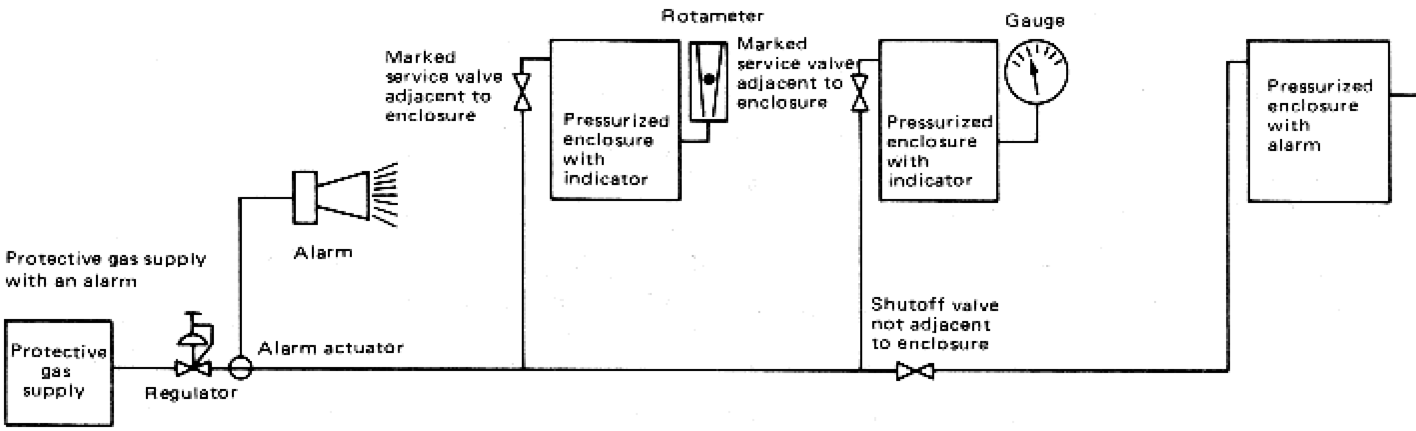
(a) The indicator shall be located for convenient viewing.

(b) The indicator shall not be installed between the enclosure and the protective gas supply.

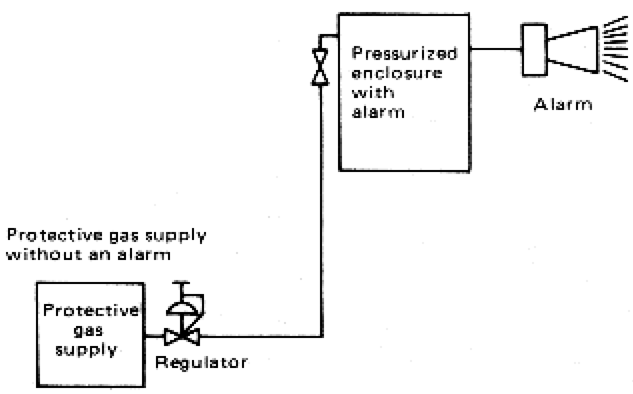
(c) The indicator shall indicate either pressure or flow.

(d) No valves shall be permitted between the indicator and the enclosure.

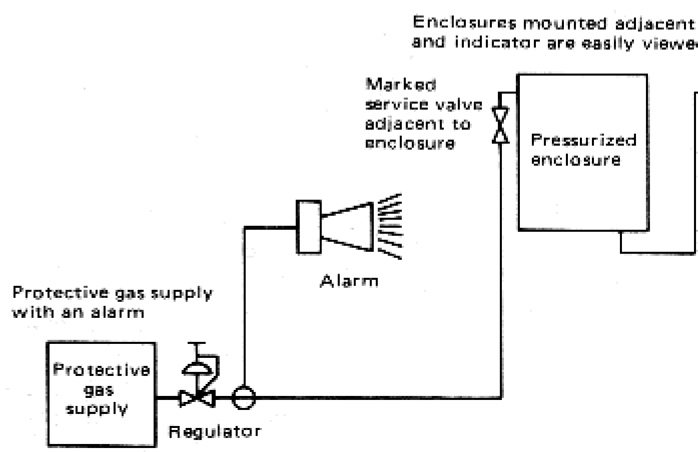
(e) The protective gas supply shall have an alarm that is located at a constantly attended location to fulfill the requirement in 2-3.3.



Example 1: Shows indicators may be used if protective gas supply has an alarm and the shutoff valve is adjacent to the enclosure.



Example 2: Shows enclosure alarm can also fulfill requirement for protective gas supply alarm.



Example 3: Shows multiple enclosures can be series purged.

Figure 2-8 Typical alarm and indicator configurations for Types Y and Z pressurization.

2-9* Type Y Pressurization

.

2-9.1

All applicable requirements in Section 2-8 shall be complied with.

2-9.2

Equipment within the protected enclosure shall be approved for Division 2 locations.

2-9.3

Ventilated equipment that would develop temperatures hotter than the marked T Code rating upon failure of the ventilation shall be automatically de-energized when the flow of protective gas stops.

2-10* Type X Pressurization.

2-10.1*

A cutoff switch shall be incorporated to de-energize power automatically from all circuits within the protected enclosure not approved for Division 1 upon failure of the protective gas supply.

Exception: Power to the circuits shall be permitted to be continued for a short period if immediate loss of power would result in a more hazardous condition and if both audible and visual alarms are provided at a constantly attended location.

2-10.1.1 The cutoff switch provided to de-energize power upon failure of the protective gas supply to maintain positive pressure shall be either flow or pressure actuated.

2-10.1.2 The cutoff switch shall be approved for use in the location in which it is installed.

2-10.1.3 No valves shall be permitted between the cutoff switch and the protected enclosure.

2-10.1.4 The cutoff switch shall take its signal from the protected enclosure and shall not be installed between the enclosure and the protective gas supply.

2-10.2*

Equipment, such as motors or transformers, that may be overloaded shall be provided with appropriate devices to detect any increase in temperature of the equipment beyond its design limits and shall de-energize the equipment automatically.

Exception: Power to the circuits shall be permitted to be continued for a short period if immediate loss of power would result in a more hazardous condition and if both audible and visual alarms are provided at a constantly attended location.

2-10.3

For ventilated equipment, the flow of protective gas shall provide sufficient cooling even during overload conditions or the equipment subject to overloading shall be provided with appropriate devices to detect any increase in temperature beyond its design limits and de-energize that equipment automatically.

Exception: Power to the circuits shall be permitted to be continued for a short period if immediate loss of power would result in a more hazardous condition and if both audible and *visual alarms are provided at a constantly attended location.*

2-11 Markings.

2-11.1

A permanent label shall be mounted on the protected enclosure in a prominent location so that it is visible before the protected enclosure can be opened. Labeling shall include:

2-11.1.1 The following, or an equivalent, statement:

"WARNING—PRESSURIZED ENCLOSURE

> This enclosure shall not be opened unless the area is known to be free of flammable materials or unless all devices within have been de-energized."

2-11.1.2 The area classification for the protected enclosure.

2-11.1.3 The pressurization type, e.g. Type X, Type Y, or Type Z.

2-11.1.4 The temperature identification number (T Code) or the actual temperature in degrees Celsius as determined in Section 2-5.

Exception No. 1: The T Code marking shall not be necessary if the hottest temperature does not exceed 100°C.

Exception No. 2: For equipment marked for use in a specific gas or dust atmosphere, the T Code marking shall not be necessary when the hottest temperature does not exceed 80 percent of the ignition temperature (in degrees C) of the flammable vapor, gas, or dust involved. If the dust involved is an organic dust that may dehydrate or carbonize, then the hottest temperature may not exceed the lower of either 80 percent of the layer/cloud ignition temperature or 165°C.

2-11.2

The additional markings specified in 3-3.1 and 4-3.1 may also be included on the permanent label described in 2-11.1.

2-11.3

Where 2-5.1, Exception (a) or (b) is used, the following or equivalent statement shall appear on a permanent label:

"WARNING—HOT INTERNAL PARTS

> This enclosure shall not be opened unless the area is known to be nonflammable or unless all equipment within has been de-energized for ____________ minutes."

2-11.4

Where 2-8.2, Exception is used, the following or equivalent statement shall appear on a permanent label:

"WARNING—PROTECTIVE GAS SUPPLY VALVE

> This valve must be kept open unless the area is known to be nonflammable or unless all equipment within the protected enclosure is de-energized."

Chapter 3 Pressurized Enclosures in Class I Locations

3-1 Scope.

This chapter shall apply to enclosures containing electrical equipment that are located in Class I locations.

3-2 General Requirements.

3-2.1

All the applicable requirements of Chapter 2 shall be complied with.

3-2.2

If the enclosure has been opened or if the protective gas supply has failed to maintain the required positive pressure, the enclosure shall be purged.

3-2.3

Airflow through the enclosure during purging shall be designed to avoid air pockets.

3-2.4

Once the enclosure has been purged of flammable concentrations, only positive pressure shall be required to be maintained within the enclosure. No specific flow rate shall be required to be maintained.

3-2.5*

Compartments within the main enclosure or adjacent enclosures connected to the main enclosure shall be considered separately, and protection shall be provided by one of the following methods:

(a) The internal compartment shall be vented to the main enclosure by nonrestricted top and bottom vents, common to the main enclosure. Each vent shall provide not less than 6.5 cm^2 (1.0 sq in.) of vent area for each 6560 cm^3 (400 cu in.), with a minimum vent size of 6.3 mm ($^1/_4$ in.) diameter.

(b) The internal compartment or adjacent enclosure shall be purged in series or shall be purged separately.

(c) The equipment in the internal compartment or adjacent enclosure shall be protected by other means, e.g., explosionproof, intrinsic safety, hermetic sealing, nonincendive, encapsulation, etc.

NOTE 1: Cathode ray tubes (CRTs) are hermetically sealed components.

NOTE 2: Components with a free internal volume less than 20 cm^3 (1.22 cu in.) are not considered to be internal compartments requiring protection as long as the total volume of all such components is not a significant portion of the protected enclosure volume.

NOTE 3: Components considered to be environmentally sealed such as transistors, microcircuits, capacitors, etc., are not included in the percent of volume analysis.

3-3 Markings.

A permanent label containing the start-up conditions shall be mounted on the protected enclosure in a prominent location. The label shall contain the following, or an equivalent, statement:

> "Power shall not be restored after enclosure has been opened until enclosure has been purged for minutes at a flow rate of ____________."

NOTE: The minimum pressure may be used in place of the flow rate if the pressure is a positive indication of the correct flow.

Exception: Start-up conditions shall be permitted to alternately be mounted on an adjacent pressurizing system if referenced on the protected enclosure.

3-4* Additional Requirements for Type Y or Type Z Pressurization.

The protected equipment shall not be energized until at least four enclosure volumes of the protective gas (ten volumes for motors) have passed through the enclosure while maintaining an internal pressure of at least 25 Pa (0.1 in. water).

Exception: Equipment shall be permitted to be energized immediately if a pressure of at least 25 Pa (0.1 in. water) exists and the atmosphere within the enclosure is known to be nonflammable.

3-5 Additional Requirements for Type X Pressurization.

3-5.1

A timing device shall be used to prevent energizing of electrical equipment within the protected enclosure until at least four enclosure volumes of the protective gas (ten volumes for motors) have passed through the enclosure while maintaining an internal pressure of at least 25 Pa (0.1 in. water).

3-5.2*

If the enclosure can be readily opened without the use of a key or tools, an interlock shall be provided to immediately de-energize all circuits within the enclosure that are not approved for Division 1 locations when the enclosure is opened.

3-5.2.1 The interlock, even though located within the enclosure, shall be approved for Class I, Division 1 locations.

3-5.2.2 Protected enclosures that contain hot parts requiring a cooldown period shall not be readily opened without the use of a key or tool.

Chapter 4 Pressurized Enclosures in Class II Locations

4-1 Scope.

This chapter shall apply to enclosures containing electrical equipment that are located in Class II locations.

4-2 General Requirements.

4-2.1

All applicable requirements in Chapter 2 for each type of pressurization shall be complied with, except as modified below.

4-2.2*

If combustible dust has accumulated within the protected enclosure, the protected enclosure shall be opened and the dust removed before pressurization.

NOTE: Protected enclosures should normally be kept closed whether the equipment is in operation or not.

4-2.3

Adjacent enclosures connected to the main enclosure shall be permitted to be collectively pressurized to prevent the entrance of dust if there is adequate communication to maintain the specified pressure at all points.

4-2.4*

The protected enclosure shall be constantly maintained at a pressure above the surrounding atmosphere, dependent upon the specific particle density during operation of the protected equipment. The positive pressure shall comply with Table 4-2.4.

Table 4-2.4
Minimum Enclosure Pressure Versus Dust Density

Specific Particle Density			Minimum Pressure	
lb/cu ft	kg/m^3	Specific Gravity	in. H_2O	Pa
< 130	< 2083	< 2.083	0.1	25
> 130	> 2083	> 2.083	0.5	125

4-2.5*

If the ignition temperature of the dust is not known, maximum surface temperatures shall not exceed those stated in Table 500-3(d) of NFPA 70, *National Electrical Code*.

4-3* Markings.

A permanent label containing the start-up conditions shall be mounted on the protected enclosure in a prominent location. The label shall contain the following, or an equivalent, statement:

> "Power shall not be restored after the enclosure has been opened until combustible dusts have been removed and the enclosure repressurized."

4-4* Additional Requirements for Type X Pressurization.

An alarm, provided at a constantly attended location, shall be permitted to be used in place of the cutoff switch specified in 2-10.1 if the enclosure is tightly sealed to prevent the entrance of dust.

4-5 Additional Requirements for Ventilated Equipment.

The discharge of protective gas shall not create a combustible atmosphere by disturbing layers of dusts.

Chapter 5 Pressurized Control Rooms

5-1* Scope.

This chapter shall apply to buildings or portions of buildings commonly referred to as control rooms.

5-2 Protective Gas.

5-2.1

The protective gas shall be air.

5-2.2*

The air shall be essentially free of contaminants or foreign matter and shall contain no more than trace amounts of flammable vapor or gas.

5-2.3*

The source of air shall be determined from the nature of the process and the physical layout but shall not be from a classified location.

5-2.4

Any ducts shall be constructed of noncombustible materials. The fan suction line shall be free of leaks and shall be given suitable protection from mechanical damage and corrosion to prevent hazardous concentrations of flammable gases, vapors, or dusts from being drawn into the control room.

5-3 Considerations Relating to Positive Pressure Ventilation.

5-3.1

The following factors shall be considered in designing a control room suitable for safe operation in a hazardous (classified) location:

(a) The number of people to be housed;

(b) The type of equipment to be housed;

(c) The location of the control room relative to the direction of the prevailing wind and to the location of process units, e.g., relief valves, vent stacks, and emergency relief systems.

5-3.2*

If the control room is in a classified location, it shall be designed to minimize the entry of flammable vapors, gases, liquids, or dusts.

5-4 Requirements for Positive Pressure Air Systems.

5-4.1*

The positive pressure air system shall be capable of:

(a) Maintaining a pressure of at least 25 Pa (0.1 in. water) in the control room with all openings closed;

(b) Providing a minimum outward velocity of 0.305 m/sec (60 fpm) through all openings capable of being opened. The velocity shall be measured with all these openings simultaneously open.

A drop in pressure below the 25 Pa (0.1 in. water) specified in 5-4.1(a) is permissible while meeting the requirements of 5-4.1(b).

5-4.1.1 The positive pressure air system may include heating, ventilation, and air conditioning equipment, as well as any auxiliary equipment necessary to comply with 5-4.1.

5-4.2

If there is an air consuming device (such as a compressor or laboratory hood) in the control room, sufficient air shall be supplied to accommodate its needs as well as the needs of the positive pressure air system. Alternatively, the air supply to such a device shall be taken from a separate source.

5-4.3

The positive pressure air system shall be designed to provide the required pressure and flow rate for all areas of the control room.

5-4.4

For Type X pressurizing, a cutoff switch shall be incorporated to de-energize power automatically from all circuits within the control room not approved for Division 1 upon failure of the positive pressure air system.

Exception: Power to the circuits shall be permitted to be continued for a short period if immediate loss of power would result in a more hazardous condition.

5-4.5

For Type Y and Type Z pressurizing, power to the control room shall not be required to be de-energized upon failure of the positive pressure air system.

5-4.6*

Failure of the positive pressure air system shall be detected at the discharge end of the fan and shall activate an alarm at a constantly attended location.

5-4.7*

Provisions shall be made to energize the control room safely after interruption of the positive pressure air system. Such provisions shall include checking the atmosphere in the control room with a flammable vapor detector (*see ANSI/ISA RP12.13, Part II, "Installation, Operation and Maintenance of Combustible Gas Detection Instruments"*) to determine that the atmosphere is not flammable or removing hazardous quantities of dust.

5-4.8

The switch, electrical disconnect, and motor for the air system fan shall be approved for the location as it would be classified in the absence of positive pressure ventilation.

5-4.9

The electrical power for the positive pressure air system shall be taken off the main power line ahead of any service disconnects to the control room or shall be supplied from a separate power source.

Chapter 6 Pressurized Enclosures Having an Internal Source of Flammable Gas or Vapor

6-1 Scope.

This chapter shall apply to instruments such as gas chromatographs and gas analyzers and other enclosures that contain an internal source of flammable gas or vapor.

6-2* General Requirements.

6-2.1

The applicable requirements of Chapters 2, 3, and 4 shall apply except as modified herein.

6-2.2*

For the purpose of this chapter, every protected enclosure shall be considered to have a "normal" and an "abnormal" condition. In both conditions, the electrical equipment in the enclosure is assumed to be operating correctly. The types and magnitudes of these conditions are described below.

6-2.2.1 "Normal" shall mean the anticipated release of flammable gas or vapor within the enclosure when the system that supplies the flammable gas or vapor is operating properly. The magnitude of this anticipated release may be:

(a) None — i.e., there is no release of flammable gas or vapor; or

(b) Limited — i.e., there is release of flammable gas or vapor, but the release is limited to an amount that can be diluted by the pressurizing system to less than 25 percent of the lower flammable limit.

6-2.2.2 "Abnormal" shall mean the anticipated release of flammable gas or vapor within the enclosure when the system that supplies the flammable gas or vapor is either leaking or is otherwise operating abnormally. The magnitude of this anticipated release is:

(a) Limited — i.e., the release of flammable gas or vapor is limited to an amount that can be diluted to less than 25 percent of the lower flammable limit; or

(b) Unlimited — i.e., the release of flammable gas or vapor is of such magnitude that it cannot be diluted to less than 25 percent of the lower flammable limit.

6-2.3

If all the electrical equipment within the protected enclosure is suitable for Class I, Division 1 locations, no pressurization shall be required because of the internal source.

6-2.3.1 Precautions shall be taken if the abnormal condition release may be great enough to adversely affect an external area classification.

6-2.4*

If the electrical equipment within the protected enclosure is suitable for either Class I, Division 2 locations or nonclassified locations, the pressurization requirements shall be established according to Table 6-2.4.

Table 6-2.4 Pressurization Requirements for Enclosures Subject to Internal Release

(a)	(b)	(c)		(d)
		Pressurization Requirements for Limited Release Under Abnormal Conditions		
External Area Classification	**Internal Equipment Suitable for**	**No Release Under Normal Conditions**	**Limited Release Under Normal Conditions**	**Additional Requirements for Unlimited Release Under Abnormal Conditions**
	Class I, Div. 1	None	None	None
Class I,	Class I, Div. 2	Y	Y	None
Division 1	Nonclassified	X	X	Inert**
	Class I, Div. 1	None	None	None
Class I,	Class I, Div. 2	None	Z	None
Division 2	Nonclassified	Z	X	Inert**
	Class I, Div. 1	None	None	None
Class II	Class I, Div. 2	None	Z	None
	Nonclassified	Z	X	Inert**
	Class I, Div. 1	None	None	None*
None	Class I, Div. 2	None	Z	None*
	Nonclassified	Z	X	Inert**

* Precautions must be taken if unlimited release is large enough to alter the external area classification.
** See A-6-2.4.

6-2.4.1 To determine the pressurization requirements according to Table 6-2.4:

(a) Find the external area classification in column (a).

(b) Find the internal equipment type in column (b).

(c) Determine the pressurization requirement for limited release under abnormal conditions by using the appropriate normal condition in column (c).

(d) Determine any additional requirements from column (d) if the abnormal condition is unlimited release.

6-2.5

Protected enclosures containing an open flame shall be considered to have equipment suitable for nonclassified locations for the purposes of determining the pressurization requirement according to Table 6-2.4. The flame shall be automatically extinguished upon failure of the pressurization system regardless of pressurization type.

6-3 Specific Requirements.

6-3.1

Where a release of flammable gas or vapor within an enclosure can occur either in normal operation or under abnormal conditions, protection shall be provided by:

(a) Diluting with air to maintain the concentration of flammable gas, vapor, or mixture to less than 25 percent of its lower flammable limit, based on the lowest value of the lower flammable limit of any individual flammable gas or vapor entering the enclosure, or

(b) Diluting or pressurizing with inert gas to reduce the oxygen content in the enclosure to a level of not more than 5 percent by volume or to 50 percent of the minimum concentration of oxygen required to form a flammable mixture, whichever is lower.

6-3.2

Where the protected enclosure is located in a Class I or Class II area, the pressurizing system shall also prevent entrance of the external atmosphere by providing a minimum internal pressure of 25 Pa (0.1 in. water).

6-3.3

The locations and sizes of gas or vapor outlets in the protected enclosure shall be designed to allow effective removal of both the flammable gas or vapor and the protective gas.

6-3.3.1 Where an inert protective gas is used, the outlets shall be permitted to be closed after purging to prevent undue loss of inert protective gas, provided that this does not constitute a further danger such as inadequate flow of protective gas or excessive pressure buildup.

6-3.4

In applications where flammable mixtures shall be permitted to be piped into the enclosure through the flammable gas or vapor system, suitable precautions shall be taken to prevent propagation of an explosion back to the process equipment.

6-3.5

The flow rate of protective gas shall be sufficient to maintain the requirements of 6-3.1 and to ensure adequate mixing so that the release of a flammable gas or vapor is limited.

6-3.6

To achieve proper pressurization with air, caution is needed to ensure that the air pressure used within the enclosure does not exceed the pressure of the flammable gas or vapor system supplying the enclosure, as air could enter the process, causing possible problems such as explosive concentrations of the flammable gas or vapor, corrosion, or oxidation.

6-3.7

Precautions shall be taken to protect the enclosure from excessive pressure of the protective gas supply.

Chapter 7 Pressurized Analyzer Rooms Containing a Source of Flammable Gas, Vapor, or Liquid

7-1 Scope.

This chapter shall apply to analyzer rooms containing electrical equipment having process streams of flammable liquid, vapor, or compressed flammable gas piped into the equipment.

7-2 General.

7-2.1

If the analyzer room is in a hazardous (classified) location, it shall be designed to prevent the entry of flammable gases and vapors, flammable liquids, and combustible dusts.

7-2.2

The applicable requirements of Chapter 5 for control rooms shall apply except as modified herein.

7-2.3*

Analyzer rooms shall be separated from control rooms by distance or by a wall impermeable to vapors.

7-2.4*

Flow of air through the room shall ensure adequate air distribution. Flammable vapors shall be removed as close to their source as practical.

7-2.5

Leakage of inert gases used for purging or pressurization of enclosures in an analyzer room can deplete the room’s oxygen. Where personnel can enter the analyzer room, administrative controls combined with adequate training and safe entry procedures shall be established. Warning signs advising of the hazard of inert gas shall be posted. Inert gas shall not be used for purging an entire analyzer room where personnel shall be permitted to enter. (See NFPA 69, *Standard on Explosion Prevention Systems*.)

7-2.6

The analyzer room shall be ventilated with sufficient clean air to dilute any leakage to less than 25 percent of the lower flammable limit based on the largest single failure. (See NFPA 69, *Standard on Explosion Prevention Systems*.)

7-3 Specific Requirements.

7-3.1

Process streams shall have orifices or other flow-limiting devices on the inlets. An orifice or other flow-limiting device shall be installed on the outlet, if the outlet can constitute a source of uncontrolled leakage from the process. Orifices or other flow-limiting devices shall be located outside and close to the wall of the building or room.

7-3.2*

If flammable vapor, gas, or liquid is discharged from an enclosure (e.g., analyzer enclosure) it shall not create a hazard within the analyzer house or to the surroundings.

7-3.3

Ventilation shall adequately dilute any internal release of flammable gas or vapor. If the analyzer room is located in a hazardous (classified) location, appropriate protection shall be provided against the entry of flammable gases, vapors, liquids, or dusts.

7-3.4

Sample conditioning operations (such as heating, cooling, or drying) shall be located outside the analyzer room. Process piping within the analyzer room shall be minimized.

7-3.5

All process piping shall be equipped with shutoff valves for emergency isolation located outside of the building or room.

7-3.6

False ceilings and floors shall not be used in analyzer rooms.

7-3.7*

Ventilation fans shall be constructed to minimize the possibility of sparking.

7-3.8*

In the event of ventilation failure, an audible and visual alarm shall be activated at a constantly attended location. All electrical power to the analyzer room shall be automatically shut down, and open flames shall be automatically extinguished. Power shall not be restored until the analyzer room is free of any ignitable atmosphere mixtures.

Exception: Automatic shutdown shall not be required:

(a) If the analyzer room is classified as Division 1 and does not contain any open flames, or

(b) If the analyzer room is classified as Division 2 and does not contain any open flames and has permanently installed piping or tubing to the analyzer equipment, and any flammable vapors are vented to the outside of the room or building.

7-3.9

If gas or vapor mixtures within the flammable range must be piped to the analyzer room, suitable precautions shall be taken to prevent propagation of an explosion back to the process equipment.

Chapter 8 Referenced Publications

Appendix A

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

A-1-1

Electrical equipment should be located in an area having as low a degree of hazard classification as practical.

This standard does not address exclusion of flammable liquids that may be splashed or spilled on such enclosures. Where there is probability of flammable liquid exposure, additional means should be taken to avoid ingress.

A-1-3.3

The flammable gas or vapor is piped internally to the enclosure so that process parameters can be measured. The source of release could be fittings or vents. It is not intended that fumes or vapors from components within the electrical equipment be considered, e.g., from decomposing insulation.

A-1-4

The degree of hazard may be reduced from Division 1 to Division 2 or may be eliminated (i.e., Division 1 or 2 to nonhazardous) by pressurizing, provided the installations are properly designed, installed, and maintained. Information on determining the extent of hazardous (classified) locations may be found in NFPA 497A and NFPA 497B.

A-1-5 Alarm.

An alarm is intended to alert the user that the pressurizing system should be immediately repaired or the electrical equipment protected by the failed pressuring system should be removed from service.

A-1-5 Ignition Temperature.

Normally, the minimum ignition temperature of a layer of a specific dust is lower than the minimum ignition temperature of a cloud of that dust. Since this is not universally true, the lower of the two minimum ignition temperatures is listed in NFPA 497M. The autoignition temperature (AIT) is determined by ASTM D 2155, *Method of Test for Autogenous Ignition Temperatures of Petroleum Products*, or ASTM E 659, *Standard Method for Determining the Autoignition Temperature of Liquid Chemicals*.

A-1-5 Pressurizing System.

The pressurizing system may include components such as the alarm actuator, indicator, cutoff switch, or components of the protective gas supply. The components may be mounted in a separate enclosure/panel or be included within the protected enclosure.

A-1-5 Specific Particle Density.

Specific particle density (sometimes referred to as the true density) is the mass per unit volume or, more commonly, weight per unit volume and is expressed as pounds per cubic foot (kilograms per cubic meter). It refers only to the material making up the particle. The term "bulk density" is obtained by placing granular or powdered material in a specified volume and calculating the density. Bulk density includes the void space between the particles created because of the irregular particle shape. As an example, the specific particle density of sulfur is about 130 lb/cu ft while the bulk density of pulverized sulfur dust is about 50 lb/cu ft.

A-2-2.2

Pressurized raceways do not need to be sealed if they have been properly designed as part of pressurized systems with the required alarms or indicators. The exception is not meant to allow the user to install the equipment and ignore proper installation of hazardous location wiring. The exception allows the same raceway to be used for electrical wiring and the protective gas. The design must consider the restriction of protective gas flow when conductors are installed in the raceway.

A-2-3.1

The reason for requiring that a positive pressure be maintained is to prevent flammable vapors or gases from being forced into the enclosure by external air currents.

A-2-4.1

Air filtration may be desirable.

A-2-4.1.1 Ordinary plant compressed air is usually not suitable for purge or pressurizing systems, due to contaminants that may cause equipment to malfunction.

A-2-4.4

The compressor suction line should not pass through any area having a hazardous atmosphere, unless it is not practical to do otherwise.

A-2-5.1

Because a high temperature source of ignition is not immediately removed by de-energizing the equipment, additional precautions are necessary for hot components.

If the external temperature of the enclosure is greater than the autoignition temperature (in degrees Celsius) of the gas or vapor, it is obvious that purging will not prevent an explosion. Thus, it is essential that excess surface temperature be prevented, unless it has been specifically shown to be safe by a qualified testing laboratory. Dust that is carbonized or excessively dry is highly susceptible to spontaneous ignition.

Sources of internal temperatures above the autoignition temperature (in degrees Celsius) of the gas or vapor involved, such as vacuum tube filaments, are hermetically sealed to prevent them from contacting the atmosphere that may become hazardous. However, it is essential that the surface of the glass envelope does not exceed the 80 percent limit, unless shown by test to be safe.

A-2-5.1 Exception (c) The ignition temperature of gases and vapors that is listed in reference documents such as NFPA 497M is determined under conditions where a significant volume of gas is at the same temperature. When ignition is attempted with a small component, convection effects and partial oxidation at the surface of the component decrease the rate of heat transfer to the gas. Therefore, the component must be at a temperature much higher than the quoted ignition temperature to ignite the flammable mixture. Typical transistors, resistors, and similar small components must have a surface temperature of 220 to 300°C to ignite diethyl ether whose ignition temperate is 160°C. Similar values have been measured in ignition tests of carbon disulfide whose ignition temperature is 100°C.

A-2-5.2

The T Code is based upon the ambient temperature surrounding the pressurized equipment not exceeding 40°C. Higher temperatures will require adjustment of the marked T Code rating. For example, equipment marked T5 would be considered as T4A if used in a 60°C ambient. The maximum ambient temperature rating of the equipment must not be exceeded.

A-2-6.2

Airflow required for cooling may be more than that required for purging.

A-2-7

Enclosures containing power equipment are more likely to produce ignition-capable particles. It is necessary to have an enclosure that these particles will not burn through nor escape from openings other than the vents. Other techniques may be used to ensure that ignition-capable particles are contained in the enclosure.

A-2-8

Type Z pressurization reduces the classification within an enclosure from Division 2 to nonhazardous. With Type Z purging, a hazard is created only if the purge system fails at the same time that the normally nonhazardous area becomes hazardous. For this reason, it is not considered essential to remove power from the equipment upon failure of the purge system.

A-2-8.1

An alarm is preferred, but an indicator is acceptable if the protected enclosure is much less likely to fail than the protective gas supply. Excessive leakage from the protected enclosure is only likely during servicing at which time the indicator will assist the maintenance personnel in determining when the enclosure is adequately sealed to maintain pressure.

A-2-9

Type Y pressurization reduces the classification within an enclosure from Division 1 to Division 2. Equipment and devices within the enclosure must be suitable for Division 2. This requires that the enclosure does not contain an ignition source. Thus, a hazard is created within the enclosure only upon simultaneous failure of the purge system and of the equipment within the enclosure. For this reason, it is not considered essential to remove power from the equipment upon the failure of the purge system.

A-2-10

Type X pressurization reduces the classification within an enclosure from Division 1 to nonhazardous. Because the probability of a hazardous atmosphere external to the enclosure is high and the enclosure normally contains a source of ignition, it is essential that any interruption of the purging results in de-energizing of the equipment. Also, it is essential that the enclosure be tight enough to prevent escape of molten metal particles or sparks.

A-2-10.1

Power to the circuits may be continued for a short period where the Division 1 location only has a flammable concentration on an intermittent basis and where entrance of the external atmosphere would be slow because the protected enclosure is tightly sealed. Where flammable concentrations occur frequently or enclosure failure may be catastrophic, then Type Y pressurization should be used if it is necessary to continue operating the process to prevent a more hazardous condition.

A-2-10.2

Overload conditions need only be a concern where the motor load or the transformer load is not determined by the product but by external variable loading in the actual application.

A-3-2.5

In order for any internal or adjacent enclosure to be automatically purged as the main enclosure is purged, adequate vents must be provided to permit air circulation between the two enclosures. The area required to provide adequate venting will depend on the volume of the internal or adjacent enclosure. It is considered that meeting this requirement will prevent the formation of unpurged pockets of gas or vapor within the enclosure. This does not imply that internal or adjacent enclosures not meeting these requirements are prohibited but that such enclosures must be provided with their own purge system.

A-3-4

Any time the enclosure has been opened or the purge system has failed, the possibility exists that an explosive mixture may have accumulated in the enclosure. For enclosures that are effectively subdivided by internal parts, a greater purge volume may be necessary.

A-3-5.2

It is essential that any door access that can be opened by untrained personnel be protected with interlock switches. Consistent with the practice that has been established with explosionproof enclosures, it is considered that the commonly displayed warning nameplate is adequate protection for an enclosure that requires the use of a tool to be opened.

A-4-2.2

Cleaning should be done using a method that will not create a dust cloud, e.g., vacuum cleaner or brushing. Use of compressed air should be avoided.

A-4-2.4

The density of 2083 kg per m^3 (130 lb per cu ft) is slightly greater than that of sulfur dust, which was one of the dusts used in performing the tests on which the values in Table 4-2.4 are based. The pressures in the table are based on the assumption that the maximum crack width exposed to falling dust is 0.4 mm ($^1/_{64}$ in.). The ability of a dust to enter an opening due to the force of gravity against an outward velocity of gas is directly proportional to its specific particle density.

A-4-2.5

Equipment installed in Class II locations should be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of any organic dust deposits that may occur.

A-4-3

If there is not enough room on the enclosure to print the statements required in 2-11.1.1 and Section 4-3 in type large enough to be legible, equivalent wording such as the following may be used:

"De-energize before opening unless area is known to be nonhazardous. Remove dust and repressurize before restoring power."

A-4-4

A hazard is created within an enclosure only after the pressure has failed and enough dust to be explosive penetrates into the enclosure. This takes an appreciable length of time with any normally tight enclosure. Because of this, it is not always considered essential to remove the power from the equipment automatically upon failure of the pressurization. It is necessary only to provide an adequate warning so that operations will not continue indefinitely without pressurization. It is essential that the enclosure be tight enough to prevent escape of sparks or burning material.

A-5-1

Control rooms commonly house one or more of the following facilities:

(a) Process control instruments and panels;

(b) Data processing equipment;

(c) Communications equipment;

(d) Lighting, power equipment, and related equipment;

(e) Emergency power equipment;

(f) Lunch, restroom, and locker facilities;

(g) Offices and maintenance facilities;

(h) Heating and ventilating equipment.

A-5-2.2

Air filtration may be desirable.

A-5-2.3

Ordinarily, air can be taken from an area to one side of a process area where there is a minimum chance of flammable gases or vapors or combustible dusts being found. The elevation of the fan suction depends on the density of the gases, vapors, or dust under handling temperatures and adverse atmospheric conditions. For a control room in the center of a process area, ducting may be necessary.

A-5-3.2

To prevent entry of flammable vapors, gases, or dusts, positive pressure ventilation using a source of clean air may be used, and the equipment in the control room need not be housed in special enclosures. To prevent entry of flammable liquids, differences in elevation or use of dikes, etc., may be required.

A-5-4.1

A minimum number of doors should be provided so that positive pressures can be maintained, but, at the same time, the number of doors should be adequate for safe exit.

A-5-4.6

Suitable devices for detecting loss of air pressure include velocity pressure switches, static pressure switches, and plenum chambers with orifices. Electrical interlocks on the fan motor are not adequate, since belt slippage, loose impellers, or backward rotation of the fan would not be detected.

A-5-4.7

An enforced purge wherein an interlock timer requires proof of purging for a set period of time prior to energizing the control room should be considered.

A-6-2

The consequences of a release of flammable gas or vapor into an enclosure are substantially more serious than a similar release to the open atmosphere. Through the use of a purge system, these consequences may be minimized, and electrical equipment not otherwise acceptable for a flammable atmosphere may be utilized.

The effect of a temporary leak in the open is a transient rise in concentration of flammable gas or vapor in the atmosphere. A leak inside an enclosure, in the absence of purging, remains within the enclosure and if undetected will slowly raise the concentration inside the enclosure until its atmosphere becomes flammable. This increase in concentration is likely to be slowed only slightly by breathing and diffusion.

A-6-2.2

Because of the confining property of electrical equipment enclosures, it is necessary to view “normal” and “abnormal” conditions in terms of a longer time span than is necessary in considering releases in the open. Normal must include consideration of the probable operation of the apparatus after some years of service and includes degradation of the system components over time.

For no release within an enclosure under normal conditions, there must be a minimum risk (i.e., very low probability) that flammable material will escape from its containment system during the time the apparatus is in service and within the range of service conditions to which it is likely to be subjected. Therefore, materials and types of construction that degrade in service or with age and that are not likely to be maintained or replaced cannot be considered to permit a “normal condition—no release” as defined in 6-2.2.

Although specific rules that will apply to all designs cannot be written, in general, a design will be considered to have no normal release: if the flammable gas or vapor is enclosed in metallic pipes, tubes, vessels, or elements such as bourdons, bellows, or spirals; in systems that contain no moving seals; and if prototype systems do not leak when tested at 1.5 times their rated pressure, except in cases where another safety factor is applicable. Joints made with pipe threads, welding, metallic compression fittings, or other equally reliable methods would usually be considered to have no normal release.

Windows, elastomeric seals, and nonmetallic flexible tubing would in most cases not meet the requirement for “normal condition—no release” unless it can be demonstrated that time and environment will not degrade them below the leakage level expected of the operating pipe threads and compression seals. Systems that cannot meet a stringent interpretation of these guidelines should be considered “normal condition—limited release.” Seals, rotating or sliding seals, flanged joints, and flexible nonmetallic tubing can be assumed to leak minutely after a period of service.

Attention must be given to the possibility that expected degradation of components may result in release of flammable gas or vapor at a rate faster than that which the dilution system can handle. Such situations are not common but, when encountered, they should not be classified as “normal condition—limited release.” The prime criterion for “normal condition—limited release” is that the dilution capability of the protective system must not be exceeded.

In enclosures having open flames in normal operation, it is assumed that flame extinguishment is a normal occurrence and should be classified as a normal release unless loss of flame automatically stops the flow of flammable gas or vapor.

A limited abnormal release is one that, by design, is maintained at a level within the dilution capability of the protective system. The limiting element may be a restriction in the flow line. In the case of designs using elastomeric seals, the limiting flow may be considered to be the flow that would exist were the seal not in place.

A-6-2.4

Electrical equipment permitted in nonhazardous (nonclassified) locations may contain arcing or sparking contacts or may have hot surfaces. If there is no normal release within the equipment enclosure, a single failure of the system containing the flammable gas will provide the flammable atmosphere. The ignition source is always present, by virtue of the electrical equipment. Purging is, therefore, required, and Type Z purging will provide adequate protection. If, however, there is a limited release under normal conditions and there is limited release under abnormal conditions, then Type X purging is required. In this case, purging with air is satisfactory. Type X purging requires that the electrical power to the purged enclosure be disconnected upon failure of the purge system. Disconnection is required because, under the conditions described, a flammable atmosphere will be generated in the presence of arcing or sparking equipment or hot surfaces.

Electrical equipment suitable for Division 2 locations may present a source of ignition only upon failure or other abnormal conditions. If there is no normal release within the equipment enclosure, no purging is required because there is not normally a source of ignition present, even if the system containing the flammable gas fails. If there is limited normal release and limited abnormal release, then Type Z purging, with air, provides adequate protection. If, however, the abnormal release is unlimited (i.e., beyond the dilution from a single failure of the containment system); therefore, air is not permitted as the purge gas for such enclosures when the electrical equipment is only suitable for nonclassified locations. Inert gas must be used so that a flammable atmosphere is prevented from developing (unless, of course, the purge system itself fails).

For an air-purged enclosure containing equipment suitable for Division 2 locations, although an unlimited abnormal release results in a flammable atmosphere, the electrical equipment is assumed to be operating normally and, therefore, does not present a source of ignition. However, if a failure of the containment system is not obvious, inert gas purging should be used because of the danger that a flammable atmosphere may exist for a prolonged period of time, during which the electrical equipment may also fail and provide the source of ignition.

Whether electrical equipment is located in a Division 2 or a nonclassified location does not affect the need for a purge system. For Division 2 locations, the purge system serves two purposes: (1) to prevent the external atmosphere from entering the enclosure, and (2) to dilute any flammable gas released within the enclosure. In a nonclassified location, the purge system serves only to dilute any flammable gas released within the enclosure.

A-7-2.3

Flammable gases, vapors, or liquids for analysis should not be piped into control rooms because of the danger of ignition.

A-7-2.4

Flammable hydrocarbon vapors are usually heavier than air and should be removed at floor level. Lighter-than-air gases such as hydrogen and methane should be removed at the ceiling level.

A-7-3.2

Flammable gases or vapors should be discharged at a safe point outside the analyzer room in an upward or horizontal direction to aid in dispersion. The vent discharge should be located at least 5 ft (1.5 m) away from building openings and at least 12 ft (3.7 m) above grade level. The vent design and location should further consider possible trapping of vapors by eaves or other obstructions. (See NFPA 30, *Flammable and Combustible Liquids Code*.)

A-7-3.7

The fan motor and associated control equipment should be located external to the ductwork or should be suitable for the location.

A-7-3.8

It is assumed that the flow of flammable vapors or liquids will continue in case of failure of the ventilation system and that the atmosphere in the analyzer room will reach the flammable range. In these situations, power must be removed to avoid ignition.

NFPA 496

Purged and Pressurized Enclosures for Electrical Equipment

1993 Edition

Reference : 3-3.1
F.I.

Paragraph 3-3.1 requires a positive pressure purge system to:

(a) Be capable of maintaining a pressure of at least 25 Pascals (0.1 in. of water) in the control room with all openings closed.

(b) Be capable of providing a minimum outward velocity of 0.305 m/sec (60 ft per min) through all openings capable of being opened. The velocity shall be measured with all three openings simultaneously open. A drop in pressure below the 25 Pascals (0.1 in. of water) specified in 5-4.1(a) is permissible while meeting 5-4.1(b).

Question: Is it the intent of 3-3.1 to require that the purge system function as "a" and "b" simultaneously?

Answer: No.

Issue Edition: 1974

1992 Edition

Recommended Practice for Classification of Class I Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas

1992 Edition

This edition of NFPA 497A, *Recommended Practice for Classification of Class I Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, was prepared by the Technical Committee on Electrical Equipment in Chemical Atmospheres and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 18-20, 1991 in Montréal, Québec, Canada. It was issued by the Standards Council on January 17, 1992, with an effective date of February 10, 1992, and supersedes all previous editions.

The 1992 edition of this document has been approved by the American National Standards Institute.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

Origin and Development of NFPA 497A

The Committee on Electrical Equipment in Chemical Atmospheres began the development of this recommended practice in 1973. The Committee based the diagrams in this document on various codes and standards of the National Fire Protection Association and on the accepted practices of the chemical process industries and the petroleum refining industry. The first edition of this recommended practice was adopted by the Association at the 1975 Annual Meeting.

The Committee began a thorough review of this document in 1980 and completed its work in 1985. The designation was changed to NFPA 497A in anticipation of a similar recommended practice for Class II hazardous (classified) locations.

In 1989 the Technical Committee on Electrical Equipment in Chemical Atmospheres recognized a need for editorial revisions to the drawings referenced in Section 3-4. There were also new drawings included for flammable liquid tank truck loading and unloading and for marine terminal handling of flammable liquids.

NFPA 497A
Recommended Practice for
Classification of Class I Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas

1992 Edition

Information on referenced publications can be found in Chapter 4 and Appendix A.

Chapter 1 General

1-1 Scope.

1-1.1

This recommended practice applies to those locations where flammable gases or vapors, flammable liquids, or combustible liquids are processed or handled and where their release into the atmosphere may result in their ignition by electrical systems or equipment.

1-1.2

This recommended practice applies to chemical process areas. As used in this recommended practice, a chemical process area may be a large integrated chemical process plant or it may be a part of such a plant. It may be a part of a manufacturing facility where flammable gases or vapors, flammable liquids, or combustible liquids are produced or used in chemical reactions or are handled or used in certain unit operations such as mixing, filtration, coating, spraying, distillation, etc.

1-1.3

This recommended practice does not apply to situations that may involve catastrophic failure of or catastrophic discharge from process vessels, pipelines, tanks, or systems.

1-1.4

This recommended practice does not apply to situations involving enriched oxygen atmospheres. It also does not apply to situations involving pyrophoric materials.

1-1.5

This recommended practice is not intended to supersede or conflict with applicable requirements of the following:

NFPA 30, *Flammable and Combustible Liquids Code*;

NFPA 33, *Standard for Spray Application Using Flammable and Combustible Materials*;

NFPA 34, *Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids*;

NFPA 35, *Standard for the Manufacture of Organic Coatings*;

NFPA 36, *Standard for Solvent Extraction Plants*;

NFPA 45, *Standard on Fire Protection for Laboratories Using Chemicals*;

NFPA 50A, *Standard for Gaseous Hydrogen Systems at Consumer Sites*;

NFPA 50B, *Standard for Liquefied Hydrogen Systems at Consumer Sites*;

NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*; and

NFPA 59A, *Standard for the Production, Storage, and Handling of Liquefied Natural Gas (LNG)*.

1-2 Purpose.

1-2.1

It is the intent of this recommended practice to provide the user with a basic understanding of the parameters that determine the degree and the extent of the hazardous (classified) location. This recommended practice also provides the user with examples of the application of these parameters.

1-2.2

This recommended practice is intended as a guide and should be applied with sound engineering judgment. When all factors are properly evaluated, a consistent area classification scheme can be developed.

1-3 *National Electrical Code*® Criteria.

This recommended practice is based on the criteria established by Article 500 of NFPA 70, *National Electrical Code*, but is not intended to supercede or conflict with the requirements therein. Once an area is properly classified, the *National Electrical Code* specifies the type of equipment and the wiring methods that may be used.

Chapter 2 Basic Considerations

2-1 *National Electrical Code* Criteria.

2-1.1

Article 500 of NFPA 70, *National Electrical Code*, designates as hazardous (classified) any location in which a combustible material is or may be present in the atmosphere in sufficient concentration to produce an ignitible mixture. Article 500 defines three major categories of hazardous location:

(a) Class I, in which the combustible material is a gas or vapor;

(b) Class II, in which the combustible material is a dust;

(c) Class III, in which the combustible material is a fiber or flying.

This recommended practice is limited to Class I hazardous (classified) locations.

2-1.2

The intent of Article 500 is that electrical equipment and systems in hazardous (classified) locations should not provide a means of ignition for an ignitible mixture that may be present.

2-1.3

Within each class, Article 500 recognizes two degrees of hazard: Division 1 and Division 2. In Division 1, an ignitible mixture is likely to be present continuously or intermittently under normal conditions of operation, repair, maintenance, or leakage. In Division 2, an ignitible mixture is likely to be present under abnormal operating conditions, such as failure of process equipment.

2-1.3.1 Electrical installations in Division 1 locations are designed so that normal operation or failure of any part of the electrical system will not release flame, sparks, or hot gases, nor will it result in surface temperatures high enough to ignite the surrounding atmosphere.

2-1.3.2 Installations for Division 2 locations are designed and arranged so that normal operation of the electrical system does not provide a source of ignition. Protection against ignition during electrical breakdown is *not* provided. However, electrical breakdowns are sufficiently rare that the chances of one occurring simultaneously with accidental release of an ignitible mixture are extremely remote. Arcing and sparking devices are permitted only if suitably enclosed or if the sparks are of insufficient energy to ignite the mixture.

2-1.4

Electrical installations for areas classified as hazardous may be designed in various manners. No single manner is best in all respects or for all types of equipment used in a chemical process plant. Explosionproof electrical equipment, Types X, Y, and Z purged electrical equipment, and intrinsically safe electrical equipment are applicable to both Division 1 and Division 2 locations. Nonsparking electrical equipment and other less restrictive equipment, as specified in NFPA 70, *National Electrical Code*, are permitted in Division 2 locations.

2-1.5

Factors such as corrosion, weather, maintenance, equipment standardization and interchangeability, and possible process changes or expansion frequently dictate the use of special enclosures or installations for electrical systems. However, such factors are outside the scope of this recommended practice, which is concerned entirely with the proper application of electrical equipment to avoid ignition of flammable mixtures.

2-1.6

Locations that do not need to be classified as Division 1 or Division 2 are “nonclassified.”

2-2 Conditions Necessary for Ignition.

2-2.1

In a Class I location, three conditions must be satisfied for ignition to occur:

(a) A combustible gas or vapor must be present.

(b) The gas or vapor must be mixed with air in the proportions required to produce an ignitible mixture. Further, within the context of this recommended practice, a sufficient quantity of this mixture must be present in the atmosphere surrounding the electrical equipment.

(c) There must be a release of energy intense enough to cause ignition of the mixture. Within the context of this recommended practice, the energy release is understood to originate within the electrical system.

2-2.2

In classifying a particular location, the first condition, presence of a combustible gas or vapor, is significant in determining the correct division. As described in 2-1.3, the presence of an ignitible mixture during normal conditions of operation, repair, maintenance, or leakage of the process equipment, either continuously or intermittently, calls for a Division 1 classification. In other words, combustible gas or vapor is assumed to be present at any time; all that is necessary for electrical ignition is failure of the electrical system. If combustible gas or vapor is only present as a result of abnormal operation or breakdown of equipment, then the location is designated Division 2; ignition will only occur if there is simultaneous failure of the electrical system and the equipment.

2-2.3

The second condition, presence of an ignitible mixture, is important in determining the boundaries of the hazardous location, i.e., how far it extends. The quantity of material that may be released, its physical and chemical properties, and the natural tendency of gases and vapors to disperse all must be recognized.

2-3 Behavior of Gases, Vapors, and Liquids.

2-3.1 Lighter-than-Air Gases.

Gases whose densities are less than that of air will tend to dissipate rapidly once released to the atmosphere. They will not affect as great an area as heavier-than-air gases or vapors. Except in enclosed spaces, such gases seldom accumulate to form an ignitible mixture near grade level, where most electrical installations are located.

2-3.2 Heavier-than-Air Gases.

Gases whose densities at ambient temperature are greater than that of air tend to fall to grade level when released from a container. Under stagnant conditions, diffusion is slow and depends on the particular characteristics of the gas. The gas may remain for a significant period of time, unless disturbed by natural or forced ventilation, which will assist the dispersion process.

2-3.2.1 As the gas diffuses into the surrounding air, the density of the mixture approaches that of air.

2-3.2.2 The temperature of a gas as it leaves its container must be considered. A heavier-than-air gas may have been heated sufficiently to decrease its density so that on release it behaves as a lighter-than-air gas until cooled by the surrounding atmosphere. Conversely, a lighter-than-air gas may have been cooled sufficiently to behave as a heavier-than-air gas until it absorbs heat from the surrounding atmosphere.

2-3.3 Compressed Liquefied Gases.

These gases are stored above their normal boiling point but kept in the liquid state by pressure. When released from this pressure, the liquid immediately expands and vaporizes, creating large volumes of cold gas. The cold gases behave like heavier-than-air gas, until they warm, mix with air, and dissipate.

2-3.4 Cryogenic Liquids and Other Cold Liquefied Flammable Gases.

Cryogenic liquids are generally handled below –101°C (–150°F). Those that are combustible, such as hydrogen, carbon monoxide, and natural gas, behave like flammable liquids when they are spilled. Small spills will immediately vaporize, but larger spills will remain in the liquid state, spreading horizontally and freezing the ground beneath, thus inhibiting heat transfer. As the liquid absorbs heat, it vaporizes and rises. This results in a vertical cylinder of gas in the ignitable range that diffuses as it rises.

Some liquefied flammable gases are stored at low temperatures [above –101°C (–150°F)] and pressures close to atmospheric. These materials will behave as described above. Examples of such gases are anhydrous ammonia, propane, ethane, ethylene, and propylene.

2-3.5 Flammable and Combustible Liquids.

Flammable and combustible liquids are categorized by NFPA 30, *Flammable and Combustible Liquids Code*, as follows:

(a) Class I: those having flash points below 100°F (37.8°C);

(b) Class II: those having flash points at or above 100°F (37.8°C) and below 140°F (60°C);

(c) Class III: those having flash points at or above 140°F (60°C).

2-3.5.1 When released in appreciable quantity, a Class I liquid will begin to evaporate at a rate that depends on its volatility: the lower the flash point, the greater the volatility; hence, the faster the evaporation. The vapors of Class I liquids form ignitible mixtures with air at ambient temperatures more or less readily. Even when evolved rapidly, the vapors tend to disperse rapidly, becoming diluted to a concentration below the lower flammable limit. Until this dispersion takes place, however, these vapors will behave like heavier-than-air gases. Class I liquids normally will produce ignitible mixtures that will travel some finite distance from the point of origin; thus, they will normally require area classification for proper electrical system design.

2-3.5.2 With Class II liquids, the degree of hazard is lower because the vapor release rate is low at the normal handling and storage temperatures. In general, these liquids will not form ignitible mixtures with air at ambient temperatures unless heated above their flash points. Also, the vapors will not travel as far because they tend to condense as they are cooled by ambient air. Class II liquids should be considered capable of producing an ignitible mixture near the point of release when handled, processed, or stored under conditions where the liquid may exceed its flash point.

2-3.5.3 Class III liquids are subdivided into two classes: IIIA and IIIB. Class IIIA liquids have flash points at or above 140°F (60°C) but below 200°F (93.4°C). These liquids do not form ignitible mixtures with air at ambient temperatures unless heated above their flash points. Furthermore, the vapors cool rapidly in air and condense. Hence, the extent of the area requiring electrical classification will be very small or nonexistent.

Class IIIB liquids have flash points at or above 200°F (93.4°C). These liquids seldom evolve enough vapors to form ignitible mixtures even when heated and are seldom ignited by properly installed and maintained general purpose electrical equipment.

2-3.5.4 The density of air saturated with combustible vapor at ambient temperature is generally less than 1.5 times the density of air. However, when the vapor is diluted with enough air to form an ignitible mixture, the density of the mixture approaches that of air.

2-4 Division 1 Classified Locations.

2-4.1

The decision to classify a location as hazardous is based upon the possibility that a flammable mixture may be present. Having decided that a location should be classified, the next step is to determine the degree of hazard: Is the location Division 1 or Division 2?

2-4.2

As stated in 2-1.3, a condition for Division 1 is whether the location is likely to have an ignitible mixture present under normal conditions. For instance, the presence of flammable vapors in the vicinity of open-dome loading of flammable liquid tank trucks is normal and requires a Division 1 classification.

2-4.3

Normal does not necessarily mean the situation that prevails when everything is working properly. For instance, there may be cases in which frequent maintenance and repair are necessary. These are viewed as normal and, if quantities of flammable liquid, gas, or vapor are released as a result of the maintenance, the location is Division 1. However, if repairs are not usually required between turnarounds, the need for repair work is considered abnormal. In any event, the classification of the location, as related to equipment maintenance, is influenced by the maintenance procedures and frequencies.

2-5 Division 2 Classified Locations.

2-5.1

The criterion for a Division 2 location is whether the location is likely to have ignitible mixtures present only under abnormal conditions. The term "abnormal" is used here in a limited sense and does not include a major catastrophe.

2-5.2

As an example, consider a vessel containing liquid hydrocarbons (the source) that releases flammable material only under abnormal conditions. In this case, there is no Division 1 location because the vessel is normally tight. To release vapor, the vessel would have to leak, and that would not be normal. Thus, the vessel is surrounded by a Division 2 location.

2-5.3

Process equipment does not fail often. Furthermore, the electrical installation requirements of NFPA 70, *National Electrical Code*, for Division 2 locations are such that an ignition-capable spark will occur only in the event of a breakdown of the electrical system. Otherwise, any spark will be contained within a suitable enclosure. On a realistic basis, the possibility of simultaneous failure of operating equipment and electrical equipment is very remote; this justifies the recognition and acceptance of the Division 2 concept.

2-5.4

The Division 2 classification is equally applicable to conditions not involving equipment failure. For example, consider a location classified as Division 1 because of the normal presence of an ignitible mixture. Obviously, one side of the Division 1 boundary cannot be normally hazardous and the opposite side never hazardous. Therefore, a surrounding Division 2 location separates the Division 1 location from the nonhazardous location. Another example would be a point emission source that releases combustible vapors during normal operation. This source is surrounded by a Division 1 location that, in turn, is surrounded by a larger, concentric Division 2 location. Division 2 is the transition zone, and the area outside the Division 2 location is not classified.

2-5.5

In cases in which an unpierced barrier, such as a blank wall, completely prevents the spread of gas or vapor, area classification does not extend beyond the barrier.

2-6 Nonclassified Locations.

2-6.1

Experience has shown that the release of ignitible mixtures from some operations and apparatus is so infrequent that area classification is not necessary. For example, it is not usually necessary to classify the following locations where combustible materials are processed, stored, or handled:

(a) Locations that are adequately ventilated, where combustible materials are contained within suitable, well-maintained, closed piping systems.

(b) Locations that are not adequately ventilated but where piping systems are without valves, fittings, flanges, and similar accessories that may be prone to leaks.

(c) Locations where combustible materials are stored in suitable containers.

2-6.2

Adequate ventilation is defined by NFPA 30, *Flammable and Combustible Liquids Code*, as that which is sufficient to prevent accumulation of significant quantities of vapor-air mixtures in concentrations over 25 percent of the lower flammable limit.

2-6.3

An adequately ventilated location is one of the following:

(a) An outside location.

(b) A building, room, or space that is substantially open and free of obstruction to the natural passage of air, either vertically or horizontally. Such locations may be roofed over with no walls, may be roofed over and closed on one side, or may be provided with suitably designed windbreaks.

(c) An enclosed or partly enclosed space provided with mechanical ventilation equivalent to natural ventilation. The mechanical ventilation system must have adequate safeguards against failure.

2-6.4

Open flames and hot surfaces associated with the operation of certain equipment, such as boilers and fired heaters, provide inherent thermal ignition sources. Electrical classification is not appropriate in the immediate vicinity of these facilities. Consideration should be given, however, to potential leak sources in pumps, valves, etc., or in waste product and fuel lines feeding flame- or heat-producing equipment to avoid installing electrical devices, which could then become primary ignition sources for such leaks.

2-7 Extent of Classified Location.

2-7.1

The extent of a Division 1 or Division 2 location requires careful consideration of the following factors:

(a) The flammable or combustible material;

(b) The vapor density of the material;

(c) The temperature of the material;

(d) The process or storage pressure;

(e) The size of release;

(f) The ventilation.

2-7.2

The first step is to identify the materials being handled and their vapor densities. Hydrocarbon vapors and gases are generally heavier than air, while hydrogen and methane are lighter than air. The following guidelines apply:

(a) In the absence of walls, enclosures, or other barriers, and in the absence of air currents or similar disturbing forces, the gas or vapor will disperse. Heavier-than-air vapors will travel primarily downward and outward; lighter-than-air vapors will travel upward and outward. If the source of the vapors is a single point, the horizontal area covered by the vapor will be a circle.

(b) For heavier-than-air vapors released at or near grade level, ignitible mixtures are most likely to be found below grade level; next most likely at grade level; with decreasing likelihood of presence as height above grade increases. In the open, away from the immediate point of release, freely drifting gases or vapors from a source near grade have seldom reached ignition sources at elevations more than 6 or 8 ft (1.8 to 2.4 m) above grade. For lighter-than-air gases, the opposite is true: there is little or no hazard at and below grade but greater hazard above grade.

(c) In cases where the source of vapor is above grade or below grade or in cases where the gas or vapor is released under pressure, the limits of the classified location are altered substantially. Also, a very mild breeze may extend these limits. However, a stronger breeze may accelerate dispersion of gases or vapors so that the extent of the classified location is greatly reduced. Thus, dimensional limits recommended for Division 1 or Division 2 zones must be based on experience rather than relying solely on the theoretical diffusion of vapors.

2-7.3

The degree to which air movement and material volatility combine to affect the extent of the classified location can be illustrated by two experiences monitored by combustible gas detectors. Gasoline spilled in a sizeable open manifold pit gave no indication of ignitible mixtures beyond 3 or 4 ft (0.9 to 1.2 m) from the pit when the breeze was 8 to 10 mph (13 to 16 km/hr). A slightly smaller pool of a more volatile material, blocked on one side, was monitored during a gentle breeze. At grade, vapors could be detected for approximately 100 ft (30 m) downwind; however, at 18 in. (46 cm) above grade there was no indication of vapor as close as 30 ft (9 m) from the pool.

These examples show the great variability that may be present in situations of this type and points out again that careful consideration must be given to a large number of factors when classifying areas.

2-7.4

The size of a building and its design may influence considerably the classification of the enclosed volume. In the case of a small inadequately ventilated sampling or testing room, it may be appropriate to classify the entire internal volume as Division 1.

2-7.5

When classifying buildings, careful evaluation of prior experience with the same or similar installations should be made. It is not enough to merely identify a potential source of vapor within the building and proceed immediately to defining the extent of a Division 1 or Division 2 location. Where experience indicates that a particular design concept is sound, a more hazardous classification for similar installations is not justified. Furthermore, it is conceivable that a location might be reclassified from Division 1 to Division 2, or from Division 2 to nonhazardous, based on experience.

2-7.6

Correctly evaluated, an installation will be found to be a multiplicity of Division 1 locations of very limited extent. Probably the most numerous of offenders are packing glands. A packing gland leaking a quart per minute (360 gallons per day) (0.95 liter per minute) would certainly not be commonplace. Yet, if a quart bottle were emptied each minute outdoors, the zone made hazardous would be difficult to locate with a combustible gas detector.

2-7.7

The volume of liquid or vapor released is of extreme importance in determining the extent of a hazardous location, and it is this consideration that necessitates the greatest application of sound engineering judgment. However, one cannot lose sight of the purpose of this judgment: the location is classified solely for the installation of electrical equipment.

Chapter 3 Determining the Degree and Extent of Hazardous (Classified) Locations

3-1 Diagrams and Recommendations.

3-1.1

This chapter contains a series of diagrams that illustrate the recommended extent of classified locations around typical sources of flammable gases or vapors. These locations may be assumed to contain an ignitible atmospheric mixture under the conditions described. Some of the diagrams are for single-point sources; others apply to multiple sources in an enclosed space or in an operating area. The bases for the diagrams are explained in Section 3-2.

3-1.2

The intended use of the diagrams is to aid in developing electrical classification maps of operating units, process plants, or buildings. Elevations or sectional views may be required where different classifications apply at different levels.

3-1.3

An operating unit will have many interconnected sources of combustible material, including pumps, compressors, vessels, tanks, and heat exchangers. These will, in turn, present sources of leaks such as flanged and screwed connections, fittings, valves, meters, etc. Thus, considerable judgment will be required to establish the boundaries of the Division 1 and Division 2 locations.

3-1.4

In some cases, individual classification of a multitude of point sources within an operating unit is neither feasible nor economical. In such cases, the entire unit may be classified as a single source entity. However, this should be considered only after a thorough evaluation of the extent and interaction of the various sources, both within the unit and adjacent to it.

3-1.5

In developing these diagrams, vapor density is generally assumed to be greater than that of air. Lighter-than-air gases, such as hydrogen and methane, will quite readily disperse, and the diagrams for lighter-than-air gases should be used. However, if such gases are being evolved from the cryogenic state (i.e., liquefied hydrogen or LNG), caution must be exercised because, for some finite period of time, these gases will be heavier than air due to their low temperature when first released.

3-2 Bases for Recommendations.

3-2.1

The practices of the petroleum refining industry are published in the American Petroleum Institute's RP 500A, *Classification of Locations for Electrical Installations in Petroleum Refineries*. These practices are based on a survey and an analysis of the practices of a large segment of the industry, experimental data, and careful weighing of pertinent factors. Refinery operations are characterized by the handling, processing, and storage of large quantities of materials, often at elevated temperatures. The recommended limits of classified locations for refinery installations may therefore be stricter than are warranted for more traditional chemical processing facilities that handle smaller quantities.

3-2.2

Various codes, standards, and recommended practices of the National Fire Protection Association include recommendations for classifying hazardous locations. These recommendations are based on many years of experience. NFPA 30, *Flammable and Combustible Liquids Code*, and NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, are two of these documents.

3-2.3

Continuous process plants and large batch chemical plants may be almost as large as refineries and should, therefore, follow the practices of the refining industry. The volume of leakage from pump and agitator shaft packing glands, piping flanges, and valves increases proportionately with process equipment size and flow rate, as does the travel distance and area of dispersion from the discharge source. Similarly, the volume of the leakage, the travel distance, and the area of dispersion all increase as operating pressure increases.

3-2.4

In deciding whether to use an overall plant classification scheme or individual equipment classification, process equipment size, flow rate, and pressure should be taken into consideration. Generally speaking, for small or batch chemical plants, point source diagrams can be used; for large, high pressure plants, the API recommendations are more suitable. Table 3-2 gives ranges of process equipment size, pressure, and flow rate for equipment and piping handling flammable or combustible liquids or gases.

3-2.5

The great majority of chemical plants fall in the moderate range of size, pressure, and flow rate for equip- ment and piping handling flammable or combustible liquids or gases. However, since all cases are not the same, sound engineering judgment is required.

Table 3-2 Relative Magnitudes of Process Equipment and Piping Handling Flammable Liquids or Gases

Process Equipment	Units	Small/Low	Moderate	Large/ High
Size	gal	<5000	5000 to 25000	>25000
Pressure	psi	< 100	100 to 500	> 500
Flow Rate	gpm	< 100	100 to 500	> 500

3-3 Procedure for Classifying Locations.

The following procedure should be used for each room, section, or area being classified.

3-3.1 Step One — Need for Classification.

The area should be classified if the answer to either of the following questions is "Yes":

(a) Are flammable liquids or flammable gases likely to be present?

(b) Are combustible liquids likely to be handled, processed, or stored at temperatures above their flash points?

3-3.2 Step Two — Assignment of Division Classification.

Assuming an affirmative answer to Step One, the following questions should be answered to determine the correct Division classification.

3-3.2.1 Division 1 locations are distinguished by a "Yes" answer to any one of the following questions:

(a) Is an ignitible atmospheric mixture likely to exist under normal operating conditions?

(b) Is an ignitible atmospheric mixture likely to occur frequently due to repair, maintenance, or leakage?

(c) Would failure of process equipment, storage vessels, or piping systems be likely to cause a failure of the electrical system simultaneous with the release of the combustible material?

(d) Is a piping system containing a combustible material in an inadequately ventilated space, and is the piping system likely to leak?

(e) Is the space or area in question below grade level such that vapors may accumulate there?

(f) Are pressure relief valve discharges located within the area?

3-3.2.2 Division 2 locations are distinguished by a "Yes" answer to any of the following questions:

(a) Is a piping system containing a combustible material in an inadequately ventilated space, and is the piping system *not* likely to leak?

(b) Is a process equipment system containing a combustible material in an inadequately ventilated space, and can the material escape only during abnormal situations, such as failure of a gasket or packing?

(c) Is the location adjacent and open to a Division 1 location, or can gas or vapor be transmitted from a Division 1 location to the location in question by trenches, pipes, or ducts?

(d) If mechanical ventilation is used, can failure or abnormal operation of the ventilation equipment permit an ignitible atmospheric mixture?

3-3.3 Step Three — Extent of Classified Location.

The extent of the classified location may be determined by applying, with sound engineering judgment, the distances recommended in the diagrams contained in this chapter.

3-4 Index of Classification Diagrams.

This section contains descriptions of the classification diagrams that follow. Most of the diagrams include a table of "suggested applicability," corresponding to Table 3-2. The check marks show the ranges of process equipment size, pressure, and flow rate where each diagram most appropriately applies. Unless otherwise stated, these diagrams assume that the material being handled is a flammable liquid.

Figure 3-4.1 shows a source of leakage located outdoors, at grade. The material being handled is a flammable liquid.

Figure 3-4.2 shows a source of leakage located outdoors, above grade. The material being handled is a flammable liquid.

Figure 3-4.3 shows a source of leakage located indoors, at floor level. Adequate ventilation is provided. The material being handled is a flammable liquid.

Figure 3-4.4 shows a source of leakage located indoors, above floor level. Adequate ventilation is provided. The material being handled is a flammable liquid.

Figure 3-4.5 shows a source of leakage located indoors, at floor level, adjacent to an opening in an exterior wall. Adequate ventilation is provided. The material being handled is a flammable liquid.

Figure 3-4.6 shows a source of leakage located indoors, at floor level, adjacent to an opening in an exterior wall. Ventilation is *not* adequate. The material being handled is a flammable liquid.

Figure 3-4.7 shows a source of leakage located outdoors, at grade. The material being handled may be a flammable liquid or a liquefied or compressed flammable gas, or a flammable cryogenic liquid.

Figure 3-4.8 shows a source of leakage located outdoors, above grade. The material being handled may be a flammable liquid or a liquefied or compressed flammable gas, or a flammable cryogenic liquid.

Figure 3-4.9 shows a source of leakage located outdoors, at grade. The material being handled is a flammable liquid.

Figure 3-4.10 shows a source of leakage located outdoors, above grade. The material being handled is a flammable liquid.

Figure 3-4.11 shows a source of leakage located indoors, adjacent to an opening in an exterior wall. Ventilation is *not* adequate. The material being handled is a flammable liquid.

Figure 3-4.12 shows a source of leakage located indoors, adjacent to an opening in an exterior wall. Adequate ventilation is provided. The material being handled is a flammable liquid.

Figure 3-4.13 shows multiple sources of leakage, located both at grade and above grade, in an outdoor process area. The material being handled is a flammable liquid.

Figure 3-4.14 shows multiple sources of leakage, located both at grade and above grade, in an outdoor process area. The material being handled is a flammable liquid.

Figure 3-4.15 shows multiple sources of leakage, located both at and above grade, in an outdoor process area. The material being handled is a flammable liquid.

Figure 3-4.16 shows multiple sources of leakage, located both at and above floor level, in an adequately ventilated building. The material being handled is a flammable liquid.

Figure 3-4.17 shows a product dryer located in an adequately ventilated building. The product dryer system is totally enclosed. The material being handled is a solid wet with a flammable liquid.

Figure 3-4.18 shows a plate and frame filter press. Adequate ventilation is provided. The material being handled is a solid wet with a flammable liquid.

Figure 3-4.19 shows a product storage tank located outdoors, at grade. The material being stored is a flammable liquid.

Figure 3-4.20 shows tank car loading and unloading via a closed transfer system. Material is transferred only through the dome. The material being transferred is a flammable liquid.

Figures 3-4.21(a) and (b) show tank car and tank truck loading and unloading via a closed transfer system. Material is transferred through the bottom fittings. The material being transferred is a flammable liquid.

Figure 3-4.22 shows tank car (or tank truck) loading and unloading via an open transfer system. Material is transferred either through the dome or the bottom fittings. The material being transferred is a flammable liquid.

Figure 3-4.23 shows tank car (or tank truck) loading and unloading via a closed transfer system. Material is transferred only through the dome. The material being transferred may be a liquefied or compressed flammable gas or a flammable cryogenic liquid.

Figure 3-4.24 shows a drum filling station located either outdoors or indoors in an adequately ventilated building. The material being handled is a flammable liquid.

Figure 3-4.25 shows an emergency impounding basin or oil/water separator and an emergency or temporary drainage ditch oil/water separator. The material being handled is a flammable liquid.

Figure 3-4.26 shows a liquid hydrogen storage located outdoors or indoors in an adequately ventilated building. This diagram applies to liquid hydrogen only.

Figure 3-4.27 shows a gaseous hydrogen storage located outdoors or indoors in an adequately ventilated building. This diagram applies to gaseous hydrogen only.

Figure 3-4.28 shows an adequately ventilated compressor shelter. The material being handled is a lighter-than-air gas.

Figure 3-4.29 shows an inadequately ventilated compressor shelter. The material being handled is a lighter-than-air gas.

NOTES:

1. The "source of vapor" shall be the operating envelope and stored position of the outboard flange connection of the loading arm (or hose).
2. The berth area adjacent to tanker and barge cargo tanks is to be Division 2 to the following extent:
   (a) 25 ft (7.6 m) horizontally in all directions on the pier side from that portion of the hull containing cargo tanks.
   (b) From the water level to 25 ft (7.6 m) above the cargo tanks at their highest position.
3. Additional locations may have to be classified as required by the presence of other sources of flammable liquids or by Coast Guard or other regulations.

Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas

1991 Edition

This edition of NFPA 497B, *Recommended Practice for the Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, was prepared by the Technical Committee on Electrical Equipment in Chemical Atmospheres and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 12-14, 1990 in Miami, FL. It was issued by the Standards Council on January 11, 1991, with an effective date of February 8, 1991.

The 1991 edition of this document has been approved by the American National Standards Institute.

Origin and Development of NFPA 497B

The Committee on Electrical Equipment in Chemical Atmospheres began the development of this recommended practice in 1989. The Committee based the diagrams in this document on various codes and standards of the National Fire Protection Association and on the accepted practices of the chemical process industries. This is the first edition of this recommended practice, and it was adopted by the Association at the 1990 Fall Meeting.

NFPA 497B
Recommended Practice for the
Classification of Class II Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas

1991 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 6 and Appendix B.

Chapter 1 General

1-1 Scope.

1-1.1

This recommended practice applies to those locations where combustible dusts are produced, processed, or handled and where dust released into the atmosphere or accumulated on surfaces may be ignited by electrical systems or equipment.

1-1.2

It also applies to chemical process areas. As used in this recommended practice, a chemical process area may be a chemical process plant, or it may be a part of such a plant. It may be a part of a manufacturing facility where combustible dusts are produced or used in chemical reactions or are handled or used in operations such as mixing, coating, extrusion, conveying, drying, grinding, etc.

1-1.3

This recommended practice does not apply to situations that may involve catastrophic failure of, or catastrophic discharge from, silos, process vessels, pipelines, tanks, hoppers, or conveying or elevating systems.

1-1.4

It does not apply to agricultural grain handling facilities except where powdered grain is used in a chemical reaction or mixture.

1-1.5

It does not apply to situations involving enriched oxygen atmospheres. It also does not apply to situations involving pyrophoric materials.

1-1.6

This recommended practice is not intended to supersede or conflict with applicable requirements of the following NFPA dust standards:

NFPA 36, *Solvent Extraction Plants*

NFPA 61A, *Manufacturing and Handling Starch*

NFPA 61B, *Grain Elevators and Facilities Handling Bulk Raw Agricultural Commodities*

NFPA 61C, *Feed Mills*

NFPA 61D, *Milling of Agricultural Commodities for Human Consumption*

NFPA 65, *Processing and Finishing of Aluminum*

NFPA 68, *Venting of Deflagrations*

NFPA 69, *Explosion Prevention Systems*

NFPA 85E, *Pulverized Coal-Fired Multiple Burner Boiler-Furnaces*

NFPA 85F, *Pulverized Fuel Systems*

NFPA 650, *Pneumatic Conveying Systems for Handling Combustible Materials*

NFPA 651, *Manufacture of Aluminum and Magnesium Powder*

NFPA 654, *Chemical, Dye, Pharmaceutical, and Plastics Industries*

NFPA 655, *Sulfur Fires and Explosions*

NFPA 664, *Wood Processing and Woodworking Facilities*

1-2 Purpose.

1-2.1

It is the intent of this recommended practice to provide the user with a basic understanding of the parameters that determine the degree and extent of the hazardous (classified) location. This document also provides the user with examples of the application of these parameters.

1-2.2

This recommended practice is intended as a guide and should be applied with sound engineering judgment. When all factors are properly evaluated, a consistent area classification scheme can be developed.

1-3 National Electrical Code® (NEC®).

1-3.1

This recommended practice is based on the criteria established by Articles 500 and 502 of NFPA 70, *National Electrical Code*. Once an area is properly classified, the *NEC* specifies the type of equipment and the wiring methods that may be used.

1-4 NFPA 497M.

1-4.1

NFPA 497M, *Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, provides information for determining if a dust is combustible based on the ignition sensitivity and explosion severity concepts specified in *Classification of Combustible Dust in Accordance with the National Electrical Code*, National Materials Advisory Board Publication 353-3.

Chapter 2 Basic Considerations

2-1 National Electrical Code Criteria.

2-1.1

Article 500 of NFPA 70, *National Electrical Code*, designates as hazardous (classified) any location in which a combustible material is or may be present in the atmosphere in sufficient concentration to produce an ignitible mixture. Article 500 defines three major categories of hazardous locations:

- Class I, in which the combustible material is a gas or vapor;
- Class II, in which the combustible material is dust;
- Class III, in which the combustible material is a fiber or flying.

This recommended practice is limited to Class II hazardous (classified) locations.

2-1.2

The intent of Article 500 is to prevent electrical equipment and systems in Class II hazardous (classified) locations from providing a means of ignition for an ignitible dust cloud or layer.

2-1.3

Within Class II hazardous (classified) locations, Article 500 recognizes two degrees of hazard: Division 1 and Division 2.

2-1.3.1 A Division 1 location is a location where (a) combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures; or (b) mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced and might also provide a source of ignition through simultaneous failure of electrical equipment, operation of protection devices, or other causes; or (c) Group E dusts may be present in hazardous quantities.

2-1.3.2 A Division 2 location is a location where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus. However, combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and where combustible dust accumulations on, in, or in the vicinity of the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment.

NOTE: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an unclassified area.

2-1.4

Electrical installations in Division 1 locations are designed and enclosed in a manner that will exclude ignitible amounts of dusts and will not permit arcs, sparks, or heat generated or liberated inside the enclosures to cause ignition of exterior dust accumulations on the enclosure or of atmospheric dust suspensions in the vicinity of the enclosure.

2-1.5

Electrical installations in Division 2 locations may be designed with dusttight enclosures or other equipment enclosures as specified in Article 502.

2-1.6

Electrical installations for classified locations may be designed in various manners. No single manner is best in all respects for all types of equipment used in a chemical plant. Dust-ignitionproof electrical equipment, pressurized electrical equipment, and intrinsically safe electrical equipment are applicable to both Division 1 and Division 2 locations. Other dusttight equipment enclosures as specified in Article 502 of NFPA 70, *National Electrical Code*, are permitted in Division 2 locations.

2-1.7

Equipment and wiring suitable for Class I, Division 1 locations are not required and may not be acceptable in Class II locations.

2-1.7.1 Where both combustible vapors and dusts are present, electrical equipment and wiring suitable for simultaneous exposure to both Class I and Class II conditions are required.

2-1.7.2 Where Group E dusts are present in hazardous quantities, there are only Division 1 locations. The *NEC* does not recognize any Division 2 areas for such dusts.

2-1.8

Factors such as corrosion, weather, maintenance, equipment standardization and interchangeability, and possible process changes or expansion frequently dictate the use of special enclosures or installations for electrical systems. However, such factors are outside the scope of this recommended practice, which is concerned entirely with the proper application of electrical equipment to avoid ignition of combustible dusts.

2-1.9

For the purpose of this recommended practice, locations that do not need to be classified as Division 1 or Division 2 are nonclassified locations.

2-2 Conditions Necessary for Ignition.

2-2.1*

In a Class II location, ignition may occur under three different sets of conditions.

2-2.1.1 In the first set of conditions,

(a) A combustible dust must be present.

(b) The dust must be suspended in the air in the proportions required to produce an ignitible mixture. Further, within the context of this recommended practice, a sufficient quantity of this suspension must be present in the vicinity of the electrical equipment.

(c) There must be a release of energy intense enough to cause ignition of the suspended mixture. Within the context of this recommended practice, the energy release is understood to originate within the electrical system.

2-2.1.2 In the second set of conditions,

(a) A combustible dust must be present.

(b) The dust must be layered on the electrical equipment sufficiently thick to interfere with the dissipation of heat and allow the layer to reach the ignition temperature of the dust.

(c) The external temperature of the electrical equipment must be high enough to cause the dust to reach its ignition temperature directly or to dry out the dust and cause it to self-heat.

2-2.1.3 In the third set of conditions,

(a) A Group E dust must be present.

(b) The dust must be layered or in suspension in hazardous quantities.

(c) Tracking must be sufficient to cause ignition. (*See 2-4.2.*)

2-2.2

Once ignition has occurred either in a cloud suspension or in a layer, an explosion is likely. Often the initial explosion is followed by another much more violent explosion fueled by the dust from dust accumulations on structural beams and equipment surfaces that are thrown into suspension by the initial blast. For this reason, good housekeeping in all areas handling dust is vitally important and is assumed throughout this recommended practice.

2-2.3

In classifying a particular location, the presence of a combustible dust is significant in determining the correct division. The classification depends both on the presence of dust clouds and on the presence of hazardous accumulations of dust in layer form. As defined in 2-1.3.1, the presence of a combustible dust cloud under normal conditions of operation, or due to frequent repair or maintenance, calls for a Division 1 classification. Abnormal operation of machinery and equipment, which may simultaneously produce a dust cloud or suspension and a source of ignition, also calls for a Division 1 classification. In other words, if a dust cloud is present at any time, it is assumed to be ignitible, and all that is necessary for electrical ignition is failure of the electrical system. If dust clouds or hazardous dust accumulations are present only as a result of infrequent malfunctioning of handling or processing equipment, and ignition can result only from abnormal operation or failure of electrical equipment, the location is designated as Division 2.

2-2.4

The presence of an ignitible dust cloud or an ignitible dust layer is important in determining the boundaries of the classified location. The quantity of dust, its physical and chemical properties, dust dispersion properties, and the location of walls and cutoffs must all be recognized.

2-3 Behavior of Dusts.

2-3.1 Dispersion and Explosion.

2-3.1.1 Dust discharged or leaking from equipment into the atmosphere is acted on by gravity and will settle relatively quickly depending on the size of particles, the internal pressure propelling the particles out of the equipment, and any air currents in the vicinity. The result is a layer of dust that settles on horizontal surfaces below the leak opening in a radial or elliptical manner, depending on the location of the opening on the equipment. The depth of the layer will be greatest under and close to the source and will taper off to the outside of the circle or ellipse. The greater the height of the dust source above the surface, the greater the area covered. The internal pressure in the equipment will likewise increase the area covered. The size of the leak opening and the elapsed time of emission also affect the quantity of dust on the surface. Some dusts have particles that are extremely fine and light (have a low specific particle density). Such particles may behave more like vapors than like dusts and may remain in suspension for long periods. These particles may travel far from the emitting source and collect on surfaces above the source. While horizontal surfaces accumulate the largest quantities of dust, vertical surfaces may in some instances also accumulate significant quantities.

2-3.1.2 While a dust cloud will ignite and explode readily in the presence of an open ignition source, dust layers, if undisturbed and not in direct contact with the ignition source, will not explode. However, if a small amount of dust is dispersed in the air at the ignition source, a small explosion will occur. The pressure wave from this explosion blows the dust layer into the air, and a larger explosion then takes place. It is often this secondary explosion that does the most damage.

2-3.2 Hybrid Dusts.

2-3.2.1 A hybrid dust is a mixture of a dust with one or more flammable gases or vapors. The presence of the flammable gas or vapor, even at concentrations less than their lower flammable limit (LFL), will not only add to the violence of the dust-air combustion but will drastically reduce the ignition energy. This situation is encountered in certain industrial operations, such as fluidized bed driers and pneumatic conveying systems for plastic dusts from polymerization processes where volatile solvents are used. In such cases, electrical equipment should be specified that is suitable for simultaneous exposure to both the Class I (flammable gas) and the Class II (combustible dust).

2-4 Classification of Dusts.

2-4.1

Class II combustible dusts are divided into three groups (Groups E, F, and G) based upon the nature of the dust.

The definitions of the three dust groups are as follows:

Group E: Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

Group F: Atmospheres containing combustible carbonaceous dusts, including carbon black, charcoal, coal, or coke dusts that have more than 8 percent total entrapped volatiles (*see ASTM D3175-82 for coal and coke dusts*) or that have been sensitized by other materials so that they present an explosion hazard.

Group G: Atmospheres containing other combustible dusts, including flour, grain, wood flour, plastic, and chemicals.

2-4.2

For purposes of classification, only Group E dusts shall be considered conductive. Group E dusts are sensitive to a phenomenon whereby an electric current finds the path of least resistance through a dust layer, heating up the dust particles in its path and thus providing a source of ignition. Thus, an electric arc may ignite a dust layer or a dust cloud. This phenomenon is commonly known as tracking.

Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution will be necessary to avoid ignition and explosion.

Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures [as low as 20°C (68°F)] and minimum ignition energies lower than any material classified in any of the Class I or Class II groups.

All areas where Group E dusts are present in hazardous quantities are classified as Division 1 locations. There are no Division 2 locations for Group E dusts.

2-4.3

A listing of selected combustible dusts appears in NFPA 497M, *Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, with their group classification and autoignition temperature of the cloud or layer, whichever is less.

2-5 Ignition of Dust Clouds.

2-5.1

The ignition energy required to ignite a dust cloud varies from dust to dust. However, the ignition energies are well below those that may be produced by most electrical sparks or an electrical fault; it is therefore not necessary to know the exact figure in order to classify areas for appropriate electrical equipment.

Exception: Intrinsically safe equipment energy levels are below the minimum ignition energies.

2-5.2

On the other hand, the cloud ignition temperature is important since the surface temperatures of both electrical and mechanical equipment in the area must be safely below this temperature.

2-5.3

Section 500-3(d) of the *NEC* specifies temperature limitations for Class II electrical equipment.

2-5.4

Some dusts that are not normally combustible may form explosive dust clouds when mixed with a flammable gas or vapor. (*See 2-3.2 Hybrid Dusts*.)

2-6 Ignition of Dust Layers.

2-6.1

The ignition temperature of a dust layer is a function of the type of dust and its physical and chemical properties. Where the dust covers electrical equipment that produces heat, such as lighting fixtures and motors, the dust acts as an insulator and leads to a heat buildup in the equipment and in the dust layer. As the thickness of the dust layer increases and the duration of exposure to the heat increases, the ignition temperature decreases and the dust ignites. Often the layer ignition temperature of the dust is less than the cloud ignition temperature of the dust.

2-6.2

The burning of the dust not only introduces an open flame ignition source that can ignite a dust cloud in the vicinity, but it also stirs up the dust layer, throwing dust into a cloud suspension.

2-6.3

Section 500-3(d) of the *NEC* specifies temperature limitations for Class II electrical equipment.

2-6.4

Some dusts in layers melt before they reach their layer ignition temperatures. In some cases, the melted material may then act more like a combustible liquid than a dust. Other materials, such as some polymers, degrade to a lower molecular weight material or to the monomer itself. This may introduce a flammable liquid problem into what was only a combustible dust problem. Materials such as unplasticized polyvinyl chloride, sulfur, and zinc stearate melt but cause only maintenance problems.

2-6.5

When subjected to heat, dusts of thermosetting plastics, such as phenol formaldehyde resins, tend to polymerize ("set up") and become hard. Continued heat buildup in the polymerized material ultimately leads to carbonization (degradation) of the material and a significantly lower ignition temperature. While this phenomenon is well known, there is no standardized test to define the precise parameters. Nonplastic materials such as sugar, cornstarch, and dextrine also carbonize and ignite at lower than expected temperatures.

Chapter 3 Degree of Hazard for Group F and G Dusts

3-1 Dust Layer Thickness.

3-1.1*

Generally speaking, the *NEC* indicates that (a) if there are explosive dust clouds under normal operating conditions, or (b) if such explosive dust clouds can be produced at the same time that a source of ignition is produced, then the area is a Division 1 location. The dust in (b) can be provided directly by some malfunction of machinery or equipment or can be provided by accumulations of dust on surfaces that are thrown into the air. Presumably, if all the dust on all surfaces in a room is sufficient to produce a dust concentration above the minimum explosive concentration, then that quantity of dust should define a Division 1 location.

From a practical point of view, a room with a concentration of dust that is above the minimum explosive concentration [criterion (a)] results in an atmosphere so dense that visibility beyond 3–5 ft (0.9 1.5 m) is impossible. Such a condition is unacceptable under today's standards for chemical plant work places. If such a situation were encountered, accumulations on horizontal surfaces would build up very rapidly.

On the other hand, working back from dust layers on horizontal surfaces in a room to a minimum explosive concentration in the room based on laboratory dust explosion tests shows a very thin layer of dust in the order of $^{1}/_{84}$ in. (0.3 mm) to be hazardous. This is an equally impractical answer since one of the most difficult experimental problems in dust explosion test work is to obtain a reasonably uniform cloud for ignition. As a result, the test apparatus is designed specifically to obtain uniform dust distribution. For dust lying on horizontal surfaces in a room or factory to attain such an efficient uniform distribution during an upset condition is obviously impossible.

3-2 Optimum Concentration Criteria.

3-2.1*

The optimum concentration is the concentration where the maximum rate of pressure rise is obtained under test conditions. Since the optimum concentration is far higher than the minimum explosive concentration, the layer thicknesses necessary to produce an optimum concentration are from 0.075 in. to 0.5 in. (1.9 mm   12.7 mm). There is then much more dust available to be thrown into uniform suspension without postulating a 100 percent efficiency of dispersal and distribution. In addition, there are a number of factors such as particle size and shape, moisture content, uniformity of distribution, etc., that negatively affect the susceptibility of a dust to ignition. Thus, dusts encountered in industrial plants tend to be less susceptible to ignition than those used in the laboratory to obtain explosion concentration data. The following classifications of areas are recommended, based on a buildup of the dust level in a 24-hr period on the major portions of the horizontal surfaces.

Thickness	Division
Greater than $^1/_8$ in. (3.18 mm)	1
$^1/_8$ in. (3.18 mm) and less but surface color not discernible	2
Surface color discernible under dust layer	Nonclassified

Based on these thicknesses of dust, good housekeeping can determine the difference between a classification of Division 1 and a classification of Division 2, and a classification of Division 2 and nonclassified. It should be emphasized, however, that housekeeping is a supplement to dust source elimination and mechanical ventilation. It is not a primary method of dust control.

3-3 Division 1 Classified Location.

3-3.1

The decision to classify a location as hazardous is based upon the possibility that an ignitible mixture of dust may be present. Having decided that a location should be classified, the next step is to determine the degree of hazard. Is the location Division 1 or Division 2?

3-3.2

As stated in 2-1.3.1 and 2-2.4, a condition for Division 1 is whether the location is likely to have an ignitible dust cloud or a thick layer of dust present under normal conditions. For example, the presence of ignitible dust suspensions and layers of dust in the vicinity of an open bagging operation is normal and requires a Division 1 classification.

3-3.3

Normal does not necessarily mean the situation that prevails when everything is working properly. For instance, there is a bucket elevator that requires frequent maintenance and repair. This is viewed as normal, and, if quantities of ignitible dust are released as a result of the maintenance, the location is Division 1. However, if that elevator is replaced and now repairs are not usually required between turnarounds, the need for repairs is considered abnormal. The classification of the location, therefore, is related to equipment maintenance, both procedures and frequencies. Similarly, if the problem is the buildup of dust layers without the presence of visible dust suspensions, good frequent cleaning procedures or the lack thereof will influence the classification of the area.

3-4 Division 2 Classified Location.

3-4.1

The criterion for a Division 2 location is whether the location is likely to have ignitible dust suspensions or hazardous dust accumulations only under abnormal conditions. The term "abnormal" is used here in a limited sense and does not include a major catastrophe.

3-4.2

As an example, consider the new bucket elevator of 3-3.3, which releases ignitible dust only under abnormal conditions. In this case there is no Division 1 location because the elevator is normally tight. To release dust, the elevator would have to leak, and that would not be normal. Thus, the elevator is surrounded by a Division 2 location.

3-4.3

Chemical process equipment does not fail often. Furthermore, the electrical installation requirement of NFPA 70 for Division 2 locations is such that an ignition-capable spark or hot surface will occur only in the event of abnormal operation or failure of electrical equipment. Otherwise, sparks and hot surfaces are not present or are contained in enclosures. On a realistic basis, the possibility of process equipment and electrical equipment failing simultaneously is remote; this justifies the recognition and acceptance of the Division 2 concept.

3-4.4

The Division 2 classification is applicable to conditions not involving equipment failure. For example, consider a location classified as Division 1 because of normal presence of ignitible dust suspension. Obviously, one side of the Division 1 boundary cannot be normally hazardous and the opposite side never hazardous. Similarly, consider a location classified as Division 1 because of the normal presence of hazardous dust accumulations. One side of the division boundary cannot be normally hazardous with thick layers of dust and the other side nonhazardous with no dust unless there is an intervening wall. When there is no wall, a surrounding transition Division 2 location separates a Division 1 location from a nonclassified location.

3-4.5

Walls are much more important in separating Division 1 locations from Division 2 and nonclassified locations in Class II areas than in Class I areas. Only unpierced solid walls make satisfactory barriers in Class I areas, while walls with closed doors, lightweight partitions, even partial partitions, make satisfactory barriers between Class II, Division 1 locations and nonhazardous locations. Area classification does not extend beyond the barrier, provided any openings can be closed or are effective in preventing the passage of dust in suspension or layer form.

3-5 Nonclassified Locations.

3-5.1

Experience has shown that the release of ignitible dust suspensions from some operations and apparatus is so infrequent that area classification is not necessary. For example, it is usually not necessary to classify the following locations where combustible ground up solids are processed, stored, or handled:

- Locations where materials are stored in sealed containers — bags, drums, fiber packs — palletized or racked.

- Locations where materials are transported in well-maintained closed piping systems.

- Locations where palletized materials with minimal dust are handled or used.

- Locations where closed tanks are used for storage and handling.

- Locations where mechanical dust collection systems on equipment prevent (a) visual dust clouds or (b) layer accumulations that make surface colors indiscernible. (*See 3-2.1*.)

- Locations where excellent housekeeping is maintained and there are (a) no visual dust suspensions or (b) layer accumulations that make surface colors indiscernible. (*See 3-2.1*.)

3-5.2

Mechanical dust collection systems that are provided on equipment to allow a nonclassified location must have adequate safeguards and warnings against failure.

3-5.3

Open flames and hot surfaces associated with the operation of certain equipment, such as boilers and fired heaters, provide inherent thermal ignition sources. Electrical classification is not appropriate in the immediate vicinity of these facilities. Dust containing operations should be cut off by blank walls or located away from such facilities. Where pulverized coal or ground up solid waste is used to fire a boiler or incinerator, consideration should be given to potential leak sources in fuel feed lines to the burners to avoid installing electrical devices that could in themselves become primary ignition sources for such leaks.

Chapter 4 Extent of Classified Locations

4-1 Extent of Classified Locations.

4-1.1

This chapter deals with the extent of Division 1 or Division 2 locations. References to Division 2 locations apply only to Group F or G dusts. Careful consideration of the following factors is necessary in determining the extent of the locations:

- the combustible material involved

- the bulk density of the material

- the particle sizes of the material

- the density of the particles

- the process or storage pressure

- the size of the leak opening

- the quantity of the release

- the dust collection system
- the housekeeping
- the presence of any flammable or combustible gas.

4-1.2

The dispersal of dusts and the influence of the above factors on this dispersal were discussed generally in Sections 2-3, 2-4, 2-5, and 2-6. The influence of dust collection and housekeeping were discussed generally in other paragraphs of this chapter.

4-1.3

In addition, walls, partitions, enclosures, or other barriers and strong air currents will also affect the distance that dust particles will travel and the extent of the Division 1 and Division 2 locations.

4-1.4

Where there are walls that limit the travel of the dust particles, area classifications do not extend beyond the walls. Enclosing rooms, walls, and partitions are a primary means of limiting the extent of hazardous locations.

4-1.5

Where there are no effective walls involved, the extent of the Division 1 and Division 2 locations can be estimated as follows:

- By visual observation of the existing area using the guidelines of 3-2.1.
- By experience with similar dusts and similar operations and taking into consideration any new equipment, any new enclosures, any new mechanical dust collection, and any changes in housekeeping rules and methods.
- By calculation.

4-1.6

Tight equipment, mechanically ventilated hoods and pickup points, adequate maintenance, and housekeeping should limit Division 1 locations to the inside of process enclosures and equipment and close to openings necessary for transfer of material such as from conveyors to grinders to storage bins to bags. Similarly, such good engineering will also limit the Division 2 location surrounding the Division 1 location.

4-1.7

The size of a building and its walls will influence the classification of the enclosed volume. In the case of a small room, it may be appropriate to classify the entire volume as Division 1 or Division 2.

4-1.8

When classifying large buildings, careful evaluation of prior experience with the same or similar installations should be made. Where experience indicates that a particular design concept is sound, a more hazardous classification for similar installations may not be justified. On the other hand, where experience indicates a particular design concept results in an unsatisfactory dust condition, sound engineering judgment is essential in reducing the extent of the hazardous locations based on engineering changes.

4-1.8.1 Wherever possible with large buildings, walls should be used to cut off dusty operations to avoid extensive use of special electrical equipment. Where walls are not possible, the concentric volume approach of a Division 1 location surrounded by a larger Division 2 location may be satisfactory.

4-1.8.2 Where a number of dusty operations are located in a building, it may be satisfactory to have a multiplicity of Division 1 locations with the intervening Division 2 and nonclassified locations.

4-1.9

The quantity of dust released and its distance of travel is of extreme importance in determining the extent of a hazardous location, and it is this consideration that necessitates the greatest application of sound engineering judgment. However, one cannot lose sight of the purpose of this judgment; the location is classified solely for the installation of electrical equipment.

Chapter 5 Determining the Degree and Extent of Hazardous (Classified) Locations

5-1 Diagrams and Recommendations.

5-1.1

This chapter contains a series of diagrams that illustrate how typical dusty sites should be classified and the recommended extent of the various classifications.

5-1.2

The intended use of the diagrams is to aid in developing electrical classification maps of operating units, storage areas, and process buildings. Most of the diagrams are plan views. Elevations may be necessary to provide the three-dimensional picture of an actual operation.

5-1.3

These diagrams apply to operating equipment processing dusts when the specific particle density is greater than 40 lb/cu ft (640.72 kg/m^3). When dusts with a specific particle density less than 40 lb/cu ft (640.72 kg/m^3) are being handled there is a pronounced tendency for the fine dust to drift on air currents normally present in industrial plants for distances considerably farther than those shown on these diagrams. In those cases it will be necessary to extend the classified area. It is difficult to recommend precise classified areas in these circumstances.

5-1.4

Good engineering practices, good housekeeping practices, and dust control systems are necessary to limit the extent of the classified locations and to minimize the chances of primary and the often more violent secondary explosions.

5-1.5

An operating unit may have many interconnected sources of pulverized combustible materials such as storage tanks, bins and silos, piping and ductwork, hammer mills, ball mills, grinders, pulverizers, milling machines, conveyors, bucket elevators, and bagging or other packaging machines. These in turn present sources of leaks such as flanged and screwed connections, fittings, openings, valves, and metering and weighing devices. Thus, actual diagrams of the equipment may be required so that the necessary engineering judgment to establish the boundaries of Division 1 and Division 2 locations may be applied properly.

5-2 Procedure for Classifying Locations.

The following procedure should be used for each room, section, or area being classified.

5-2.1 Step One — Need for Classification:

The area should be classified if the answer to the following question is "Yes."

(a) Are combustible dusts likely to be present?

5-2.2 Step Two — Assignment of Division Classification:

Assuming an affirmative answer to Step One, the following questions should be answered to determine the correct division classification.

5-2.2.1 Division 1 locations are distinguished by a "Yes" answer to any one of the following questions:

(a) Is a Group E dust present in hazardous quantities?

(b) Is a dust likely to be in suspension in air continuously, periodically, or intermittently under normal conditions in quantities sufficient to produce explosive or ignitible mixtures?

(c) Will mechanical failure or abnormal operation of machinery or equipment cause such explosive or ignitible mixtures to be produced, and might it also provide a source of ignition through simultaneous failure of electrical equipment operation of protective devices or from other causes?

(d) Are there dust layers or accumulations on surfaces deeper than $^1/_8$ in. (3.18 mm)?

5-2.2.2 Division 2 locations for Group F or G dusts are distinguished by a "Yes" answer to any of the following questions:

(a) Is the dust not normally in suspension in the air in quantities sufficient to produce explosive or ignitible mixtures, but could it be thrown into suspension by infrequent malfunctioning of handling or processing equipment?

(b) Are the dust accumulations insufficient to interfere with the normal operation of electrical equipment, but could the accumulations be ignited by the abnormal operation or failure of electrical equipment?

(c) Is there a dust layer that makes the colors of the surfaces indiscernible?

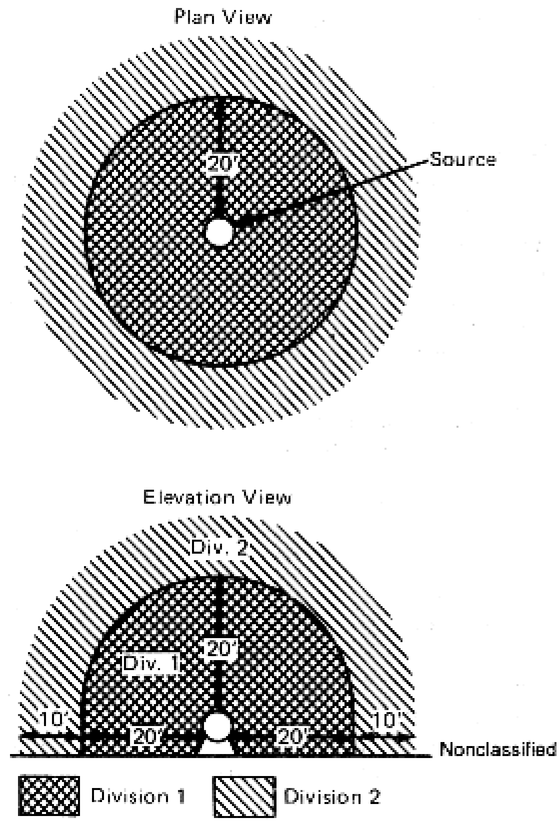
(d) Would the failure of mechanical dust collection allow an ignitible suspension of dust or a layer deeper than $^1/_8$ in. (3.18 mm) to build up?

5-2.3 Step Three — Extent of Classified Location:

The extent of the classified location may be determined by applying, with sound engineering judgment, the methods discussed in 4-1.5 and the diagrams contained in this chapter.

5-3 Index of Classification Diagrams.

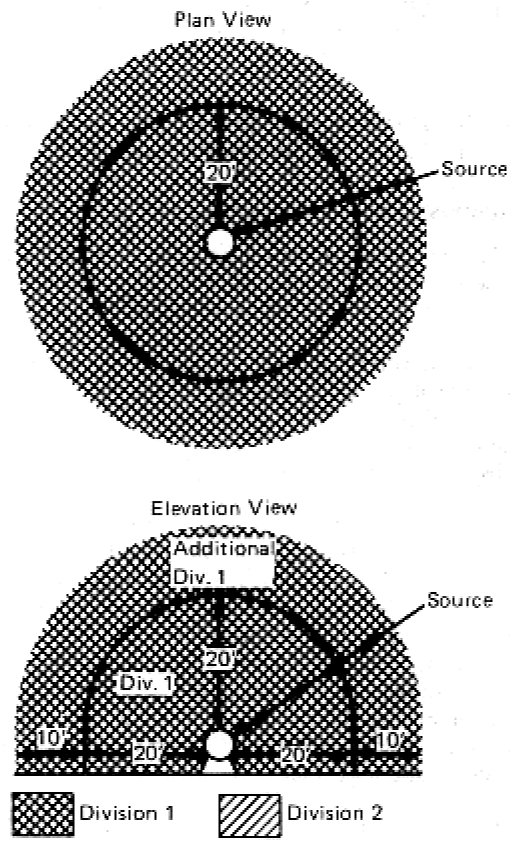
This section contains descriptions of the classification diagrams that follow.



Description of Dust Condition

DIVISION 1	DIVISION 2
Moderate or dense dust cloud. Dust layer greater than 1/8 in. (3.18 mm).	No visible dust cloud. Dust layer less than 1/8 in. (3.18 mm) and surface color not discernible.

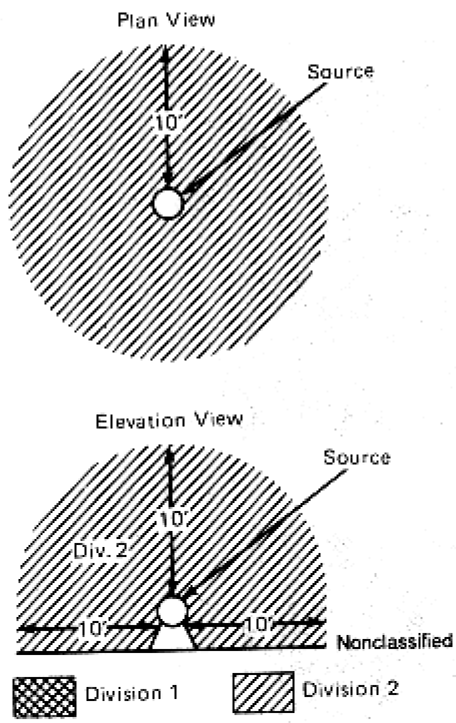
Figure 5-3.1 Group F or Group G dust—indoor unrestricted area, open or semienclosed equipment.



Description of Dust Condition

DIVISION 1	ADDITIONAL DIVISION 1
Moderate or dense dust cloud or dust layer greater than 1/8 in. (3.18 mm).	Dust layer less than 1/8 in. (3.18 mm) and surface color not discernible.

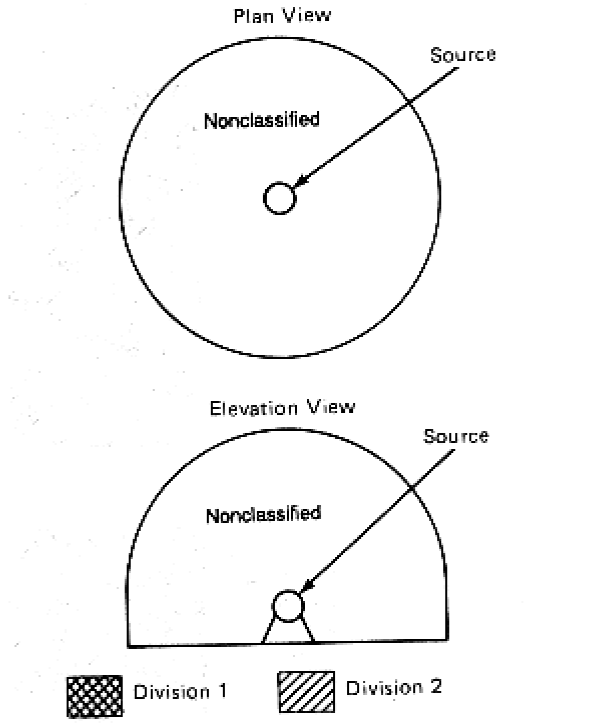
Figure 5-3.2 Group E dust—indoor unrestricted area, open or semienclosed operating equipment.



Description of Dust Condition

DIVISION 1	DIVISION 2
None	No visible dust cloud. Dust layer less than 1/8 in. (3.18 mm) and surface color notdiscernible.

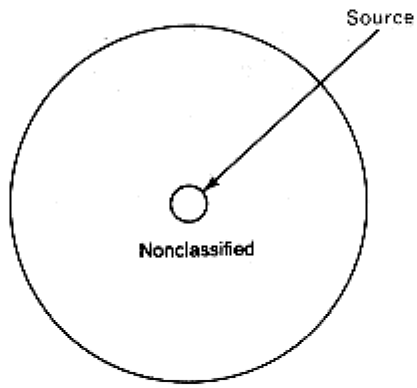
Figure 5-3.3 Group F or Group G dust—indoor unrestricted area, operating equipment enclosed.



Description of Dust Condition

DIVISION 1	DIVISION 2	NONCLASSIFIED
None	None	Surface color discernible.

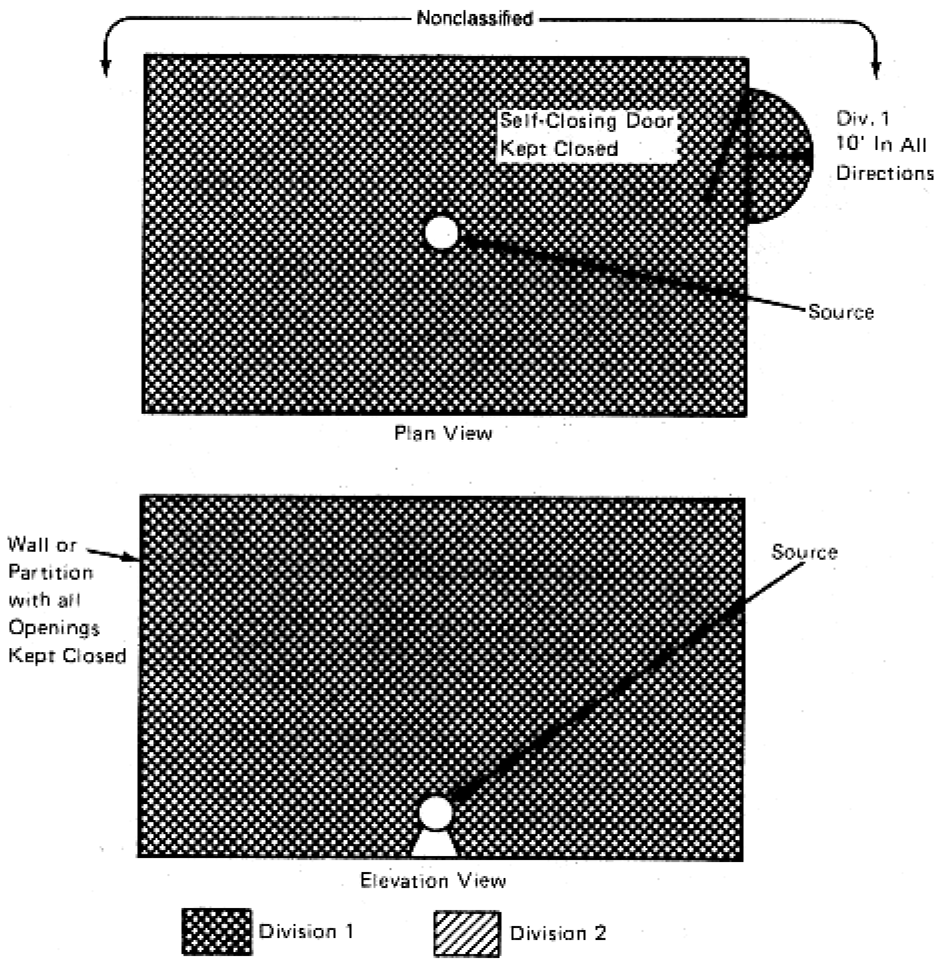
Figure 5-3.4 Group F or Group G dust—indoor unrestricted area, operating equipment enclosed.



Description of Dust Condition

DIVISION 1	DIVISION 2	NONCLASSIFIED
None	None	Dust layer not apparent. Surface color discernible.

Figure 5-3.5 Groups E, F, or G dusts—storage area bags, drums, or closed hoppers.



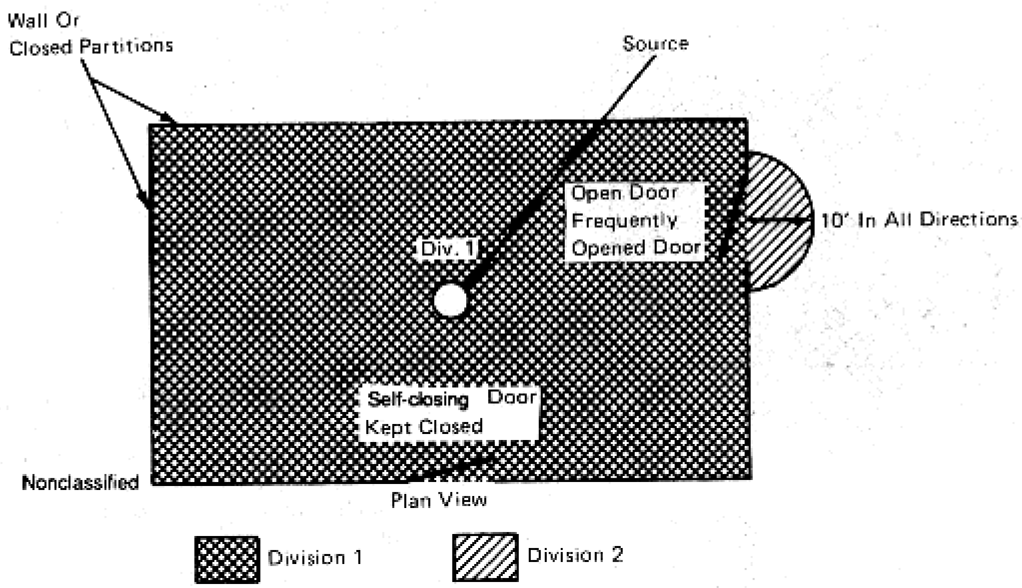
Description of Dust Condition

Minimize Division 1 Cutoff Volume and Area

Description of Equipment/Area Control

Maximize Confinement
Maximize Dust Control
Maximize Housekeeping
See 5-1.4

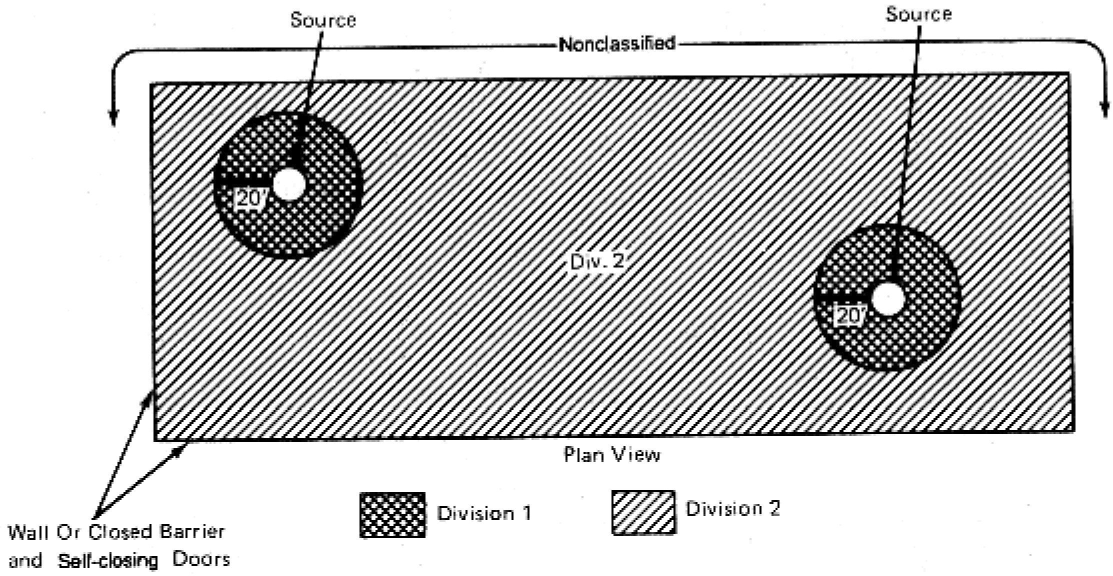
Figure 5-3.6 Group E dust—inside walled off area; operating equipment enclosed.



Description of Dust Condition

DIVISION 1	DIVISION 2
Moderate to dense dust cloud or dust layer greater than 1/8 in. (3.18 mm).	No visible dust cloud. Dust layer less than 1/8 in. (3.18 mm) but surface color not discernible.

Figure 5-3.7 Group F or G indoor walled off area; operating equipment open or semienclosed.



Description of Dust Condition

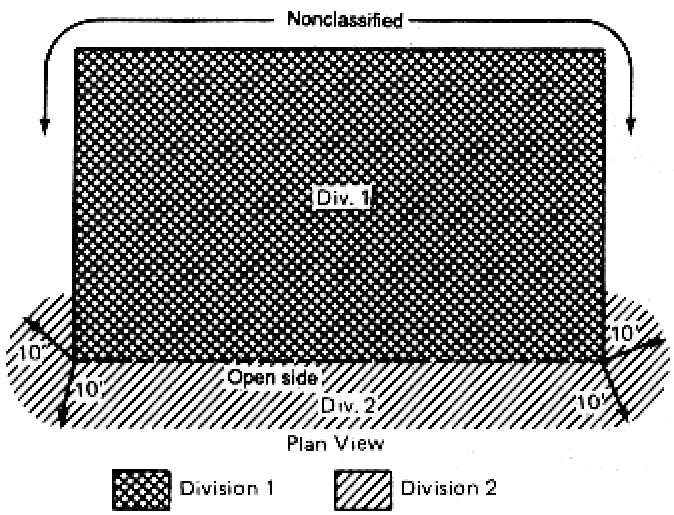
DIVISION 1

Moderate to dense dust cloud. Dust layer greater than ⅛ in. (3.18 mm).

DIVISION 2

No visible dust cloud. Dust layer less than ⅛ in. (3.18 mm) and surface color not discernible.

Figure 5-3.8 Group F or Group G indoor walled off area; multiple operating equipment.



Description of Dust Condition

DIVISION 1	DIVISION 2
Moderate to dense dust cloud or dust layer greater than $\frac{1}{8}$ in. (3.18 mm).	No visible dust cloud. Dust layer less than $\frac{1}{8}$ in. (3.18 mm) and surface color not discernible.

ASTM D3175-82, *Standard Test Method for Volatile Matter in the Analysis Sample of Coal and Coke*

Appendix A

This Appendix is not a part of the recommendations of this NFPA document, but is included for information purposes only.

A-2-2.1

Open flames and welding and cutting operations have far more energy and heat than most electrical fault sparks and arcs and are quite capable of igniting dusts. Hot surfaces such as those in some heaters, or caused by continuous friction, may also have sufficient heat to ignite dusts. Such sources of ignition must therefore be carefully controlled.

A-3-1.1

A typical calculation considers cornstarch with a powder bulk density of approximately 25 lb/ft^3. The minimum explosive concentration is 0.04 oz/ft^3. In a room 10 ft high by 10 ft wide by 10 ft long, calculate the depth of dust that would accumulate on the floor if the room were completely filled with a cornstarch cloud at the minimum concentration.

$$\frac{0.04\ \text{oz}}{\text{ft}^3} \times 1000\ \text{ft}^3 \times \frac{1\ \text{lb}}{16\ \text{oz}} \times \frac{1\ \text{ft}^3}{25\ \text{lb}} = 0.1\ \text{ft}^3 \text{ of dust on the floor}$$

Evenly distributed over 100 sq ft, the depth of dust would be:

$$\frac{0.1\ \text{ft}^3}{100\ \text{ft}^2} = 0.001\ \text{ft} = 0.012\ \text{in. } (^1/_{84}\ \text{in. thick})$$

Theoretically, throwing this amount of dust back from the floor and ledges into the room volume would create a hazardous condition. Accomplishing such a feat, even experimentally, would be virtually impossible.

A-3-2.1

The following table shows the theoretical thickness of dust on the floor of a 10 ft × 10 ft × 10 ft room necessary to satisfy the concentration requirements for a uniform dust cloud of minimum explosive concentration and for a uniform dust cloud of optimum concentration for four dusts.

Table A-3-2.1

	Min. Conc.	Depth of Dust	Opt. Conc.	Depth of Dust	Bulk Density
	oz/ft^3	In.	oz/ft^3	In.	lb/ft^3
Cornstarch	0.04	0.012	0.5	0.15	25-50
Cork	0.035	0.022	0.2	0.125	12-15

Sugar	0.045	0.0068	0.5	0.075	50-55
Wood Flour	0.035	0.016	1.0	0.47	16-36
Polyethylene	0.020	0.0072	0.5	0.180	21-35
(Low Density)

NFPA 497M

1991 Edition

Manual for Classification of Gases, Vapors, and Dusts for

Electrical Equipment in Hazardous (Classified) Locations

1991 Edition

This edition of NFPA 497M, *Manual for Classification of Gases, Vapors, and Dusts for Electrical Equipment in Hazardous (Classified) Locations*, was prepared by the Technical Committee on Electrical Equipment in Chemical Atmospheres and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 12–14, 1990 in Miami, FL. It was issued by the Standards Council on January 11, 1991, with an effective date of February 8, 1991, and supersedes all previous editions.

The 1991 edition of this document has been approved by the American National Standards Institute.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

Origin and Development of NFPA 497M

In May, 1980, the 1981 edition of NFPA 70, *National Electrical Code*,® was proposed for adoption. Article 500 of this edition of the NEC® contained extensive lists of gases, vapors, and dusts, and their group classifications, as recommended by the National Materials Advisory Board of the National Academy of Sciences. Upon recommendation of the NFPA Technical Committee on Electrical Equipment in Chemical Atmospheres, these lists were removed from the 1981 NEC. The Technical Committee justified this action by claiming that the entries in the lists did not receive adequate review, were, in some cases, incorrect, and, in other cases, greatly overstated the hazard. Code-Making Panel 14 of the National Electrical Code Committee, the body responsible for Article 500, gave the Technical Committee the task of reviewing and amending the lists and requested that a classification manual be developed in time to be adopted by the Association prior to the next edition of the NEC.

The Technical Committee on Electrical Equipment in Chemical Atmospheres immediately developed criteria for gases, vapors, and dusts for the classification lists. Using these criteria, the Committee reviewed the NMAB lists and removed some materials that the Committee felt did not warrant classification. As a result of the public review and comment period, the Committee revised its criteria and expanded the lists significantly.

The information in this manual is intended to aid the engineer in specifying electrical equipment for hazardous (classified) locations in compliance with the *National Electrical Code*.

This manual was first adopted by the Association at its 1982 Fall Meeting. Amendments were adopted at the 1985 Fall Meeting and the 1990 Fall Meeting.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Manual for Classification of Gases,Vapors, and Dusts for Electrical Equipment in Hazardous(Classified) Locations

1991 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.

Information on referenced publications can be found in Chapter 4 and Appendix C.

Chapter 1 General

1-1 Scope.

This manual provides information on specific flammable gases, flammable and combustible liquids, and combustible dusts whose relevant combustion properties have been identified sufficiently to allow their classification into the groups established by the *National Electrical Code* for proper selection of electrical equipment in hazardous (classified) locations. The tables in this manual are not intended to be all inclusive.

1-2 Purpose.

The purpose of this manual is to assist in the selection of special electrical equipment for hazardous (classified) areas where such electrical equipment is required. *(See Article 500 of NFPA 70, National Electrical Code*.)

1-3 Definitions.

For the purpose of this manual, the following terms shall have the meanings given below:

Approved. Acceptable to the "authority having jurisdiction."

NOTE: The National Fire Protection Association does not approve, inspect or certify any installations, procedures, equipment, or materials nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations which is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The "authority having jurisdiction" is the organization, office or individual responsible for "approving" equipment, an installation or a procedure.

NOTE: The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner since jurisdictions and "approval" agencies vary as do their responsibilities. Where public safety is primary, the "authority having jurisdiction" may be a federal, state, local or other regional department or individual such as a fire chief, fire marshal, chief of a fire prevention bureau, labor department, health department, building official, electrical inspector, or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the "authority having jurisdiction." In many circumstances the property owner or his designated agent assumes the role of the "authority having jurisdiction"; at government installations, the commanding officer or departmental official may be the "authority having jurisdiction."

Autoignition Temperature. The minimum temperature required to initiate or cause self-sustained combustion of a solid, liquid, or gas independently of the heating or heated element. *(See NFPA 325M, Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids*.)

Class I, Division 1. A location (1) in which ignitible concentrations of flammable gases or vapors exist under normal operating conditions; or (2) in which ignitible concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or (3) in which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases or vapors and might also cause simultaneous failure of electrical equipment. [*See Section 500-5(a) of NFPA 70, National Electrical Code*.]

Class I, Division 2. A location (1) in which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment; or (2) in which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment; or (3) that is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided. [*See Section 500-5(b) of NFPA 70, National Electrical Code*.]

Class II, Division 1. A location (1) in which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures; or (2) where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitible mixtures to be produced and might also provide a source of ignition through simultaneous failure of electrical equipment, operation of protection devices, or from other causes; or (3) in which combustible dusts of an electrically conductive nature may be present in hazardous quantities. [*See Section 500-6(a) of NFPA 70, National Electrical Code*.]

Class II, Division 2. A location where combustible dust is not normally in the air in quantities sufficient to produce explosive or ignitible mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but combustible dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment and where combustible dust accumulations on, in, or in the vicinity of, the electrical equipment may be sufficient to interfere with the safe dissipation of heat from electrical equipment or may be ignitible by abnormal operation or failure of electrical equipment. [*See Section 500-6(b) of NFPA 70, National Electrical Code*.]

Combustible Dust. Any finely divided solid material 420 microns or less in diameter (i.e., material passing through a U.S. No. 40 Standard Sieve) that presents a fire or explosion hazard when dispersed and ignites in air or other gaseous oxidizer.

Combustible Liquid. A liquid having a flash point at or above 100°F (37.8°C). Combustible liquids are subdivided as follows:

Class II liquids are those having flash points at or above 100°F (37.8°C) and below 140°F (60°C).

Class IIIA liquids are those having flash points at or above 140°F (60°C) and below 200°F (93.4°C).

Class IIIB liquids are those having flash points at or above 200°F (93.4°C).

(*See NFPA 321*, *Standard on Basic Classification of Flammable and Combustible Liquids*.)

Electrical Resistivity. A property of a dust that is determined by the test procedure described in Chapter 3 of *Test Equipment for Use in Determining Classification of Combustible Dusts*, NMAB 353-2.

NOTE: Metal dusts are to be considered conductive if the resistivity of the solid material from which the dust is formed has a value less than 10^5 ohm-cm.

Explosion Severity. A measure of the damage potential of the energy released by a dust explosion. (*See Section 3-3*.)

Flammable Liquid. A liquid having a flash point below 100°F (37.8°C) and having a vapor pressure not exceeding 40 psia at 100°F (37.8°C). Flammable liquids are subdivided as follows:

Class IA liquids are those having flash points below 73°F (22.8°C) and having boiling points below 100°F (37.8°C).

Class IB liquids are those having flash points below 73°F (22.8°C) and having boiling points at or above 100°F (37.8°C).

Class IC liquids are those having flash points at or above 73°F (22.8°C) and below 100°F (37.8°C).

(*See NFPA 321*, *Standard on Basic Classification of Flammable and Combustible Liquids*.)

Flash Point. The minimum temperature at which a liquid gives off vapor in sufficient concentration to form an ignitible mixture with air near the surface of the liquid, as specified by test. (*See NFPA 321*, *Standard on Basic Classification of Flammable and Combustible Liquids*.)

Hybrid Dust. A mixture of a dust with one or more flammable gases or vapors.

Ignition Sensitivity. A measure of the ease by which a cloud of combustible dust may be ignited. (*See Section 3-3*.)

Labeled. Equipment or materials to which has been attached a label, symbol or other identifying mark of an organization acceptable to the "authority having jurisdiction" and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed. Equipment or materials included in a list published by an organization acceptable to the "authority having jurisdiction" and concerned with product evaluation, that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

NOTE: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The "authority having jurisdiction" should utilize the system employed by the listing organization to identify a listed product.

Chapter 2 Class I Materials — Gases and Vapors

2-1

Articles 500 and 501 of NFPA 70, *National Electrical Code*, provide guidance for the use of electrical equipment in Class I locations (i.e., those made hazardous by flammable gases or vapors). Normally, the criteria for a Class I, Division 1 or Class I, Division 2 location, as specified in NFPA 70, *National Electrical Code*, must also be met. However, the mere presence of a flammable gas or vapor in an area does not necessarily require special electrical equipment for that area. For example, there are areas where a Division 2 condition may exist and sources of ignition, which cannot be modified because of process constraints, are normally present. Examples of such cases are open flames and exposed equipment surfaces with temperatures above the autoignition temperatures of the materials being handled. Also, there are materials that ignite spontaneously on contact with air. Special electrical equipment would not prevent ignition by those other sources.

2-2

The materials and their group classifications listed in Tables 2-3, 2-4, and 2-5 have been selected from *Matrix of Combustion-Relevant Properties and Classification of Gases, Vapors, and Selected Solids*, NMAB 353-1, published by the National Academy of Sciences. Those materials whose group classifications are marked with asterisks were previously assigned group classifications based on tests conducted in the Westerberg Apparatus at Underwriters Laboratories Inc. (*See "An Investigation of Fifteen Flammable Gases or Vapors with Respect to Explosion-Proof Electrical Equipment," UL Bulletin of Research No. 58 and subsequent Bulletins Nos. 58A and 58B.*) All other materials were assigned group classifications based on analogy with tested materials and on chemical structure. While the classifications of these latter materials represent the best judgment of two groups of experts, it is conceivable that the group classification of any particular untested material may be incorrect. In certain instances, therefore, it may be advisable to submit an un- tested material to a qualified testing laboratory for verification of the assigned group classification.

2-3

Table 2-3 lists those materials that are either flammable gases or vapors of flammable liquids as defined by NFPA 321, *Standard on Basic Classification of Flammable and Combustible Liquids*. In general, these gases or vapors form ignitible or explosive mixtures with air at ambient temperatures. Thus, special electrical equipment is normally required. (*See Section 2-1 for exceptions and mitigating circumstances*.)

Table 2-3

Group Classification and Autoignition Temperature (AIT) of Selected Flammable Gases and Vapors of Liquids Having Flash Points Below 100°F (37.8°C)

Notes To Table 2-3

* Material has been classified by test.

** Fuel and process gas mixtures found by test not to present hazards similar to those of hydrogen may be grouped based on the test results.

[1]If equipment is isolated by sealing all conduit $^1/_2$ in. or larger, in accordance with Section 501-5(a) of NFPA 70, *National Electrical Code*, equipment for the group classification shown in parentheses is permitted.

[2]For classification of areas involving Ammonia, see *Safety Code for Mechanical Refrigeration*, ANSI/ASHRAE 15, and *Safety Requirements for the Storage and Handling of Anhydrous Ammonia*, ANSI/CGA G2.1.

[3]Certain chemicals may have characteristics that require safeguards beyond those required for any of the above groups. Carbon disulfide is one of these chemicals because of its low autoignition temperature and the small joint clearance to arrest its flame propagation.

[4]Petroleum Naphtha is a saturated hydrocarbon mixture whose boiling range is 20° to 135°C. It is also known as benzine, ligroin, petroleum ether, and naphtha.

References: Autoignition temperatures listed above are the lowest value for each material as listed in NFPA 325M, *Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids*, or as reported in an article by Hilado, C. J. and Clark, S. W., in *Chemical Engineering*, September 4, 1972.

2-4

Table 2-4 lists vapors of Class II combustible liquids as defined by NFPA 321, *Standard on*

Basic Classification of Flammable and Combustible Liquids. In general, these materials do not form flammable mixtures with air at ambient temperatures unless heated above their flash points. Special electrical equipment is normally required only under such circumstances. (*See 1-1.3 of NFPA 30, Flammable and Combustible Liquids Code*.)

Table 2-4 Group Classification and Autoignition Temperature (AIT) of Vapors of Selected Liquids Having Flash Points 100°F (37.8°C) or Greater, but Less than 140°F (60°C)

NOTE: In accordance with 1-1.3 of NFPA 30, *Flammable and Combustible Liquids Code*, special electrical equipment is required only where these materials are stored or handled at temperatures above their flash points.

Notes to Table 2-4

* Material has been classified by test.

[1]If equipment is isolated by sealing all conduit $^1/_2$ in. or larger, in accordance with Section 501-5(a) of NFPA 70, *National Electrical Code,* equipment for the group classification shown in parentheses is permitted.

References: Autoignition temperatures listed above are the lowest value for each material as listed in NFPA 325M, *Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids*, or as reported in an article by Hilado, C. J. and Clark, S. W., in *Chemical Engineering*, September 4, 1972.

2-5

Table 2-5 lists vapors of Class IIIA combustible liquids as defined by NFPA 321, *Standard on Basic Classification of Flammable and Combustible Liquids*. These materials do not form flammable mixtures with air at ambient temperatures unless they are heated above their flash points. Furthermore, the vapors from such heated liquids cool rapidly in air. Special electrical equipment is required only in the space in which the temperature of the vapor is actually above the flashpoint of the liquid or in the space in which mists may condense in ignitible concentrations as vapors cool. (*See 1-1.3 of NFPA 30*.)

Table 2-5 Group Classification and Autoignition Temperature (AIT) of Vapors of Selected Liquids Having Flash Points 140°F (60°C) or Greater, but Less than 200°F (93.3°C)

NOTE: In accordance with 1-1.3 of NFPA 30, *Flammable and Combustible Liquids Code*, special electrical equipment is required only where these materials are stored or handled at temperatures above their flash points. Vapors of such heated liquids cool rapidly in air, limiting the area of concern to that space in which the temperature of the vapors remains above the flash point of the liquid.

Reference: Autoignition temperatures listed above are the lowest value for each material as listed in NFPA 325M, *Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids*, or as reported in an article by Hilado, C. J. and Clark, S. W., in *Chemical Engineering*, September 4, 1972.

2-6

Experience has shown that Class IIIB combustible liquids are seldom ignited by properly installed and maintained general purpose electrical equipment. Therefore, Class IIIB liquids are not included in the tables.

2-7

Appendix B lists references that deal with the testing of various characteristics of flammable and combustible gases and vapors.

Chapter 3 Class II Materials — Dusts

3-1*

Articles 500 and 502 of NFPA 70, *National Electrical Code*, provide guidance for the use of electrical equipment in Class II locations (i.e., those made hazardous by combustible dusts). Normally the criteria for a Class II, Division 1 or Class II, Division 2 location, as specified in NFPA 70, *National Electrical Code*, must be met. However, the mere presence of a combustible dust in an area does not necessarily require special electrical equipment for that area. For example, if ignition sources are normally present, special electrical equipment would not prevent ignition by those sources. On the other hand, materials that are normally not considered combustible may have dusts that are explosive or may, as in the form of a hybrid dust, be combustible. The presence of flammable gas(es) or vapors, even at concentrations less than their lower flammable limit (LFL), will add to the violence of the dust-air combustion and may require electrical equipment that is suitable for simultaneous exposure to both Class I and Class II locations. Additionally, the dusts from other materials may exhibit characteristics that require special electrical equipment for that area.

3-2

The materials, and their group classifications, listed in Tables 3-4, 3-5, and 3-6, have been taken from *Classification of Combustible Dusts in Accordance with the National Electrical Code*, NMAB 353-3, published by the National Academy of Sciences. Dusts having ignition sensitivities equal to or greater than 0.2 or explosion severities equal to or greater than 0.5 are listed. Dusts whose explosibility parameters fall below these limits are not generally considered to be significant explosion hazards and are, therefore, not included in these tables. Selection of electrical equipment for dusts that sublime or melt below the operating temperature of the equipment requires additional consideration of the properties of the specific dust. Electrical equipment evaluated and found acceptable for use in the presence of dusts may not be acceptable when exposed to molten material.

3-3

The U.S. Bureau of Mines has defined ignition sensitivity and explosion severity as follows:

$$\text{Explosive Severity} = \frac{(P_{max} \times P)_2}{(P_{max} \times P)_1}$$

$$\text{Ignition Sensitivity} = \frac{(T_c \times E \times M_c)_1}{(T_c \times E \times M_c)_2}$$

where P_{max}	=	Maximum Explosive Pressure;
P	=	Maximum Rate of Pressure Rise;
T_c	=	Minimum Ignition Temperature;
E	=	Minimum Ignition Energy;
M_c	=	Minimum Explosive Concentration.

Subscript 1 refers to the appropriate values for Pittsburg seam coal, the standard dust used by the U.S. Bureau of Mines.

Subscript 2 refers to the values for the specific dust in question.

NOTE: Units must be consistent in both numerators and denominators.

3-4

Table 3-4 lists selected metallic dusts that are classified as Group E.

Table 3-4 Selected Metallic Dusts Classified as Group E — Ignition Sensitivity Equal to or Greater than 0.2; Explosion Severity Equal to or Greater than 0.5

	Minimum Cloud or Layer Ignition Temp.[1]		
Material[2]	**°F**		**°C**
Aluminum, atomized collector fines	1022	Cl	550
Aluminum, A422 flake	608		320
Aluminum — cobalt alloy (60-40)	1058		570
Aluminum — copper alloy (50-50)	1526		830
Aluminum — lithium alloy (15% Li)	752		400

Aluminum — magnesium alloy (Dowmetal)	806	Cl	430
Aluminum — nickel alloy (58-42)	1004		540
Aluminum — silicon alloy (12% Si)	1238	NL	670
Boron, commercial-amorphous (85% B)	752		400
Calcium Silicide	1004		540
Chromium, (97%) electrolytic, milled	752		400
Ferromanganese, medium carbon	554		290
Ferrosilicon (88%, 9% Fe)	1472		800
Ferrotitanium (19% Ti, 74.1% Fe, 0.06% C)	698	Cl	370
Iron, 98%, H_2 reduced	554		290
Iron, 99%, Carbonyl	590		310
Magnesium, Grade B, milled	806		430
Manganese	464		240
Tantalum	572		300
Thorium, 1.2% 0_2	518	Cl	270
Tin, 96%, atomized (2% Pb)	806		430
Titanium, 99%	626	Cl	330
Titanium Hydride (95% Ti, 3.8% H_2)	896	Cl	480
Vanadium, 86.4%	914		490
Zirconium Hydride (93.6% Zr, 2.1% H_2)	518		270

Notes to Table 3-4

[1]Normally, the minimum ignition temperature of a layer of a specific dust is lower than the minimum ignition temperature of a cloud of that dust. Since this is not universally true, the lower of the two minimum ignition temperatures is listed. If no symbol appears between the two temperature columns, then the layer ignition temperature is shown. “Cl” means the cloud ignition temperature is shown. “NL” means that no layer ignition temperature is available, and

the cloud ignition temperature is shown.

[2]Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures (as low as 20°C) and minimum ignition energies lower than any material classified in any of the Class I or Class II groups.

3-5

Table 3-5 lists selected carbonaceous dusts that are classified as Group F.

Table 3-5 Selected Carbonaceous Dusts Classified as Group F — Ignition Sensitivity Equal to or Greater than 0.2; Explosion Severity Equal to or Greater than 0.5

	Minimum Cloud or Layer Ignition Temp.[1]

Note to Table 3-6

[1]Normally, the minimum ignition temperature of a layer of a specific dust is lower than the minimum ignition temperature of a cloud of that dust. Since this is not universally true, the lower of the two minimum ignition temperatures is listed. If no symbol appears between the two temperature columns, then the layer ignition temperature is shown. “Cl” means the cloud ignition temperature is shown. “NL” means that no layer ignition temperature is available, and the cloud ignition temperature is shown. “M” signifies that the dust layer melts before it ignites; the cloud ignition temperature is shown. “S” signifies that the dust layer sublimes before it ignites; the cloud ignition temperature is shown.

3-7* Dust Groupings.

Combustible dusts may be divided into the following groupings:

Group E: Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment. (See hybrid dust.)

Group F: Atmospheres containing combustible carbonaceous dusts, including carbon black, charcoal, coal, or coke dust, that have more than 8 percent total entrapped volatiles (see ASTM D3175-89 for coal and coke dusts), or that have been sensitized by other materials so that they present an explosion hazard. (See hybrid dust.)

Group G: Atmospheres containing other combustible dusts, including flour, grain, wood flour, plastic, and chemicals. (See hybrid dust.)

For purposes of classification, only Group E dusts are considered conductive.

3-8

Appendix B lists references that deal with the testing of various characteristics of combustible dusts.

Appendix A

This Appendix is not a part of the recommendations of this NFPA document, but is included for information purposes only.

A-3-1 Hybrid Dusts.

The presence of flammable gas in a combustible dust cloud drastically reduces the ignition energy. The flammable gas need not be present in amounts sufficient to reach the lower flammable limit (considering the gas phase alone) to exhibit this phenomenon.

Similarly, the rate of pressure rise when a cloud of dust, gas, and air ignites is higher than would normally be expected. This situation is encountered in certain industrial operations, such as fluidized bed driers and pneumatic conveying systems for plastic dusts from polymerization processes where a volatile solvent is used. In such cases, electrical equipment should be specified that is suitable for simultaneous exposure to both Class I and Class II locations and has safe operating temperatures.

A-3-7

Prior to the 1981 edition of NFPA 70, *National Electrical Code* (1978 and prior editions), all Group E (metal dusts such as aluminum, magnesium, and their commercial alloys) and Group F (carbonaceous dusts such as carbon black, charcoal, or coke dusts having more than 8 percent total volatile materials) were considered to be electrically conductive. As a result, areas containing Group E or Group F dusts were all classified Division 1, as required by the definition of a Class II, Division 1 location. It was only possible to have a Division 2 area for Group G dusts.

The 1984 edition eliminated Group F altogether. Carbonaceous dusts with resistivity of less than 10^5 ohm-cm were considered conductive and were classified as Group E. Carbonaceous dusts with resistivity of 10^5 ohm-cm or greater were considered nonconductive and were classified as Group G. This reclassification allowed the use of Group G, Division 2 electrical equipment for many carbonaceous materials.

The 1987 edition of the *National Electrical Code* reinstated Group F because the close tolerances in Group E motors necessary for metal dusts are unnecessary for conductive carbonaceous dusts, and the low temperature specifications in Group G equipment necessary for grain, flour, and some chemical dusts are unnecessary for nonconductive carbonaceous dusts. This imposed an unwarranted expense on users.

This change allowed the use of Group F, Division 2 electrical equipment for carbonaceous dust with a resistivity greater than 10^5 ohm-cm.

The problem with this work was that the resistivity value, a number that related to the dust's ability to conduct an electric current, was not a constant and varied considerably based on dust particle size and extent of oxidation, the moisture content, voltage applied, temperature, and test apparatus and technique. No standardized test method for the resistivity value considering long-term environmental effects has been developed. Finally, the resistivity value is not directly related to the explosion hazard.

NFPA 498

1996 Edition

Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives

1996 Edition

This edition of NFPA 498, *Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives*, was prepared by the Technical Committee on Explosives and acted on by the National Fire Protection Association, Inc., at its Annual Meeting held May 20-23, 1996, in Boston, MA. It was issued by the Standards Council on July 18, 1996, with an effective date of August 9, 1996, and supersedes all previous editions.

This document has been submitted to ANSI for approval.

Origin and Development of NFPA 498

This standard was developed by the Technical Committee on Explosives to address the special requirements of motor vehicle terminals specifically designed to handle cargoes of explosive materials. It was tentatively adopted at the 1969 NFPA Annual Meeting and officially adopted at the 1970 NFPA Annual Meeting. Several amendments were adopted at the 1976 NFPA Annual Meeting and at the 1982 NFPA Annual Meeting. In 1986, 1990, and 1992, the document was reconfirmed.

Formerly titled "Explosives Motor Vehicle Terminals," the 1996 edition of NFPA 498 is a complete revision.

The new standard more completely addresses the fire, theft, and explosion hazards that exist when explosive materials are present in parked vehicles in safe havens and in explosives interchange lots.

NOTICE

Following the issuance of this edition of NFPA 498, Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives, by the NFPA Standards Council, an appeal was filed with the NFPA Board of Directors.

The appeal requests that the Board of Directors reverse the Standards Council decision and issue the 1996 edition of NFPA 498 with the inclusion of public comments 498-11 (1-4), 498-12 (1-4, 2-1, 3-1), 498-13 (2-1.3, 2-1.6, 3-2.7), 498-16 (2-2), 498-24 (2-6, 3-6), and 498-31 (4-1.1). At the time of printing, this appeal was under consideration by the NFPA Board of Directors.

NFPA will announce the disposition of the appeal when it has been determined. Anyone wishing to receive the disposition of the appeal should notify in writing the Secretary, Standards Council, NFPA, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

David G. Trebisacci, NFPA Staff Liaison

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents safeguarding against the fire and life hazards associated with explosives and related materials during their manufacture, storage, transportation and use. The sale and use of fireworks and model rockets are the responsibility of the Technical Committee on Pyrotechnics.

NFPA 498
Standard for
Safe Havens and Interchange Lots for
Vehicles Transporting Explosives

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.

Information on referenced publications can be found in Chapter 4.

Foreword

Safe havens and interchange lots provide parking and interchange facilities for vehicles transporting explosives. Some explosives interchange lots also provide temporary holding facilities for less-than-truckload quantities of explosives. This standard is designed to prevent the occurrence or spread of fire in facilities where an explosion can present a distinct threat to the surrounding areas.

Explosives motor vehicle facilities are part of the over-the-road transportation of explosives. These facilities not only provide the services noted above, but can also provide vehicle maintenance and driver rest areas.

Motor vehicles using these facilities operate under the regulations of the U.S. Department of Transportation (Title 49 CFR). These vehicles are engaged in transporting explosives and ammunition on government bills of lading, or are often carriers of commercial explosives.

Properly operated explosives motor vehicle facilities provide a safe and controlled environment for parking vehicles carrying explosives. The overall result is improved highway safety.

Chapter 1 General

1-1 Scope.

1-1.1

This standard shall apply to safe havens that are used for the parking of vehicles transporting explosives and to explosives interchange lots that are safe areas where less-than-truckloads of explosives shall be permitted to be held for transfer from one vehicle to another for continuance in transportation.

All vehicles covered by this standard shall be required to be engaged in the transportation of explosives and shall carry shipping papers to show that the explosives being transported are properly described, classified, identified, packaged, and labeled in accordance with regulations of the U.S. Department of Transportation. Additionally, all vehicles shall be required to be marked and placarded in accordance with regulations of the U.S. Department of Transportation.

1-1.2

This standard shall apply to the design and operating features of explosives motor vehicle facilities related to the prevention of fire, theft, and explosion.

1-1.3*

This standard shall not apply to motor freight terminals for vehicles handling general freight.

1-1.4

The requirements of NFPA 513, *Standard for Motor Freight Terminals,* shall apply to explosives motor vehicle facilities where they are applicable and are not covered by this standard.

1-2 Purpose.

This standard shall provide reasonable requirements for the prevention of fires, theft, and explosion within explosives motor vehicle facilities.

1-3 Definitions.

For the purpose of this standard the following terms shall have the meanings given below:

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Explosives Interchange Lot. A specially designated safe area of a motor vehicle terminal where less-than-truckload lots of explosives can be held for transfer from one vehicle to another for continuance in transportation.

Explosives Motor Vehicle Facility. A designated area where motor vehicles transporting explosives can be parked, pending further movement in transportation. Such a facility can be a safe haven or interchange lot and can include maintenance shops, driver rest services, or any combination of these conveniences.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed.* Equipment, materials, or services included in a list published by an organization acceptable to the authority having jurisdiction and concerned with evaluation of products or services that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services and whose listing states either that the equipment, material, or service meets identified standards or has been tested and found suitable for a specified purpose.

Motor Vehicle. Any self-propelled vehicle, truck, tractor, semi-trailer, or truck-trailer combination used for the transportation of freight over public highways.

Safe Haven.* A secured area specifically designated and approved in writing by local, state, or federal governmental authorities for the parking of vehicles containing Division 1.1, Division 1.2, or Division 1.3 materials (explosives).

Shall. Indicates a mandatory requirement.

Shipping Papers. A shipping order, bill of lading, manifest, or other shipping document serving a similar purpose and containing the information required by regulations of the U.S. Department of Transportation as specified in Title 49 CFR, Parts 172.202, 172.203, and 172.204.

Should. Indicates a recommendation or that which is advised but not required.

Chapter 2 Safe Havens

2-1 General.

2-1.1

All safe havens shall be located in a secured area that complies with the provisions of this chapter.

2-1.2

Safe havens shall not be located within 300 ft (91.5 m) of a bridge, tunnel, dwelling, building, or place where people work, congregate, or assemble.

Exception: Facilities and personnel related to the operation of the safe haven.

2-1.3

Weeds, underbrush, vegetation, or other combustible materials shall be cleared for a distance of 25 ft (7.6 m) from the safe haven.

2-1.4*

The safe haven shall be protected from unauthorized persons or trespassers by use of warning signs, gates, and patrols specified in 2-4.1.

When vehicles carrying Division 1.1, Division 1.2, or Division 1.3 materials (explosives) are parked in a safe haven, the entrance to the safe haven shall be marked with this warning sign:

DANGER NO SMOKING
NEVER FIGHT EXPLOSIVE FIRES
VEHICLES ON THIS SITE CONTAIN EXPLOSIVES
CALL ________________

The sign shall be weatherproof with reflective printing, and the letters shall be at least 2 in. high.

2-1.5

Watch personnel assigned to patrol the safe haven shall be made familiar with the information in NFPA 601, *Standard for Security Services in Fire Loss Prevention.*

2-1.5.1 All watch personnel at the safe haven shall be made aware of the classification of explosives (Division 1.1, Division 1.2, or Division 1.3) in each vehicle and its inherent dangers, and shall have been instructed in the measures and procedures to be followed in order to protect the public from these dangers.

2-1.5.2 A motor vehicle in good operating condition and capable of moving the explosives-laden trailers in the safe haven shall be kept at the safe haven at all times. The watch or patrol personnel shall be familiar with the vehicle, trained in its use, and supplied with the necessary means and authority to use the motor vehicle to move any of the explosives-loaded vehicles in the safe haven where required. The motor vehicle shall not be parked within 25 ft (7.6 m) of any vehicle containing explosives.

2-1.6

Fire protection equipment capable of handling incipient fires shall be provided at each safe haven. Two or more portable fire extinguishers with a total fire extinguisher rating of at least 4-A:70-B:C shall be placed at accessible locations in the safe haven. Where a dependable water supply source is readily accessible, water hoses shall be permitted to be used in addition to the required portable extinguishers.

2-2 Vehicle Parking.

2-2.1

Before any vehicle is admitted to a safe haven a thorough inspection shall be made of the unit. As a minimum, the vehicle shall be checked for hot tires, hot wheel bearings, hot brakes, any accumulation of oil or grease, any defects in the electrical system, or any apparent physical damage to the vehicle that could cause or contribute to a fire. Any defects shall be corrected before the vehicle is placed in the safe haven.

2-2.2

After a loaded trailer is properly positioned in the safe haven, the tractors shall be disconnected immediately and removed from the safe haven.

2-2.3

Spacing of not less than 5 ft (1.5 m) shall be maintained between parked trailers, side by side, or back to back. Parking shall be maintained so as not to require the moving of one vehicle in order to move another vehicle.

2-2.4

Trailers in the safe haven shall be maintained in the same condition as is required for highway transportation, including placarding.

2-2.5

Where a self-propelled vehicle loaded with explosives is parked in a safe haven it shall be parked at least 25 ft (7.6 m) from any other vehicles containing explosives, and shall be in operable condition, properly placarded, and in a position and condition where it can be moved easily in case of necessity or emergency.

2-2.6

No explosives shall be transferred from one vehicle to another in a safe haven except in case of necessity or emergency.

2-2.7*

No vehicle transporting other hazardous materials shall be parked in a safe haven unless the materials being transported are compatible with explosives.

2-3 Control of Ignition Sources.

2-3.1

Except for minor repairs, no other repair work shall be performed on any vehicle parked in a safe haven. Any repair work involving cutting or welding, operation of the vehicle engine, or the electrical wiring shall be performed only after the explosives have been unloaded from the vehicle, and the vehicle to be repaired has been removed from the safe haven.

2-3.2

Smoking, matches, open flames, spark-producing devices, and firearms shall be prohibited inside or within 50 ft (15.3 m) of the safe haven.

Exception: Law enforcement and security personnel shall be permitted to carry firearms where specifically authorized by the authority having jurisdiction.

2-3.3

Electric service lines required to be in close proximity to a safe haven shall be no closer than the length of the lines between the poles or towers supporting the lines, unless an effective means is provided to ensure that energized lines, on breaking, cannot come into contact with vehicles parked in the safe haven.

2-4 Security Against Trespassers.

2-4.1

When any vehicle transporting explosives is parked in a safe haven, at least one trained person, 21 years of age or older, shall be assigned to patrol the safe haven on a dedicated basis.

Exception: Safe havens located on explosives manufacturing facilities or at motor vehicle terminals shall employ other means of acceptable security such as existing plant or terminal protection systems or electronic surveillance devices.

2-5 Employee Training.

2-5.1

The operator of the safe haven shall maintain an active safety training program in emergency response procedures for all employees working at the safe haven. Written emergency instructions shall be posted and readily accessible to all employees. Employees involved in the loading, shipping, or transportation of explosives shall receive hazardous material training as required by the U.S. Department of Transportation (Title 49 CFR, Subpart H, Sections 172.700 through 172.704) and shall be familiar with the U.S. Department of Transportation *Emergency Response Guide* (ERG) (RSPA-5800.6).

2-6 Notification of Authority Having Jurisdiction.

2-6.1

The operator of the safe haven shall notify, in writing (with signed receipt), local fire department, law enforcement, and emergency response agencies of the establishment and approval of a safe haven, and advise of the type and maximum quantity of Division 1.1, Division 1.2, and Division 1.3 materials authorized for the safe haven. Copies of the safe haven approval and emergency response notifications shall be maintained by the safe haven operator.

Chapter 3 Explosives Interchange Lots

3-1

General.

3-1.1*

A temporary holding facility conforming to the construction requirements for Type 1 or Type 2 magazines as described in NFPA 495, *Explosive Materials Code*, shall be provided in the interchange lot. If detonators or other initiators are to be temporarily held at the same time as other explosives, then two temporary holding facilities shall be required; one for detonators (initiators) and the second for the other explosives.

3-1.2

The facilities specified in 3-1.1 shall be located a minimum of 50 ft (15.3 m) from structures on the adjoining property or from any facility that could create a fire hazard.

3-1.3

Where an area at the loading dock is designated for the temporary holding of explosives in a trailer (as provided in Section 3-2), it shall not be located within 50 ft (15.3 m) of a fire hazard such as an area where smoking is permitted, where hot work is being done, or where combustible or flammable materials are present.

3-2

Operations.

3-2.1

Explosives brought into the interchange lot to await shipment shall be immediately placed in the facility specified in 3-1.1 until such time as the explosives are loaded on a departing over-the-road motor vehicle.

3-2.2

Explosives delivered to the interchange lot by a connecting carrier shall be retained in the trailer at a designated section of the loading dock, or the trailer shall be parked in an isolated area of the interchange lot, or the explosives shall be placed in the holding facility.

3-2.3

The explosives transport vehicles, including trailers, in the interchange lot shall be maintained in the same condition as is required for highway transportation, including placarding.

3-2.4

Explosives shall not be retained on the lot, either in a trailer or holding facility, for a period longer than necessary, but in no case for more than 100 hours.

3-2.5

Smoking, matches, open flames, spark-producing devices, and firearms shall be prohibited inside of and within 50 ft (15.3 m) of the temporary holding facility or trailer containing explosives.

Exception: Law enforcement and security personnel shall be permitted to carry firearms where specifically authorized by the authority having jurisdiction.

3-2.6

Temporary facilities as specified in 3-1.1 shall be appropriately marked so that the interchange lot employees are aware of the location.

3-2.7

Portable fire extinguishers, having a capacity of 4-A:70-B:C, shall be placed at each temporary holding facility and shall be readily available for immediate use.

3-2.8

The operator of the explosives motor vehicle interchange lot shall maintain an active training program in emergency procedures for all employees stationed at the interchange lot. Written emergency instructions shall be posted and readily accessible to all employees. Employees involved in the loading, shipping, or transportation of explosives shall receive hazardous material training as required by the U.S. Department of Transportation (49 CFR, Subpart H, Sections 172.700 through 172.704) and shall be familiar with the U.S. Department of Transportation *Emergency Response Guide* (ERG) (RSPA-5800.6). Any driver who transports a vehicle loaded with explosives over public highways shall possess a valid commercial driver's license (CDL) with a hazardous material endorsement (H).

Chapter 4 Referenced Publications

4-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

4-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 495, *Explosive Materials Code*, 1996 edition.

NFPA 513, *Standard for Motor Freight Terminals*, 1994 edition.

NFPA 601, *Standard for Security Services in Fire Loss Prevention*, 1996 edition.

4-1.2 Federal Government Publications.

Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

ERG RSPA-5800.6, *Emergency Response Guide*.

Title 49 CFR, Parts 325 through 399, *Federal Motor Carrier Safety Regulations*.

Title 49 CFR, Parts 100 through 199, *Hazardous Materials Regulations*.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-1.3 See NFPA 513, Standard for Motor Freight Terminals.

A-1-3 Approved. The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-3 Authority Having Jurisdiction. The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-3 Listed. The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-3 Safe Haven. See Title 49 CFR, Part 397.5.

A-2-1.4 The sign does not need to be displayed when there are no explosives-laden vehicles in the safe haven.

A-2-2.7 In case of an emergency where vehicles loaded with other hazardous materials are brought to a safe haven, such vehicles should be parked at a location on the lot well separated from the explosives-laden vehicles.

A-3-1.1 Temporary holding facilities should be separated as far as practicable to reduce the concentration of explosives in any single area of the terminal.

Appendix B Referenced Publications

B-1 The following documents or portions thereof are referenced within this standard for informational purposes only and thus are not considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

B-1.1 NFPA Publication. National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 513, Standard for Motor Freight Terminals, 1994 edition.

B-1.2.1 U.S. Government Publication. U.S. Government Printing Office, Washington, DC 20402.

Title 49 CFR, Part 397.5.

NFPA 501A

1992 Edition

Standard for Fire Safety Criteria for Manufactured Home

Installations, Sites, and Communities

1992 Edition

This edition of NFPA 501A, *Standard for Fire Safety Criteria for Manufactured Home Installations, Sites, and Communities,* was prepared by the Technical Committee on Manufactured Homes and acted on by the National Fire Protection Association, Inc. at its Annual Meeting held May 18-21, 1992 in New Orleans, LA. It was issued by the Standards Council on July 17, 1992, with an effective date of August 14, 1992, and supersedes all previous editions.

The 1992 edition of this document has been approved by the American National Standards Institute.

Origin and Development of NFPA 501A

NFPA activity in this general area commenced in 1937 when NFPA organized its first

Committee on Trailers and Trailer Courts. The first standard covering trailer coach camps appeared in 1939, with revisions in 1940, 1952, 1960, and 1964. A completely new edition was adopted in 1971, and this text was revised in 1972, 1973, 1974, 1975, 1977, and 1982.

The American National Standards Institute (ANSI) approved the 1972 NFPA edition on May 8, 1973; the 1973 NFPA edition on December 28, 1973; the 1974 NFPA edition on January 30, 1975; the 1975 NFPA edition on February 27, 1976; and the 1977 NFPA edition on October 18, 1977.

The 1982 edition of *Standard for Firesafety Criteria for Mobile Home Installations, Sites, and Communities* superseded the 1977 edition and was adopted by NFPA at its Annual Meeting held in San Francisco on May 19, 1982.

The 1982 edition was produced by the newly formed Committee for Firesafety for Mobile Homes (June 10, 1979) charged with the responsibility of developing documents for fire safety criteria for single-family mobile homes including the installation, sites, and communities, and the maintenance of and improvements for existing mobile homes. Therefore, that edition excluded all sections of previous editions not considered within the Committee scope. Notably excluded were stabilizing and anchoring systems, requirements for piers and footings, and plumbing, including sewage disposal systems. Requirements for park electrical systems were addressed by reference to the *National Electrical Code*.®

Modifications were also made in sections dealing with fuel supply, air conditioning, and life and fire safety.

Major revisions to the standard were made in the 1987 edition in an attempt to better coordinate the NFPA chapters in a joint publication with NCSBCS, ANSI A225.1/ NFPA 501A. Major changes included substituting “manufactured home” for “mobile home” throughout, deleting Chapter 3, “Air Conditioning,” expanding Chapter 2, “Fuel Supply,” and combining three appendixes into two.

The standard was reconfirmed in 1992 with a plan to expand the scope of NFPA 501A to cover fire safety requirements for the design, construction, installation, alteration/rehabilitation, maintenance, use, and occupancy of manufactured homes, manufactured home sites, manufactured home communities including accessory buildings, and structures. This will be a major revision of the scope and the entire standard, and the Committee has targeted a complete revision of 501A for 1994.

NOTICE: NFPA has previously published A225.1/501A as jointly developed by NFPA and NCSBCS. This edition of NFPA 501A includes only the fire safety portion of this document. The non-fire-safety portion is being published separately as A225.1 by NCSBCS.

Jesse J. Beitel, Southwest Research Institute, MD

NFPA 501A

Standard for Fire Safety Criteria for Manufactured Home Installations, Sites, and Communities

1992 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.

Information on referenced publications can be found in Chapter 5 and Appendix D.

Chapter 1 Scope, Intent of Standard, and Definitions

1-1 Scope.

This standard covers fire safety requirements for the installation of manufactured homes and manufactured home sites, including accessory buildings, structures, and communities.

The provisions of this standard shall not apply to recreational vehicles as defined in NFPA 501C, *Standard on Recreational Vehicles,* or to park trailers as defined in the ANSI A119.5, *Standards for Park Trailers*.

1-2 Definitions.

Approved.* Acceptable to the "authority having jurisdiction."

Authority Having Jurisdiction.* The "authority having jurisdiction" is the organization, office or individual responsible for "approving" equipment, an installation or a procedure.

Awning. A shade structure supported by posts or columns, or partially supported by a manufactured home, installed, erected, or used on a manufactured home site.

Cabana. A portable, demountable, or permanent room enclosure or other building erected or constructed for human occupancy.

Carport. An awning or shade structure for a vehicle or vehicles that may be either freestanding or partially supported by a manufactured home.

Community Building. Any nonresidential building used for manufactured home community purposes.

Community Management. The person or entity who owns a development or has charge, care, or control of a community (park, estate, subdivision, etc.).

Community Street. A private way that affords principal means of access to abutting individual sites, homes, and buildings.

Dwelling Unit. One or more habitable rooms designed to be occupied by one family with facilities for living, sleeping, cooking, eating, and sanitation.

Garage. A structure, located on a manufactured home site, designed for the storage of motor vehicles.

Gas Supply Connector, Manufactured Home. A listed connector designed for connecting the manufactured home to the gas supply source.

Habitable Room. A room or enclosed floor space arranged for living, eating, food preparation, or sleeping purposes not including bathrooms, toilet compartments, laundries, pantries, foyers, hallways, and other accessory floor space.

Labeled. Equipment or materials to which has been attached a label, symbol or other identifying mark of an organization acceptable to the “authority having jurisdiction” and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed.* Equipment or materials included in a list published by an organization acceptable to the “authority having jurisdiction” and concerned with product evaluation, that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

Manufactured Home.* A structure, transportable in one or more sections, that, in the traveling mode, is 8 body feet (2.4 m) or more in width and 40 body feet (12 m) or more in length or, when erected on site, is 320 or more square feet (28.8 m^2), that is built on a permanent chassis and designed to be used as a dwelling with or without a permanent foundation when connected to the required utilities, and that includes the plumbing, heating, air conditioning, and electrical systems contained therein.

Manufactured Home Accessory Building or Structure. A building or structure that is an addition to or supplements the facilities provided in a manufactured home. It is not a self-contained, separate, habitable building or structure. Examples are awnings, cabanas, garages, ramadas, storage structures, carports, fences, windbreaks, or porches.

Manufactured Home Site. A parcel of land for the accommodation of one manufactured home, its accessory building or structures, and accessory equipment for the exclusive use of the occupants.

Porch. An outside walking area having the floor elevated more than 8 in. (203 mm) above grade.

Ramada. Any freestanding roof or shade structure, installed or erected above a manufactured home or any portion thereof.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Chapter 2 Fuel Supply

2-1 Fuel Supply.

2-1.1* General.

All fuel gas piping systems serving manufactured homes, accessory buildings, or structures and communities shall be designed and constructed in accordance with any applicable provisions of NFPA 54, *National Fuel Gas Code*, and NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*. NFPA 31, *Standard for Installation of Oil-Burning Equipment*, shall apply to oil fuel-burning systems and shall conform to the criteria of the authority having jurisdiction.

2-1.2 Gas Supply Connections.

Gas supply connections at sites, where provided from an underground gas supply piping system, shall be located and arranged to permit attachment to a manufactured home occupying the site in a worklike manner. For the installation of liquefied petroleum gas storage systems, the applicable provisions of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, shall be followed.

2-1.3 Location of Gas Supply Connection.

The gas supply to the manufactured home shall be located within 4 ft (1.22 m) of the manufactured home stand. (*See also Sections 2-3 and 2-4, 2-3.2 and 2-4.5.*)

Exception: The above requirements do not apply to gas supply connections for manufactured homes located on all-weather wood or concrete or concrete block foundation systems or on foundations constructed in accordance with the local building code or, in the absence of a local code, with a recognized model building code.

2-2 Single and Multiple Manufactured Home Site Fuel Supply Systems.

2-2.1 Gas Piping Installations.

2-2.1.1 Gas Supply Connections — Underground Gas Piping. Gas supply connections at sites, where provided from an underground gas supply piping system, shall be located and arranged to permit attachment in a worklike manner to a manufactured home occupying the site. For the installation of liquefied petroleum gas storage systems, the provisions of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, shall be followed.

2-2.1.2 Underground gas piping system installations shall comply with any applicable building code and the following:

(a) Gas piping shall not be installed underground beneath that portion of a manufactured home site reserved for the location of a manufactured home, or a manufactured home accessory building or structure, unless installed in an open-ended gastight conduit. The conduit shall conform to the following:

1. The conduit shall be a pipe approved for installation underground beneath buildings and shall be not less than Schedule 40 pipe. The interior diameter of the conduit shall be not less than $^{1}/_{2}$ in. (13 mm) larger than the outside diameter of the gas piping.

2. The conduit shall extend to a point not less than 4 in. (102 mm) beyond the outside wall of the manufactured home, accessory building, or structure, and the outer ends shall not be sealed. Where the conduit terminates within a manufactured home, accessory building, or structure, it shall be readily accessible and the space between the conduit and the gas piping shall be sealed to prevent leakage of gas into the building.

2-2.2 Manufactured Home Site Gas Shutoff Valve.

Each manufactured home site shall have a listed gas shutoff valve installed upstream of the manufactured home site gas outlet, and it shall be located on the outlet riser at a height of not less than 6 in. (152 mm) above grade. Such valve shall not be located under any manufactured home. The outlet shall be equipped with a cap or plug to prevent discharge of gas whenever the manufactured home site outlet is not connected to a home.

Exception: All gas shutoff valves for manufactured homes located on foundations constructed in accordance with the local building code or, in the absence of a local code, with a recognized model building code.

2-2.3 Gas Meters.

2-2.3.1 Support of Meters. Where gas meters are installed, they shall not depend on the gas outlet riser for support, but shall be adequately supported by a post or bracket placed on a firm footing or other means providing equivalent support.

2-2.3.2* Location of Meters. Each meter installed shall be in an accessible location and shall be provided with unions or other fittings so that the motor is easily removable and replaceable in an upright position. Meters shall not be installed in unventilated or inaccessible locations or closer than 3 ft (0.91 m) to sources of ignition.

2-2.4 Meter Shutoff Valve or Cock.

All gas meter installations shall be provided with shutoff valves or cocks located adjacent to and on the inlet side of the meters. In the case of a single meter installation utilizing a liquefied petroleum gas container, the container service valve may be used in lieu of the shutoff valve or cock. All gas meter installations shall be provided with test tees located adjacent to and on the outlet side of the meters.

2-3 Multiple Manufactured Home Site Fuel Distribution and Supply Systems.

(*See also Sections 2-1 and 2-4, 2-3.5, and 2-4.5*.)

2-3.1 Manufactured Home Community Gas Distribution and Supply Systems.

2-3.1.1* Manufactured Home Community Natural-Gas Distribution Systems. All underground metallic fuel piping systems shall comply with the cathodic protection requirements of 49 CFR, Parts 191 and 192.

2-3.1.2 Liquefied Petroleum Gas Supply Systems. Where ten or more customers are served by one liquefied petroleum gas supply system, the installation shall be in accordance with 49 CFR, Part 192, *Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards*. For other systems and for the storage and handling of liquefied petroleum gas, NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases,* shall be followed. (*See also 2-3.2*.)

2-3.1.3 Installation of Cathodic Protection Systems. Where required by the federal standard cited in 2-3.1.1, cathodic protection shall be installed for corrosion control of buried or submerged metallic gas piping. [*See also 2-3.1.6(a) and (b)*.]

2-3.1.4 Required Gas Supply. The minimum hourly volume of gas required at each manufactured home site outlet or any section of the manufactured home community gas piping system shall be calculated as shown in Table 2-3.1.4.

Table 2-3.1.4 Demand Factors for Use in Calculating Gas Piping Systems in Manufactured

Home Communities

No. of Manufactured Home Sites	Btu per Hour per Manufactured Home Site
1	125,000
2	117,000
3	104,000
4	96,000
5	92,000
6	87,000
7	83,000
8	81,000
9	79,000
10	77,000
11-20	66,000
21-30	62,000
31-40	58,000
41-60	55,000
Over 60	50,000

NOTE: In extreme climate areas, additional capacities should be considered.

2-3.1.5 Gas Pipe Sizing and Pressure.

(a) The size of each section of a gas piping system shall be determined in accordance with NFPA 54, *National Fuel Gas Code*, or by other standard engineering methods acceptable to the authority having jurisdiction.

(b) Where all connected appliances are operated at their rated capacity, the supply pressure shall be not less than 4 oz per sq in. (7 in. water column) (1743 Pa). The gas supply pressure shall not exceed 8 oz per sq in. (14 in. water column) (3486 Pa).

2-3.1.6 Gas Piping Materials.

(a) *Metal.* Metal gas pipe shall be standard weight wrought iron or steel (galvanized or black), yellow brass containing not more than 75 percent copper, or internally tinned or treated copper of iron pipe size. Galvanizing shall not be considered protection against corrosion.

Seamless copper or steel tubing shall be permitted to be used with gases not corrosive to such material. Steel tubing shall comply with ANSI/ASTM A539, *Standard Specification for Electric-Resistance-Welded Coiled Steel Tubing for Gas and Fuel Oil Lines*, or ANSI/ASTM A254, *Standard Specification for Copper Brazed Steel Tubing*. Copper tubing shall comply with ANSI/ASTM B88, *Specification for Seamless Copper Water Tubing* (Type K or L) or ANSI/ASTM B280, *Specification for Seamless Copper Tubing for Air Conditioning and Refrigeration Field Service*. Copper tubing (unless tin-lined) shall not be used if the gas contains more than an average of 0.3 grains of hydrogen sulfide per 100 standard cubic feet of gas.

(b) *Protection Coatings for Metal Gas Piping.* All buried or submerged metallic gas piping shall be protected from corrosion by approved coatings or wrapping materials. All gas pipe protective coatings shall be approved types, be machine applied, and conform to recognized standards. Field wrapping shall provide equivalent protection and is restricted to those short sections and fittings necessarily stripped for threading or welding. Risers shall be coated or wrapped to a point at least 6 in. (152 mm) above ground.

(c) *Plastic.* Plastic piping shall only be used underground and shall meet the requirements of ASTM D2513, *Thermoplastic Gas Pressure Pipe, Tubing, and Fittings,* or ASTM D2517, *Reinforced Epoxy Resin Gas Pressure Pipe and Fittings*, and shall meet the design pressure and design limitations of 49 CFR, Part 192.123 and shall otherwise conform to the installation requirements thereof.

2-3.1.7 Gas Piping Installations.

(a) *Minimum Burial Below Ground Level and Clearances.* All gas piping installed below ground shall have a minimum earth cover of 18 in. (451 mm) and shall be installed with at least 12 in. (305 mm) of clearance in any direction from any other underground utility system.

(b) *Metallic Gas Piping.*

1. *Plan Approval Required.* All metallic gas piping systems shall be installed in accordance with approved plans and specifications, including provisions for cathodic protection. Each cathodic protection system shall be designed and installed to conform to the provisions of 49 CFR, Part 192.

2. *Where Cathodic Protection Is Designed Only to Protect Underground Gas Piping.* Where the cathodic protection system is designed to protect only the gas piping system, the gas piping system shall be electrically isolated from all other underground metallic systems or installations. Where only the gas piping system is cathodically protected against corrosion, a dielectric fitting shall be used in the manufactured home gas connection to insulate the manufactured home from the underground gas piping system.

3. *Where Cathodic Protection Is Designed to Protect All Underground Metallic Systems.* Where a cathodic protection system is designed to provide all underground metallic systems and installations with protection against corrosion, all such systems and installations shall be electrically bonded together and protected as a whole.

(c) *Plastic Gas Piping.* Plastic gas piping shall only be used underground and shall be installed with an electrically conductive wire for locating the pipe. The plastic pipe-locating wire shall be copper, not smaller in size than No. 18 AWG, with insulation approved for direct burial. Every portion of a plastic gas piping system consisting of metallic pipe shall be cathodically protected against corrosion.

(d) *Gas Piping System Shutoff Valve.* A readily accessible and identifiable shutoff valve controlling the flow of gas to the entire manufactured home community gas piping system shall be installed near the point of connection to the service piping or to the supply connection of a liquefied petroleum gas container.

2-3.2 Liquefied Petroleum Gas Equipment.

LP-Gas equipment shall be installed in accordance with the applicable provisions of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

The referenced standard, NFPA 58, includes provisions on: location of containers; installation of containers; installation of container appurtenances; regulator installations; piping system service limitations; installation of pipe, tubing, pipe and tubing fittings, valves, and hose; and hydrostatic relief valve installation.

2-3.3 Oil Supply.

The following three methods of supplying oil to an individual manufactured home site shall be permitted:

(a) Supply from an outside underground tank. (*See 2-4.6*.)

(b) Supply from a centralized oil distribution system designed and installed in accordance with accepted engineering practices and in compliance with NFPA 31, *Standard for the Installation of Oil-Burning Equipment*.

(c) Supply from an outside aboveground tank. (*See 2-4.6*.)

2-3.4 Minimum Oil Supply Tank Size.

Oil supply tanks shall have a minimum capacity equal to 20 percent of the average annual oil consumption. [Sixty-gal (230-L) ICC-5 shipping containers or drums are not recommended, except for areas with less than 1,800 degree-days.]

2-3.5 Oil Supply Connections — General.

Oil supply connections at manufactured home stands, where provided from a centralized oil distribution system, shall be located and arranged to permit attachment in a worklike manner to a manufactured home utilizing the stand. The installation of such facilities shall meet the provisions of NFPA 31, *Standard for the Installation of Oil-Burning Equipment*, and particularly Section 3-8 thereof.

2-4 Fuel Supply Systems Installation.

2-4.1* Flexible Gas Connector.

Each gas supply connector shall be listed for outside manufactured home use, be not more than 6 ft (1.83 m) in length, and have a capacity rating adequate to supply the connected load.

Exception: All gas supply connections for manufactured homes located on an all-weather wood, concrete, or concrete block foundation systems or on a foundation constructed in accordance with the local building code or, in the absence of a local code, with a recognized model building code.

2-4.2 Use of Approved Pipe and Fittings of Extension.

Where it is necessary to extend the manufactured home inlet to permit connection of the 6-ft (1.83-m) listed connector to the site gas outlet, the extension shall be of approved materials of the same size as the manufactured home inlet and be adequately supported at no more than 4-ft (1.22-m) intervals to the manufactured home.

2-4.3* Mechanical Protection.

Where subject to physical damage, all gas outlet risers, regulators, meters, valves, or other exposed equipment shall be protected against accidental damage.

2-4.4 Special Rules on Atmospherically Controlled Regulators.

Atmospherically controlled regulators shall be installed in such a manner that moisture cannot enter the regulator vent and accumulate above the diaphragm. Where the regulator vent may be obstructed due to snow and icing conditions, shields, hoods, or other suitable devices shall be provided to guard against closing of the vent opening.

2-4.5 Fuel Gas Piping Test.

The manufactured home fuel gas piping system shall be tested with air only before it is connected to the gas supply. The manufactured home gas piping system shall be subjected to a pressure test with all appliance shutoff valves in their closed position.

(a) The test shall consist of air pressure at not less than 10 in. nor more than 14 in. water column (6 to 8 oz per sq in.) (2490 to 3486 Pa). The system shall be isolated from the air pressure source and shall maintain this pressure for not less than 10 minutes without perceptible leakage. Upon satisfactory completion of the test, the appliance valves shall be opened and the gas appliance connectors tested with soapy water or bubble solution while under the pressure remaining in the piping system. Solutions used for testing for leakage shall not contain corrosive chemicals. Pressure shall be measured with either a manometer, slope gage, or gage calibrated in either water in. or psi with increments of either $^{1}/_{10}$ in. or $^{1}/_{10}$ psi, as applicable. Upon satisfactory completion of the test, the manufactured home gas supply connector shall be installed and the connections tested with soapy water or bubble solution.

WARNING: Do Not Overpressurize the Fuel Gas Piping System! Pressurization beyond the maximums specified may result in damage to valves, regulators, appliances, etc.

(b) Gas appliance vents shall be visually inspected to ensure that they have not been dislodged in transit and are securely connected to the appliance.

2-4.6 Oil Tanks.

Not more than one 660 gal (2500 L) tank or two tanks of aggregate capacity of 660 gal (2500 L) or less shall be connected to one oil-burning appliance. Two supply tanks, where used, shall be cross-connected and provided with a single fill and single vent as described in Appendix A of NFPA 31, *Standard for the Installation of Oil-Burning Equipment*; but when so connected, they shall be on a common slab and rigidly secured, one to the other. Tanks having a capacity of 660 gal (2500 L) or less shall be securely supported by rigid noncombustible supports to prevent settling, sliding, or lifting.

2-4.6.1* Oil supply tanks shall be installed in accordance with the applicable provisions of

NFPA 31, *Standard for the Installation of Oil-Burning Equipment*. Chapter 2 of the referenced standard includes provisions on the design and construction of tanks, installation of underground tanks, outside aboveground tanks not larger than 660 gal (2500 L), and location with respect to adjacent buildings and adjoining property lines.

2-4.6.2 A tank not larger than 60 gal (230 L) capacity shall be permitted to be a DOT-5 shipping container (drum), and so marked, or a tank meeting the provisions of UL 80, *Steel Inside Tank for Oil Burner Fuel*. Tanks other than DOT-5 shipping containers having a capacity of not more than 660 gal (2500 L) shall meet the provisions of UL 80. Pressure tanks shall be built in accordance with Section VIII of the ASME *Boiler and Pressure Vessel Code*, Code for Unfired Pressure Vessels.

2-4.6.3 Tanks as described in 2-4.6 and 2-4.6.2 may be located adjacent to buildings, but shall be located not less than 10 ft (3.05 m) from a property line that may be built upon.

2-4.6.4 Tanks not larger than 660 gal (2500 L) capacity shall be equipped with an open vent not smaller than $1^1/_2$ in. (38 mm) iron pipe size; tanks with a 500 gal (1900 L) or less capacity shall have a vent of $1^1/_4$ in. (32 mm) iron pipe size.

2-4.6.5 Tanks shall be provided with a means to determine the liquid level. [*See Section 3-6 of NFPA 31, Standard for the Installation of Oil-Burning Equipment (ANSI).*]

2-4.6.6 The fill opening shall be of such size and so located to permit ready filling in a manner that will avoid spillage.

2-5 Manufactured Home Accessory Building Fuel Supply Systems.

Fuel gas supply systems installed in a manufactured home accessory building or structure shall comply with the applicable provisions of NFPA 54, *National Fuel Gas Code*, and NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*. Fuel oil supply systems shall comply with the applicable provisions of NFPA 31, *Standard for the Installation of Oil-Burning Equipment*.

2-6 Community Building's Fuel Supply Systems.

2-6.1 Fuel Gas Piping and Equipment Installations.

Fuel gas piping and equipment installed within a permanent building in a manufactured home community shall comply with nationally recognized appliance and fuel gas piping codes and standards adopted by the authority having jurisdiction. Where the state or other political subdivision does not assume jurisdiction, such fuel gas piping and equipment installations shall be designed and installed in accordance with the appropriate provisions of NFPA 54, *National Fuel Gas Code*, or NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

2-6.2 Manufactured Home Community Oil Supply Systems.

Oil-burning equipment and installations within a manufactured home community shall be designed and constructed in accordance with the applicable codes adopted by the authority having jurisdiction. Where the state or other political subdivision does not assume jurisdiction, such installations shall be designed and constructed in accordance with the applicable provisions of the standard referenced in 2-3.5.

2-6.3 Oil-Burning Equipment and Installation.

Oil-burning equipment and installation within a building constructed in accordance with the local building code or a nationally recognized building code in a manufactured home community shall comply with nationally recognized codes and standards adopted by the authority having jurisdiction. Where the state or other political subdivision does not assume jurisdiction, such oil-burning equipment and installation shall be designed and installed in accordance with the appropriate provisions of NFPA 31, *Standard for the Installation of Oil-Burning Equipment*.

Chapter 3 Electrical

3-1 Site and Community Electrical Equipment and Installations.

Sites and communities provided with electrical service shall have all electrical equipment and installations designed, constructed, and maintained in accordance with the applicable provisions of NFPA 70, *National Electrical Code*.®

Chapter 4 Life Safety and Fire Safety

4-1 General.

Responsibility for life safety and fire safety within manufactured home communities is that of the owners and operators of the community.

4-1.1

Arrangement of manufactured homes and accessory buildings or structures on the site shall not restrict reasonable access to the site by emergency personnel. Each community operator shall maintain a community site plan for review by agencies responsible for emergency services including, but not limited to, street names, site separation lines, site numbers, water supplies for fire protection personnel, fire alarms, and utility disconnects.

4-1.2

Each street name shall be clearly marked by signs, and each site marked for identification in a uniform manner clearly visible from the street serving the site.

4-2 Manufactured Home Site Fire Safety Requirements.

4-2.1 Fire Safety Separation Requirements.

4-2.1.1 Any portion of a manufactured home, excluding the tongue, shall not be located closer than 10 ft (3 m) side to side, 8 ft (2.4 m) end to side, or 6 ft (1.8 m) end to end horizontally from any other manufactured home or community building unless the exposed composite walls and roof of either structure are without openings and constructed of materials that will provide a one-hour fire rating or the structures are separated by a one-hour fire-rated barrier. (*See 4-4.1.*)

4-2.1.2 Vertical Positioning of Manufactured Homes. Manufactured homes shall not be positioned vertically (stacked with one over the other) in whole or in part unless the structure is designed and approved for such installation and permitted by the authority having jurisdiction.

4-2.2* Marking of Underground Utility Lines.

The location of electrical cables, gas piping, water piping, and sewer lines buried underground along the periphery or within 4 ft (1.2 m) of the perimeter of the site's largest planned manufactured home shall be indicated by an aboveground sign(s) or underground marker tapes identifying the proximity of the lines. A plot plan showing the "as built" location of underground utility lines shall be available for installations in multiple-site facilities.

4-2.3 Manufactured Home Installations.

4-2.3.1 Installation Instructions. Installations of all manufactured homes, including the support system and connections of structural, electrical, mechanical, and plumbing systems to the site utilities or between sections in the case of multiple-section homes, shall be performed in accordance with printed installation instructions provided by the manufacturer of the home.

For installations where printed instructions by the manufacturer are not available, the installation shall be performed in a manner satisfying the intent of this standard, as determined by the authority having jurisdiction.

The design of support systems shall consider the climatic and geological conditions present at the manufactured home site.

4-2.3.2 Approved Materials Required. All manufactured home utility services shall be connected to the supply sources only with approved materials.

4-2.4 Egress.

Any manufactured home, accessory building, structure, or community building shall be located and maintained in such a manner that any required egress window or door is not blocked.

4-3 Manufactured Home Community Buildings.

4-3.1 Construction.

Every community building shall be designed and constructed in accordance with the applicable provisions of local building codes.

4-3.1.1 Materials, Fixtures, Devices, Fittings. Materials, fixtures, devices, and fittings, and their installation shall conform to nationally recognized standards.

4-3.2 Incinerators and Rubbish Burning.

4-3.2.1 Burning of rubbish within a community shall not be permitted unless specifically permitted by the authority having jurisdiction.

4-3.2.2 Incinerators, where permitted by the authority having jurisdiction, shall be constructed in accordance with NFPA 82, *Standard on Incinerators, Waste, and Linen Handling Systems and Equipment*.

4-3.2.3 Incinerators, where permitted by the authority having jurisdiction, shall meet the applicable standards of the Environmental Protection Agency having jurisdiction.

4-3.3 Outdoor Hazards.

All areas of the community and individual sites shall be maintained free of dry brush, leaves, weeds, and other debris that could contribute to the spread of fire within the site or community.

4-3.4 Fire Detection and Alarm Systems.

4-3.4.1* Detection Systems in Community Buildings. Fire detection and alarm systems installed in community buildings shall be installed in accordance with NFPA 72, *Standard for the Installation, Maintenance, and Use of Protective Signaling Systems*.

4-3.4.2 Public Fire Alarm Services. Street fire alarm services for the community, where provided, shall be in accordance with NFPA 1221, *Standard for the Installation, Maintenance, and Use of Public Fire Service Communication Systems*. Where such services are not provided, alarm procedures shall be posted as required by the local fire service.

4-3.5 Water Supplies for Fire Protection — Minimum Requirements.

Water supplies for fire department operations shall be as required by the authority having jurisdiction. Where there are no such requirements, water supplies shall be at least adequate to permit the effective operation of two $1^1/_2$-in. (38 mm) hose streams on any fire in a building. The supply may be derived from hydrants connected to an underground water supply system, a reservoir or water supply with a source of not less than 3,000 gal (11,360 L) (accessible fire department drafting operations), or fire department apparatus equipped with a water tank(s) with a capacity of 750 gal (2840 L) and a pump capacity of 250 gpm (16 L/s), constructed in accordance with NFPA 1901, *Standard for Pumper Fire Apparatus*.

Hydrants, where provided, shall be located along the community streets or public ways readily accessible for fire department use and located within 500 ft (152.4 m) of all homes and buildings. Hydrant-hose coupling threads shall be national standard threads (*see NFPA 1963, Standard for Screw Threads and Gaskets for Fire Hose Connections*) or shall conform to those used by the local fire department if different from those specified in the referenced standard.

4-3.6 Manufactured Home and Community Fire Safety Requirements.

4-3.6.1 Use and Maintenance of Space Under Manufactured Homes, Accessory Buildings, or Structures. The space under manufactured homes and accessory buildings and structures shall not be used for the storage of combustible materials or for the storage or placement therein of flammable liquids, gases, or liquid- or gas fuel-powered equipment. (*See Appendix B.*)

4-3.6.2 Emergency Information. The requirements of this section shall be printed and posted in conspicuous places in the community and shall contain the following information.

(a) List the following phone numbers:

1. Fire department.
2. Police department or sheriff's office.
3. Community office.
4. The person responsible for operation and maintenance.

(b) List the following locations:

1. Nearest fire alarm box, where available.
2. Nearest public telephone.

3. Address of community.

4-3.6.3* Portable Fire Extinguishers. Portable fire extinguishers, where required or installed, shall be of the type and size required by NFPA 10, *Standard for Portable Fire Extinguishers*.

4-3.6.4 Life Safety from Fire. The provisions of NFPA *101*,® *Life Safety Code*,® regarding construction, protection, and occupancy features of community buildings to minimize danger to life from fire, smoke, or panic shall be followed, as applicable, with special attention given the number, size, and arrangement of exit facilities in community buildings used as places of public assembly.

4-3.6.5 Portable Fire Fighting Equipment. Community buildings shall be provided with listed portable fire extinguishers in accordance with the applicable provisions of NFPA 10, *Standard for Portable Fire Extinguishers*.

4-4 Accessory Building or Structure Fire Safety Requirements.

4-4.1 Setback Requirements.

Accessory buildings or structures shall be permitted to be located immediately adjacent to a site line where constructed entirely of materials that do not support combustion and provided that such buildings or structures are not less than 3 ft (0.9 m) from an accessory building or structure on an adjacent site. An accessory building or structure constructed of combustible materials shall be located not closer than 5 ft (1.5 m) from the site line of an adjoining site.

4-4.2 Exits.

Every habitable room in an accessory building or structure shall have access to at least one exterior opening suitable for exiting directly to the outside without passing through the manufactured home. Where a building or structure encloses two doors of the manufactured home or an emergency exit window, an additional exterior door shall be installed. This exterior door shall be not less than 28 in. (0.7 m) in width and 6 ft 2 in. (1.9 m) in height.

Chapter 5 Referenced Publications

5-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

5-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 10, *Standard for Portable Fire Extinguishers*, 1990 edition

NFPA 31, *Standard for the Installation of Oil-Burning Equipment*, 1992 edition

NFPA 54, *National Fuel Gas Code*, 1992 edition

NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, 1992 edition

NFPA 70, *National Electrical Code*, 1993 edition

NFPA 72, *Standard for the Installation, Maintenance, and Use of Protective Signaling Systems*, 1990 edition

NFPA 82, *Standard on Incinerators, Waste, and Linen Handling Systems and Equipment*, 1990 edition

NFPA *101*, *Life Safety Code*, 1991 edition

NFPA 501C, *Standard on Recreational Vehicles*, 1990 edition

NFPA 1221, *Standard for the Installation, Maintenance, and Use of Public Fire Service Communication Systems*, 1991 edition

NFPA 1901, *Standard for Pumper Fire Apparatus*, 1991 edition

NFPA 1963, *Standard for Screw Threads and Gaskets for Fire Hose Connections*, 1985 edition

5-1.2 Other Publications.

5-1.2.1 U.S. Government Publication. U.S. Government Printing Office, Superintendent of Documents, Washington, DC 20402.

Title 49, *Code of Federal Regulations, October 1, 1990*

UL 80-80, *Steel Inside Tank for Oil Burner Fuel*

Appendix A

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

A-1-2 Approved.

The National Fire Protection Association does not approve, inspect or certify any installations, procedures, equipment, or materials nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations which is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-2 Authority Having Jurisdiction.

The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner since jurisdictions and “approval” agencies vary as do their responsibilities. Where public safety is primary, the “authority having jurisdiction” may be a federal, state, local or other regional department or individual such as a fire chief, fire marshal, chief of a fire prevention bureau, labor department, health department, building official, electrical inspector, or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the “authority having jurisdiction.” In many circumstances the property owner or his designated agent assumes the role of the “authority having jurisdiction”; at government installations, the commanding officer or departmental official may be the “authority having jurisdiction.”

A-1-2 Listed.

The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The “authority having jurisdiction” should utilize the system employed by the listing organization to identify a listed product.

A-1-2 Manufactured Home.

Manufactured homes were formerly referred to as “mobile homes” or “trailer coaches.”

A-2-1.1

Gas piping systems (natural gas, manufactured gas, liquefied petroleum gas in the vapor phase, liquefied petroleum gas-air mixtures, or mixtures of these gases) owned, operated, and maintained by a public utility are exempt from the provisions of this standard but are required to conform to 49 CFR, Part 192. (*See 2-3.1.1*.)

A-2-2.3.2 Manufactured home electrical service equipment should not be considered a source of ignition where it is not enclosed in the same compartment with a gas meter.

A-2-3.1.1 The Natural Gas Pipeline Safety Act of 1979 has the effect of requiring that all gas distribution system operators must adhere to the referenced title. Any master-metered gas distribution system through which a manufactured home community is supplied gas and that, in turn, distributes the gas to the ultimate users (tenants) is defined as a gas distribution system within the context of the federal regulations. Owners of master-metered housing projects or manufactured home communities accordingly are defined as “gas distribution system operators.”

Attention is also called to 49 CFR, Part 191, prescribing requirements for the reporting of gas leaks that are not intended by the operator.

Code of Federal Regulations, Title 49, Transportation, Parts 100-199, revised as of October 1, 1990, is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. The American Society of Mechanical Engineers publishes the ASME *Guide for Gas Transmission and Distribution Piping Systems*, which contains CFR, Title 49, Part 192, along with other useful technical information.

The Handbook on Natural Gas Pipeline Safety in Residential Areas Served by Master Meters is published by the Superintendent of Documents, U.S. Government Printing Office. It was developed under contract for the U.S. Department of Housing and Urban Development HUD-PDR-124 November 1975) and is specifically aimed at providing "a timely and comprehensive safety guide for architects and engineers involved in the planning and design phases of multifamily projects and manufactured home parks."

A-2-4.1

The flexible connector should be installed to provide some slack.

A-2-4.3

Such protection may consist of posts, fencing, or other permanent barriers.

A-2-4.6.1 These provisions do not apply to centralized oil distribution systems (*see 2-3.5 and 2-6.2 of this standard*). See also NFPA 31, *Standard for the Installation of Oil-Burning Equipment*.

A-4-2.2

This requirement is to preclude possible damages to such underground services by the use of ground anchors, installations of skirting (underfloor enclosures), plantings, foundations for steps at access doors, etc.

A-4-3.4.1 See NFPA 71, *Standard for the Installation, Maintenance, and Use of Signaling Systems for Central Station Service*, or NFPA 72, *Standard for the Installation, Maintenance, and Use of Protective Signaling Systems*, for other suitable types of fire protective signaling systems.

A-4-3.6.3 It is recommended that each building owner provide a listed portable fire extinguisher suitable for handling incipient fire in the building. A listed extinguisher labeled as suitable for class A, B, and C fires (multipurpose dry-chemical-type) is recommended. The provision on each site of a $^3/_4$-in. (19-mm) nominal valved water outlet designed for connecting a $^3/_4$-in. (19-mm) nominal female swivel hose connection for fire suppression use is desirable where practical and if protected against freezing.

Appendix B Manufactured Home Community Action for Fire Safety

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

B-1 Purpose.

The purpose of this appendix is to give fire safety guidance for the manufactured home community.

B-2 Responsibilities of the Community Management.

Community management should prepare the type of material detailed herein with the cooperation of the responsible local fire protection authority.

Community management should be responsible for instructing staff in the use of fire protection equipment and defining specific duties in the event of fire.

The objective is to give information to the community's manufactured home owner/occupants and to encourage their cooperation in the protection of life and property from fire.

How to Report a Fire. Give specific instructions to owners on how to report a fire including: name of manufactured home community, its location, and identification of involved manufactured home site.

Utility Services. The connecting and disconnecting of water, fuel, and electrical services should be made only by authorized persons, as determined by park management. Should these services be interrupted, telephone or notify __________ for water, __________ for fuel, and __________ for electrical.

B-2.1 Care and Maintenance of Equipment.

Fire Fighting Equipment. Portable fire extinguishers (and/or other fire fighting equipment) are maintained on the premises and the nearest emergency equipment is located ______________________________.

NOTE: Give full directions as to their location.

Laundry Rooms. Clothes dryers should be cleaned periodically by management to remove combustible material, including lint. A sign should be placed in a conspicuous place warning of the fire hazard in the placement of plastics in dryers and warning against the use of flammable liquids as cleaning agents.

Recreation Buildings. Management should instruct staff and community residents in the proper use of appliances in community buildings and provide a list of these instructions near each appliance.

Appendix C Responsibilities of the Manufactured Home Resident

This Appendix is not a part of the requirements of this NFPA document, but is included for information purposes only.

C-1

The resident should comply with all applicable requirements of this standard and should maintain his/her manufactured home site, its facilities, and its equipment in good repair and in a firesafe condition.

Procedures in Case of Fire. In case of fire in your home, the home owner should do these things in the following order:

(1) Get all occupants out of the home.

(2) Call the fire department or sound the alarm. The important thing to do is to get professional fire fighters to the fire as promptly as possible.

Fire Conditions. Home owners should aid the management in keeping the area free of fire hazards by notifying the management when they recognize unsafe conditions. Constant vigilance is necessary to maintain the premises free from fire at all times.

LP-Gas Containers. In addition to mounted containers, a home may have two additional vessels installed on the lot. The home may be served by either the vehicle containers or vessels on the lot but not by both at the same time. LP-Gas containers should be installed in accordance with the applicable provisions of NFPA 58, *Standard for Storage and Handling of Liquefied Petroleum Gases*.

Charging of Vessels. Liquefied petroleum gas vessels should be charged in accordance with the applicable provisions of NFPA 58, *Standard for Storage and Handling of Liquefied Petroleum Gases*.

Prohibited Location of Vessel. No liquefied petroleum gas vessel should be stored or located inside of or beneath any storage cabinet, cabana, awning, carport, ramada, home, or any other structure in a community.

Empty LP-Gas Containers. Owners should not place empty LP-Gas containers under their homes. Empty containers should be left in place if there is more than one container. If the manufactured home's LP-Gas supply is limited to one container and a replacement has been secured, any empty fuel container should be stored in the area designated for such storage.

Home Inspections. If an owner would like to have a voluntary inspection of his/her home, he/she should notify the fire department.

Traffic Regulations. Operators of vehicles should observe the posted signs and should keep all designated fire lanes and access to fire hydrants open at all times.

Marking. Each home site should be marked for identification. Such a marker should be easily readable from the street servicing the site.

C-2

Periodic inspections of the enclosed space are recommended to ensure that all utility and other connections are secure and that no fire hazards exist.

NFPA 501C

1996 Edition

Standard on Recreational Vehicles

1996 Edition

This edition of NFPA 501C, *Standard on Recreational Vehicles*, was prepared by the Technical Committee on Recreational Vehicles and acted on by the National Fire Protection Association, Inc., at its Fall Meeting held November 13-15, 1995, in Chicago, IL. It was issued by the Standards Council on January 12, 1996, with an effective date of February 2, 1996, and supersedes all previous editions.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

This edition of NFPA 501C was approved as an American National Standard on February 2, 1996.

Origin and Development of NFPA 501C

Period 1937-1970

The earliest activity of the NFPA in the field of mobile homes and recreational vehicles was the formation of an NFPA Committee on Trailers and Trailer Camps in 1937. Its first standard was adopted in 1940. That edition remained unchanged until after World War II when a 1952 revision was approved. These editions were entitled “Standards for Fire Prevention and Fire Protection in Trailer Coaches and Trailer Courts.” In 1960 the Association acted to approve a revised version, dividing the text into two parts — one designated No. 501A covering trailer courts and the other, No. 501B, covering trailer coaches. In 1961 a new edition of 501B was adopted under the title “Standard for Fire Prevention and Fire Protection in Mobile Homes and Travel Trailers”; and in 1963 a revision of same was approved. Revisions of both NFPA Nos. 501A and 501B were acted upon in 1964.

In the early 1960s the Mobile Homes Manufacturers Association (MHMA) and the Trailer Coach Association (TCA) prepared, under the aegis of the American Standards Association (now ANSI), two standards that were subsequently approved as the American Standard Installations of Plumbing, Heating and Electrical Systems in Travel Trailers (A119.2-1963) and a similar text for Mobile Homes (A119.1-1963). In 1964 the two separate standards activities were consolidated with the approval of the United States of America Standards Institute (formerly American Standards Association and subsequently ANSI) as of October 16, 1964. In 1969 the Recreational Vehicle Institute (RVI) was added to the MHMA, NFPA, and TCA as a fourth cosponsor of the project. The first *Standard for Recreational Vehicles* developed under the consolidated efforts of NFPA, MHMA, TCA, and RVI was that approved by NFPA in 1970 and by ANSI in 1971. This replaced ASA Standard A119.2-1963.

The Mobile Homes Manufacturers Association and the Trailer Coach Association were merged in 1975 to become the Manufactured Housing Institute. The Recreational Vehicle Institute was redesignated the Recreation Vehicle Industry Association also in 1975, absorbing the Recreational Vehicle Division of the Trailer Coach Association.

1970-1977

Previous editions of this standard were published in 1970 (approved by NFPA May 20, 1970), 1972 (approved by NFPA May 16, 1972, and approved by ANSI on April 19, 1973), 1974 (approved by NFPA May 21, 1974, and approved by ANSI on February 5, 1975), and 1976 (adopted by NFPA November 17, 1976).

The 1977 edition of the standard was developed by the Sectional Committee on Recreational Vehicles, processed through the Correlating Committee on Mobile Homes and Recreational Vehicles, approved by the National Fire Protection Association at its 1977 Annual Meeting held in Washington, DC, May 16-19, and approved by ANSI on October 18, 1977. The *only* substantive changes since the previous (1975) edition were revisions to Part 8 on mobile home park electrical systems. Some editorial revisions were accomplished in other parts and references to other standards referenced herein were updated.

1977-present

Subsequent to the 1977 edition, the NFPA withdrew as a cosponsor of the ANSI project and established its own project covering only the subject of fire safety for recreational vehicles.

The 1982 edition of the standard was produced by this newly formed Committee (June 20, 1979) charged with the responsibility of developing a standard for fire safety for recreational vehicles and recreational vehicle parks. Therefore, this edition and the 1982 edition both exclude all sections of the previous editions not considered within the Committee Scope. Notably excluded are sections dealing with plumbing. Modifications have also been made in sections dealing with heating, fire, and life safety, and include conformance with the NFPA *Manual of Style*.

The 1986 edition included minor changes in all chapters, and a new Chapter 5 to replace Appendix C so that all mandatory provisions are contained in the body of the document.

The 1990 edition contained minor revisions to Chapters 2 and 3 and one new definition added to Chapter 1.

A few definitions were revised in the 1993 edition, and minor changes were incorporated in Chapters 2 and 3, including the size of alternate exits.

Minor changes have been made in all chapters of this 1996 edition, including a new section on clothes dryers, 2-6.8; the requirement for an LP-Gas detector, 3-4.7; and the expansion of provisions for recreational vehicles used for transporting or storing internal combustion engine vehicles, 3-4.8 (formerly 3-4.7).

Notice

Requirements for plumbing are developed by the ANSI A119 Committee of which the Recreation Vehicle Industry Association is Secretariat. Those requirements and the fire safety requirements of NFPA 501C are published and distributed under one cover as ANSI A119.2/NFPA 501C by ANSI, NFPA, and RVIA.

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the

Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on the fire safety criteria for recreational vehicles and recreational vehicle parks.

NFPA 501C
Standard on
Recreational Vehicles

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 5.

Chapter 1 General

1-1 Introduction.

1-1.1 Need for Standard.

Those members of the engineering profession and others associated with the design, manufacturing, and inspection of recreational vehicles have been aware of the need for uniform technical standards leading to the proper use of this special type of equipment. They also have recognized that, because of conditions of transport, size, and use, existing standards for motor vehicles or permanent buildings are not completely applicable to recreational vehicles. It is with these factors in mind that this standard has been developed.

1-1.2 Basis for Standard.

Much of the material in this standard has been taken from, or is based on, nationally recognized standards for fire and life safety. Applicable standards are shown in Chapter 5.

1-2 Scope.

1-2.1 Applicability.

This standard shall cover fire and life safety criteria for recreational vehicles considered necessary to provide a reasonable level of protection from loss of life from fire and explosion. They reflect situations and the state of the art prevalent at the time the standard was issued.

Unless otherwise noted, it shall not be intended that the provisions of this document be applied to facilities, equipment, structures, or installations that were existing or approved for construction or installation prior to the effective date of the document, except in those cases where it is determined by the authority having jurisdiction that the existing situation involves a distinct hazard to life or adjacent property.

1-2.2 Limitations.

This standard shall not be intended as a design specification or an instruction manual.

1-2.3 Alternate Materials, Equipment, and Procedures.

The provisions of this standard shall not be intended to prevent the use of any material, method of construction, or installation procedure not specifically prescribed by this standard, provided any such alternate is acceptable to the authority having jurisdiction. The authority having jurisdiction shall require that sufficient evidence be submitted to substantiate any claims made regarding the safety of such alternates.

1-2.4 Differing Standards.

Wherever nationally recognized standards and this standard differ, the requirements of this standard shall apply.

1-2.5 U.S. Federal Regulations.

Federal regulations under the National Highway Traffic Safety Administration can supersede all or part of this standard as applied to any category of regulated motor vehicles.

1-3 Definitions.*

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Axle Height. The distance to the lower connection of the axle spindle assembly and the outboard end of the lower control arm (lever ball joint or kingpin), excluding shock mounting, grease fitting, or similar component. A single or dual beam axle is measured at the lowest point of that beam axle at the spring location.

Camping Trailer. A vehicular portable unit mounted on wheels and constructed with collapsible partial side walls that fold for towing by another vehicle and unfold at the campsite to provide temporary living quarters for recreational, camping, or travel use. (*See definition of Recreational Vehicle*.)

Compartment. A completely enclosed volume designed to provide for a separate area.

Connection, Gas Supply. The terminal end or connection where a gas supply connector is attached.

Connector, Gas Supply. Tubing or pipe connecting the recreational vehicle to the gas supply source.

Dry Weight. The weight of the completed finished vehicle when factory-equipped, without fluids.

Fifth Wheel Trailer. A vehicular unit, mounted on wheels, designed to provide temporary living quarters for recreational, camping, or travel use, of such size or weight as not to require special highway movement permit(s), of gross trailer area not to exceed 400 ft^2 (37.2 m^2) in the set-up mode, and designed to be towed by a motorized vehicle that contains a towing mechanism that is mounted above or forward of the tow vehicle's rear axle. (*See definition of Recreational Vehicle.*)

Frame. Chassis rail and any addition thereto of equal or greater strength.

Fuel System. Any arrangement of pipe, tubing, fittings, connectors, tanks, controls, valves, and devices designed and intended to supply or control the flow of fuel.

Gross Trailer Area.* The total plan area measured to the maximum horizontal projections of exterior walls in the set-up mode.

Heat Appliance. An appliance for comfort heating of a recreational vehicle or for water heating.

Heat-Producing Appliance. An appliance that produces heat by utilizing electric energy or by burning fuel.

Identified (as applied to Equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where described in a particular requirement.

Interior Finish. The exposed interior surface in combination with the substrate to which it is applied. Interior finish shall include any material (such as paint, wallpaper, decorative panels, etc.) that is affixed to such surfaces by permanent or semi-permanent means.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Liquefied Petroleum Gas (LP-Gas and LPG). Any material having a vapor pressure not exceeding that allowed from commercial propane composed predominantly of the following hydrocarbons, either by themselves or as mixtures: propane, propylene, butane (normal butane or iso-butane), and butylene (including isomers).

Listed.* Equipment or materials included in a list published by an organization acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

Motor Home. A vehicular unit designed to provide temporary living quarters for recreational, camping, or travel use, built on or permanently attached to a self-propelled motor vehicle chassis or on a chassis cab or van that is an integral part of the completed vehicle. (*See definition of Recreational Vehicle.*)

Recreational Park Trailer. See ANSI A119.5, *Standard for Park Trailers*.

Recreational Vehicle. A vehicular-type unit primarily designed as temporary living quarters for recreational, camping, travel, or seasonal use that either has its own motive power or is mounted on, or towed by, another vehicle. The basic entities are: camping trailer, fifth wheel trailer, motor home, park trailer, travel trailer, and truck camper. (*See individual definitions.*)

Shall. Indicates a mandatory requirement.

Travel Trailer. A vehicular unit, mounted on wheels, designed to provide temporary living quarters for recreational, camping, or travel use, of such size or weight as not to require special highway movement permits when towed by a motorized vehicle, and of gross trailer area less than 320 ft^2 (29.7 m^2). (*See definition of Recreational Vehicle*.)

Truck Camper. A portable unit constructed to provide temporary living quarters for recreational, travel, or camping use, consisting of a roof, floor, and sides, designed to be loaded onto and unloaded from the bed of a pickup truck. (*See definition of Recreational Vehicle.*)

1-4 Exterior Labels Required by this Standard.

Exterior labels required by Chapters 2 and 3 shall be made of etched, metal-stamped, or embossed brass, stainless steel, plastic laminates [0.005-in. (0.13-mm) min.], or anodized or alclad aluminum not less than 0.020 in. (0.5 mm) thickness. These labels shall be mounted by permanent attachment methods compatible with the surface to which they are applied. Other types of labels shall be permitted to be approved if there is adequate proof of permanency and comparable life expectancy to those types specified herein.

1-5 Electrical Requirements.

All electrical installations, systems, and equipment shall comply with Article 551, Part A, and other applicable sections of NFPA 70, *National Electrical Code*®.

1-6* Use of International System of Units (SI).

In some cases SI equivalents to U.S. units have been inserted in this standard. Where used, the conversions have been rounded to the number of digits commensurate with their intended precision. The way the SI units are used is in accordance with the NFPA *Manual of Style*. Alternate usage of U.S. and SI units to determine distance, size (capacity), or dimensions shall not be used to regulate same. Where SI equivalents are not given, it is because the U.S. units shall be employed by anyone enforcing this standard.

Chapter 2 Fuel Systems and Equipment

2-1 Quality of Design and Installation.

All design, construction, and workmanship shall be in conformance with accepted engineering practices.

2-2 LP-Gas Systems.

2-2.1 Maximum Container Capacities.

Where LP-Gas fuel utilization equipment is installed by the recreational vehicle manufacturer, the recreational vehicle shall be provided with:

(a) One but not more than three nonpermanently mounted DOT or ASME containers having individual water capacities of 105 lb (47.6 kg) maximum [approximately 45 lb (20.4 kg) LP-Gas capacity], or

(b) One or more permanently mounted ASME containers having a maximum aggregate water capacity of 200 gal (757 L) [approximately 712 lb (323 kg) LP-Gas capacity].

2-2.2 Construction of LP-Gas Containers.

DOT containers shall be constructed and marked in accordance with the specifications for LP-Gas containers of the U.S. Department of Transportation (DOT), the Rules for Construction of Unfired Pressure Vessels, Section VIII, Division 1, ASME *Boiler and Pressure Vessel Code*. ASME containers utilizing vapor withdrawal shall be constructed and marked in accordance with the rules for construction and shall have a design pressure of at least 312.5 psi (2155 kPa).

2-2.3 Location of LP-Gas Containers.

LP-Gas containers shall be in accordance with the following:

(a) LP-Gas containers shall not be installed nor shall provisions be made for installing or storing any LP-Gas containers, even temporarily, inside any recreational vehicle. Containers shall not be mounted on the exterior of the rear wall or the rear bumper of the vehicle.

Exception: New LP-Gas DOT containers that have never contained LP-Gas, supplied as original equipment, shall be permitted to be transported inside the vehicle.

(b) LP-Gas containers with their control valves shall be installed in compliance with one of the following:

1. In a recess or compartment other than on the roof that is vaportight to the inside of the recreational vehicle.

2. Mounted on the tongue or A frame of a travel or camping trailer or forward of the front bulkhead below the overhang of a fifth wheel travel trailer and not lower than the bottom of the trailer frame.

3. Mounted on the chassis or to the floor of a motor home or chassis-mount camper, provided neither the container nor its support is located ahead of the front axle. Containers mounted between the front and rear axles shall be installed with as much road clearance as practical but not lower than the front axle height. Containers mounted behind the rear axle of a motor home or chassis-mount camper shall be installed in such a manner that the bottom of the tank and any connection thereto shall not be lower than either the rear axle height (excluding the differential) or any section of the frame immediately to the rear of the tank, whichever is higher. All clearances shall be determined from the bottom of the container or from the lowest fitting, support, or attachment on the container or container housing, whichever is lower when all axles are simultaneously loaded to their gross axle weight rating.

2-2.4 Securing of LP-Gas Containers.

Containers shall be secured in place so they will not become dislodged when a load equal to eight times the container's filled weight is applied to the filled container's center of gravity in any direction. If the recreational vehicle is supplied with the containers not in place, the recreational vehicle manufacturer shall provide mounting instructions and required materials with the vehicle.

2-2.5 Shielding of LP-Gas Containers from Heat of Internal Combustion Engine Exhaust System Components.

LP-Gas containers located less than 18 in. (475 mm) from the exhaust system, the transmission, or a heat-producing component of the internal combustion engine, shall be shielded by a vehicle frame member or by a noncombustible baffle, with an air space on both sides of the frame member or baffle.

2-2.6 LP-Gas Container Enclosures.

2-2.6.1 Ventilation of Compartments Containing LP-Gas Containers. Compartments shall be ventilated at or near the top and at the extreme bottom to facilitate diffusion of vapors. The compartment shall be ventilated with at least two vents having an aggregate free area equal to at least 1 in.^{2} for each 7 lb (1 cm^2 per g) of the total LP-Gas fuel capacity of the container(s). The vents shall be equally distributed between the floor and ceiling of the compartment. If the lower vent is located in the access door or wall, the bottom edge of the vent shall be flush with the floor level of the compartment. The top vent shall be located in the access door or wall with the bottom of the vent within 12 in. (305 mm) of the ceiling of the compartment. Vents shall have an unrestricted discharge to the outside atmosphere. Doors or panels providing access to valves shall not be equipped with locks or require special tools to open.

2-2.6.2 Securing LP-Gas Container Housings. Doors, hoods, domes, housings (or portions of housings), and enclosures required to be removed or opened for replacement of containers shall incorporate means for clamping them firmly in place and preventing them from working loose during transit. Hoods or housings covering valves shall not be equipped with locks or require special tools to open.

2-2.6.3 Fastenings for LP-Gas Containers in Compartments. Container compartments or carriers shall be provided with hold-down fastenings complying with 2-2.4 for as many containers as the carriers or compartments are capable of holding.

2-2.6.4 Elimination of Ignition Sources. LP-Gas containers shall not be installed in compartments or under hoods or housings that contain flame- or spark-producing equipment.

2-2.7 LP-Gas Container Valves and Accessories.

2-2.7.1 Container Appurtenances. Appurtenances such as safety relief devices, container shutoff valves, automatic stop fill devices, back-flow check valves, internal valves, excess-flow check valves, liquid level gauges, pressure gauges, and pressure regulators shall be listed.

2-2.7.2 Location of Container Appurtenances. The manual control of the container's shutoff valve, the LP-Gas fill connection, and the liquid level outage valve of permanently installed ASME containers shall be located not more than 18 in. (457 mm) from the vehicle's outside wall. The LP-Gas fill connection and its liquid level outage valve shall be located in accordance with like requirements for LP-Gas safety relief devices (*see 2-2.8.3*).

Exception: Vehicles shall be permitted to be equipped with a remotely controlled normally closed electronic shutoff valve installed on the high pressure side of the LP-Gas regulator. A double back-flow valve shall be installed in the fill opening of the container. The remote fill connection, liquid level outage valve, and electronic shutoff valve control shall be located within 18 in. (45.7 cm) of the vehicle outside wall and shall be located in accordance with like requirements for LP-Gas safety relief devices (see 2-2.8.3).

2-2.7.3 Valves for Multiple LP-Gas Container Assembly System. Valves in a multiple LP-Gas container assembly system shall be arranged so that replacement of containers can be made without shutting off the flow of gas to the appliance(s).

NOTE: This provision is not to be construed as requiring an automatic changeover device.

2-2.7.4 Automatic Stop Fill Devices. Permanently installed containers shall be equipped with a listed automatic stop fill device.

2-2.7.5 Protection of LP-Gas Container Shutoff Valves. Container shutoff valves shall be protected as follows:

(a) By setting into a recess of the container to prevent possibility of their being struck if container is dropped upon a flat surface, or

(b) By a ventilated cap or collar, fastened to the container, capable of withstanding a blow from any direction equivalent to that of a 30-lb (13.6-kg) weight dropped 4 ft (1.2 m). Construction must be such that the blow will not be transmitted to the valve.

2-2.7.6 LP-Gas Regulators. Listed two-stage regulator(s) shall be supplied. Such regulator(s) shall have a capacity not less than the total input of all LP-Gas appliances installed in the recreational vehicle. The regulator(s) shall be mounted only in a position downward within 45 degrees of vertical and the diaphragm area being drained. Containers installed below floor level shall have the regulator(s) installed in a compartment that provides protection against the weather and wheel spray. The compartment shall be of sufficient size to permit tool operation for connection to and replacement of the regulator(s), shall be vaportight to the interior of the vehicle, shall have a 1 in.^{2} (6.5 cm^2) minimum vent opening to the exterior located within 1 in. (25 mm) of the bottom of the compartment, and shall not contain flame- or spark-producing equipment. The regulator vent outlet shall be at least 2 in. (51 mm) above the compartment vent opening.

Regulators installed elsewhere and not installed in compartments as specified above shall be equipped with a durable cover [that will not become brittle at temperatures as low as –40°F (–40°C)] designed to protect the regulator vent opening from sleet, snow, freezing rain, ice, mud, and wheel spray.

If the regulator is not mounted by the recreational vehicle manufacturer, instructions for proper installation shall be supplied.

2-2.7.7 LP-Gas Excess Flow Valves. A listed LP-Gas excess flow valve shall be provided in accordance with the following:

(a) The inlet or outlet of each container service valve of a permanently mounted container shall be equipped with such a listed excess flow valve or a listed POL (CGA 510) adapter with an integral excess flow valve.

(b) Vehicles with removable (DOT) type containers shall have furnished or installed a listed POL adapter with an integral listed excess flow valve.

2-2.8 LP-Gas Container and System Safety Devices.

2-2.8.1 LP-Gas Container Safety Relief Devices. DOT containers shall be provided with safety relief devices as required by the regulations of the U.S. Department of Transportation. ASME containers shall be provided with relief valves in accordance with 8-2.3(a)(4) of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*. Safety relief valves shall have a direct communication with the vapor space of the vessel.

Listed manual tank shutoff valves (service valves) of ASME containers shall be equipped with an internal excess flow check valve designed to close automatically at rated flows of vapor specified by the manufacturer. Excess flow valves shall be designed with a bypass not to exceed a number 60 drill size opening to allow equalization of pressure.

2-2.8.2 Regulator Relief Device. Final stage regulators shall be equipped on the low pressure side with one or both of the following:

(a) A relief valve having a start-to-discharge pressure setting of not less than 1.7 times and not more than 3 times the delivery pressure of the regulator.

(b) A shutoff device that shuts the gas off at the inlet side when the downstream pressure reaches the overpressure limit of not less than 1.7 times and not more than 3 times the delivery pressure of the regulator. Such a device shall not open to allow flow of gas until it has been manually reset.

2-2.8.3 Discharge from LP Safety Relief Devices. Discharge from LP safety relief devices shall be located in accordance with the following:

(a) Discharge outlets shall be so located that the discharge from the safety relief device shall be not less than 3 ft (0.9 m) measured horizontally along the surface of the vehicle from any of the following located below the level of such discharge:

1. Openings into the recreational vehicle,
2. Fuel-burning appliance intake and exhaust vents, and
3. All internal combustion engine exhaust terminations.

Exception: Unventilated compartment doors containing either door or body side seals and entry doors not containing screens or openable windows below the level of the LP discharge outlet(s).

(b) The discharge from the outlet of the safety relief device on ASME containers shall not directly impinge on the vehicle fuel container(s), the exhaust system, any other part of the vehicle, or be directed into the interior of the vehicle.

(c) Where the relief device outlets are located in a compartment vaportight to the vehicle interior, discharge from these devices shall be considered to be located at the compartment vents and shall meet the location requirements of 2-2.8.3(a) above.

2-2.9 LP-Gas System Design and Service Line Pressures.

2-2.9.1 LP-Gas System Design. Systems shall be of the vapor-withdrawal type.

Exception: Liquid withdrawal systems are permitted to supply LP-Gas as engine fuel. See Section 2-11 for engine fuel installations.

2-2.9.2 LP-Gas Vapor Pressure Maximum. Vapor, at a pressure not over 14 in. water column (3.49 kPa), shall be delivered from the system into the gas appliance supply connection.

Exception: A fuel-burning appliance that operates at a pressure higher than 14 in. water column (3.49 kPa) shall be acceptable provided it meets all of the following:

(a) The appliance must provide for a separate fuel supply system or provide a means to prevent high pressure from entering the recreational vehicle’s low pressure system.

(b) The high-pressure fuel system shall be located entirely on the exterior of the vehicle or in a compartment that is vaportight to the vehicle’s interior.

(c) Exterior rated labels shall be permanently attached to the appliance or appliance compartment and at the fuel source in a visible location indicating:

1. the operating pressure;

2. any special precautions to be taken while servicing; and

3. a statement warning against connecting the appliance to any other fuel system or that fuel system to another appliance.

(d) The fuel system shall be tested at six times its working pressure prior to its installation and at its working pressure after installation.

(e) A two-stage regulator system is not required for the high- pressure system.

(f) The appliance is listed for RV use at the specified operating pressure.

2-2.9.3 Mounting of LP-Gas Containers. Container openings for vapor withdrawal shall be located in the vapor space when the container is in service or shall be provided with a suitable permanent internal withdrawal tube that communicates with the vapor space in or near the highest point in the container when it is mounted in service position with the vehicle on a level surface. ASME tanks shall have vapor withdrawal located midway between tank ends. Each container shall be permanently and legibly stamped to show the correct mounting position. Stamping shall be $^{1}/_{4}$ in. (6 mm) minimum letter height. The method of mounting in place shall be such as to minimize the possibility of an incorrect positioning of the container.

2-3 Fuel Oil Supply for Heat-Producing Appliances.

2-3.1 Gravity Flow Oil Tanks.

Oil tanks installed for gravity flow of oil to heating equipment shall be installed so that the top of the tank is no higher than 8 ft (2.4 m) above the appliance oil control and the bottom of the tank is no less than 18 in. (457 mm) above the appliance oil control.

2-3.2 Mounting of Automatic Pumps.

Listed automatic pumps (oil lifter) shall be mounted no higher than 8 ft (2.4 m) above the appliance oil control and not less than 18 in. (457 mm) above the appliance oil control.

2-3.3 Oil Supply Tank Affixed to Vehicle.

Oil supply tanks affixed to a recreational vehicle shall be so located as to require filling and draining on the outside and shall be securely fastened in position in a place readily available for inspection.

2-3.4 Oil Supply Tank Located in Vehicle Compartment.

If the oil supply tank is located in a recess or compartment of a recreational vehicle, the compartment shall be vaportight to the inside of the recreational vehicle; ventilated at the bottom to permit diffusion of vapors; and isolated from oil absorption material members. A tank so installed shall be provided with an outside fill and vent pipe and an approved liquid level gauge.

2-3.5 Oil Supply Tank Shutoff Valves.

A readily accessible, listed, manual shutoff valve shall be installed at the outlet of an oil supply tank. The valve shall be installed to close against the supply.

2-3.6 Oil Filters.

All oil tanks, except for integrally mounted tanks, shall be equipped with a listed oil filter or strainer located downstream from the tank shutoff valve. The fuel oil filter or strainer shall contain a sump with a drain for the entrapment of water.

2-4 Fuel Gas Piping Systems.

2-4.1 General.

The requirements of this section shall govern the installation of all fuel gas piping intended for carrying gas in the vapor state attached to any recreational vehicle. None of the requirements listed in this section shall apply to the piping supplied as a part of a listed appliance. Liquid withdrawal piping shall comply with the requirements of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases (see Sections 2-4 and 3-2.8)*.

2-4.2 Gas Piping System Materials.

Materials used for the installation, extension, alteration, or repair of any gas piping system shall be new and free from defects or internal obstructions. It shall not be permitted to repair defects in gas piping or fittings. Inferior or defective materials shall be removed and replaced with acceptable material. The system shall be made of materials having a melting point of not less than 1450°F (788°C), except as provided in 2-4.5, 2-4.6, and 2-4.12, or of materials (used in piping or fittings) listed for the specific use intended. They shall be permitted to consist of one or more of the following materials:

(a) Gas pipe shall be steel or wrought-iron pipe complying with ANSI B36.10M, *Welded and Seamless Wrought Steel Pipe*. Threaded copper or brass pipe in iron pipe sizes shall be permitted to be used.

(b) Fittings for gas piping shall be wrought iron, malleable iron, steel, or brass (containing not more than 75 percent copper). Brass flare nuts shall be stress relieved or of the forged type.

(c) Copper tubing shall be annealed Type K or L, conforming to ASTM B 88, *Standard Specifications for Seamless Copper Water Tube*, or shall comply with ASTM B 280, *Specifications for Seamless Copper Tube for Air Conditioning and Refrigeration Field Service*. Where used on systems designed for natural gas, such tubing shall be internally tinned.

(d) Seamless brass tubing shall be composed of not more than 75 percent copper (cartridge brass 70 percent) and shall have a minimum thickness of 0.030 in. (0.76 mm).

(e) Steel tubing shall be constructed in accordance with ASTM A 539, *Standard Specifications for Electric-Resistance Welded Coiled Steel Tubing for Gas and Fuel Oil Lines*, and shall be externally corrosion-protected.

(f) Flexible nonmetallic tubing or hose shall be either listed and used with listed fittings or part of a listed assembly.

2-4.3 Gas Piping Design.

Each recreational vehicle requiring fuel gas for any purpose shall be equipped with a gas piping system that is designed for LP-Gas only or with a natural gas piping system acceptable for LP-Gas.

2-4.4 Gas Pipe Sizing.

Gas piping systems shall be sized so that the pressure drop to any appliance inlet connection from the gas supply connection or connections, where all appliances are in operation at maximum capacity, is not more than 0.5 in. water column (0.125 kPa) where used with natural gas if the system is designed for both natural and LP-Gas, or where used with LP-Gas if the system is designed for LP-Gas only. Conformance can be determined on the basis of test, or the gas piping system can be sized in accordance with one of the following tables [2-4.4(a) through 2-4.4(d)], or other approved method. The natural gas supply connection shall be not less than $^{3}/_{4}$ in. nominal pipe size. (*See Appendix B for further guidance on how to calculate gas piping size.*)

2-4.5 Joints for Gas Pipe.

Pipe joints in the piping system, unless welded or brazed, shall be screw joints that comply with ANSI B1.20.1, *Pipe Threads, General Purpose (Inch)*. Right and left nipples or couplings shall not be used. Unions, if used, shall be of the ground joint type. The material used for welding or brazing pipe connections shall have a melting temperature in excess of 1000°F (538°C).

2-4.6 Gas Tubing Joints.

Tubing joints shall be made with a single or double flare of 45 degrees conforming to SAE J 533, *Flares for Tubing, Standard*, as recommended by the tubing manufacturer or by means of listed vibration-resistant fittings, or the joints shall be brazed with a material having a melting point exceeding 1000°F (538°C). Brazing alloys shall not contain phosphorous. Sealants shall not be used on tubing joints. Ball sleeve or one-piece internal compression-type tubing fittings shall not be used. (*See 2-5.5.*)

2-4.7 Pipe Joint Materials.

Threaded joints shall be made up tight with approved pipe joint material, insoluble in liquefied petroleum gas, that shall be applied to the male threads only.

2-4.8 Routing and Protection of Tubing.

Tubing shall not be run inside walls, floors, partitions, or roof except that $^1/_4$ in. O.D. tubing shall be permitted to be concealed provided it is enclosed with a metallic covering of thickness equivalent to the thickness of the tubing enclosed. Where tubing passes through walls, floors, partitions, roofs, or similar installations, such tubing shall be protected by the use of weather-resistant grommets that shall fit snugly both the tubing and the hole through which the tubing passes.

2-4.9 Restrictions on Concealing Joints in Gas Piping or Tubing.

Pipe or tubing joints shall not be located in any floor, wall, partition, or concealed construction space. Pipe and tubing joints shall be permitted to be located in storage areas below the floor if they are located within 2 in. (50.8 mm) of the compartment's ceiling with the tubing joints protected from physical damage. Pipe joints shall be permitted to be located below the 2-in. (50.8-mm) requirement if protected from physical damage. Unprotected tubing shall not be located in storage areas below the floor level.

2-4.10 Gas Supply Connection Location.

For LP-Gas only systems and for combination LP-Gas and natural gas systems, the supply connection shall be located at the container location. An additional supply connection shall be permitted to be installed, located on the left (road) side, or at the rear left of the longitudinal center of the vehicle, within 18 in. (457 mm) of the outside wall. Combination LP-Gas and natural gas additional supply connections shall be within 15 ft (4.6 m) of the rear of the vehicle.

2-4.11 Gas Supply Connections.

2-4.11.1 Natural Gas Supply Connectors. A listed minimum $^1/_2$-in. (12.7-mm) nominal (I.D.) gas supply connector, with $^3/_4$-in. (19-mm) NPT terminal fittings, 6 ft (1.8 m) in length, shall be supplied by the manufacturer where the fuel gas piping system is designed for the use of natural gas.

2-4.11.2 LP-Gas Supply Connectors. Connectors used in LP-Gas systems shall be listed as conforming to UL 569, *Standard for Pigtails and Flexible Hose Connectors for LP-Gas*.

2-4.11.3 High-Pressure LP-Gas Connections. High-pressure LP-Gas connections shall be in accordance with the following:

(a) If the regulator is not directly connected to a permanently mounted container shutoff valve, it shall be connected to the container shutoff valve by a listed high-pressure flexible hose connector or by material conforming to 2-4.2.

(b) The connection between the shutoff valve of a container intended to be removed and mounted on the tongue (A frame) and a regulator mounted on a container support bracket shall be made with a listed high-pressure flexible hose connector.

(c) The connection between the shutoff valve of a container intended to be removed and mounted on the tongue (A frame) and a regulator permanently mounted other than as described in (b) above shall be made with a listed high-pressure flexible hose connector.

(d) The connection between the shutoff valve of a container intended to be removed and mounted within a compartment shall be made with a listed high-pressure flexible hose connector if the regulator is not directly attached to the shutoff valve.

2-4.11.4 Low-Pressure LP-Gas Connections. Low-pressure LP-Gas connections shall be in accordance with the following:

(a) The connection between a permanently mounted regulator or a regulator directly attached to a permanently mounted container and the gas supply system shall be made with a listed flexible hose connector or with material conforming to 2-4.2.

(b) The connection between a regulator mounted on a removable container support bracket or a regulator directly attached to the shutoff valve of a removable container and the gas supply system shall be made with a listed flexible hose connector.

2-4.12 Appliance Connections.

Except as provided herein, all gas-burning appliances shall be connected to the fuel piping with materials as provided in 2-4.2.

Exception: Where a flexible connector is required to connect a gas appliance, such as a fold-down range, the connector shall be a listed flexible hose connector conforming to UL 569, Standard for Pigtails and Flexible Hose Connectors for LP-Gas, and shall not pass through any floor or ceiling. They shall be permitted to pass through a wall or partition provided the entire length of the hose is readily available for visual inspection. Provision is made to protect against chaffing, and no part of the flexible connector is concealed in the hollow space of a wall or partition.

2-4.13 Gas Shutoff Valves.

Shutoff valves used in connection with gas piping shall be listed for use with LP-Gas and shall have nondisplaceable rotors.

2-4.14 Gas Inlet Cap.

2-4.14.1 For combination LP-Gas and natural gas systems, suitable cap(s) to effectively close the gas inlet(s) when disconnected from the source of supply and not in use shall be attached to the recreational vehicle. Inlets shall be effectively capped when disconnected from the source of supply.

2-4.14.2 The LP-Gas only supply inlet shall be effectively capped to prevent entrance of water and foreign materials when the recreational vehicle is shipped with the LP-Gas containers disconnected from the system.

2-4.15 Prohibiting Use of Gas Piping as Electrical Ground.

Gas piping shall not be used for a grounding electrode.

2-4.16 Gas Pipe Couplings.

Sections of threaded pipe shall be joined by pipe couplings or ground joint unions. Right and left nipples and couplings shall not be used.

2-4.17 Gas Piping Support.

All gas piping shall be supported at intervals of not more than 4 ft (1.2 m), except where adequate support and protection is provided by structural members. All pipe shall be rigidly anchored to a structural member within 6 in. (152.4 mm) of the supply connection(s) by galvanized, painted, or equivalently protected metal straps or hangers. All pipe shall be anchored within 6 in. (152.4 mm) of tubing connections at the end of pipe runs and within 12 in. (304.8 mm) of tubing connection within pipe runs.

2-4.18 Testing for Gas Leakage.

2-4.18.1 Before Appliances Are Connected. Piping systems shall be proven by test to be leak-free by maintaining an air pressure of at least 6 in. mercury (20.7 kPa) or 3 psi (20.7 kPa) for a period of at least ten minutes. Before the test is begun, the temperature of the air and of the piping shall be approximately the same, and a uniform temperature shall be maintained throughout the period. Leaks, if observed, shall be located and corrected. Defective material shall be replaced. Tests shall be conducted by either of the following methods:

(a) The source of the air pressure to the piping system shall be shut off. The pressure in the system shall be measured over a period of ten minutes with a mercury manometer, slope gauge, or equivalent device, calibrated so as to be read in increments of not greater than $^{1}/_{10}$ psi (0.7 kPa). During the ten-minute period a drop in pressure shall not occur.

(b) A bubble-type leak detector shall be installed between the source of air pressure and the piping system. After a ten-minute equalization period, the bubble detector shall not indicate any air flow for a period of one minute. Products that contain ammonia or chlorine shall not be used for testing.

2-4.18.2 After Appliances Are Connected. When appliances are connected to the piping system, the entire piping system shall be pressurized to not less than 10 in. water column (2.5 kPa) nor more than 14 in. water column (3.5 kPa) and the appliance connections tested for leakage with either soapy water or bubble solution. Products containing ammonia or chlorine shall not be used. As an alternative procedure a pressure drop test can be conducted in the following manner:

The entire system shall be pressurized to not less than 10 in. water column (2.5 kPa) nor more than 14 in. water column (3.5 kPa), the appliance shutoff valves closed, and the source of pressure shut off. The temperature of both the air and piping shall be approximately the same, and a uniform temperature shall be maintained throughout the test period. When the test gauge is installed downstream of an appliance regulator, before the test is begun, open one valve and lower the pressure to 9 in. water column (2.24 kPa) ± 0.5 so that the appliance regulator is in an open condition. The pressure in the system shall be measured over a period of three minutes with a manometer or with a pressure-sensing device designed and calibrated to read, record, or indicate a pressure loss due to leakage during the pressure test period. During the three-minute period, a drop in pressure shall not occur.

2-5 Fuel Oil Piping System.

2-5.1 General.

The requirements of this section shall govern the installation of all fuel oil piping attached to any recreational vehicle. None of the requirements listed in this section shall apply to the piping in the appliance(s).

2-5.2 Oil Piping System Materials.

All materials used for the installation, extension, alteration, or repair of any oil piping system shall be new and free from defects or internal obstructions. The system shall be made of materials having a melting point of not less than 1450°F (788°C), except as provided in 2-5.4. They shall be permitted to consist of one or more of the following materials:

(a) Pipe shall be steel or wrought-iron pipe complying with ANSI B36.10M, *Welded and Seamless Wrought Steel Pipe*. Threaded copper or brass pipe in iron pipe sizes shall be permitted to be used;

(b) Fittings for oil piping shall be wrought iron, malleable iron, steel, or brass (containing not more than 75 percent copper);

(c) Copper tubing shall be annealed Type K or L conforming to ASTM B 88, *Standard Specifications for Seamless Copper Water Tube*, or shall comply with ASTM B 280, *Specifications for Seamless Copper Tube for Air Conditioning and Refrigeration Field Service*;

(d) Seamless brass tubing shall have a minimum wall thickness of 0.030 in. (0.762 mm); or

(e) Steel tubing shall have a minimum wall thickness of 0.049 in. (1.24 mm), conforming to ASTM A 539, *Standard Specifications for Electric-Resistance Welded Coiled Steel Tubing for Gas and Fuel Oil Lines*, and shall be externally protected from corrosion.

2-5.3 Size of Oil Piping.

The minimum size of all fuel oil tank piping connecting outside tanks to the appliance shall be not smaller than $^{3}/_{8}$ in. O.D. copper tubing or $^{1}/_{4}$ in. IPS. In those cases where No. 1 fuel is used with a listed automatic pump (fuel lifter), $^{1}/_{4}$ in. O.D. copper tubing shall be permitted to be used if specified by the pump manufacturer.

2-5.4 Joints for Oil Piping.

All pipe joints in the piping system, unless welded or brazed, shall be screw joints that comply with ANSI B1.20.1, *Pipe Threads, General Purpose (Inch)*. The material used for welding or brazing pipe connections shall have a melting temperature in excess of 1000°F (538°C).

2-5.5 General Specifications for Flared Oil Tubing Joints.

Flared oil tubing joints shall be in accordance with the following:

(a) After cutting, tubing ends shall be internally reamed prior to flaring.

(b) Flares shall be square with the axis of the tubing within one-half degree.

(c) Flares shall be free from loose scale, burrs, and cracks. Seating surfaces shall be smooth and free from pit marks.

(*See also 2-4.6.*)

2-5.6 Oil Pipe Joint Compound.

Screw joints shall be made up tight with approved pipe joint compound, or other approved material, that shall be applied to the male threads only.

2-5.7 Couplings for Oil Piping.

Where it is necessary to join sections of screw piping, right and left nipples and couplings shall not be used. Ground joint unions shall be permitted to be installed at appliance inlet connections.

2-5.8 Slope of Oil Piping.

Fuel oil piping installed in conjunction with gravity feed systems to oil heating equipment shall slope in a gradual rise upward from a central location to both the oil tank and the appliance in order to eliminate air locks.

2-5.9 Strap Hangers for Oil Piping.

All oil piping shall be adequately supported by galvanized, painted, or equivalently protected metal straps or hangers at intervals of not more than 4 ft (1.2 m), except where adequate support and protection is provided by structural members. Iron-pipe oil supply connection(s) shall be rigidly anchored to a structural member within 6 in. (152 mm) of the supply connection(s). Iron piping shall be anchored within 6 in. (152 mm) of tubing connections at the end of the pipe runs and within 12 in. (304 mm) of tubing connections within runs.

2-5.10 Testing for Oil System Leakage.

Before setting the system in operation, tank installations and piping shall be checked for oil leaks with fuel oil of the same grade as that which will be burned in the appliance. No other material shall be used for testing fuel oil tanks and piping. Tanks shall be filled to a maximum capacity for the final check for oil leakage.

2-6 Fuel-Burning Appliances.

2-6.1 General.

2-6.1.1 Listing Requirements. Fuel-burning appliances and vents necessary for their installation shall be listed for installation in recreational vehicles.

2-6.1.2 Basic Venting Requirements. Fuel-burning, heat-producing, and refrigeration appliances, except ranges and ovens, shall be of the vented type and vented to the outside.

2-6.1.3 Gas Appliance Fuel Utilization. Gas appliances shall be listed for use with LP-Gas only or for use with both natural gas and LP-Gas (convertible from natural gas to LP-Gas and vice versa).

2-6.1.4 Conversion of Appliances. Fuel-burning appliances shall not be converted from one fuel to another unless converted in accordance with the terms of their listings and the appliance manufacturer’s instructions.

2-6.2 Installation of Fuel-Burning Appliances.

2-6.2.1 General Installation Requirements. The installation of each appliance shall conform to the terms of its listing and the appliance manufacturer’s installation instructions. Floor-mounted fuel-burning appliances shall not be installed on carpeting unless the appliance is listed for such installation. Every appliance shall be secured in place to avoid displacement.

2-6.2.2 Requirement for Direct Vent System Appliances. All fuel-burning appliances, except ranges and ovens, shall be designed and installed to provide for the complete separation of the combustion system from the interior atmosphere of the recreational vehicle. Combustion air inlets and flue gas outlets shall be listed as components of the appliance. The required separation shall be obtained by the installation of direct vent system (sealed combustion system) appliances.

Exception No. 1: A fuel-burning refrigerator shall be permitted to be installed to meet the above requirements using panels supplied by the recreational vehicle manufacturer provided that the refrigerator manufacturer furnishes the necessary vents and grills as specified by the listing requirements and, in addition, the refrigerator is equipped with the necessary means to ensure the integrity of the separation of the combustion system when the refrigerator is removed for field service and reinstalled.

Exception No. 2: A fuel-burning appliance shall not need to be of the direct vent type provided that it conforms to all of the following:

(a) It is a vented appliance.

(b) It incorporates provisions for introduction of combustion air from outside the vehicle.

(c) It incorporates a safety control system that will prevent burner operation under any operating conditions that would allow products of combustion to discharge into the interior of the recreational vehicle.

(d) It incorporates provisions either integral to the appliance design or, by use of a safety control system(s) to protect against ignition of flammable materials that could come into contact with any heat source or part of the appliance.

(e) It is listed for recreational vehicle installation and is installed with the terms of the listing.

2-6.2.3 Exterior Appliances. Fuel-burning appliances installed or intended to be used only outside the RV shall be listed but shall not be required to be of the direct vent, sealed combustion type. The installation shall preclude the possibility of appliance operation or gas flow when the appliance is in its storage (travel) position. The appliance manufacturer shall specify clearance to adjacent surfaces as applicable in both the operational and storage positions.

2-6.2.4 Auxiliary Heating Devices. Primary mover engine auxiliary devices for heating interior living or storage space, or for heating potable water, shall not be required to be listed. Heat exchangers used in the potable water system shall be identified by the device manufacturer as being of a double-wall construction. Exhaust termination of engine block heaters with a gasoline- or diesel-fired source other than the primary mover engine shall comply with 3-4.3.

2-6.2.5 Special Requirement for Forced-Air Heating Appliances. A forced-air heating appliance and its return-air system shall be designed and installed so that negative pressure created by the air-circulating fan cannot affect its, or another appliance’s, combustion air supply or act to mix products of combustion with circulating air.

2-6.3 Venting, Ventilation, and Combustion Air.

2-6.3.1 Installation of Venting and Combustion Air Systems. Venting and combustion air systems shall be installed in accordance with the following:

(a) Components shall be securely assembled and properly aligned using the method shown in the appliance manufacturer’s instructions.

(b) Vent connectors shall be firmly attached to flue collars by sheet metal screws, their equivalent, or as specified in the manufacturer’s installation instructions.

(c) Every joint of a vent, vent connector, exhaust duct, and combustion air intake shall be secure and in alignment.

2-6.3.2 Location of Flue Gas Outlets of Fuel-Burning Heating Appliances. Flue gas outlets from fuel-burning heating appliances shall be not less than 3 ft (0.9 m) from any motor-driven air intake discharging into habitable areas of the recreational vehicle. Flue gas outlets shall not terminate underneath a recreational vehicle.

2-6.3.3 Location of Combustion Air Inlets, Flue Gas Outlets, Fuel-Burning Heating Appliances. Any portion of a combustion air inlet or a flue gas outlet of a fuel-burning heating appliance shall be located at least 3 ft (0.9 m) from any gasoline filler spout on the vehicle if the inlet or outlet is located above or at the same level. If any portion of such inlet or outlet is located below the spout, the distance shall be the sum of the vertical distance below the spout plus 3 ft (0.9 m).

2-6.3.4 Ventilation of Areas Accommodating Fuel-Burning Cooking Appliances. The space where any fuel-burning cooking appliance is located shall be ventilated by a gravity or mechanical vent extending through the roof to the outside. Where a combination gravity/mechanical vent is installed, both operations must comply. A gravity vent shall have a free, clear, openable area not less than 1 $in.^2$ for every 2000 Btuh (11 cm^2/1000 W) rated input of the appliance(s). The location of the vent shall be in the roof within 5 ft (1.5 m) of any point directly above and provide unobstructed flow from the cooking appliances. Vent hood ducts shall be designed so that the duct outlet is located at such a point as to preclude the trapping of products of combustion.

Exception No. 1: Vehicles with fabric exterior walls shall be permitted to utilize an opening through the sidewall not more than 15 in. (381 mm) below the highest point of that roof within 5 ft (1.5 m) of any point directly above the appliance.

Exception No. 2: Hooded gravity vents located directly above the appliance are permitted to exhaust through the sidewall. (See 2-6.7.2.)

Exception No. 3: Mechanical vents (exhaust fans) having a flow rating of 2 cfm (0.19 m^3/m) for every 1000 Btuh (1000 W) rated input of the appliance are permitted to be located on an adjacent wall higher than the appliance within a horizontal distance of not more than 5 ft (1.5 m) from the nearest edge of the appliance.

2-6.4 Marking Appliances (Installation and Operation Features).

2-6.4.1 Clearances, Input Ratings, Lighting, and Shutdown. Information on clearances, input ratings, lighting, and shutdown shall be attached to the appliance with the same permanence as the nameplate and shall be so located that it is easily readable when the appliance is properly installed.

2-6.4.2 Type(s) of Fuel. Each fuel-burning appliance shall bear the appliance manufacturer's permanent marking designating the type(s) of fuel for which it is listed. If listed and installed for use with either LP-Gas or natural gas, the appliance manufacturer's instructions regarding conversion from one fuel to the other shall be attached to the appliance with the same permanence as the nameplate.

2-6.5 Accessibility for Service/Operation.

Every appliance shall be accessible for inspection, service, repair, and replacement without removing permanent construction or other fuel-burning appliances. Sufficient room shall be available to enable the operator to operate the controls, start the appliance, and observe the ignition for those appliances where the appliance manufacturer requires such procedure.

2-6.6 Location of Heat-Producing Appliances.

Heat-producing appliances shall be so located that doors, drapes, or other such material cannot be placed or swung closer to the appliance than the clearances specified on the labeled appliances.

2-6.7 Clearances of Heat-Producing Appliances.

2-6.7.1 Maintaining Listed Clearances. Clearances between heat-producing appliances and adjacent surfaces shall be not less than as specified in the terms of their listing. Clearance spaces shall be framed in or guarded to prevent creation of storage space within the clearance specified. The only exceptions to framing-in or guarding such spaces will be those necessary to allow access to shutoff valves or controls in order to comply with 2-4.9 and 2-6.2.1, in which case the unguarded area must have a warning tag, posted in an easily readable location, as follows:

WARNING

DO NOT STORE COMBUSTIBLE MATERIAL

IN THIS AREA

2-6.7.2 Vertical Clearances of Ranges. Ranges shall have a vertical clearance between the cooking top and combustible material or metal cabinets in accordance with Table 2-6.7.2 or the terms of their listings.

Exception: Range covers.

Table 2-6.7.2 Vertical Clearances to Combustible Material or Metal Cabinets

Type of Protection Provided to Combustible Material or Metal Cabinets above Range	Top Burner Rating	Oven Burner Rating	Vertical Clearance Required above Range Top
1. No protection provided.	Any combination, number, or input.	Any	30 in (762 mm)
2. 1/4-in. (6-mm) thick minimum insulating millboard covered with 28 U.S. gauge sheet metal extending 9 in. (229 mm) beyond the sides of the range and covering the entire bottom of the material to be protected extending over the top of range. In lieu of 28 gauge sheet metal, a hood, 28 U.S. gauge sheet metal, can be used. Hood shall be not less than the width of the range and shall be centered over the range and cover the entire bottom of the material to be protected.	Any combination, number, or input.	Any	24 in. (610 mm)
3. Range hood 28 U.S. gauge, with minimum 2-in. (51-mm) vertical	Not more than 4 top burners — input not to	10,000 Btuh	19 1/2 in. (495 mm)

sides and provided with a bead or flange around top of hood to provide a minimum 1/4-in. (6-mm) dead air space between hood and protected material. Hood shall be not less than the width of the range and shall be	exceed 6000 Btuh (1758 W) each, or not more than 3 top burners — 2 burners input not to exceed 7000 Btuh (2051 W) each and 1 burner input not to exceed 10,000 Btuh (2931 W).	(2931 W)	
installed centered over range and cover the entire bottom of the material to be protected extending over.the	Not more than 4 top burners — input not to exceed 9000 Btuh (2638 W) each.	24,000 Btuh (7034 W)	20 3/4 in. (514 mm)
top of range	2 rear burners — input not to exceed 9000 Btuh (2638 W) each and 2 front burners — input not to exceed 12,000 Btuh (3517 W) each.	22,000 Btuh (6448 W)	23 1/2 in. (597 mm)
4. Same as No. 3, except no dead air space clearance provided.	Not more than 4 burners input not to exceed 9000 Btuh (2638 W) each.	22,000 Btuh (6448 W)	23 in. (584 mm)

2-6.8 Clothes Dryers.

2-6.8.1 Exhaust Duct System. All gas and electric clothes dryers shall be exhausted to the outside by a moisture-lint exhaust duct and termination fitting.

Exception: Listed electric clothes dryers that are not required to be vented to the outside.

2-6.8.2 Where the clothes dryer is supplied by the manufacturer, the exhaust duct and termination fittings shall be provided by the manufacturer in accordance with the following:

(a) A clothes dryer moisture-lint exhaust duct shall not be connected to any other duct, vent, or chimney.

(b) The exhaust duct shall be of sufficient length so as not to terminate beneath the recreation vehicle.

(c) Moisture-lint exhaust ducts shall not be connected with sheet metal screws or other fastening devices that extend into the interior of the duct.

(d) Moisture-lint exhaust duct and termination fittings shall be installed in accordance with the appliance manufacturer's printed instructions.

2-6.8.3 Prevention of Negative Pressure in Recreation Vehicles. Fuel-burning clothes dryers shall receive their combustion air and drying air from outside the vehicle and shall exhaust the combustion products and drying air from inside the vehicle. A warning label with $^{3}/_{8}$ in. (9 mm) high letters shall be posted on or near the dryer in a conspicuous location that shall read:

CAUTION: OPEN A WINDOW OR VENT WHILE OPERATING DRYER. IT IS DANGEROUS TO CREATE A NEGATIVE AIR PRESSURE INSIDE A TRAILER CONTAINING FUEL-BURNING APPLIANCES.

2-6.8.4 Provisions for Future Installation of a Gas Clothes Dryer. A recreation vehicle shall be permitted to be provided with gas piping to facilitate a future gas clothes dryer installation by the owner provided it complies with the following provisions:

(a) Its gas outlet shall be provided with a shutoff valve, the outlet of which is closed by threaded pipe plug or cap;

(b) Its gas outlet shall be permanently labeled to identify it for use only as the supply connection for a gas clothes dryer;

(c) A moisture-lint exhaust duct system shall be roughed in by the manufacturer.

The manufacturer shall provide written instructions to the owner on how to complete the exhaust duct installation in accordance with provisions of 2-6.8.2.

2-6.8.5 Provisions for Future Installation of an Electric Clothes Dryer. When wiring is installed to supply an electric clothes dryer for future installation by the owner, the manufacturer shall install a receptacle for future connection of the dryer and provide written instructions on how to complete the exhaust duct installation in accordance with the provisions of 2-6.8.2.

2-6.8.6 Clothes Dryers Installed in Closets or Alcoves. Each clothes dryer installed in closets or in alcoves shall be listed as suitable for such installation. Closets containing clothes dryers shall have ventilation openings sized in accordance with the appliance manufacturer's installation instructions.

2-7 Circulating Air Systems for Heating (Other than Automotive-type).

2-7.1 Supply System Ducts.

Air supply ducts shall be made of galvanized steel, tin-plated steel, aluminized steel, or aluminum; or made of Class 0 or Class 1 listed air ducts or air connectors as tested in accordance with UL 181, *Standard for Factory-Made Air Ducts and Air Connectors*. A duct system integral with the structure shall be of durable construction that can be demonstrated to be equally resistant to fire and deterioration. Air ducts and plenums constructed of sheet metal shall be in accordance with Table 2-7.1.

Table 2-7.1 Minimum Metal Thickness for Ducts*

	Diameter 14 in. (381 mm) or less	or	Width Over 14 in. (381 mm)
Round Exposed	0.013 in. (0.33 mm)		0.016 in. (0.41 mm)
Enclosed Rectangular or Round	0.013 in. (0.33 mm)		0.016 in. (0.41 mm)
Exposed Rectangular	0.016 in. (0.41 mm)		0.019 in. (0.48 mm)

*When "nominal" thicknesses are specified, 0.003 in. shall be added to these "minimum" metal thicknesses.

2-7.2 Sizing of Supply Ducts.

Ducts shall be designed so that where a labeled forced-air furnace is installed and operated continually at its normal input rating in the recreational vehicle, with all registers in full open position, the static pressure measured in the duct plenum shall not exceed that shown on the label of the appliance. Where an air-cooling coil is installed in the system, the total static pressure of the coil and the system shall not exceed that shown on the label of the appliance. The minimum dimension of any branch duct shall be at least $1^1/_2$ in. (38 mm) and of any main duct, $2^1/_2$ in. (63.5 mm).

2-7.3 Static Pressure.

The internal static pressure of the furnace air delivery system shall comply with the furnace manufacturer's instructions.

2-7.4 Return Air System Air Openings.

Provisions shall be made to permit the return of circulating air from all rooms and living spaces to the circulating air supply inlet of the furnace.

Exception: Toilet rooms shall not be required to have return air openings.

2-7.5 Return Air Duct Materials.

Return air ducts, if used, shall be in accordance with the following:

(a) Portions of return air ducts directly above the heating surfaces, or closer than 2 ft (0.6 m) from the outer jacket or casing of the furnace, shall be constructed of metal in accordance with 2-7.1.

(b) Return air ducts, except as required in (a) above, shall be constructed of 1-in. (25-mm) nominal wood boards (flame spread classification of not more than 200) or other suitable material no more combustible than 1-in. (25-mm) board. The interior of such combustible ducts (ducts of material other than as specified in 2-7.1) shall be lined with noncombustible material at points susceptible to damage from incandescent particles dropped through the register or from the furnace, such as directly under floor registers and bottoms of vertical ducts or directly under furnaces having bottom return.

2-7.6 Sizing of Return Air Ducts.

The cross-sectional area of the return air duct shall not be less than 2 in.^{2} for each 1000 Btuh (44 cm^2/1000 W) input rating of the appliance. A complete ducted heating system need not comply with this return air duct sizing requirement if the numerical total of the static pressure at the inlet and the outlet of the appliance is equal to or less than that shown on the label of the appliance. For example: Supply Duct Static Pressure + 0.10 in. water column and Return Air Duct Static pressure - 0.04 in. water column. Numerical Total is 0.14 in. water column static pressure. Dampers shall not be placed in any return air duct, except that a diverting damper shall be permitted to be placed in a combination fresh air intake and return air duct so arranged that the required cross-sectional area will not be reduced at all possible positions of the damper.

2-7.7 Return Air Duct Permanent Unclosable Openings.

Living areas not served by return air ducts and closed off from the return opening of the furnace by doors, sliding partitions, or other means shall be provided with permanent unclosable openings in the doors or separating partitions to allow circulated air to return to the furnace. Such openings shall be permitted to be grilled or louvered. The net free area of each opening shall be not less than 1 in.^{2} (6.5 cm^2) for every 5 ft^2 (0.46 m^2) of total living area closed off from the furnace by the door or partition serviced by that opening. Undercutting doors connecting the closed-off area shall be permitted to be used as a means of providing return air area. However, in the event that doors are undercut, not more than one-half of the free air area provided shall be considered return air area.

2-7.8 Air Duct Joints and Seams.

Joints and seams of ducts shall be securely fastened and made substantially airtight. Slip joints shall have a lap of at least 1 in. (25 mm) and shall be individually fastened. Tape or caulking compound shall be permitted to be used for sealing mechanically secure joints. Where used, tape or caulking compound shall not be subject to deterioration under long exposures to temperatures up to 200°F (93.4°C) and to conditions of high humidity, excessive moisture, or mildew.

2-7.9 Air Duct Supports.

Ducts shall be securely supported.

2-7.10 Air Duct Registers or Grills.

Fittings connecting the registers or grills to the duct system shall be constructed of metal or material that complies with the requirements for Class 0, or Class 1 air ducts under UL 181, *Standard for Factory-Made Air Ducts and Air Connectors*. Registers or grills shall be constructed of metal or conform with the following:

(a) Registers or grills shall be made of a material classified 94 V-0 or 94 V-1 when tested as described in UL 94, *Standard for Tests for Flammability of Plastic Materials for Parts in Devices and Appliances*.

(b) Floor registers or grills shall resist without structural failure a 200-lb (90.7-kg) concentrated load on a 2-in. (51-mm) diameter disc applied to the most critical area of the exposed face of the register or grill. For this test the register or grill is to be at a temperature of not less than 165°F (74°C) and is to be supported in accordance with the manufacturer's instructions.

Exception: This section does not apply to ducted rooftop air conditioning systems with heat strips or heat pumps where the system does not exceed 175°F when tested in accordance with UL 484, Standard for Safety Room Air Conditioners.

2-8 Air Conditioning (Other than Automotive-type).

2-8.1 General Requirement — Air Conditioning Appliances.

Every air conditioning appliance or combination air conditioning and heating appliance used in a recreational vehicle shall be listed or certified for the application for which the air conditioning appliance is intended and shall be installed in accordance with the terms of its listing.

2-8.2 Air Conditioning Installation and Instructions.

2-8.2.1 Installation of Air Conditioning Appliances. The installation of each appliance shall conform to the terms of its listing and the manufacturer's installation instructions. Appliances shall be secured in place to avoid displacement and movement from vibration and road shock.

2-8.2.2 Rating Plates for Air Conditioning Appliances. The air conditioner rating plate shall be located so that it is easily readable when the appliance is installed.

2-8.2.3 Fuel-Burning Air Conditioners. Each fuel-burning air conditioner shall comply with Section 2-6.

2-8.2.4 Accessibility of Air Conditioners. Each air conditioner shall be accessible for inspection, service, repair, and replacement without removing permanent construction.

2-9 Consumer Information.

2-9.1 Required Information.

2-9.1.1 Instructions for Appliances. Operating instructions shall be provided for each appliance, including air conditioning appliances (other than automotive-type).

2-9.1.2 Owner's Manual. Each recreational vehicle shall be provided with an owner's manual that shall contain the following information as a minimum:

(a) WARNING: LP-Gas containers shall not be placed or stored inside the vehicle. LP-Gas containers are equipped with safety devices that relieve excessive pressure by discharging gas to the atmosphere.

(b) The following warning label has been located in the cooking area to remind the user to provide an adequate supply of fresh air for combustion:

WARNING: IT IS NOT SAFE TO USE COOKING
APPLIANCES FOR COMFORT HEATING

Cooking appliances need fresh air for safe operation. Before operation:

1. Open overhead vent or turn on exhaust fan, and
2. Open window.

Unlike homes, the amount of oxygen supply is limited due to the size of the recreational vehicle, and proper ventilation when using the cooking appliance(s) will avoid dangers of asphyxiation. It is especially important that cooking appliances not be used for comfort heating as the danger of asphyxiation is greater when the appliance is used for long periods of time.

(c) A warning label has been located near the LP-Gas container. This label reads:

DO NOT FILL CONTAINER(S) TO MORE THAN 80 PERCENT OF CAPACITY

Overfilling the LP-Gas container can result in uncontrolled gas flow, which can cause fire or explosion. A properly filled container will contain approximately 80 percent of its volume as liquid LP-Gas.

(d) A warning that portable fuel-burning equipment, including wood and charcoal grills and stoves, shall not be used inside the recreational vehicle. The use of this equipment inside the recreational vehicle can cause fires or asphyxiation.

(e) A warning that states not to bring or store LP-Gas containers, gasoline, or other flammable liquids inside the vehicle because a fire or explosion can result.

(f) The following label has been placed in the vehicle near the range area:

IF YOU SMELL GAS:

1. Extinguish any open flames, pilot lights, and all smoking materials.
2. Do not touch electrical switches.
3. Shut off the gas supply at the tank valve(s) or gas supply connection.
4. Open doors and other ventilating openings.
5. Leave the area until odor clears.
6. Have the gas system checked and leakage source corrected before using again.

(g) LP-Gas regulators must always be installed with the diaphragm vent facing downward. Regulators that are not in compartments have been equipped with a protective cover. Make sure that the regulator vent faces downward and that the cover is kept in place to minimize vent blockage that could result in excessive gas pressure causing fire or explosion.

2-9.2 Required Markings.

2-9.2.1 Identification of Gas Supply Connections. Each recreational vehicle shall have permanently affixed to the exterior skin at or near each gas supply connection, or at the end of the pipe, a plate complying with the requirements for exterior labels (*see 1-4*) 3 in. × $1^3/_4$ in. (76 mm × 44 mm) minimum size that reads (as appropriate) either:

(a) THIS GAS PIPING SYSTEM IS DESIGNED FOR USE OF LIQUEFIED PETROLEUM GAS ONLY. DO NOT CONNECT NATURAL GAS TO THIS SYSTEM. Securely cap inlet(s) when not connected for use. After turning on gas, except after normal container replacement, test gas piping and connections to appliances for leakage with soapy water or bubble solution. Do not use products that contain ammonia or chlorine. Or,

(b) THIS GAS PIPING SYSTEM IS DESIGNED FOR USE OF EITHER LP-GAS OR NATURAL GAS. BEFORE TURNING ON GAS BE CERTAIN APPLIANCES ARE DESIGNED AND ARRANGED FOR THE GAS CONNECTED. (SEE EACH APPLIANCE INSTRUCTION PLATE.) Securely cap this inlet when not connected for use. After turning on gas, except after normal container replacement, test gas piping and connections to appliances for leakage with soapy water or bubble solution. Do not use products that contain ammonia or chlorine.

2-9.2.2 Warning Relative to Refueling.

(a) Each vehicle shall have a permanent label adjacent to the LP-Gas container that reads:

DO NOT FILL LP-GAS CONTAINER(S) TO MORE THAN 80 PERCENT OF CAPACITY

(b) Each motor home or truck camper having exterior combustion air inlet(s) at a level below the roof shall have a permanent label that reads:

WARNING: ALL PILOT LIGHTS, APPLIANCES, AND THEIR IGNITORS (SEE OPERATING INSTRUCTIONS) SHALL BE TURNED OFF DURING REFUELING OF MOTOR FUEL TANKS AND/OR LP-GAS CONTAINERS

On truck campers this label shall be placed near the front on both the left and right exterior walls. On motor homes and chassis-mounted truck campers, this label shall be placed by the gasoline filler spout and the LP-Gas container.

NOTE: The above labels, where required near the LP-Gas containers, shall be permitted to be incorporated in the plates required in 2-9.2.1.

2-9.2.3 Warning if Gas Odor Is Detected. Where LP-Gas fuel-burning equipment is installed by the recreational vehicle manufacturer, a permanent label with $^3/_8$-in. (9-mm) high title letters and $^1/_8$-in. (3-mm) high text letters shall be affixed in a noticeable location near the range. This label shall be permitted to be affixed to the back of a cabinet door providing the cabinet door will be frequently used.

IF YOU SMELL GAS:

1. Extinguish any open flames, pilot lights, and all smoking materials.
2. Do not touch electrical switches.
3. Shut off the gas supply at the tank valve(s) or gas supply connection.
4. Open doors and other ventilating openings.
5. Leave the area until odor clears.
6. Have the gas system checked and leakage source corrected before using again.

2-9.2.4 Warning Label for Cooking Appliances. A permanent warning label with the word "WARNING" with $^3/_8$-in. (9-mm) high letters and body text with $^1/_8$-in. (3-mm) high letters shall be affixed in a conspicuous manner adjacent to fuel-burning ranges and shall read:

WARNING: IT IS NOT SAFE TO USE COOKING APPLIANCES FOR COMFORT HEATING

Cooking appliances need fresh air for safe operation. Before operation:

1. Open overhead vent or turn on exhaust fan, and
2. Open window.

2-10 Gasoline or Diesel Fuel Systems for Engine Generator Sets for Travel Trailers and Fifth Wheels.

2-10.1 General.

The requirements of this section shall apply to the installation of gasoline or diesel fuel systems for travel trailers and fifth wheels intended for use with engine generator sets.

2-10.1.1 The entire fuel system shall be liquidtight and vaportight from the interior of the vehicle.

2-10.1.2 Valves, filters, strainers, and similar components shall be accessible for maintenance.

2-10.1.3 Auxiliary outlets for drawing fuel from the system other than tank drain plugs shall not be permitted.

2-10.2 Generator Ready.

2-10.2.1 When an electrical generator is not installed at the recreational vehicle factory, all fuel lines between the tank and the generator compartment shall be plugged.

2-10.2.2 The following label shall be located near the fuel filler cap:

CAUTION: DO NOT PUT FUEL IN TANK UNLESS GENERATOR IS INSTALLED AND FUEL LINES ARE CONNECTED. CHECK ALL CONNECTIONS FOR LEAKAGE.

2-10.3 Tank Installation.

2-10.3.1 Location. The tank shall be located under the floor, in a compartment, on a trailer A frame, or forward of the front bulkhead below the overhang of a fifth wheel trailer. Clearances shall be as specified below. All measurements shall be determined from the bottom of the tank, or from the lowest fitting, support, or attachment on the tank or tank housing, whichever is lower, while the vehicle is level and at dry weight.

(a) *Rear clearance line.* Above a plane tangent to a point that is 8 in. (203 mm) above the ground on the vertical centerline of the wheel spindle and the lowest point on the intersection of the rear wall and floor lines (skid bars are excluded).

(b) *Front clearance line.* Above a plane tangent to the point that is 8 in. (203 mm) above the ground on the vertical centerline of the wheel spindle and the lowest point of the frame's front cross member. It is not the intent to prohibit the fuel tank from being located in the A frame area providing neither the tank nor connections extend below the bottom of the trailer frame.

2-10.3.2 The tank shall be permitted to be located in a compartment provided:

(a) A compartment containing a tank with filler opening or vent within the compartment shall have no floor.

(b) A compartment containing a tank that is filled and vented to the exterior shall be permitted to have a floor provided that the compartment side walls and floor are resistant and nonabsorbent to fuel, that the floor has a minimum $^1/_2$-in. (12.7-mm) diameter drainage hole at each potential low point, and that the joints between compartment side walls and floor are sealed to prevent fuel entry.

(c) The fuel tank compartment shall be vaportight to the vehicle interior and sealed so that vapors cannot travel through concealed spaces between the exterior-interior surfaces of the recreational vehicle. Sealing compounds used to seal the compartment shall be fuel resistant.

(d) The fuel tank compartment shall not contain flame- or spark-producing equipment.

2-10.3.3 Securing of Fuel Tanks. The tank shall be secured by fastenings that hold it in place when a force equal to 8 times the tank's filled weight is applied through the tank in any direction.

2-10.4 Fill System.

2-10.4.1 The filler subsystem shall run as directly as possible from the filler cap to the tank. The filler cap end shall be completely above the top of the tank.

2-10.4.2 The area surrounding fuel filler pipes and vents shall be sealed so that vapors cannot travel through concealed spaces between the exterior-interior surfaces of the recreational vehicle. The sidewall surface below the filler cap and extending at least 12 in. (304.8 mm) to each side of the cap's vertical centerline shall be constructed of fuel-resistant nonabsorbent materials. Sealing compounds used around the filler pipe and in this area shall be fuel resistant.

2-10.4.3 A marking indicating the type of fuel to be used shall be provided on or near the filler cap.

2-10.5 Fuel Distribution System.

2-10.5.1 Tubes shall be constructed of steel or material suitable for use with fuel.

2-10.5.2 Hoses shall conform to SAE J30, *Fuel and Oil Hoses, Standard*, except that hose with a wire-inserted rubber tube and cover (SAE 30R5) or similar hose containing wire shall not be used.

2-10.5.3 Hose to tube joints shall remain leak-free when subjected to a 20-lb (9.0-kg) axial pull test applied for one minute.

2-10.5.4 The distribution system shall be supported to minimize chafing and to maintain at least a 6-in. (152-mm) clearance from any unshielded exhaust system component.

2-10.5.5 The fuel system shall not be in contact with electrical wiring except as required for component operation.

2-10.5.6 The fuel system shall be designed so that leakage from tanks or joints will not contact electrical or exhaust system components. (Drain troughs shall be permitted to be used as required.)

2-11 LP-Gas Engine Fuel Installations.

2-11.1

Dual utilization LP-Gas systems supplying both vapor and liquid withdrawal shall comply with Chapter 8, Section 8-2 of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, except as provided for in 2-11.2.

2-11.2

Permanently mounted ASME containers shall be mounted in accordance with 2-2.3(b)(3) and secured in accordance with 2-2.4.

Chapter 3 Fire and Life Safety Provisions

3-1 Interior Finish and Textile or Film Materials.

3-1.1 Interior Finish Flame Spread Limitation.

Interior finish (*as defined in Section 1-3*) of walls, partitions, ceilings, exterior passage doors, cabinets, habitable areas, hallways, and bath or toilet rooms, including shower/tub walls, of recreational vehicles shall be of materials whose flame spread classification does not exceed 200 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*.

An alternate method of testing for cabinet door and drawer faces, exposed cabinet bottoms and end panels, and tub/shower walls shall be permitted to use ASTM E 162, *Test for Surface Flammability of Materials Using a Radiant Heat Energy Source*, to establish the flame spread rating not to exceed 200.

Exception: These flame spread limitations do not apply to moldings; trim; furnishings; windows, *door, or skylight frames and casings; interior passage doors; countertops; cabinet rails, stiles, mullions, toe kicks, and padded cabinet ends.*

3-1.2 Combustibility of Textile or Film Materials.

Where the walls, partitions, or ceilings consist of textile or film materials, such as tent fabric, insect screening, flexible plastic weather protection, etc., they shall conform to the requirements of paragraphs S4.3 and S5 of *Federal Motor Vehicle Safety Standard No. 302*, "Flammability of Interior Materials" (*Code of Federal Regulations*, Title 49, Part 571.302).

3-1.3 Use of Cellular Foam or Foamed Plastic Materials.

Cellular foam or foamed plastic materials shall not be used for interior finish (*as defined in Section 1-3*) in recreational vehicles.

Exception No. 1: Cellular or foamed plastic materials shall be permitted on the basis of fire tests that substantiate on a reasonable basis their combustibility characteristics, for the use intended, in actual fire conditions.

Exception No. 2: Incidental use of such materials for molding, trim, splash panels, and on doors shall be permitted.

3-1.4 Mirrors.

All interior mirrors with an exposed area exceeding 431 in.^{2} (278 064 mm^2) shall comply with ANSI Z97.1, *Safety Glazing Materials Used in Buildings — Safety Performance Specifications and Methods of Test*, or equal requirements and shall be so identified by the manufacturer of the mirror.

3-2 Recreational Vehicle Exit Facilities.

3-2.1* Minimum Exit Facilities.

Recreational vehicles shall have a minimum of two exits located remote from each other and so arranged as to provide a means of unobstructed travel to the outside of the vehicle. Each bedroom or area designed for sleeping shall have at least two unobstructed paths to exit. The path to exit must not require passing any designated exit to gain use of another designated exit except where any part of a bed in its normal sleeping configuration is within 24 in. (610 mm) of the plane of the nearest designated exit as projected across the vehicle. (*See Appendix A, Figure A-3-2.1.*)

3-2.2 Alternate Means in Motor Homes and Truck Campers.

The alternate exits in motor homes and truck campers shall be located on a wall other than that wall where the main vehicle exit door is located, or shall be located in the roof. Use of the driver's door as an alternate egress is permitted provided that the driver's seat locks only in the forward position and arm rests, if any, are retractable and nonlockable when in the arm rest position. The distance between the upright portion of the seat in its extreme forward position and the nearest point of the steering wheel shall be not less than 12 in. (305 mm).

3-2.3 Access to Alternate Exits.

The path leading to an alternate exit, other than that stated in 3-2.2, shall be not less than 13 in. (330 m) wide at the narrowest point and as a minimum shall extend vertically from the supporting surface below the alternate exit to the top of the alternate exit. The supporting surface shall be not more than 3 ft (0.9 m) below the bottom of the alternate exit and shall be capable of supporting a weight of 300 lb (136 kg). Recreational vehicles that contain a designated roof alternate exit shall be provided with a ladder or equivalent device for descending from the roof.

3-2.4 Operation of Exits.

The latch mechanism of any required exit facility shall be operable by hand and shall not require the use of a key or tool for operation from the inside. No more than 20 lb of force (89 N) shall be required to open a required exit.

3-2.5* Size of Alternate Exits.

The alternate exit, if not an exterior passage door, shall provide an opening of sufficient size to permit unobstructed passage, keeping a major axis parallel to the plane of the opening and horizontal at all times, of an ellipsoid generated by rotating about its minor axis an ellipse having a major axis of 24 in. (610 mm) and a minor axis of 17 in. (432 mm). (*See Appendix A, Figure A-3-2.5.*) An exterior passage door if used for an alternate exit shall provide an unobstructed opening with a minimum horizontal dimension of 18 in. (457 mm) and a minimum vertical dimension of 48 in. (1.2 m).

3-2.6 Marking of Exits.

Alternate exits other than exterior passage doors shall be identified by a waterproof label with the word "EXIT" in 1-in. (25.4-mm) minimum red letters on a contrasting background. The label shall be placed on the interior wall surface above or below the exit or on the interior ceiling surface, within 8 in. (203 mm) of the opening in an unobscured visible location or shall be installed on the interior of the exit frame or the moveable portion of the exit approximately midway between the sides.

3-2.7 Identification of Exit Handles.

Handles that must be operated to open alternate exits shall be colored red.

Exception: Exterior and interior passage door handles shall not need to be colored.

3-3 Fire Detection Equipment.

3-3.1 Smoke Detector.

At least one integral battery-operated smoke detector shall be installed in each travel trailer or motor home that has a sleeping area separated from the living and cooking area by a door.

Exception: A travel trailer that has only interior lighting capable of being powered only by a 120-volt or 120-volt/240-volt external power supply shall be permitted to be equipped with a 120-volt operated smoke detector that shall be on a branch-circuit supplying lighting and receptacle outlets that shall not have ground-fault protection.

3-3.2* Smoke Detector Listing Requirement.

The smoke detector shall be listed and marked on the device as being suitable for installation in recreational vehicles under the requirements of UL 217, *Standard for Single and Multiple Station Smoke Detectors*. (*Also see Appendix A, A-3-3.2.*)

3-3.3 Installation of Smoke Detector.

The required smoke detector shall be installed in accordance with its listing, but not within the separate sleeping areas, a minimum of 6 in. (152 mm) from all exterior walls measured edge to edge and away from the direct flow of air from heat and air conditioning outlets.

3-3.4 Operational Check Warning Label.

A permanent label shall be installed in a visible location on or within 24 in. (610 mm) of the smoke detector with the following text in contrasting letters at least $^{1}/_{8}$ in. (3.2 mm) high:

WARNING TEST SMOKE DETECTOR OPERATION AFTER VEHICLE HAS BEEN IN STORAGE, BEFORE EACH TRIP, AND AT LEAST ONCE PER WEEK DURING USE

3-4 Other Considerations.

3-4.1 Provisions for Portable Fire Extinguishers.

Each motor home shall be equipped with a listed portable fire extinguisher with a minimum rating of 10B:C. Each recreational vehicle equipped with fuel-burning equipment (other than the prime mover engine) or 120/240 volt electrical system shall be provided with a listed portable fire extinguisher with a minimum rating of 5B:C as defined in NFPA 10, *Standard for Portable Fire Extinguishers*.

The fire extinguisher shall be installed in accordance with its listing and Section 1-6 of NFPA 10, *Standard for Portable Fire Extinguishers*, and shall be located within the recreational vehicle interior as near as practical to the primary means of egress.

3-4.2 Fuel Spout Installation.

The area surrounding liquid fuel filler pipes and vent tubing shall be sealed so that fuel vapors cannot travel into concealed spaces between exterior and interior surfaces of the recreational vehicle nor to the interior of the vehicle (*see also Chapter 2*). Materials and sealants used to seal the fill pipe and vent tubing location shall be nonabsorbent and resistant to intermittent contact (splashing) with fuel.

3-4.3 Internal Combustion Engine Exhausts.

Exhausts from internal combustion engines shall not terminate under the vehicle. Exhausts shall extend beyond the periphery of the vehicle so that exhaust gases discharge away from the vehicle. Internal combustion engine exhaust components installed by the RV manufacturer shall not extend or protrude in a manner where they could be unduly subject to road damage. Internal combustion engine exhaust shall not terminate so that a communicable air passage exists into the living area within an area defined as a distance of 6.0 in. (152 mm) as measured from the tailpipe termination perimeter as projected onto the vehicle side. Regardless of location of vehicle exhaust, vents or windows that can be opened shall not be installed in the rear wall of motor home and truck campers.

Exception No. 1: Normally unopenable alternate egress windows shall be permitted to be installed in rear walls.

Exception No. 2: Rear entry doors with fixed windows shall be permitted to be installed in truck campers.

Exception No. 3: Rear entry doors with fixed windows shall be permitted to be installed in motor homes provided that no combustion engine exhausts discharge from the rear of the vehicle.

3-4.4 Floor Penetrations.

No uncovered hole(s) shall be permitted in or through the floor of a recreational vehicle that is equipped with, or designed for future installation of, an internal combustion engine(s). Holes or other penetrations provided for piping, wiring, or other similar components for systems addressed by this standard shall be sealed.

3-4.5 Installation of Internal Combustion Engine Generators.

Internal combustion engine-driven generator units (subject to the provisions of this standard) shall be secured in place to avoid displacement in accordance with manufacturer's instructions and shall be installed in a compartment that is vaportight to the interior of the vehicle.

Where generator compartments are used to isolate the generator from the vehicle's interior, generator compartments shall be lined with galvanized steel not less than 26 MSG thick. Seams and joints shall be lapped, mechanically secured, and made vaportight to the interior of the vehicle. Alternate materials and methods of construction shall be permitted to be used if they provide equivalent quality, strength, effectiveness, fire resistance, durability, and safety. Liquid fuel lines and exhaust systems shall not penetrate into the living area. Holes into the living area shall be sealed vaportight.

3-4.6 Carbon Monoxide (CO) Detectors.

All RVs equipped with an internal combustion engine or designed with features to accommodate future installation of an internal combustion engine and all truck campers shall be equipped with a CO detector listed as suitable for use in recreational vehicles under the requirements of UL 2034, *Standard for Safety Single and Multiple Station Carbon Monoxide Detectors*, and installed according to the terms of its listing.

3-4.7 LP-Gas Detectors.

All recreational vehicles equipped with an LP-Gas appliance and electrical system shall be equipped with an LP-Gas detector listed as suitable for use in recreational vehicles under the requirements of UL 1484, *Standard for Safety Residential Gas Detectors*, and installed according to the terms of its listing.

3-4.8 Special Transportation Provisions.

All recreational vehicles providing any entrance door greater than 36 in. (914 mm) in width, and an access ramp for that door, or that are promoted as providing or provide the ability for transporting or storing internal combustion engine vehicles shall provide the following:

(a) A minimum of one opening or window on each side of the vehicle having a minimum of 200 $in.^2$ (129 032 mm^2) of free openable area. The top of the opening or window shall not be more than 18 in. above the vehicle's interior floor level.

(b) Seamless floor coverings nonabsorbent to fuel extending along the entire floorline of the transportation area and sealed to the wall with sealant that is resistant to intermittent contact (splashing) with fuel.

(c) Electrical equipment and lighting installed in accordance with Sections 511-6(d) and 511-7(b) of NFPA 70, *National Electrical Code*.

(d) A listed portable fire extinguisher with a minimum rating of 10B:C, as defined in NFPA 10, *Standard for Portable Fire Extinguishers*.

(e) LP-Gas ranges and ovens, if provided, shall not contain pilot lights or shall be equipped with a pilot light shutoff.

(f) A warning label placed inside of the RV adjacent to each entry and visible to anyone entering the RV. This label(s) shall be printed with red letters on a white background with the word "WARNING" a minimum of $^3/_4$ in. (19 mm) high, text that shall be a minimum of $^1/_4$ in. (6 mm) high and shall read:

WARNING

Any motorized vehicle or any motorized equipment powered with flammable liquid can cause fire or explosion or asphyxiation if stored or transported within the recreational vehicle. To reduce the risk of fire, explosion, or asphyxiation:

1. Do not allow passengers to ride inside internal combustion engine vehicle storage area while vehicles are present.

2. Run fuel out of engine after shutting off fuel at the tank.

3. Do not store or transport supplementary motor fuel within this vehicle.

4. Ventilate the interior of the vehicle to reduce the risk of fire, explosion, or asphyxiation.

5. Do not operate gas appliances, pilot lights, or electrical equipment when motorized vehicles or motorized equipment are inside vehicle.

(g) A statement in the owner's manual warning of the hazards of transporting, storing, or cohabiting with internal combustion engines inside the vehicle.

(h) A label affixed to the interior of the vehicle and a statement in the owner's manual explaining the proper weight distribution for the transportation of internal combustion engine vehicles.

Exception No. 1: Recreational vehicles having vaportight separation between the special transportation area and the living space are exempt from the requirements of 3-4.8(e) and (f).

Exception No. 2: Recreational vehicles designed and promoted for the physically impaired are not required to comply with the requirements of 3-4.8.

Exception No. 3: Portions of recreational vehicles designed to transport animals are not required to comply with 3-4.8.

Chapter 4 Plumbing Systems

Requirements for plumbing are developed by the ANSI A119 Committee of which the Recreational Vehicle Industry Association is Secretariat. Those requirements and the fire safety requirements in this standard are published and distributed under one cover as ANSI A119.2/ NFPA 501C.

Chapter 5 Referenced Publications

5-1

The following documents or portions thereof are referenced within this standard and shall be

considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

5-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-3

Other definitions relating to heat-producing appliances are contained in NFPA 97, *Standard Glossary of Terms Relating to Chimneys, Vents, and Heat-Producing Appliances*.

A-1-3 Approved.

The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-3 Authority Having Jurisdiction.

The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety isprimary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-3 Gross Trailer Area.

In calculating the square footage, measurements should be taken on the exterior. Square footage includes all siding, corner trims, moldings, storage spaces, areas enclosed by windows but not the roof overhangs (Ref. HUD Interpretive Bulletin A-1-88).

Expandable room sections, regardless of height, should be included. Storage lofts contained within the basic unit should have ceiling heights less than 5 ft (1.5 m) and would not constitute additional square footage.

A-1-3 Listed.

The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-6

SI stands for the International System of Units, which is officially abbreviated SI in all languages. For full explanation, see ASTM E 380, *Standard Practice for Use of the International System of Units (SI) (the Modernized Metric System).*

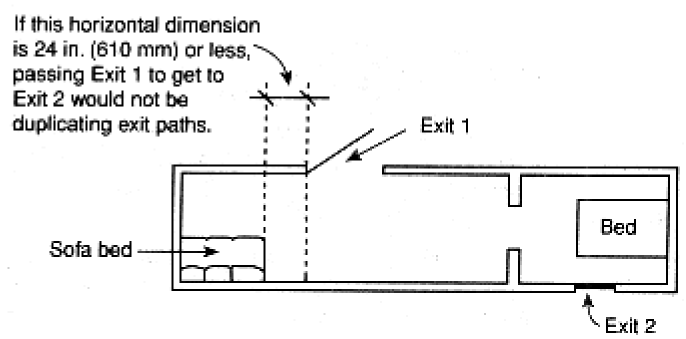

Figure A-3-2.1 Bed within 24 in. (610 mm) of the plane of the nearest designated exit.

A-3-2.5

This diagram is useful in explaining the method of measuring the alternate exit in 3-2.5.

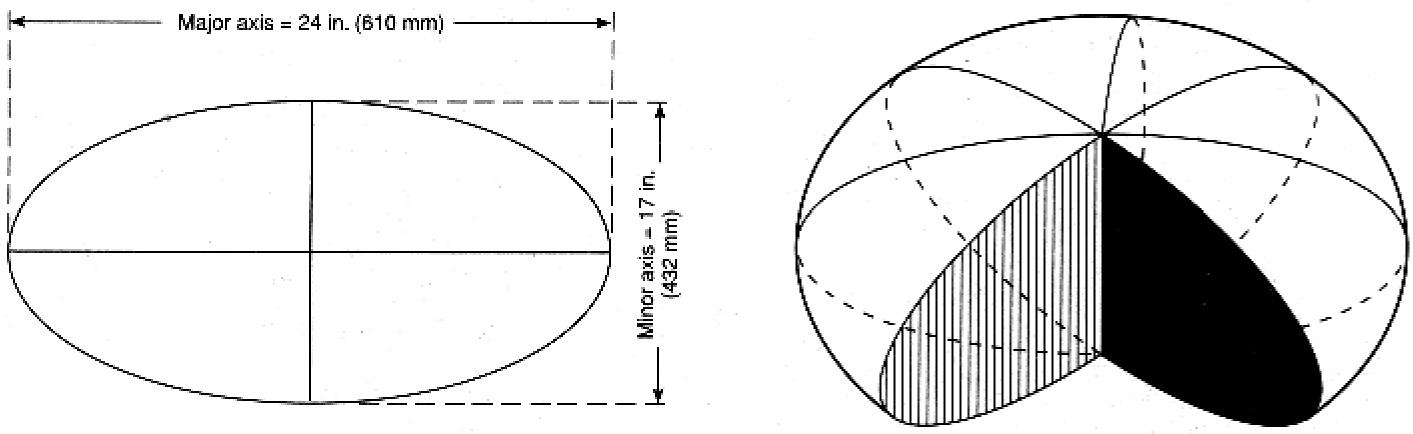

Figure A-3-2.5 Ellipsoid of revolution about a minor axis.

A-3-3.2

Because some smoke detectors are activated by the gases released when cooking food and can result in an unwanted alarm, the smoke detector manufacturer should be consulted regarding the detector's suitability for operation in close proximity to cooking processes.

Appendix B Gas Pipe Sizing

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

B-2-4.4 Example of Gas Pipe Sizing.

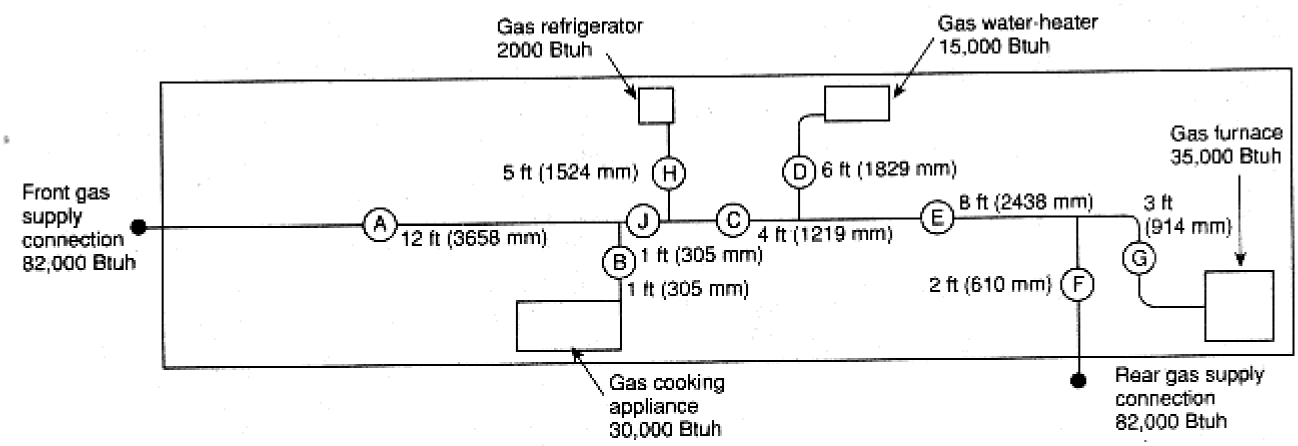

Figure B-2-4.4 Typical example of gas pipe system sizing for a recreational vehicle.

To determine the required gas supply pipe sizes for each piping section of the typical example diagrammed in B-2-4.4, assuming a combination LP-Gas/Natural Gas Supply System, take the following steps:

Table B-2-4.4 Example of Determining Gas Supply Pipe Sizes

Figure Sizing By	Front Gas Supply Connection	Rear Gas Supply Connection
Step 1. Measure the length of the piping from the gas supply connection to the inlet of the most remote appliance.	28 ft (8.5 m) (A + J + C + E + G) [Total: 28,000 Btuh (8204 W)]	19 ft (5.8 m) (F + E + C + H) [Total: 82,000 Btuh (24,026 W)]
Step 2. In the appropriate Table 2-4.4 (a) – (d), select the column showing that distance or the next longer distance if the table does not give the exact length. In this example use Table 2-4.4 (a) since it presumes using a combination LP-Gas/Natural Gas Piping System using iron pipe.	30 ft (9.2 m) column [which for 82,000 Btuh (24,026 W) means ½ in. (13 mm) iron pipe or ¾ in. (19 mm) tubing]	20 ft (6.1 m) column [which for 82,000 Btuh (24,026 W) means ½ in. (13 mm) iron pipe or ¾ in. (19 mm) tubing]
Step 3. Use the vertical column in Table 2-4.4 (a) selected in Step 2 for all gas pipe sizing. For each section of piping, determine the total demand for that section. In the vertical column selected in Step 2 locate the Btuh demand equal to or just greater than the demand for that section of pipe.	30 ft (9.2 m) Column Front Connection (see below)	20 ft (6.1 m) Column Rear Connection (see below)
Step 4. Choose the larger size piping required from either the front or rear gas supply connection. If a single gas supply connection is provided, this step is not required.		

30 ft (9.2 m) Column Front Connection

Piping Section	Btuh Demand (1000's)	(W) Demand	Nominal I.D. Pipe In.	Nominal I.D. Pipe (mm)	Tubing O.D. In.	Tubing O.D. (mm)
A	82	24,026	½	13	¾	19
B	30	8790	⅜	10	½	13
C	50	14,650	⅜	10	⅝	16
D	15	4395	¼	6	⅜	10
E	35	10,255	⅜	10	⅝	16
F	—	—	—	—	—	—
G	35	10,255	⅜	10	⅝	16
H	2	586	¼	6	⅜	10
J	52	15,236	⅜	10	⅝	16

20 ft (6.1 m) Column Rear Connection

Piping Section	Btuh Demand (1000's)	(W) Demand	Nominal I.D. Pipe In.	Nominal I.D. Pipe (mm)	Tubing O.D. In.	Tubing O.D. (mm)
A	—	—	—	—	—	—
B	30	8790	⅜	10	½	13
C	32	9376	⅜	10	½	13
D	15	4395	¼	6	⅜	10
E	47	13,771	⅜	10	⅝	16
F	82	24,026	½	13	¾	19
G	35	10,255	⅜	10	½	13
H	2	586	¼	6	⅜	10
J	30	8790	⅜	10	½	13

1996 Edition

This edition of NFPA 501D, *Standard for Recreational Vehicle Parks and Campgrounds*, was prepared by the Technical Committee on Recreational Vehicles and acted on by the National Fire Protection Association, Inc., at its Fall Meeting held November 13-15, 1995, in Chicago, IL. It was issued by the Standards Council on January 12, 1996, with an effective date of February 2, 1996, and supersedes all previous editions.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

This edition of NFPA 501D was approved as an American National Standard on February 2, 1996.

Origin and Development of NFPA 501D

The earliest activity of the NFPA in the development of standards for recreational vehicle parks was initiated in 1937 with the first NFPA standard officially adopted in 1940. This standard was entitled *Standard for Trailer Coaches and Trailer Coach Camps*. A revision of the 1940 standard was adopted by NFPA in 1952 (post-World War II), entitled NFPA 501, *Standards for Fire Prevention and Fire Protection in Trailer Coaches and Trailer Coach Courts*. In 1960 the NFPA acted to approve a revised version dividing the earlier text into two parts, one designated NFPA 501A and adopted that year under the title *Standard for Fire Protection in Trailer Courts*; the other, NFPA 501B, adopted in 1971 and entitled *Standard for Fire Prevention and Fire Protection in Mobile Homes and Travel Trailers*. The latter (NFPA 501B) was further amended in 1963. In 1964 a revision of NFPA 501A was approved as the NFPA *Standard for Fire Protection in Trailer Courts.*

During the years 1962-64 arrangements were made to consolidate the separate standards activities of the Mobile Homes Manufacturers Association and the Trailer Coach Association, which had produced standards under the American Standards Association (now ANSI) known as *American Standard Installations of Plumbing, Heating and Electrical Systems in Travel Trailers* (A119.2-1963) and a similar *Standard on Mobile Homes* (A119.1-1963). These inter-organizational arrangements were completed in 1964, and in 1969 the newly formed Recreational Vehicle Institute was added as a fourth co-sponsor.

The first standard covering any aspect of recreational vehicle parks completed by the present ANSI-sponsored committee was the *Electrical Standard for Recreational Vehicle Parks* (NFPA 501D-1971; ANSI A177.2-1972, subsequently redesignated ANSI A119.4-1972). This edition was prepared and published to update the previous material covering electrical safety in the 1964 edition of NFPA 501A, *Standard for Fire Prevention and Fire Protection in Trailer Courts*. In the 1971 edition of NFPA 70, *National Electrical Code®*, electrical requirements for trailer courts first appeared, based largely on NFPA 501D-1971. Since it obviously was necessary to maintain coordination between this standard and NFPA 70, *National Electrical Code*, the sponsoring committees established liaison procedures so that Chapter 6 of the 1977 edition and the content of Part B of Article 551 of NFPA 70, *National Electrical Code*, were identical in intent.

Companion NFPA documents to this standard, besides the *National Electrical Code*, are NFPA 501C, *Standard on Recreational Vehicles*, and NFPA 501A, *Standard for Fire Safety Criteria for Manufactured Home Installations, Sites, and Communities*.

Sponsorship for the 1977 edition of the standard was held jointly by the National Fire Protection Association and the Recreation Vehicle Industry Association. The standard was developed by the Sectional Committee on Recreational Vehicle Parks and Campgrounds, which operated under the Correlating Committee on Mobile Homes and Recreational Vehicles.

The 1977 edition included substantive revisions to the previous edition in Chapter 6 ("Electrical Systems").

The 1982 edition of the *Standard for Fire Safety Criteria for Recreational Vehicle Parks and Campgrounds* superseded the 1977 edition.

The 1982 edition was produced by the newly formed Committee on Fire Safety for Recreational Vehicles (June 20, 1979), which was responsible for developing a standard for fire safety for recreational vehicles and recreational vehicle parks. Therefore, the 1982 edition excluded all sections of the previous editions not considered within the Committee scope. Notably excluded were sections dealing with environmental health and sanitation. Also excluded were requirements for park electrical systems, which are addressed by reference to the *National Electrical Code*.

Modifications also were made in sections dealing with definitions and fire safety and to conform with the NFPA *Manual of Style*.

The 1986 edition included very minor reference changes and revised definitions.

The 1990 edition contained a completely revised chapter on fire safety requirements, Chapter 3, so that non-fire safety items could be moved to other chapters handled by the ANSI A119 Committee. The standard was reconfirmed in 1993, and some sections that were considered operational concerns were deleted from Chapter 3 in this 1996 edition.

NOTICE

Requirements for environmental health and sanitation are developed by the ANSI A119 Committee of which the Recreational Vehicle Industry Association is Secretariat. These requirements and the fire safety requirements of NFPA 501D are published and distributed under one cover as ANSI A119.4/NFPA 501D by ANSI, NFPA, and RVIA.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on the fire safety criteria for recreational vehicles and recreational vehicle parks.

NFPA 501D

Standard for Recreational Vehicle Parks and Campgrounds

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 5.

Chapter 1 General

1-1 Introduction.

1-1.1 Need for Standard.

Those members of the recreational vehicle industry, recreational vehicle park owners, and code enforcement officials have been aware of the need for uniform minimum standards for recreational vehicle parks and campgrounds. It is with this thought that the standard has been developed.

1-1.2 Basis for Standard.

Much of the material in this standard has been taken from, or is based on, nationally recognized standards for fire, health, and life safety. Applicable standards are shown in Chapter 5.

1-2 Scope.

The intent of this standard is to provide minimum construction requirements to ensure a reasonable degree of safety and health for occupants using facilities supplied by recreational vehicle parks and campgrounds, which offer temporary living sites for use by recreational vehicles and camping units. This standard shall provide minimum requirements that are applicable, in varying degrees, to recreational vehicle parks and campgrounds, dependent on the intended use for each.

1-2.1 Not Covered.

This standard shall not cover the design of recreational vehicles or other forms of camping units. ANSI A119.2/NFPA 501C, *Standard on Recreational Vehicles*, is a companion standard on which the provisions of this standard are largely based. Operational and maintenance practices for recreational vehicle parks and campgrounds are not included.

1-2.2 Applicability.

This standard has been developed to serve as a basis for regulations by authorities having jurisdiction over the facilities provided in new recreational vehicle parks and campgrounds and additions to existing facilities only. Facilities provided in existing recreational vehicle parks and campgrounds can be continued in use providing such facilities do not constitute a recognized health or safety hazard.

1-2.3 Limitations.

This standard shall not be intended as a design specification or an instruction manual.

1-2.4 Alternate Materials, Equipment, and Procedures.

The provisions of this standard shall not be intended to prevent the use of any material, method of construction, or installation procedure not specifically prescribed by this standard, provided any such alternate is acceptable to the authority having jurisdiction. The authority having jurisdiction shall require that sufficient evidence be submitted to substantiate any claims made regarding the safety of such alternates.

1-2.5 Differing Standards.

Wherever nationally recognized standards and this standard differ, the requirements of this standard shall apply.

1-2.6 U.S. Federal Regulations.

Federal regulations under the National Highway Traffic Safety Administration might supersede all or part of this standard as applied to any category of regulated motor vehicles.

1-3 Definitions.

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Campground. As used in this standard, any parcel or tract of land under the control of any person, organization, or governmental entity wherein sites are offered for the use of the public or members of an organization for the establishment of temporary living sites for two or more recreational vehicles or camping units. Campgrounds can be one of the following types:

Developed Campground. A campground with two or more recreational unit sites accessible by vehicular traffic where sites are substantially developed and refuse disposal systems, flush toilets, bathing facilities, and water are provided.

Fully Developed Campground. A developed campground with one or more service buildings.

Primitive Campground. A campground accessible only by walk-in, pack-in, or equestrian campers where no facilities are provided for the comfort or convenience of the campers.

Semi-Developed Campground. A campground with two or more recreational unit sites, accessible by vehicular traffic. Roads, facilities (toilets and/or privies) are provided.

Semi-Primitive Campground. A campground accessible only by walk-in, equestrian, or motorized trail vehicles where rudimentary facilities (privies and/or fireplaces) might be provided for the comfort and convenience of the campers.

Camping Trailer. A vehicular portable unit mounted on wheels and constructed with collapsible partial side walls that fold for towing by another vehicle and unfold at the campsite to provide temporary living quarters for recreational, camping, or travel use. (*See definition of Recreational Vehicle.*)

Camping Unit. A tent or other type of portable shelter intended, designed, or used for temporary human occupancy.

Camping Unit Site. A specific area within a campground or recreational vehicle park that is set aside for use as a temporary living site by a camping unit. [*See also definition of Recreational Vehicle Site (including A-1-3) and Recreational Unit Site.*]

Developed Campground. (*See definition of Campground.*)

Fifth Wheel Trailer. A vehicular unit, mounted on wheels, designed to provide temporary living quarters for recreational, camping, or travel use, that is of such size or weight as not to require special highway movement permit(s), of gross trailer area not to exceed 400 ft^2 (37.2 m^2) in the set-up mode, and designed to be towed by a motorized vehicle that contains a towing mechanism that is mounted above or forward of the tow vehicle's rear axle. (*See definition of Recreational Vehicle.*)

Fully Developed Campground. (*See definition of Campground.*)

Gross Trailer Area.* The total plan area of a travel trailer measured to the maximum horizontal projection of exterior walls when in the set-up mode.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Liquefied Petroleum Gas, LP-Gas, and LPG. Any material having a vapor pressure not exceeding that allowed from commercial propane composed predominantly of the following hydrocarbons, either by themselves or as mixtures: propane, propylene, butane (normal butane or iso-butane), and butylene (including isomers).

Listed.* Equipment or materials included in a list published by an organization acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

Motor Home. A vehicular unit designed to provide temporary living quarters for recreational, camping, or travel use built on or permanently attached to a self-propelled motor vehicle chassis or on a chassis cab or van that is an integral part of the completed vehicle. (*See definition of Recreational Vehicle.*)

Park Trailer. A recreational vehicle that meets the following criteria:

(a) Built on a single chassis mounted on wheels.

(b) Having a gross trailer area not exceeding 400 ft^2 (37.2 m^2) in the set-up mode.

(c) Certified by the manufacturer as complying with ANSI A119.5, *Standard for Park Trailers*.

Primitive Campground. (*See definition of Campground.*)

Recreational Unit Site. Either a recreational vehicle site or a camping unit site. [*See definition of Recreational Vehicle Site (including A-1-3) and Camping Unit Site.*]

Recreational Vehicle. A vehicular-type unit primarily designed as temporary living quarters for recreational, camping, travel, or seasonal use that either has its own motive power or is mounted on or towed by another vehicle. The basic entities are: travel trailer, camping trailer, fifth wheel trailer, truck camper, park trailer, and motor home. (*See individual definitions.*)

Recreational Vehicle Park. A plot of land where two or more recreational vehicle sites are located, established, or constructed to provide for occupancy by recreational vehicles owned or operated by the general public as temporary living quarters for recreational or vacation purposes.

Recreational Vehicle Site.* A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis. It can be used as either a recreational vehicle site or as a camping unit site. (*See definition of Camping Unit Site.*)

Recreational Vehicle Stand. An area completely contained within a recreational vehicle site intended for the placement of a recreational vehicle.

Semi-Developed Campground. (*See definition of Campground.*)

Semi-Primitive Campground. (*See definition of Campground.*)

Service Building. A structure or portion thereof that is used to house sanitary facilities, such as water closets or lavatories. It can include other facilities for the convenience of the owner or the occupants of the recreational vehicle park or campground.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Travel Trailer. A vehicular unit, mounted on wheels, designed to provide temporary living quarters for recreational, camping, or travel use and of such size or weight as not to require special highway movement permits when towed by motorized vehicle, and that has a gross trailer area less than 320 ft^2 (28.8 m^2). (*See definition of Recreational Vehicle.*)

Truck Camper. A portable unit constructed to provide temporary living quarters for recreational, travel, or camping use, consisting of a roof, floor, and sides designed to be loaded onto and unloaded from the bed of a pickup truck. (*See definition of Recreational Vehicle.*)

1-4 Units.

Metric units of measurement in this standard shall be in accordance with the modernized metric system known as the International System of Units (SI). Two units (liter and bar), outside of but recognized by SI, are commonly used in international fire protection. These units are listed in Table 1-4.2 with conversion factors.

1-4.1

If a value for measurement as given in this standard is followed by an equivalent value in other units, the first stated shall be regarded as the requirement. A given equivalent value might be approximate.

1-4.2

The conversion procedure for the SI units has been to multiply the quantity by the conversion factor and then round the result to the appropriate number of significant digits.

Table 1-4.2

Name of Unit	Unit Symbol	Conversion Factor
liter	L	1 gal = 3.785 L
liter per minute per square meter	$L/min/m^2$	1 gpm/ft^2 = 40.746 $L/min/m^2$
cubic decimeter	dm^3	1 gal = 3.785 dm^3
pascal	Pa	1 psi = 6894.757 Pa
bar	bar	1 psi = 0.0689 bar 1 bar = 10^6 Pa

1-5 Electrical Requirements.

All electrical installations, systems, and equipment shall comply with Article 551, Part (B) and other applicable sections of NFPA 70, *National Electrical Code*®.

Chapter 2 General Design Criteria for Recreational Vehicle Parks and Campgrounds

Requirements for general design criteria for recreational vehicle parks and campgrounds are developed by the ANSI A119 Committee, of which the Recreational Vehicle Industry Association is Secretariat. These requirements and the fire safety requirements in this standard are published and distributed under one cover as ANSI A119.4/NFPA 501D.

Chapter 3 Fire Safety

3-1 Fire Detection and Alarm Services.

3-1.1 Water Supplies for Fire Protection.

Water supplies for fire protection purposes shall meet the requirements of the authority having jurisdiction. (*See also NFPA 1231, Standard on Water Supplies for Suburban and Rural Fire Fighting.*)

3-1.2 Detection Systems in Structures Open to the Public.

Fire detection and alarm systems installed in structures open to the public shall be installed in accordance with NFPA 72, *National Fire Alarm Code*.

3-1.3 Fire Extinguishers.

Portable fire extinguishers provided by the recreational vehicle park or campground operator shall be of the multipurpose dry chemical type or equal. Such extinguishers shall have a minimum rating of 2A:20B:C and shall be installed in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*.

3-1.4 Use of Fire Protection Equipment.

The recreational vehicle park and campground operator shall instruct the park staff in the use of the fire protection equipment available in the park and define the staff's specific duties in the event of fire.

3-1.5 Evacuation Plan.

Each recreational vehicle park and campground shall have a written evacuation plan approved by the authority having jurisdiction.

3-1.6 Campfire Locations.

Designated outdoor campfire locations, if provided, shall be in safe and convenient areas where they will not constitute fire hazards to vegetation, undergrowth, trees, recreational vehicles, recreational park trailers, camping units, and structures.

3-2 Fire Safety Rules and Regulations for Recreational Vehicle Parks and Campgrounds.

3-2.1 Posting of Emergency Information.

Fire safety rules and regulations shall be conspicuously posted by management. These regulations shall contain the following information and any additional information as required by the fire department.

(a) The telephone number of the fire department or other information needed for summoning the fire department, such as the location of the nearest fire alarm box.

(b) The telephone number of the police department.

(c) The telephone number of the recreational vehicle park or campground (or any other data that would aid in ensuring prompt fire department response, such as the recreational vehicle park or campground name and address).

(d) The location of the nearest public telephone.

3-2.2 Refuse.

A refuse disposal system shall be provided.

Chapter 4 Environmental Health and Sanitation

Requirements for environmental health and sanitation are developed by the ANSI A119 Committee, of which the Recreational Vehicle Industry Association is Secretariat. These requirements and the fire safety requirements in this standard are published and distributed under one cover as ANSI A119.4/NFPA 501D.

Chapter 5 Referenced Publications

5-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

5-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 10, *Standard for Portable Fire Extinguishers*, 1994 edition.

NFPA 70, *National Electrical Code*, 1996 edition.

NFPA 72, *National Fire Alarm Code*, 1993 edition.

NFPA 501C, *Standard on Recreational Vehicles*, 1996 edition.

NFPA 1231, *Standard on Water Supplies for Suburban and Rural Fire Fighting*, 1993 edition.

5-1.2 Other Publications.

5-1.2.1 ANSI Publications. American National Standards Institute, Inc., 1430 Broadway, New York, NY 10018.

ANSI A119.2/NFPA 501C, *Standard on Recreational Vehicles*, 1996.

ANSI A119.5, *Standard for Park Trailers*, 1993.

5-1.2.2 ASTM Publication. American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

ASTM E 380, *Standard Practice for Use of the International System of Units (SI) (the Modernized Metric System)*, 1993.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-3 Approved.

The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-3 Authority Having Jurisdiction.

The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-3 Gross Trailer Area.

In calculating the square footage, measurements should be taken on the exterior. Square footage includes all siding, corner trims, moldings, storage spaces, areas enclosed by windows but not the roof overhangs (Ref. HUD Interpretive Bulletin A-1-88).

Expandable room sections, regardless of height should be included. Storage lofts contained within the basic unit should have ceiling heights less than 5 ft (1.5 m) and would not constitute additional square footage.

A-1-3 Listed.

The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-3 Recreational Vehicle Site.

The term “recreational unit site” (*see definition*) is used in this standard when it is desired to describe conditions that apply equally to a “recreational vehicle site” and to a “camping unit site” (*see definitions*).

NFPA 502

1996 Edition

Recommended Practice on Fire Protection for Limited Access

Highways, Tunnels, Bridges, Elevated Roadways, and Air

1996 Edition

This edition of NFPA 502, *Recommended Practice on Fire Protection for Limited Access Highways, Tunnels, Bridges, Elevated Roadways, and Air Right Structures*, was prepared by the Technical Committee on Motor Vehicle and Highway Fire Protection and acted on by the National Fire Protection Association, Inc., at its Annual Meeting held May 20-23, 1996, in Boston, MA. It was issued by the Standards Council on July 18, 1996, with an effective date of August 9, 1996, and supersedes all previous editions.

This edition of NFPA 502 was approved as an American National Standard on July 26, 1996.

Origin and Development of NFPA 502

A tentative standard, NFPA 502T, *Standard for Limited Access Highways, Tunnels, Bridges and Elevated Structures*, was prepared by the Technical Committee on Motor Vehicle Fire Protection and was adopted by the National Fire Protection Association on May 16, 1972 at its Annual Meeting in Philadelphia, PA. It was withdrawn in November 1975. In 1980, the Committee rewrote the document as a Recommended Practice and included a chapter on Air Right Structures. It was adopted at the 1981 Annual Meeting.

Minor revisions to Chapters 2 through 5, primarily water supply and fire apparatus requirements, were made in the 1987 edition.

The recommended practice was reconfirmed in 1992.

The recommended practice was revised in 1996 to incorporate a totally revised chapter on tunnels and make other revisions and changes to correlate the new material in tunnel and air right structure requirements with existing chapters in the document.

The reworking of the document as related to tunnels and air right structures was to bring it up to current technology and practices.

The development of this 1996 edition was accomplished by an NFPA 502 Task Group appointed by the Chairman of the Technical Committee in October 1993. This task group effort was conducted by the following individuals:

Arthur G. Bendelius, Task Group Chair, Parsons Brinckerhoff, NY; Dennis J. Becker, Richard D. Kimball Co., Inc., MA; Anthony S. Caserta, U.S. Federal Highway Administration, DC; William G. Connell, Parsons Brinckerhoff, MA; Stephan K. Dunbar, Boston Fire Dept., MA; Phillip Egilsrud, Consultant, MO; William A. Eppich, Protectowire Co., MA; John P. Kenney, Boston Fire Dept., MA; Maurice M. Pilette, Mechanical Designs, Ltd., MA.

Technical Committee on

Motor Vehicle and Highway Fire Protection

Enoch Lipson, *Chair*
The Port Authority of New York & New Jersey, NY

Dennis J. Becker, Richard D. Kimball Co., Inc., MA

Neill Darmstadter, American Trucking Assn. Inc., VA

A. L. Elliott, Sacramento, CA

William A. Eppich, The Protectowire Co., Inc., MA

Edward E. Friloux, Sr., American Fire Retardant Corp., LA

Clifford J. Harvison, Nat'l Tank Truck Carriers Inc., VA

Maurice M. Pilette, Mechanical Designs Ltd., MA

George E. Ralph, Southport, ME

Steven R. Shinners, Yellow Freight System, Inc., KS

Michael P. Wilson, American Insurance Services Group Inc., NY

Alternate

Arthur G. Bendelius, Parsons Brinckerhoff, NY
(Alt. to A. L. Elliott)

Richard Ortisi-Best, NFPA Staff Liaison

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on motor vehicle fire prevention and protection measures to reduce loss of life and property damage in the operation and maintenance (repair) of such vehicles (except as specified herein); fire prevention and protection recommendations for motor freight terminals; protection for tunnels, air right structures, and bridges; and to recommend protection facilities on limited access highways. Included as motor vehicles are trucks, buses, taxicabs, limousines, and passenger cars; excluded are the design, fire protection, and operational procedures for fire apparatus, mobile homes and travel trailers, tank vehicles of all kinds for handling flammable and combustible liquids and liquefied petroleum gases, and vehicles transporting explosives and other hazardous chemicals. The construction and protection of garages is handled by the NFPA Committee on Garages.

NFPA 502
Recommended Practice on Fire Protection for

Limited Access Highways, Tunnels, Bridges, Elevated Roadways, and Air Right Structures

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 11 and Appendix H.

Chapter 1 General

1-1 Scope.

This recommended practice is intended primarily for the guidance of those individuals responsible for the design, construction, operation, maintenance, and fire protection of limited access highways, tunnels, bridges, elevated roadways, depressed roadways, and air right structures. It also applies, to a lesser extent, to buildings and structures that are exposed to the hazards of the operational zones.

1-1.1

This recommended practice does not apply to requirements for the following:

(a) Parking garages;

(b) Bus terminals;

(c) Truck terminals;

(d) Any other facility in which motor vehicles travel or are parked.

1-1.2

To the extent where a facility, including those listed in 1-1.1(a) through (d), introduces hazards of a similar nature to those addressed in this document, this recommended practice can be used as a guide.

1-2 Purpose.

The purpose of this document is to establish minimum criteria that provide a reasonable degree of protection from fire and its related hazards.

1-3 Equivalency.

Nothing in this recommended practice is intended to prevent the use of systems, methods, or devices that are of equivalent or superior quality, strength, fire resistance, effectiveness, durability, and safety to those prescribed by this recommended practice, provided technical documentation is submitted to the authority having jurisdiction to demonstrate equivalency and provided the system, method, or device is approved for the intended purpose.

1-4 Characteristics of Fire Protection.

Fire protection on limited access highways, in tunnels, and on bridges is achieved through a composite of facility design, operating equipment, hardware, software, subsystems, and procedures integrated to provide requirements for the protection of life and property from the effects of fire. The level of fire protection desired for the entire facility should be achieved by integrating the requirements developed through use of this document for each subsystem.

1-5 Application.

1-5.1

The provisions of this document are considered necessary to provide a reasonable level of protection from loss of life and property from fire and explosion. They reflect the practices and the state of the art prevalent at the time this recommended practice was issued.

1-5.2

Unless otherwise noted, it is not intended that the provisions of this document be applied to facilities, equipment, structures, or installations that were existing or approved for construction or installation prior to the effective date of this recommended practice, except in those cases where it is determined by the authority having jurisdiction that the existing situation involves a distinct hazard to life or adjacent property.

1-5.3

Application of this recommended practice to alterations should be determined by the authority having jurisdiction.

1-5.4

That portion of this document that covers emergency procedures does apply to both new and existing facilities.

1-5.5

This recommended practice also can be used for upgrading fire protection facilities, except in those instances where compliance with this recommended practice is not practical or possible within the limits of the existing structure.

1-6 Safeguards During Construction.

During the course of construction or major modification of any limited access highway, tunnel, or bridge structure, the provisions of NFPA 241, *Standard for Safeguarding Construction, Alteration, and Demolition Operations,* should apply.

1-7 Limited Access Highways.

1-7.1

Limited access highways present two fire protection problems. One is the protection of life and property transported by vehicles traveling on the facility, and the other is the protection of permanent installations located on, over, below, or adjacent to the facility. Protection to life is to be given primary consideration in all cases. Protection of the facility is also of major importance because of its vital role in the community.

1-7.2

Protection of related facilities such as service areas, rest areas, toll booths, and buildings used for administration, law enforcement, and maintenance presents problems that are not basically different from the fire protection problems of all such buildings. However, special consideration should be given to the fact that on, or adjacent to, limited access highways, such buildings might be located in isolated areas. (*See NFPA 30, Flammable and Combustible Liquids Code, and NFPA 30A, Automotive and Marine Service Station Code, for service stations*.)

1-7.3

Protection for people and property transported by vehicles is somewhat more complicated, since the location of emergencies cannot be predetermined; emergencies can occur at any point or simultaneously at several points along the course of any vehicle transport facility. Fire emergencies can range from incipient fires in passenger vehicles to major accidents involving loaded buses and trucks carrying hazardous materials. Heavy traffic, adverse weather conditions, and night usage escalate the problem.

1-7.4

Studies of fire protection for limited access highways indicate that there are three interdependent factors to be considered. The first is the rapid transmission of alarms to the proper authorities and a simultaneous warning to approaching vehicle operators. The second is the response of appropriate apparatus and fire-fighting personnel with minimal delay. The third is the matter of rescue operations followed by fire extinguishment or control. Where life is endangered by fire, the possibility of effective rescue operations decreases rapidly with any delay.

1-7.5

Unless an effective means of communication is provided, the reporting of fire and other emergencies by occupants of passing vehicles has little value. The distance to interchanges, service areas, and toll booths, and indecision due to lack of familiarity with such emergencies, often consumes the limited time that exists for effective action.

1-7.6

Control of traffic is a continuous problem from the start of any emergency to the time at which the occupants and vehicle(s) are removed from the facility.

1-7.7

Fire protection for limited access highways is addressed in Chapter 2.

1-8 Bridges and Elevated Roadways.

1-8.1

A fire occurring on an elevated roadway or bridge has the same characteristics as a fire occurring on a highway, but it usually is less accessible due to the elevated structure.

1-8.2

Protection of life is the primary concern. However, protection of the elevated roadway or bridge might be more important than protection of vehicles and cargo. Damage to a critical structural member from collision or exposure to high temperatures could result in dangerous weakening or complete collapse of the elevated roadway or bridge.

1-8.3

Approaches to elevated structures and bridges frequently pass directly over congested residential or high-value industrial areas. Certain hazardous materials fires on the structures could result in serious exposure fires in the occupancies beneath and in close proximity to the structures. Conversely, these occupancies, particularly those dealing with hazardous materials, can seriously expose the structures.

1-8.4

Fire protection for bridges and elevated roadways is addressed in Chapter 3.

1-8.5

Consideration is to be given to the fact that flammable liquids or vapors can flow from the roadway by gravity and thus extend the fire risk well beyond the area of the original emergency.

1-9 Depressed Roadways.

1-9.1

A depressed roadway is defined as an uncovered, below-grade roadway where emergency response access is limited or a "boat section" where walls rise to the surface above the roadway surface.

1-9.2

A fire occurring in a depressed highway poses problems similar to those of a fire in a bridge or elevated roadway, with restricted access to the scene of the fire due to the containing walls.

1-9.3

Since the majority of depressed roadways are associated with tunnels as connecting sections or open approaches, depressed roadways are addressed in Chapter 4.

1-10 Tunnels.

1-10.1

The fire protection problem created by a fire in a highway tunnel is similar to that of a fire occurring on a highway in that the emergency is complicated by existing traffic conditions, the number of passengers carried by involved vehicles, and the wide diversity of cargo transported by trucks.

A fire in a tunnel can be extremely destructive and dangerous because the confined space hinders the dissipation of heat and smoke. Additional problems connected with a fire emergency in a tunnel include access limitations for fire-fighting equipment and personnel, early fire detection and alarm transmission, control of traffic, and evacuation of the public from an enclosed facility.

1-10.2

Protection of life is the primary concern. Access points for fire personnel, emergency egress for motorists, fire detection and alarm systems designed to meet the demands of tunnel application, availability of water supply, and adequate ventilation capabilities are among the fundamentals that are to be considered in providing adequate safeguards for both the motorists and the fire fighters to help cope in an emergency. The secondary consideration is protection of the tunnel structure itself. Damage to the ventilation, lighting, or fire suppression systems can endanger lives.

1-10.3

As in the case of highways, the primary need is a means for prompt and rapid detection and notification to the authorities of the existence and location of an emergency and the development of effective response plans, reliable communications, and means of traffic control.

1-10.4

Every tunnel has its own unique characteristics. Tunnels vary in length, cross section, profile, traffic operations, and traffic volumes, among other characteristics. Tunnels can be found in either urban or rural environments and can be subaqueous, subterranean, or mountain type. Therefore, it is imperative that each of these characteristics be considered when establishing emergency/life safety system requirements.

1-10.5

For the purpose of this recommended practice, tunnel length should dictate minimum requirements as follows:

(a) Where the tunnel length exceeds 300 ft (90 m), a standpipe system should be installed to ensure that no point along the tunnel roadway is more than 150 ft (45 m) from a hose connection.

(b) Where the tunnel length exceeds 800 ft (240 m), whereby the maximum distance from any point within the tunnel to an area of safety exceeds 400 ft (120 m), all provisions of this recommended practice should apply.

1-10.6

Fire protection for tunnels is addressed in Chapter 4.

1-11 Air Right Structures.

1-11.1

Where a building is constructed using the air rights over an active motor roadway, the facility begins to resemble a tunnel from the fire protection standpoint. If the sides of the facility are closed, then the air right structure is to be considered a tunnel.

Where an air right structure is fully enclosed on both sides of the roadway, it should be treated, from a fire protection standpoint, as a tunnel. Where the air right structure is not fully enclosed, the decision to treat it as a tunnel should be made by the authority having jurisdiction after sufficient engineering analysis.

1-11.2

Air right structures, as defined in 1-11.1, present two distinctly different fire protection problems. One relates to the persons and property in the structure built above the roadway. The other relates to the persons and property using the roadway that passes under or adjacent to the air right structure.

Fire protection for structures built over the roadway presents problems similar to those involving like buildings in other locations. However, these problems can be complicated by limited access, traffic congestion, and the fire situation on the roadway under or adjacent to the structure.

1-11.3

Fire protection for the roadway under an air right structure is similar to that needed for a tunnel. Occupancy and use of the space above the ceiling of the roadway is significantly different, as outlined in 1-11.2.

1-11.4

While protection of life is the primary consideration, there are other important concerns. The structural members that support the air right building could be subjected to very high temperatures, particularly in a flammable liquids fire or explosion. Damage to these members could have a serious effect on the building. In addition, openings from the roadway such as ventilation shafts and access/egress stairways could allow the passage of flammable vapors to the air right structure with subsequent damage from fire or explosion.

1-11.5

Consideration is to be given to the fact that flammable liquids or vapors can flow from the roadway by gravity or via the drainage system and thus extend the fire risk well beyond the area of the original emergency.

1-11.6

Major structural elements that support an air right structure could be subject to physical damage from motor vehicle accidents.

1-11.7

Fire protection for air right structures is addressed in Chapter 5.

1-12 Units.

1-12.1*

Metric units of measurement in this standard are in accordance with the modernized metric system known as the International System of Units (SI). The liter unit, which is outside of but recognized by SI, is commonly used in international fire protection.

1-12.2

If a value for measurement as provided in this recommended practice is followed by an equivalent value in other units, the first stated value is to be regarded as the recommendation. A given equivalent value might be an approximation.

1-12.3

SI units have been converted by multiplying the value by the conversion factor and rounding the result to the appropriate number of significant digits.

1-13 Definitions.

Agency. The organization legally established and authorized to operate a facility.

Air Right Structure. The roadway facility created when a building is built over the roadway using the roadway's air rights.

Alternate Central Supervising Station. A prearranged location that is equipped, or that can quickly be equipped, to function as the central supervising station in the event the central supervising station is inoperative or untenable for any reason.

Alternative Fuels. Motor vehicle fuels other than gasoline and diesel.

Ancillary Facility. The structure usually used to house or contain operating, maintenance, or support equipment and functions.

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Backlayering. The reversal of the movement of smoke and hot gases contrary to the direction of the ventilation airflow.

Bridge. A structure spanning and providing a roadway across an obstacle such as a waterway, railroad, or another roadway.

Building. Any structure used or intended for supporting or sheltering any use or occupancy. The term building should be construed as if followed by the words "or portions thereof."

Central Supervising Station. The operations center where the authority controls and coordinates the facility operations from which communication is maintained with supervisory and operating personnel of the authority and with participating agencies where required.

Combustible. Capable of undergoing combustion.

Command Post. The location during an emergency, selected by the person in command, for controlling and coordinating the emergency operation.

Communications. Radio, telephone, and messenger services throughout the facility and particularly at the central supervising station and command post.

Control Valve. A valve used to control the water supply system of a standpipe system.

Critical Velocity. The minimum steady-state velocity of the ventilating airflow moving toward the fire, within a tunnel, that is necessary to prevent backlayering.

Dry Standpipe. A standpipe system designed to have piping contain water only while the system is being utilized.

Elevated Roadway. A roadway that is constructed on a structure that is located above the surface but that is not a bridge.

Emergency Procedures Plan. A plan developed by the authority with the cooperation of all participating agencies detailing specific actions to be performed by all those who are to respond during an emergency.

Engineering Analysis. An analysis that evaluates all the various factors that affect the fire safety of the facility or component. A written report of the analysis should be submitted to the authority indicating the fire protection method(s) recommended that will provide a level of fire safety commensurate with this recommended practice.

Facility. As used in this recommended practice, this includes limited access highways, tunnels, bridges, elevated roadways, and air right structures.

Fire Department Connection. A connection through which the fire department can pump water into the standpipe system.

Fire Emergency. The existence of, or threat of, fire or the development of smoke or fumes, or any combination thereof, that calls for immediate action to correct or alleviate the condition or situation.

Hose Connection. A combination of equipment provided for connection of a hose to the standpipe system that includes a hose valve with a threaded outlet.

Hose Valve. The valve to an individual hose connection.

Incidental Occupancy. A facility used by others who are neither employees nor motorists.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Latching-Type Detector. A detector circuit configuration in which the detector cannot reset itself once it is in alarm mode. The only way of resetting (restoring) the detector to normal operating mode is at the fire alarm control panel.

Length of Tunnel. The length measured from face of portal to face of portal using the centerline alignment along the tunnel roadway.

Limited Access Highway. A highway where preference is given to through traffic by providing access connections using only selected public roads and by prohibiting crossings at grade and direct private driveways.

Listed.* Equipment, materials, or services included in a list published by an organization acceptable to the authority having jurisdiction and concerned with evaluation of products or services that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services and whose listing states either that the equipment, material, or service meets identified standards or has been tested and found suitable for a specified purpose.

Motorist. A motor vehicle occupant, including both the driver and passenger.

MUTCD. *Manual on Uniform Traffic Control Devices for Streets and Highways.*

Noncombustible Material. A material that, in the form in which it is used and under the conditions anticipated, does not aid combustion or add appreciable heat to an ambient fire. Materials, where tested in accordance with ASTM E 136, *Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C*, and conforming to the criteria contained therein are to be considered as noncombustible.

Participating Agency. A public, quasi-public, or private agency that has agreed to cooperate with and assist the authority during an emergency.

Person-in-Command. A person designated by the authority or a responsible fire or police representative on the scene of an emergency who is fully responsible at the command post.

Point of Safety.* An enclosed fire exit that leads to a public way or safe location outside the structure, or an at-grade point beyond any enclosing structure, or another area that affords adequate protection for motorists.

Portal. The interface between a tunnel and the atmosphere through which vehicles pass.

Power Substation. An arrangement of electrical equipment that does not generate electricity but receives and converts or transforms generated energy to usable electric energy.

Replace-in-Kind. To furnish with new parts or equipment, as applied to equipment and facilities, of the same type but not necessarily of identical design.

Should. Indicates a recommendation or that which is advised but not required.

Structures. Includes, but is not limited to, buildings, bridges, and underground installations.

Tunnel. An enclosed roadway for vehicular traffic with vehicular access limited to portals.

Chapter 2 Limited Access Highways

2-1 General.

The limited access highway poses unique challenges for the fire fighter. The primary problem is the limitation of access to the facility and the possible remote location of the highway.

2-2

Alarm Transmission. Alarm transmission can be provided by the installation of outdoor-type telephone boxes, coded alarm telegraph stations, radio transmitters, sensing equipment, or other suitable devices. The means of transmission should be made conspicuous by indicating lights or other suitable markers and should be located in a way that allows users to park their vehicles clear of the roadway.

Mile markers or other readily available location reference markers should be installed along the highway to allow motorists to provide authorities with reasonably accurate locations for accident or emergency areas.

2-3 Fire Protection.

2-3.1

Arrangements for the response of nearby fire companies and emergency squads should be made. Means of access that allows the entrance of outside aid companies to the facility should be provided, and procedures for utilizing such access should be included in the emergency plan. Appropriate precautions should be taken at these points of entry to alert and control traffic to allow safe entrance by emergency equipment. It is important that fire apparatus responding to fires on limited access roads be equipped with booster tanks [500 gal (1900 L) minimum] and foam-production equipment or an equivalent amount of dry chemical.

2-3.2

All ancillary facilities that support the operation of limited access highways such as maintenance/service buildings, toll plazas, pump stations, and electrical substations should be protected as required by all applicable NFPA standards and local building codes.

2-3.3

Fire extinguishers should be provided at highway installations and buildings in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*.

2-4 Emergency Planning.

2-4.1

It is important that a designated authority carry out a complete and coordinated program of fire protection that includes written preplanned response and standard operating procedures.

2-4.2*

Emergency traffic control procedures should be established to regulate traffic.

2-4.3

To derive the maximum benefit from the fire protection program, comprehensive training programs are necessary for all personnel and agencies expected to participate in fire-fighting operations and hazardous materials emergencies. Such a program should involve a competent supervisory staff experienced in fire-fighting techniques and hazardous materials emergencies.

2-4.4

Contacts should be made with roadside businesses and responsible persons living along limited access highways to elicit their cooperation in the reporting of fires and other emergencies. The objective of such contacts should be to establish a positive system for the reporting of emergencies. Those who agree to participate in the system are to be provided with specific information on the procedures for reporting and a means for determining and reporting the location of the emergency as precisely as possible.

2-4.5

Emergency procedures and the development of an emergency response plan are addressed in Chapter 9.

Chapter 3 Bridges and Elevated Roadways

3-1 General.

Elevated roadways and bridges pose both a vertical and a horizontal access problem for fire-fighting activities. In addition, the potential for a fire under the structure that impacts the integrity of the structure is to be considered.

3-2 Alarm Transmission.

3-2.1

Alarm transmission can be provided by the installation of outdoor-type telephone boxes, coded alarm telegraph stations, radio transmitters, sensing equipment, or other suitable devices. The means of transmission should be made conspicuous by indicating lights or other suitable markers and should be located in a way that allows users to park their vehicles clear of the roadway.

Signs or mile markers should be installed along the bridge to allow motorists to provide authorities with reasonably accurate locations for accident or emergency areas.

3-2.2

A traffic control procedure should be established so that vehicles will either stop or proceed with caution. It is essential that traffic does not block or otherwise interfere with the response of emergency and fire equipment.

3-3 Fire Apparatus, Standpipe Systems, Water Supplies, and Equipment.

Suitable fire apparatus should be available within 1 mi (1.6 km) of all points on elevated roadways and bridges in urban areas; use of ladders by municipal fire fighters may be permitted where elevated structures and bridges are accessible from beneath. The design of apparatus intended for use only on bridges or elevated structures should be based on the conditions encountered. Apparatus responding to fires on bridges and elevated roadways should be equipped with potassium bicarbonate-based dry chemical/aqueous film-forming foam (AFFF) or similar self-contained fire-fighting equipment. In addition, the vehicle should have booster tanks [500 gal (1900 L) minimum].

3-3.1

The responding fire apparatus should be equipped to deliver a foam solution at a minimum rate of 125 gpm (475 L/min) for a minimum duration of 15 minutes. If hydrant or standpipe water is not available, suitable arrangements should be made to transport water in tankers so that the delivery rate of foam can be maintained. Additional supplies of foam should be readily available from mutual aid fire departments or other sources so that the application can be continued for an additional 45 minutes if necessary. These units also should carry multipurpose dry chemical extinguishers and an extinguishing agent for Class D metal fires. Mutual aid, supplier, or manufacturer reserve capability should be available.

3-3.2

In urban locations, hose outlets (hydrants) from the municipal water supply should be located at both ends of bridges. Where more than one agency has the responsibility for providing fire protection, every effort should be made to standardize hose connectors. If this is not possible, suitable adapters should be readily available. In addition, where the length or width of the bridge is such that hose lines of more than 400 ft (120 m) cannot be provided from the hydrants, a standpipe system, in accordance with Chapter 6, should be provided. In certain instances, it might be desirable for duplicated systems to be installed on each side of the roadway and to be cross-connected. Where freezing conditions prevail, systems should be of the dry type. Signs should indicate the location of street-level hydrants.

3-3.3

Sand should be provided for use during icy weather conditions. Suitable absorbent materials should be provided for controlling the spill of hazardous materials. On bridges and elevated roadways, consideration should be given to drainage systems to channel spilled hazardous materials to areas that cannot cause additional hazards. For example, expansion joints should be designed to prevent spillage to the area below.

3-4 Control of Hazardous Materials.

Control of hazardous materials is addressed in Chapter 10.

3-5 Emergency Planning.

3-5.1

It is important that a designated authority carry out a complete and coordinated program of fire protection that should include preplanned emergency response procedures to be contained in an emergency response plan.

3-5.2

To derive the maximum benefit from the fire protection program, comprehensive training programs are necessary for all personnel and agencies expected to participate in fire-fighting operations and hazardous materials emergencies. Such a program should involve a competent supervisory staff experienced in fire-fighting techniques and hazardous materials emergencies.

3-5.3

Emergency procedures and the development of an emergency response plan are addressed in Chapter 9.

Chapter 4 Tunnels

4-1 General.

A tunnel is an enclosed roadway for motor vehicle traffic in which access is limited to portals, which poses some unique fire-fighting challenges due to both the restricted access to the fire site and the confined nature of a tunnel.

4-2 Detection and Alarm.

4-2.1

At least one and preferably two means should be provided to detect fire and transmit an alarm to a local 24-hour monitoring facility, an approved central station, or the local fire department.

4-2.1.1 Manual fire alarm pull stations of the double-action type that are mounted on weatherproof boxes should be installed at intervals of not more than 300 ft (100 m) and at all cross passages and means of egress from the tunnel. The stations should be accessible to both the public and tunnel personnel. The manual fire alarm pull stations should be made conspicuous by lights installed directly above each pull station. Pull stations should be reset with a key. All manual fire alarm pull stations should use an identical key. Each alarm should be transmitted to a local 24-hour monitoring facility, an approved central station, or the local fire department. The alarm is to indicate the location of the pull station. Confirmation of receipt of the sent alarm should be provided at the pull station by a light. Voice communication at the pull station should be considered if a local 24-hour monitoring facility is available.

4-2.1.2 Closed-circuit television systems (CCTV) together with traffic flow indication should be used to detect and identify fires only in tunnels with 24-hour, full-time supervision. Rooms within ancillary structures (pump rooms, utility rooms, cross passages, ventilation structures) and areas not covered by CCTV should be supervised by automatic fire alarm systems.

4-2.1.3 Manual fire alarm pull stations or automatic fire alarm systems should be used in tunnels without 24-hour, full-time supervision. The systems should be in compliance with NFPA 72, *National Fire Alarm Code.*

Exception: Signals for the purpose of evacuation and relocation of occupants are not necessary.

4-2.2

Fire detection in an automatic fire alarm system should identify the location of the fire clearly and should identify the device initiating any alarm (false or otherwise) clearly. The initiating device should have a light that remains on until the device is reset. Automatic fire detection should be provided in all normally unoccupied spaces such as utility rooms, cross passages, stairways, and ventilation structures.

Automatic fire detection within the tunnel should be zoned to correspond with the tunnel ventilation zones and should also identify the location of the fire to within 50 ft (15.3 m).

Portals should be provided with a remote fire alarm annunciator panel at a suitable location accessible to the fire service. Remote annunciator panels should indicate the zone in alarm and should display the location of that alarm.

4-2.3 Fire Alarm Control Panel.

Means should be provided for the installation of a fire alarm control panel (FACP). The FACP should be zoned and should be of the positive, noninterfering, successive (PNIS) type. One zone entering into an alarm should not interfere with any other zone entering into an alarm and should annunciate all alarms. The FACP should have battery backup power. All FACP should be locked, should use an identical key, and should be in compliance with NFPA 72, *National Fire Alarm Code*. The fire alarm zones should correspond to the ventilation zones in the tunnel. The FACP should be in a suitable enclosure for the environment. The FACP should be approved. All FACPS should be fed by a single-phase, three-wire system. The circuit breakers protecting this system should not be configured in a common trip mode of operation. Each circuit breaker should operate independently of all other circuit breakers.

4-2.4 Inspection, Testing, and Maintenance.

Means should be provided for the fire detection alarm systems, including all associated appurtenances, to be inspected, tested, and maintained in accordance with NFPA 72, *National Fire Alarm Code*.

4-3 Traffic Control and Surveillance.

4-3.1

For tunnel lengths greater than 300 ft (90 m), a traffic surveillance and control system should be provided. This system should be capable of monitoring and controlling traffic within and approaching the tunnel.

4-3.2

Tunnels longer than 300 ft (90 m) should provide the capability to automatically prevent approaching traffic from entering the tunnel when a fire alarm is activated. This capability should consist of traffic signals in proximity to the portal. The system should be reset to normal operation when the fire site is cleared. Control of this system can be either from within the tunnel or from a remote location.

4-3.3

Tunnels longer than 800 ft (240 m) should provide additional capabilities to divert traffic from entering the direct approaches to the tunnel and to clear traffic downstream of the fire site.

(a) Traffic beyond the direct approaches to the tunnel should be diverted by means of signs. This also could necessitate preempting traffic signals to prevent traffic from entering the approaches. This can be accomplished by omitting traffic movements or otherwise directing traffic to alternate roadways.

(b) Traffic within the tunnel approaching the fire site should be stopped prior to the fire site until it is safe to proceed. The controls used should be spaced for safe braking requirements.

Visibility requirements should be in accordance with the MUTCD.

(c) The control systems should be configured to control all modes in which the tunnel is operated.

(d) Controls should be provided so that traffic beyond the fire site can proceed to exit the tunnel. If signals are provided for this function, their display should be green.

(e) If contraflow operation is permitted during emergency vehicle response periods, the control systems should be configured to control traffic in each direction.

(f) If traffic exiting the tunnel is obstructed by intersectional traffic signals in the area of the exit, such signals should be preempted to eliminate the obstruction.

(g) The return of the traffic controls to normal operation should follow prearranged protocol between the tunnel system operator and authority having jurisdiction.

4-4 Emergency Communications.

Radio communication systems, such as highway advisory radio (HAR) and AM/FM commercial station overrides, are recommended to the motorist as communications routes for all tunnels over 800 ft (240 m) and should provide identification of the emergency and actions the motorist should take. All messaging systems for tunnels over 800 ft (240 m) should be capable of real time composition and selection by the emergency response authority and should not be of the recorded type. Areas of refuge or assembly, if available, should be provided with reliable two-way voice communication to the emergency response authority.

4-5 Emergency Response Apparatus and Equipment.

4-5.1

Emergency response apparatus should be available within the general site of the emergency, thus providing a rapid response. Where the tunnel is a high-capacity urban tunnel, it might be appropriate to house the apparatus at one or both of the tunnel portals.

4-5.2

Suitable apparatus, if appropriate, should be available at the tunnel portal(s). Apparatus should be designed for double-end lifting operation and equipped with "dollies" for towing disabled vehicles from the tunnel. The apparatus should carry a potassium bicarbonate-based dry chemical/aqueous film-forming (AFFF) or similar self-contained fire-fighting system or means to obtain water from a standpipe system, or any combination thereof. It also should carry portable extinguishers, complete self-contained breathing apparatus, cutting torches, forcible entry tools, hose, chains, coffin hoists, tarpaulins, and other appropriate hand tools. The apparatus should be equipped with a radio.

4-5.3

The responding fire apparatus should be equipped to deliver a foam solution at a minimum rate of 125 gpm (475 L/min) for a minimum duration of 15 minutes. If hydrant or standpipe water is not available, suitable arrangements should be made to transport water in tankers so that the delivery rate of foam can be maintained. Additional supplies of foam should be readily available from mutual aid fire departments or other sources so that the application can be continued for an additional 45 minutes if necessary. These units also should carry multipurpose dry chemical extinguishers and an extinguishing agent for Class D metal fires. Mutual aid, supplier, or manufacturer reserve capability should be available.

4-6 Fire Standpipe and Water Supply.

The fire standpipe and water supply are addressed in Chapter 6.

4-7 Portable Fire Extinguishers.

Portable fire extinguishers, each with at least a nominal 20-lb (9-kg) capacity for multipurpose agent, should be placed on both sides of the roadway in well-marked, flush-wall cabinets at intervals of not more than 300 ft (90 m). Portable fire extinguishers should be provided in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*.

4-8 Emergency Ventilation.

Emergency ventilation is addressed in Chapter 7.

4-9 Drainage System.

4-9.1

A drainage system should be provided in tunnels to collect, store, or discharge, or any combination of these functions, influent emanating from within the tunnel. In addition to water discharged from the fire protection system and liquids from accidental spills, this influent also might include water from tunnel cleaning operations and water from incidental seepage.

4-9.2

The drainage collection system should consist of an embedded main drain pipe with grate-covered inlets regularly spaced along the curb rather than a continuous open gutter, which could allow spills of hazardous material, such as flammable liquids that could ignite, to propagate along the length of the tunnel.

4-9.3

The spacing of connections to the gravity line should be at a maximum of 100 ft (30 m) on centers.

4-9.4

Components of the drainage collection system, including the main drainlines, should be noncombustible (steel, ductile iron, or concrete). Polyvinyl chloride (PVC), fiberglass pipe, or other combustible material should not be permitted.

4-9.5

The collection system should drain to a storage tank or transfer pumping station of sufficient capacity to receive, as a minimum, the simultaneous rate of flow from two fire hoses without causing flooding on the roadway.

4-9.6

Storage tanks and pump stations should be classified for hazard in accordance with NFPA 70, *National Electrical Code*®□. All motors, starters, level controllers, and system controls should be specified to conform to the intrinsic requirements of the hazard classification.

4-9.7

Storage tanks and pump stations should be monitored for hydrocarbons. Detection of hydrocarbons in the drainage influent should initiate both a local and remote alarm.

4-10 Control of Hazardous Materials.

Control of hazardous materials is addressed in Chapter 10.

4-11 Emergency Planning.

4-11.1

It is important that a designated authority carry out a complete and coordinated program of fire protection that should include preplanned response and standard operating procedures in the form of an emergency response plan.

4-11.2

To derive the maximum benefit from the fire protection program, comprehensive training programs are necessary for all personnel and agencies expected to participate in fire-fighting operations and hazardous materials emergencies. Such a program should involve a competent supervisory staff experienced in fire-fighting techniques and hazardous materials emergencies.

4-11.3

Emergency procedures and development of emergency response plans are addressed in Chapter 9.

4-12 Alternative Fuels.

4-12.1

The majority of the vehicles currently in the U.S. traffic population are fueled by either gasoline or diesel fuel. Vehicles powered by alternative fuels have been introduced, but, at this time, the portion of the vehicle population powered by alternative fuels remains too small to impact the normal ventilation of tunnels; however, there can be an impact on the emergency ventilation. (*See Appendix F*.)

4-12.2 Mitigation Measures.

As the use of alternative fuels in road vehicles has gradually increased, each tunnel operating agency has dealt with the issue of whether to allow vehicles through the tunnels for which it is responsible. Most tunnel agencies throughout the world do allow the passage of alternative fuel vehicles.

The mitigation measures that can be taken by the tunnel designer relate primarily to the ventilation system, which, in most circumstances, can provide sufficient air to dilute the fuel below any troublesome levels adequately. It might be necessary to establish a minimum level of ventilation to provide this dilution under all circumstances. The other measure to be taken is to reduce or eliminate any irregular surfaces of the tunnel ceiling or structure where a pocket of gas could collect and remain undiluted, thus posing a potential explosive hazard.

4-13 Safeguards During Construction.

During the course of construction or major modification of any structure, the provisions of NFPA 241, *Standard for Safeguarding Construction, Alteration, and Demolition Operations*, should apply.

Exception: Where specifically addressed in this recommended practice.

4-13.1 Temporary Fire Detection and Alarm System.

A temporary fire detection and alarm system should be installed and maintained during construction. The system should consist of heat detectors; manual pull stations spaced not more than 200 ft (60 m) apart; indication appliances consisting of horn and light combination units spaced to be clearly visible/heard in all areas of construction; a fire alarm control panel; a backlighted graphic annunciator that depicts (graphically) the entire area under construction; and an approved fire alarm master box connected to the local authority having jurisdiction. All system controls and devices should be in compliance with NFPA 72, *National Fire Alarm Code*.

Chapter 5 Air Right Structures

5-1 General.

An air right structure imposes limitations on the ability of a fire fighter to fight a fire similar to those of a tunnel, due to its limited access and restricted work space.

5-2 Detection and Alarm Transmission.

5-2.1

Where the air right structure approximates the physical characteristics of a tunnel, an alarm system similar to that of a tunnel should be considered. (*See Chapter 4.*)

5-2.2 Traffic Control and Surveillance.

5-2.2.1 Where the air right structure approximates the physical characteristics of a tunnel, a traffic control and surveillance system should be considered. (*See Chapter 4.*)

5-2.2.2 A traffic control system should be provided. It may be permitted to be interlocked with the fire alarm system. The system should be capable of operation from a remote control source or from either end of the roadway passing under the air right structure. The traffic control system should be designed for use by authorized personnel only.

5-3 Fire Apparatus, Equipment.

Fire apparatus responsible for air right structure roadways are to be equipped to deal with flammable liquid and hazardous materials fires and incidents effectively. They should be equipped to carry foam, potassium-based dry chemical/aqueous film-forming foam (AFFF), or similar systems and should be suited to the unique characteristics of the structure. If the air right structure roadway approximates the physical characteristics of a tunnel, fire apparatus similar to the type used for tunnels should be used.

5-4 Fire Standpipe Systems and Water Supply Systems.

Standpipe systems for roadways within air right structures should be designed and installed as a Class I system in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*. (*See Chapter 6.*)

5-5 Portable Fire Extinguishers.

Portable multipurpose fire extinguishers, each with a minimum nominal 20-lb (9-kg) capacity, should be placed on both sides of the roadway in well-marked, flush-wall cabinets at intervals of not more than 300 ft (90 m). Consideration should be given to incorporating removal detection of an extinguisher into the alarm system.

5-6 Emergency Ventilation.

Emergency ventilation is addressed in Chapter 7.

5-7 Drainage System.

A drainage system designed in accordance with Section 4-9 should be provided for roadways beneath air right structures.

5-8 Control of Hazardous Materials.

Control of hazardous materials is addressed in Chapter 10.

5-9 Structural Factors.

5-9.1

All structural elements that support buildings over roadways or provide separation between the buildings and roadways, or both, should have a 4-hour fire resistance rating in accordance with ASTM E 119, *Standard Test Methods for Fire Tests of Building Construction and Materials*.

Exception: Buildings with a fire resistance rating greater than 4 hours.

5-9.2

Structural members should be protected from physical damage from vehicle-based accidents. An inspection and repair program should be kept in force to monitor and maintain the protection of the structure.

5-9.3

Structural support elements on centerlines of roadways should not be permitted.

5-9.4

Buildings above roadways should be designed with consideration for the fact that the roadway below the air right structure is a potential source of heat, smoke, and toxic gases. The structural elements should be designed in such a way as to shield the air right buildings from these potential hazards. The design of the building should neither increase nor create any risk to those using the roadway below.

5-10 Emergency Planning.

5-10.1

It is important that a designated authority carry out a complete and coordinated program of fire protection that includes written preplanned response and standard operating procedures.

5-10.2

To derive the maximum benefit from the fire protection program, joint comprehensive training exercises are necessary for all personnel and agencies expected to participate in fire-fighting operations and hazardous materials emergencies. The training program should involve a competent supervisory staff experienced in fire-fighting techniques and hazardous materials emergencies.

5-10.3

Emergency procedures and development of emergency response plans are addressed in

Chapter 9.

Chapter 6 Fire Standpipe and Water Supply

6-1 Standpipe Systems.

6-1.1

Standpipe systems for tunnels, bridges, and elevated and limited access roadways should be designed and installed as Class I systems in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*.

6-1.2

Standpipe systems should be permitted to be either wet or dry, depending upon climatic conditions, fill times, or the requirements of the authority having jurisdiction, or any combination thereof.

6-1.3

Where wet standpipe systems are required in areas subject to freezing conditions, the water should be heated and circulated, and all piping and fittings exposed to such conditions should be heat-traced and insulated.

6-1.4

Wet standpipe systems should be provided with suitable interconnection and bypass valve arrangements to allow isolation and repair of any segment without impairment to the operation of the remainder of the system.

6-1.5

Dry standpipe systems should be designed to ensure that the delivery time of water to any hose connection on the system is less than 10 minutes. Dry standpipe systems should have provisions for complete draining after use. Combination air relief/vacuum valves should be installed at each high point on the system.

6-1.6

Dry standpipes should be installed in a manner that provides accessibility for inspection and repair and should be protected from damage by moving vehicles.

6-2 Design Capacity.

6-2.1

Standpipe systems should be designed to provide a minimum water supply of 250 gpm (16 L/s) at 100 psi (690 kPa) residual at the most remote hose connection with a minimum of two hose connections flowing for a total flow of 500 gpm (32 L/s) at 65 psi (450 kPa) residual.

6-2.2

Maximum residual pressure at any hose connection should be limited to 175 psi (1207 kPa) by means of an approved pressure regulating device.

6-3 Water Supply.

6-3.1

Wet standpipe systems (automatic or semiautomatic) should be connected to an approved water supply capable of supplying the system demand for a minimum of 1 hour.

6-3.2

Dry standpipe systems should have an approved water supply capable of supplying the system demand for a minimum of 1 hour and accessible to a fire department pumper within 100 ft (30 m) of each fire department connection.

6-3.3

Acceptable water supplies include the following:

(a) Municipal or privately owned waterworks systems having adequate pressure and flow rate and a level of integrity acceptable to the authority having jurisdiction;

(b) Automatic or manually controlled fire pumps connected to an approved water source;

(c) Pressure-type or gravity-type storage tanks installed in accordance with NFPA 22, *Standard for Water Tanks for Private Fire Protection*.

6-4 Fire Department Connections.

6-4.1

Fire department connections should be of the threaded two-way or three-way type or should consist of one 4-in. quick-connect coupling located at ground surface level and accessible to a fire department pumper.

6-4.2

Each standpipe zone should have a minimum of two fire department connections located remotely from each other.

6-4.3

Fire department connections should be protected from vehicular damage by means of bollards or other suitable barriers.

6-4.4

Wherever possible, fire department connection locations should be coordinated with emergency access/egress locations.

6-5 Hose Connections.

6-5.1

Hose connections should be spaced so that no location on the protected roadway is more than 150 ft (45 m) from the hose connection. Hose connection spacing should not exceed 275 ft (85 m). Hose connections should be located so that they are conspicuous and convenient yet reasonably protected from damage by errant vehicles or vandals.

6-5.2

Hose connections should have $2^1/_2$-in. (63.5-mm) external threads in conformance with NFPA 1963, *Standard for Fire Hose Connections*, and the authority having jurisdiction. Hose connections should be equipped with caps to protect hose threads.

6-6 Fire Pumps.

Fire pumps should be supplied as necessary and should be installed in accordance with NFPA 20, *Standard for the Installation of Centrifugal Fire Pumps*.

6-7 Identification Signage.

6-7.1

Identification signage for standpipe systems and components should be developed with input from the authority having jurisdiction. Identification signage should, as a minimum, identify the name and limits of the roadway served.

6-7.2

Identification signage should be conspicuous and affixed to, or immediately adjacent to, ground surface level fire department connections and each roadway hose connection.

6-8 Standpipe Installation in Tunnels Under Construction.

6-8.1

A standpipe system, either temporary or permanent in nature, should be installed in tunnels under construction before the tunnel has exceeded a length of 200 ft (60 m) beyond any access shaft and should be extended as tunnel work progresses.

6-8.2

Temporary standpipes, which can be used by contractors to furnish water for construction purposes, should be equipped with hose outlets and valves with $2^{1}/_{2}$-in. (63.5-mm) hose thread conforming to NFPA 1963, *Standard for Fire Hose Connections*, and can have suitable reducers or adapters attached for connection of contractor's hose. Such reducers or adapters should be readily removable using the fire fighter's hose spanner wrenches.

6-8.3

Permanent standpipes or temporary standpipes installed in tunnels during construction should be provided with risers to approved fire department connections at ground surface level.

6-8.4

Permanent or temporary standpipes installed during the construction phase should be supported securely and adequately and should be of sufficient strength to withstand the pressure and thrust forces to which they are subjected.

6-8.5

Temporary standpipes should remain in service until the permanent standpipe installation is complete.

Chapter 7 Emergency Tunnel Ventilation

7-1 General.

Ventilation systems and procedures should be developed to allow maximum utilization of the tunnel ventilation system for the removal and control of smoke during fires. The ventilation equipment should be heat resistant so it is capable of operating even under sustained fire exposure temperatures. The design of the ventilation system should provide for excess ventilation to accomplish this purpose. The ventilation procedures should be designed to assist in the evacuation of motorists from the tunnel.

7-2 Design.

The design objectives of the emergency ventilation system should be as follows:

(a) To provide a stream of noncontaminated air to passengers in a path of egress away from a fire (*see Appendix C*);

(b) To produce airflow rates to prevent backlayering of smoke in a path of egress away from a fire;

(c) To limit the air temperature in a path of egress away from fire to 140ÿF (60ÿC) or less;

(d) To provide excess ventilation capabilities to achieve the temperature limitation specified in Section 7-2(c);

(e) To prevent or minimize adverse effects on air right structures and their occupants from fire products such as heat, smoke, and toxic gases.

7-3 Memorial Tunnel Fire Ventilation Test Program.

The Memorial Tunnel Fire Ventilation Test Program is a full-scale test program conducted under the auspices of the United States Federal Highway Administration (FHWA) to evaluate the effectiveness of various tunnel ventilation systems and ventilation airflow rates to control the smoke from a fire. The results of this program can have an impact on the design criteria for highway tunnel emergency ventilation. (*See Appendix G.*)

7-4 Criteria.

The design heat release rate produced by a vehicle should be used to design the emergency ventilation system.

7-5 Fans.

Ventilation fans used for emergency service, their motors, and all related components exposed to the ventilation airflow should be designed to operate in an ambient atmosphere of 482°F (250°C) for at least 1 hour.

7-5.1

Fans should be fixed or variable speed type driven by single speed, multiple fixed speed, or variable frequency drive motors. They should be permitted to be reversible and should be both locally and remotely controlled, as approved. They should be connected to two power feeders derived from two separate sources. Power feeders from a utility furnishing power for fans should be isolated from each other and should originate from separate and distinct utility sources to the extent possible.

7-5.2

Remote control operation of the tunnel ventilation fans at an approved location accessible to authorized fire and emergency personnel should be provided.

7-5.3

Local fan motor starters and related operating control devices should be located away from the direct airstream of the fans to the greatest extent practical.

7-5.4

Discharge/outlet openings for emergency fans should be positioned a sufficient distance from supply air intake openings to prevent recirculation. If this is not possible due to area constraints, intake openings then should be protected by other approved means or devices to prevent smoke from reentering the system.

7-5.5

Operation and fail-safe verification of proper operation of emergency fans should be effected from a remote location with indication provided for all modes of operation for each fan, as well as from a local control isolated from the direct airstream of the fans. Thermal overload protective devices should not be located on motor controls of fans dedicated solely to emergency ventilation. Local controls should allow overriding of the remote control. Local control should be capable of operating the fans in all modes in the event the remote controls become inoperable.

7-6 Controls — Fire Detection and Alarm System Operation.

A fire-fighter fan control override control station should be provided to give full control of the running speed of all tunnel fans to the local authority having jurisdiction. The location and marking of the fan override control station should be determined by the authority having jurisdiction.

Chapter 8 Electrical Systems

8-1 General.

8-1.1

The electrical systems should support personnel life safety, emergency operations, and normal operations.

8-1.2

The systems should maintain illumination, communications, and ventilation, identify areas of refuge/exit and exit routes, and provide remote annunciation/alarm and drainage under all operating and emergency modes associated with the roadway.

8-2 Wiring.

All wiring materials and installation should conform to NFPA 70, *National Electrical Code*, as modified in this recommended practice.

8-3 Materials.

8-3.1

Materials manufactured for use as conduits, raceways, ducts, cabinets, and equipment enclosures and their surface finish materials, as installed, should be capable of being subjected to temperatures up to 600°F (316°C) for 1 hour and should not support combustion under the same temperature condition.

8-3.2

The systems should not use materials within the confined spaces of limited access roadways that produce toxic by-products during electric circuit failure or when subjected to an external fire. PVC conduit and vinyl- (PVC) insulated/jacketed conductors or cables should not be used in tunnels, plenums, or enclosed spaces.

8-3.3

All insulations should conform to NFPA 70, *National Electrical Code*, and should be of the moisture- and heat-resistant types with temperature ratings corresponding to the conditions of application.

8-3.4

All conductors should be completely enclosed in armor sheaths, conduits, or enclosed raceways, boxes, and cabinets. Conductors in a raceway can be embedded in concrete or run in protected electrical duct banks, but they should not be installed in an exposed manner or surface mounted in air plenums that could carry air at the elevated temperatures accompanying fire emergency conditions.

8-4 Power Source.

The power source for all systems should be of a capacity and configuration commensurate with the purpose of the system. The following systems should be provided with emergency power:

(a) Emergency lighting;

(b) Means of egress/refuge lighting;

(c) Exit signs;

(d) Communications as defined herein;

(e) Tunnel drainage and fire pump(s).

Consideration should be given to providing emergency power to support ventilation of tunnels where such tunnels are needed to support the passage of vehicles during loss of normal power.

The recommendations for emergency sources should be as defined in NFPA 70, *National Electrical Code*. In addition, the normal and emergency source should be wired to system equipment so that a single event or fire minimizes the affect on the operation of the overall system. (It is expected that the operations of all systems within the vicinity of a fire will fail. This provision is intended to limit the area of this failure.)

8-5 Reliability.

The primary source of electric service should be from the local electric utility.

Exception: A separate service may be permitted to be an emergency source, provided it can be demonstrated that a single event within the utility system cannot affect both the primary and emergency source.

8-6 Standby System.

It should be recognized that normal service within the utility system affects one source at a time. It is not the intent of the emergency recommendation to address an event within the roadway while one source is not available. However, an additional source supporting select systems can be permitted to be provided near the roadway system to maintain operations.

8-7 Lighting.

8-7.1

Roadway illumination should meet the requirements of ANSI/IES RP-8, *American National Standard Practice for Roadway Lighting*, and ANSI/IES RP-22, *American National Standard Practice for Tunnel Lighting*. In addition, means of egress, exits, and emergency lighting should be in accordance with NFPA *101*®, *Life Safety Code*®. Emergency tunnel lighting illumination levels should not be less than 0.2 footcandles [0.22 lux] (minimum average) throughout personnel egress paths.

8-7.2

There are several issues that are related to the available equipment and features of a limited access roadway. The most significant is the emergency response agency(ies). In rural areas where response units are often made up of volunteers, longer response times can be expected. Under these conditions, self-rescue should be considered. Lighting of special features (such as fire pull stations, extinguishers, and telephones) and special feature instructional signage should be provided with emergency lighting.

8-8 Life Safety During Construction.

The construction or renovation of a tunnel or other below grade roadway should include the basic worker safety provisions of OSHA 29 *Code of Federal Regulations*, 1910S, "Underground Construction, Caisson, and Compressed Air," and OSHA 29 *Code of Federal Regulations*, 1910S, "Electrical, Safety-Related Work Practices." In addition, systems should be installed that support the construction operations in a safe manner. The method of lighting, heating, ventilation, and drainage should support the expected number of construction personnel and consider the equipment, the task, and the duration of the work. The primary underground power source should be electric. Electric power distribution should be configured so that system failure or an emergency condition allows for the safe evacuation of the facility.

Chapter 9 Emergency Procedures

9-1 General.

The agency that is responsible for the safe and efficient operation of the facility should anticipate and plan for emergencies that could involve the system. Participating agencies should be invited and should assist with the preparation of the emergency procedure plan.

9-2 Emergencies.

The following types of emergencies should be considered cause for invoking the emergency procedure plan:

(a) Fire or a smoke condition in a vehicle or in the facility;

(b) Fire or a smoke condition adjoining or adjacent to the facility;

(c) Collision involving one or more vehicles;

(d) Loss of electric power resulting in loss of illumination and ventilation;

(e) Evacuation of motorists from vehicles under adverse conditions where they need assistance;

(f) Panic of motorists;

(g) Disabled vehicles under adverse conditions;

(h) Serious flooding condition due to water main break, heavy rain, poor drainage, loss of electric power, or failure of pumping equipment;

(i) Structural collapse or imminent collapse that threatens safety;

(j) Seepage and spillage of petroleum products or flammable, toxic, or irritating vapors;

(k) Serious vandalism or other criminal acts, such as a bomb threat;

(l) First aid or medical attention needed by motorists;

(m) Extreme weather conditions, such as heavy snow, rain, high winds, high heat, low temperatures, or sleet and ice conditions, causing disruption of operation;

(n) Earthquake.

9-3 Emergency Response Plan.

9-3.1

The emergency response plan should include, but should not be limited to, the following:

(a) Name of plan;

(b) Name of responsible agency;

(c) Dates adopted, reviewed, and revised;

(d) Policy, purpose, scope, and definitions;

(e) Participating agencies, top officials, and signatures of executives signing for each agency;

(f) Safety during emergency operations;

(g) Purpose and operation of central supervising station and alternate central supervising station;

(h) Purpose and operation of command post and auxiliary command post;

(i) Communications: radio, telephone, and messenger service available at central supervising station and command post; also, efficient operation of these facilities;

(j) Fire detection, fire protection, fire extinguishing equipment, and access/egress and ventilation facilities available; details of the type, amount, location, and method of utilization;

(k) Procedures for fire emergencies; various types of fire emergencies, agency in command, and procedures to follow;

(l) Maps and plans of the roadway system and of all surface and connecting streets;

(m) Any additional information and data that the participating agencies desire to have in the plan.

9-3.2

A sample emergency response plan outline is provided in Appendix E.

9-4 Participating Agencies.

Participating agencies that should be summoned by operators to cooperate and assist, depending upon the nature of an emergency, include:

(a) Ambulance service;

(b) Building department;

(c) Fire department;

(d) Medical service;

(e) Police department;

(f) Public works, bridges, streets, sewers;

(g) Sanitation department;

(h) Utility companies (e.g., gas, electricity, telephone, steam);

(i) Water supply;

(j) Local transportation companies.

The agencies and names will vary depending upon the governmental structure and laws of the community.

9-5 Central Supervising Station.

If the facility has a central supervising station (CSS) for the operation and supervision of the facility, 9-5.1 through 9-5.7 should apply.

9-5.1

The CSS should be staffed by trained and qualified personnel and should be provided with the essential apparatus and equipment to communicate with, supervise, and coordinate all personnel.

9-5.2

The CSS should provide the capability to communicate rapidly with participating agencies. Agencies such as fire, police, ambulance, and medical service should have direct telephone lines or designated telephone numbers used for emergencies involving the facility.

9-5.3

Equipment should be available and used for recording radio and telephone communications and CCTV transmissions during an emergency.

9-5.4

CSS personnel should be thoroughly familiar with the emergency procedure plan and trained to employ it effectively.

9-5.5

An alternate site(s) that can function efficiently during an emergency in the event the CSS is out of service for any reason should be selected and equipped, or equipment should be readily available.

9-5.6

The CSS should be located in an area separated from other occupancies by construction having a 2-hour fire resistance rating. The area should be used for the CSS and similar activities and should not be jeopardized by adjoining or adjacent occupancies.

9-5.7

The CSS should be protected by fire detection, protection, and extinguishing equipment to provide early detection and extinguishment of any fire in the CSS.

9-6 Liaison.

9-6.1

An up-to-date list of all liaison personnel from participating agencies should be maintained by the operating agency and should be part of the emergency procedure plan.

The list should include the full name, title, agency, business telephone number(s), and home telephone number of the primary liaison as well as an alternate.

9-6.2

The list should be reviewed at least once every 3 months to verify the ability to contact the liaison without delay.

9-7 Command Post.

9-7.1

During an emergency where it is necessary to invoke the emergency procedure plan, a command post should be established by the person in command for the supervision and coordination of all personnel, equipment, and resources at the scene of the emergency.

9-7.2

The emergency procedure plan should delineate clearly the authority or participating agency that is in command and responsible for supervision, correction, or alleviation of the emergency.

9-7.3

The command post should be located at a site convenient for responding personnel, easily identifiable, and suitable for supervising, coordinating, and communicating with participating agencies.

9-7.4

Each participating agency should assign a liaison to the command post.

9-7.5

Effective use should be made of radio, telephone, and messenger service to communicate with participating agencies.

9-7.6

To identify the command post easily during day or night and under bad weather conditions, designated markers should be employed. The emergency procedure plan should prescribe the specific identification markers to be used for the command post and its assigned personnel.

9-8 Auxiliary Command Post.

9-8.1

Where it is necessary for an emergency operation to use an auxiliary command post because of the extent of the operation, the person in command should establish an auxiliary command post(s) that can function as a subordinate control point.

9-8.2

Where authorized, a participating agency (not in command) should establish an auxiliary command post to assist with the supervision and coordination of its personnel and equipment.

9-9 Training, Exercises, Drills, and Critiques.

9-9.1

Operating agency and participating agency personnel should be trained to function efficiently during an emergency. They should be thoroughly familiar with all aspects of the emergency procedure plan.

9-9.2

Exercises and drills should be conducted at least twice per year to prepare the authority and participating agency personnel for emergencies. Critiques should be held after the exercises, drills, and actual emergencies.

9-10 Records.

Written records and telephone, radio, and CCTV recordings should be kept at the CSS, and written records should be kept at the command post and auxiliary command post(s) during fire emergencies, exercises, and drills.

Chapter 10 Control of Hazardous Materials

10-1 General.

The facility operating agency should adopt rules and regulations applicable to the transportation of hazardous materials. A program should be maintained for enforcing these regulations. In developing such regulations, consideration should be given to the following:

(a) The availability of a suitable alternative route(s) meeting federal requirements as prescribed in Title 49, *Code of Federal Regulations*, 177.825, "Routing and Training Requirements for Class 7 (Radioactive) Materials," and Title 49, *Code of Federal Regulations*, Part 397, Subpart C, "Routing of Non-Radioactive Hazardous Materials."

(b) Title 49, Department of Transportation, *Code of Federal Regulations*, Subtitle B, Parts 100 to 199;

(c) The fire and accident experience of other similar facilities;

(d) Past fire and accident experience on the facility and adjacent roads, or, in the case of a new facility, the past fire and accident experience on roads in the area;

(e) Anticipated traffic volumes in peak and off-peak periods;

(f) The need for inspection of vehicles and cargo and the availability of a safe place to conduct inspections with a minimum of traffic interference;

(g) The need and desirability of escort service with due consideration of the extent to which it could disrupt the orderly flow of traffic and create additional hazards;

(h) A plan developed by an operating agency in a dense urban area is referenced in Appendix H. This might not be suitable for all such facilities.

Chapter 11 Referenced Publications

11-1

The following documents or portions thereof are referenced within this recommended practice and should be considered part of the recommendations of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

11-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

Appendix A Explanatory Material

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

A-1-12.1 See ASTM E 380, *Standard Practice for Use of the International System of Units (SI) (the Modernized Metric System)*, and ANSI/IEEE 268, *American National Standard for Metric Practice*.

A-1-13 Approved. The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-13 Authority Having Jurisdiction. The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-13 Listed. The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-13 Point of Safety. The egress population to be served should be determined by engineering analysis.

A-2-4.2 Such procedures have the dual purpose of preventing the involvement of additional vehicles in the original accident and of slowing traffic during inclement weather conditions.

Appendix B Air Quality Criteria in Emergencies

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

B-1 General.

B-1.1 In this appendix, criteria for the protection of the motorist, employee, and fire fighter during emergency situations are provided with regard to air quality, temperatures, and velocities.

B-1.2 To a large extent, the quantitative aspects of the criteria for emergency situations is arbitrary because there are no universally accepted tolerance limits pertaining to air quality, temperatures, and velocities. In fact, tolerance limits vary with age, health, weight, sex, and acclimatization. Most of the studies on human tolerance to adverse situations have dealt with exposure tests on healthy, acclimated adults. These individuals can survive in environments potentially harmful to the less physically fit. Criteria should instead be established based on the tolerances of higher risk groups: infants, the aged, and those suffering from respiratory or cardiac ailments. Little information is available on the physiological tolerance limits of people with health impediments, especially for short-term but intense exposures.

B-2 Emergency Air Quality Criteria.

B-2.1 During tunnel emergencies involving fire or generation of smoke, the products of combustion produce gases and aerosols, some of which are potentially toxic or incapacitating. The aerosols in smoke also tend to limit visibility. In the event of fire, the intended purpose of all emergency ventilation equipment, therefore, is to provide control of smoke migration and an effective means to purge smoke and supply fresh air to motorists and fire department personnel during evacuation and early fire-fighting operations.

B-2.2 Since some emergency situations could conceivably occur where all motorists cannot be provided with fresh air for the entire length of an evacuation route, criteria are needed to maintain air quality for those passengers. Such a situation would exist, for example, where two fire incidents have occurred in a tunnel. Because fresh air might come from only one direction, motorists positioned between the incidents could be exposed to air containing some combustion products, while motorists located in areas beyond either incident receive fresh air. Sufficient fresh air, however, needs to be supplied to motorists downwind of a fire to dilute adequately any harmful combustion product.

B-2.2.1 The usual way in which potentially harmful gases or aerosols enter the human body is through the respiratory tract. The physiological reactions of a person depend on the contaminant and its concentration and exposure time and will vary for each person. A person's reaction to potentially harmful combustion products is proportional to a characteristic of the environment that is quantified by the concentration-time product, CT.

B-2.2.2 During design, the ventilation engineer does not know how much of the smoke and combustion products will be made airborne or the exposure time of passengers in the smoke. These quantities depend on the nature of the emergency, the construction materials, and the tunnel's overall emergency policies. Nevertheless, emergency ventilation systems need to be sized, and some guidance is provided by approximating the concentration-time product, CT, for different airflow rates. (*See Subway Environmental Design Handbook, Vol. I, Principles and Applications.*)

B-3 Emergency Air Temperature Criteria.

B-3.1 It is anticipated that the 140°F (60°C) air temperature will place a physiological burden on a few motorists, but the exposure also is anticipated to be brief and to produce no lasting harmful effects. Motorists should not be exposed to maximum air temperatures exceeding 140°F (60°C) during emergencies. The heat released from a fire depends on the type and amount of material burning as well as the rate at which it burns. In a tunnel, the materials capable of supporting combustion are engine fuel, plastics, oil, wood, paper, cardboard, and bituminous products.

B-3.2 Studies of the severity of tunnel fires with respect to human environmental criteria demonstrate that the air temperature in the absence of toxic smoke is a limiting criterion for human survival.

B-4 Emergency Air Velocity Criteria. The purpose of ventilation equipment in a tunnel emergency is to sweep out heated air and to remove the smoke caused by any fire. In essentially all emergency cases, protection of the motorists and employees is enhanced by prompt activation of emergency ventilation procedures as planned in advance.

B-4.1 When emergency ventilation air is needed in evacuation routes, it might be necessary to expose passengers to air velocities higher than those permitted by normal nuisance considerations. The only upper limit to the ventilation rate occurs when the air velocity becomes great enough to create a hazard to persons walking in that airstream. According to the descriptions of the effects of various air velocities given in the Beaufort scale, motorists under emergency conditions can tolerate as much as 2200 ft/min (11 m/s).

B-4.2 The minimum air velocity within the tunnel section experiencing the fire emergency should be sufficient to mitigate backlayering of the smoke (i.e., a flow of smoke in the upper cross section of the tunnel that is opposite in direction to the forced ventilation air).

B-4.3 Increasing the airflow rate in the tunnel decreases the airborne concentration of potentially harmful chemical compounds (referred to hereinafter by the general term "smoke"). The decrease in concentration is beneficial to those exposed to the compounds. However, a situation could arise in which the smoke source is completely removed and poses no threat of exposure to passengers, and actuating any fans would draw the smoke to the evacuation routes. Under these conditions, the fans should not be activated until it is safe to do so. To make decisions under these circumstances, a rapid and thorough communication system is needed so that the responsible personnel can make judgments based on information available that are consistent with established emergency policies.

B-4.4 The effectiveness of an emergency ventilation system in providing a sufficient quantity of noncontaminated air and in minimizing the hazard of smoke backlayering in an evacuation pathway is a function of the fire load. The fire load in a tunnel results from the burning rate of a vehicle(s), which, in turn, is a function of the combustible load in Btu of the vehicle.

Appendix C Critical Velocity Calculations

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

The simultaneous solution of equations C-1 and C-2, by iteration, determines the critical velocity. The critical velocity is the minimum steady-state velocity of the ventilation air moving toward the fire that is necessary to prevent backlayering:

$$V_c = K_1 K_g \left(\frac{gHQ}{\rho C_p A T_f} \right)^{1/3} \quad \text{(C-1)}$$

$$T_f = \left(\frac{Q}{\rho C_p A V_c} \right) + T \qquad \text{(C-2)}$$

where:

A = Area perpendicular to the flow [ft^2 (m^2)].

C_p = The specific heat of air [Btu/lb R (kJ/kg K)].

g = The acceleration caused by gravity [ft/sec-sec (m/s-s)].

H = The height of the duct or tunnel at the fire site [ft (m)].

K_1 = 0.606.

K_g = Grade factor (see chart below).

Q = The heat the fire is adding directly to the air at the fire site [Btu/hr (MW)].

T = The temperature of the approach air [°F (°C)].

T_f = The average temperature of the fire site gases [°F (°C)].

V_c = Critical velocity [ft/min (m/s)].

ρ = The average density of the approach (upstream) air [lb/ft^3 (kg/m^3)].

$$V_c = K_1 K_g \left(\frac{gHQ}{\rho C_p A T_f} \right)^{1/3} \qquad \text{(C-1)}$$

Figure C-1 Grade factor for determining critical velocity.

Appendix D Fire Sprinklers in Highway Tunnels

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

D-1 General. This appendix provides design considerations for fire sprinklers in road tunnels.

D-1.1 Currently, the use of and effectiveness of fire sprinklers in vehicular roadway tunnels is not universally accepted. Although it is acknowledged that sprinklers are highly regarded by fire protection professionals and fire departments in certain types of structures, there is much evidence to suggest that sprinklers are not only ineffective in controlling a fuel fire but can actually contribute to the spread or severity of the fire. Furthermore, it is felt that vehicular tunnel conditions cannot exploit sprinkler system strengths and could turn most of their advantages into disadvantages.

D-1.2 The major concerns expressed by tunnel authorities regarding fire sprinkler use and effectiveness include the following:

(a) Typical fires usually occur under vehicles or inside passenger or engine compartments designed to be waterproof from above; therefore, overhead sprinklers would have no extinguishing effect.

(b) A thin water spray on a very hot fire, if any delay occurs between ignition and sprinkler activation, will produce large quantities of superheated steam without materially suppressing the fire. This steam has the potential to be more damaging than smoke.

(c) Tunnels are very long and narrow, often sloped laterally and longitudinally, vigorously ventilated, and never subdivided, so heat normally will not be localized over a fire.

(d) Because of stratification of the hot gases plume along the tunnel ceiling, a number of the activated sprinklers would not, in all probability, be located over the fire. A large number of the activated sprinklers would be located away from the fire scene, producing a cooling effect that would tend to draw this stratified layer of smoke down toward the roadway level.

(e) Even a light spray from sprinklers would catch motorists unaware and would be in excess of that which windshield wipers could clear (even if they were on), possibly causing the roadway to become dangerously slippery.

(f) Water squirting from the ceiling of a subaqueous tunnel could suggest tunnel failure and induce panic in motorists.

(g) The use of sprinklers could cause the delamination of the smoke layer and induce turbulence and mixing of the air and smoke, thus threatening the safety of persons in the tunnel.

(h) Testing of a fire sprinkler system on a periodic basis to determine its state of readiness is impractical and costly.

D-1.3 Because of the concerns detailed in D-1.2, the use of sprinklers in highway tunnels generally is not recommended. However, three recently commissioned U.S. vehicular tunnels have been equipped with sprinkler systems: the Central Artery North Area (CANA) Route 1 tunnels in Boston, MA, and the I-90 First Hill Mercer Island and Mt. Baker Ridge tunnels in Seattle, WA. The decision to provide sprinklers in these tunnels was motivated solely by the fact that these tunnels will be operated to allow the unescorted passage of vehicles carrying/hauling hazardous cargo.

D-2 Application. The installation of sprinkler systems should be considered applicable only where the passage of hazardous cargo is considered. However, even in these cases, the tunnel operator and the local fire department or authority having jurisdiction should consider the advantages and disadvantages of such systems as they apply to a particular tunnel installation.

D-3 Extinguishing Agent. AFFF (aqueous film-forming foam) systems should be considered for in-tunnel sprinkler systems in lieu of water-only systems. Water-only sprinkler systems pose significant concerns where applied to roadway tunnels. The high water demand rate needs to be available from the local supply, and in-tunnel drainage piping, storage, and pumping systems all become much larger. Additionally, after deluge, the possibility of vapor explosion is dangerously increased. The strong cooling effect of a water-only system reduces the ability of the smoke to stratify at the ceiling, where it can be contained more easily by the tunnel ventilation system, and instead causes the smoke to spread over the cross section of the incident area.

D-4 Sprinkler System. To help ensure against accidental discharge, the sprinkler system should be designed as a manually activated deluge system. The sprinkler system piping should be arranged using interval zoning so that the discharge can be focused on the area of incident without necessitating discharge for the entire length of the tunnel. Each zone should be equipped with its own proportioning valve set to control the appropriate water/foam mixture percentage. Sprinkler heads should provide an open deluge and be spaced so that coverage extends to roadway shoulders and, if applicable, maintenance/patrol walkways. The system should be designed with enough water and foam capacity to allow operation of at least two zones adjacent to the incident zone if the fire occurs in a "border" area. Zone length should be based on activation time as determined by the authorities having jurisdiction. Piping should be designed to allow drainage through heads after flow is stopped.

D-5 System Control. It can be assumed that a full-time, attended control room is available for any tunnel facility in which safe passage necessitates the need for sprinkler system protection. Therefore, consideration should be given to human interaction in the sprinkler system control and activation design to ensure against false alarm and accidental discharge. Any automatic mode of operation should include a discharge delay to allow incident verification and assessment of in-tunnel conditions by trained operators.

An integrated graphic display of the sprinkler system zones, fire detection system zones, tunnel ventilation system limits, and emergency access and egress locations should be provided at the control room to allow tunnel operators and responding emergency personnel to make initial response decisions.

Appendix E Emergency Response Plan Outline

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

E-1 General.

E-1.1 Purpose.

E-1.2 Background.

E-2 Emergency Response Plan.

E-2.1 General.

E-2.2 Elements of the Plan.

Appendix F Alternative Fuels

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

F-1 General. Most vehicles currently in the traffic population are powered by either spark-ignited or compression-ignited engines. Vehicles that use alternative fuels such as CNG, LPG, and LNG are being introduced into the vehicle population, but their percentage of the population is still too low for their characteristics to be a significant influence in the design of highway tunnel ventilation with regard to vehicle emissions. However, growing concerns regarding the safety of some of these vehicles operating within tunnels might soon affect the fire-related life safety design aspects of highway tunnels.

It is evident that there will be continued growth in the use of vehicles powered by alternative fuels (i.e., fuels other than gasoline or diesel). Of these potential alternative fuels, liquefied petroleum gas (LPG) currently is the most widely used, although the use of both compressed natural gas (CNG) and liquefied natural gas (LNG) are growing. The American Gas Association estimates that by the year 2000, approximately 50 percent of the 16 million fleet vehicles in the United States will be powered by alternative fuels such as CNG. Under the Energy Policy Act of 1992 and the Clean Air Act Amendment of 1990, the following are considered potential alternative fuels:

(a) Methanol;

(b) Hydrogen;

(c) Ethanol;

(d) Coal-derived liquids;

(e) Propane;

(f) Biological materials;

(g) Natural gas;

(h) Reformulated gasoline;

(i) Electricity;

(j) "Clean" diesel.

The alternative fuels considered most viable in the near future are compressed natural gas (CNG), liquefied petroleum gas (LPG), liquefied natural gas (LNG), and methanol.

F-2 Compressed Natural Gas. CNG has some excellent physical and chemical properties that make it clearly a safer automotive fuel than gasoline or LPG, provided well-designed carrier systems and operational procedures are followed. Although CNG has a relatively high flammability limit, its flammability range is relatively narrow compared to the ranges for other fuels.

In air at ambient conditions, a CNG volume of at least 5 percent is necessary to support continuous flame propagation, compared to about 2 percent for LPG and 1 percent for gasoline vapor. Thus, considerable fuel leakage is necessary in order to render the mixture combustible. Moreover, fires involving combustible mixtures of CNG are relatively easy to contain and extinguish.

Since natural gas is lighter than air, in the event of a leak, it normally dissipates harmlessly into the atmosphere instead of pooling. However, in a tunnel environment, this can lead to pockets of gas collecting in the overhead structure. Also, since natural gas can ignite only in a range of 5 percent to 15 percent volume of natural gas in air, leaks are not likely to ignite because of a lack of sufficient oxygen.

Additionally, the fueling system for CNG is one of the safest in existence. The vigorous storage requirements and greater strength of CNG cylinders compared to those of gasoline contribute to the superior safety record of CNG automobiles.

F-3 Liquefied Petroleum Gas. There is a growing awareness of the economic advantages of using LPG as a vehicular fuel. These advantages include longer engine life, increased travel time between oil and oil filter changes, longer and better performance from spark plugs, nonpolluting exhaust emissions, and, in most cases, mileage comparable to that of gasoline. LPG normally is delivered as a liquid and can be stored at 100.4°F (38°C) on vehicles under a design pressure of 250 psi to 312.5 psi (1624 kPa to 2154 kPa). It is a natural gas and petroleum derivative. On one hand, it is costly to store because a pressure vessel is required. On the other hand, if engulfed in a fire, its heating could result in a rapid increase in pressure, even if the outside temperature is not excessive relative to its vapor pressure characteristics. Rapid pressure increase can be mitigated by venting the excessive buildup of pressure through appropriate relief valves.

F-4 Methanol (Alcohol-Fueled Vehicles). Currently, methanol is used primarily as a chemical feed-stock for the production of chemical intermediates and solvents. Under the EPA's restrictions, it is being used as a substitute for lead-based octane enhancers in the form of methyl tertiary-butyl ether (MTBE) and as a viable method for vehicle emission control. MTBE is not consumed as a fuel substitute but is used as a gasoline additive.

The hazards of methanol production, distribution, and use are comparable to those of gasoline. Unlike gasoline, however, methanol vapors in a fuel tank are explosive at normal ambient temperature. Saturated vapors above nondiluted methanol in an enclosed tank are explosive at 50°F to 109.4°F (10°C to 43°C). A methanol flame is invisible, so a colorant or gasoline has to be added to enable detection.

Appendix G The Memorial Tunnel Fire Ventilation Test Program

This Appendix is not a part of the recommendations of this NFPA document but is included for informational purposes only.

G-1 General. The primary purpose for controlling smoke in a tunnel is to protect life (i.e., to allow safe evacuation of the tunnel). This involves creating a safe evacuation path for both motorists and any operating personnel located within the tunnel. The secondary purpose of smoke control ventilation is to assist fire-fighting personnel in accessing the fire site, by again providing a clear path to the site if possible.

The tunnel ventilation system is not designed to protect property, although the effect of ventilation in diluting smoke, thus recovering some of the heat, results in reduced damage to the facilities and vehicles. The continued reduction of vehicle emissions has shifted the focus of the ventilation engineer from a design based on dilution of emission contaminants to a design based on the control of smoke in a fire emergency.

Despite this increasing focus on life safety and fire control in modern highway tunnels, no uniform standards for fire emergency ventilation or other fire control means within highway tunnels have been established in the United States.

G-2 Ventilation Concepts. The ventilation concepts that have been applied to highway tunnels have been based on theoretical and empirical values, not on the results of full-scale tests. Accordingly, the design approach currently utilized to detect, control, and suppress fire and smoke within highway tunnels has become a controversial issue among tunnel design engineers, owners, operators, and fire fighters throughout the world.

While most highway tunnels have ventilation systems with smoke control operating modes, there is limited scientific data to support opinions or code requirements regarding the capabilities of various types of ventilation systems to control heat and smoke effectively.

G-3 Investigations. Engineering investigations of ventilation operating strategies and performance in full-scale fire situations were authorized by the Massachusetts Highway Department and the U.S. Federal Highway Administration to be performed in the Memorial Tunnel. The American Society of Heating, Refrigerating and Air-Conditioning Engineers Technical Committee 5.9 report, ASHRAE TC 5.9, "Enclosed Vehicular Facilities," had identified the need for a comprehensive full-scale test program in the early 1980s.

Technical Committee 5.9 was commissioned in 1989 to form a subcommittee, the Technical Evaluation Committee (TEC), to develop a "Phase 1 Concept Report" and work scope. This report outlined the objectives of the testing program, which included identification of appropriate means to account for the effects of fire size, tunnel grade and cross section, direction of traffic flow (unidirectional or bi-directional), altitude, type of ventilation system, and any other parameters that could have a significant influence on determining the ventilation capacity and operational procedures needed for safety in a fire situation.

Establishing specific approaches to permit effective reconfiguration for both new and existing tunnel facilities was deemed of equal importance. The goals and test matrices developed and documented in the "Phase 1 Concept Report" evolved into the described test plan.

The purpose of the Memorial Tunnel Fire Ventilation Test Program was to develop a database that provides tunnel design engineers and operators with an experimentally proven means to determine the ventilation rate and system configuration that provides effective smoke control during a tunnel fire.

It was even more important to establish specific operational strategies to permit effective reconfiguration of ventilation parameters for existing tunnel facilities. While the life safety issue is paramount, it should be recognized that significant cost differentials exist among the various types of ventilation systems. In the instance where more than one ventilation configuration offers an acceptable level of fire safety, the project's overall life-cycle cost needs to be addressed to identify the option with the optimum cost benefit.

In addition, the impact of ventilation systems that cause horizontal roadway-level airflow on the effectiveness of fire suppression systems (such as foam deluge sprinklers) can be better determined on the basis of full-scale test results.

G-4 The Test Facility. The Memorial Tunnel is a two-lane, 2800-ft (854-m) highway tunnel located near Charleston, WV, originally built in 1953 as part of the West Virginia Turnpike (I-77). The tunnel has a 3.2-percent uphill grade from the south to the north tunnel portal. The original ventilation system was a transverse type, consisting of a supply fan chamber at the south portal and an exhaust fan chamber at the north portal.

The tunnel has been out of service since it was bypassed by an open-cut section of a new six-lane interstate highway in 1987. The existing ventilation equipment was removed to allow installation of new variable speed, reversible, axial flow central ventilation fans. The equipment rooms were modified to accept the ventilation components needed to allow supply or exhaust operation from both ends of the tunnel.

There are six fans, three each in the modified north and south portal fan rooms. Each of the fans has a capacity to supply or exhaust 200,000 cfm (94.4 m^3/s), and they are fitted with vertical discharges to direct the smoke away from the test facility and the nearby interstate highway.

The existing overhead air duct, formed by a concrete ceiling above the roadway, is split into longitudinal sections that can serve as either supply or exhaust ducts, and a mid-tunnel duct bulkhead has been installed to allow a two-zone ventilation operation. Openings in the duct dividing wall and duct bulkhead have been designed to create airflow patterns similar to those that would be observed if the dividing wall was not present. The width of the ducts varies linearly along the length of the tunnel to provide maximum area at the point of connection to the fan rooms above the tunnel portals.

High temperature insulation was applied extensively to various structural elements, including the concrete ceiling and ceiling hangers, as well as all the utilities, instrumentation support systems, wiring, gas sampling lines, CCTV camera cabinets, and all other related items that are exposed to high tunnel fire temperatures.

G-5 Fire Size. Fires with heat release rates ranging from 20 MW — equivalent to a bus or truck fire — to 50 MW — equivalent to a flammable spill of approximately 100 gal (400 L) to 100 MW — equivalent to a hazardous material fire or flammable spill of approximately 200 gal (800 L) were produced. The fires were generated in four floor-level steel pans in which a metered flow of No. 2 fuel oil up to 2 in. (5 cm) deep was floated on top of a 6-in. (15-cm) layer of water.

Engineering estimates concluded that a fire heat release rate of approximately 10 MW would be produced when an exposed fire surface area of 16 ft^2 (1.5 m^2) is provided. The total surface area of the pans used for a 100-MW fire is 478 ft^2 (44.4 m^2).

The actual burning rate differed somewhat from that used for the engineering estimate, due to effects such as heat re-radiation from the tunnel walls and varying ventilation flow rates. Therefore, the measured tunnel conditions were interpreted to determine a measured heat release rate. The ventilation systems configured and tested under varying flow rates and varying heat release rates, with one or two zones of ventilation, included:

(a) Transverse ventilation;

(b) Partial transverse ventilation;

(c) Transverse ventilation with point extraction;

(d) Transverse ventilation with oversized exhaust ports;

(e) Natural ventilation;

(f) Longitudinal ventilation with jet fans.

When the first four series of tests in Section G-4(a) through (f) were completed, the tunnel ceiling was removed to conduct the natural ventilation tests, followed by the installation of jet fans at the crown of the tunnel for the longitudinal jet fan-based ventilation tests.

A fire suppression system that was available to suppress the fire in an emergency was installed; however, it was used during several tests to evaluate the impact of ventilation airflow on the operation of a foam suppression system.

G-6 Data Collection. All of the measured values were entered into a data acquisition system (DAS) that monitored and recorded data from all field instruments for on-line and historical use. Various trend graphs and reports were generated from the data acquisition system. The DAS consisted of five data acquisition units (DAUs), three located in the tunnel and two in the portal electrical equipment rooms. The DAS central processing units (CPUs), operator consoles, dataloggers, printer, and tape drives were located in the control trailer. The accuracy of the DAS input/output cards is ±0.05 percent.

The measurement of tunnel air temperature was accomplished through the use of thermocouples located at various cross sections throughout the length of the tunnel.

In total, there were approximately 1450 instrumentation sensing points. Each sensing point was monitored and recorded once every second during a test, which lasted from 20 minutes to 45 minutes.

Approximately 4 million data points were recorded during a single test. All test data was recorded on tapes in a control center trailer, where control operators monitored and controlled each test.

There were instrument trees located at ten tunnel cross sections, which were designed to measure airflow to a modified ASHRAE traverse method. At these locations, Type K thermocouples with an expected accuracy of ± 0.75 percent were located at each air velocity sensor and measured air temperature from 32°F to 2500°F (0°C to 1370°C).

Additional temperature measurements also were taken at five other tunnel cross sections and at two locations (15 m) outside of the tunnel portals. The measurement of air velocity in the tunnel under test conditions was accomplished through the use of differential pressure instrumentation designed to measure very low pressure ranges from 0 psi to $^{1}/_{4}$ psi (0 Pa to 61 Pa).
Temperatures in the vicinity of the bidirectional pilot tubes and the ambient pressure were combined with the measured pressure to calculate the air velocity.

A gas sampling system extracted sample gas from specific tunnel locations to analysis cabinets located in the electrical equipment rooms. Sample gases were analyzed within the analysis cabinets for two ranges of CO, CO_2, and total hydrocarbon context (THC). The analyzers were housed in climate-controlled cabinets.

To ensure personnel safety, methane gas could be detected at the test fire location through the use of individual in-situ electromechanical cell-type analyzers at the control trailer. In addition, portable detectors capable of detecting carbon monoxide, total hydrocarbon, oxygen, and methane were provided for personnel safety when entering the tunnel after fire tests.

Two meteorological towers located outside of the north and south tunnel portals include instrumentation that monitored and recorded ambient dry and wet bulb air temperatures, barometric pressure, wind speed, and wind direction.

These weather-related parameters were monitored for over $1^1/_2$ years to track weather conditions to assist in planning, scheduling, and conducting the tests.

G-7 Instrumentation. Specific instrumentation was provided to monitor and record the following variables during the fire tests:

(a) Air temperature;

(b) Air velocity;

(c) Gas concentrations.

G-8 Cameras. The closed-circuit television (CCTV) system originally included six cameras, two located within 203 ft to 217 ft (62 m to 66 m) of the fire area, two located outside of the tunnel (near the portals), and two located on the north and south meteorological towers. Another roadway-level camera was added during the tests that was located 1100 ft (335 m) north of the fire to secure added video footage of smoke movement.

Each of the four outdoor cameras had pan-tilt-zoom capabilities. They were used to monitor the fire area, visibility obscuration, and smoke stratification. Instrumentation to monitor and record important parameters of the fire suppression system, the chilled water system used for equipment cooling, and the compressed air and fuel oil systems also were included.

G-9 Conclusions. The Memorial Tunnel Fire Ventilation Test Program represents a unique opportunity to evaluate and develop design methods and operational strategies leading to safe underground transportation facilities. This comprehensive test program, which began with the initial fire tests in September 1993 and concluded with the final tests in March 1995, produced much-needed data that was acquired in a full-size facility, under controlled conditions and over a wide range of system parameters.

The results of the test program were processed and made available to the professional community for use in the development of emergency tunnel ventilation design and emergency operational procedures in late 1995, titled: "Memorial Tunnel Fire Ventilation Test Program Test Report," prepared for Massachusetts Highway Department, prepared by Bechtel/Parsons Brinckerhoff, November, 1995.

NFPA 505

1996 Edition

Fire Safety Standard for Powered Industrial Trucks Including

1996 Edition

This edition of NFPA 505, *Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operation,* was prepared by the Technical Committee on Industrial Trucks and acted on by the National Fire Protection Association, Inc., at its Annual Meeting held May 20-23, 1996, in Boston, MA. It was issued by the Standards Council on July 18, 1996, with an effective date of August 9, 1996, and supersedes all previous editions.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

This edition of NFPA 505 was approved as an American National Standard on July 26, 1996.

Origin and Development of NFPA 505

Chapter 1 (formerly Part A) of this standard was originally designated as NFPA 505A and was first adopted by the Association in 1951. Chapters 4 and 5 (formerly Parts A and B), "Maintenance of Industrial Trucks" and "Operation of Industrial Trucks," were originally adopted in 1952 and published by the NFPA under the designation NFPA No. 505B, C, *Standards for the Maintenance and Safe Operation of Industrial Trucks*. The combining of the three texts into one document, NFPA 505, was accomplished in 1955. Revisions were made in 1955, 1957, 1963, 1965, 1966, 1967, 1968, 1969, 1971, 1972, 1973, 1975, 1978, 1982, and 1987. The 1971 edition was the first edition to be approved by ANSI.

In the 1992 edition, Group F was added to the list of classified locations to correlate with the *National Electrical Code*®.

In the 1996 edition, changes were made to the types of trucks listed for operation in Class I, Division 2, locations, and a new DX type designation was added. Also, a new section on compressed natural gas (CNG) was added and related changes to the chapters on dual-fuel trucks and converted trucks were made.

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on the safe use, maintenance, and operation of industrial trucks and other material-handling equipment to minimize fire hazards.

NFPA 505
Fire Safety Standard for
Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operation

1996 Edition

NOTICE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 6 and Appendix B.

Chapter 1 Type Designations and Areas of Use

1-1 Scope.

This standard shall apply to fork trucks, tractors, platform lift trucks, motorized hand trucks, and other specialized industrial trucks powered by electric motors or internal combustion engines. This standard shall not apply to compressed air-operated or nonflammable compressed gas-operated industrial trucks, farm vehicles, or automotive vehicles for highway use.

1-2 General.

1-2.1

The design and installation of the compressed natural gas (CNG) fuel systems on CNG- and dual-fuel- (gasoline and CNG) powered industrial trucks shall be in accordance with the applicable provisions of NFPA 52, *Standard for Compressed Natural Gas (CNG) Vehicular Fuel Systems*.

1-2.2

The design and installation of the LP-Gas fuel systems on LP-Gas- and dual-fuel- (gasoline and LP-Gas) powered industrial trucks shall be in accordance with the applicable provisions of NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

1-2.3

Approved powered industrial trucks, as referred to in this standard, are those trucks listed by a testing laboratory for the use intended. Trucks shall be tested and labeled in accordance with UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered*, or UL 583, *Standard for Safety Electric-Battery-Powered Industrial Trucks.*

1-3 Equivalency.

Nothing in this standard is intended to prevent the use of new methods or devices, provided that sufficient technical data is submitted to the authority having jurisdiction to demonstrate that the proposed method or device is equivalent in quality, strength, fire endurance, effectiveness, durability, and safety to those prescribed by this standard.

1-4* Definitions.

Approved.* Acceptable to the authority having jurisdiction.

Authority Having Jurisdiction.* The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed.* Equipment, materials, or services included in a list published by an organization acceptable to the authority having jurisdiction and concerned with evaluation of products or services that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services and whose listing states either that the equipment, material, or service meets identified standards or has been tested and found suitable for a specified purpose.

Shall. Indicates a mandatory requirement.

Should. Indicates a recommendation or that which is advised but not required.

Type Designation.* A system for identifying types of powered industrial trucks for operation in nonclassified and classified areas. [*See (a) through (r), which follow*.]

(a) *Type CN* units are compressed natural gas-powered units having minimum acceptable safeguards against inherent fire hazards.

(b) *Type CNS* units are compressed natural gas-powered units that, in addition to meeting the requirements for Type CN units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

(c) *Type D* units are diesel-powered units having minimum acceptable safeguards against inherent fire hazards.

(d) *Type DS* units are diesel-powered units that, in addition to meeting all the requirements for Type D units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

(e) *Type DY* units are diesel-powered units having all the safeguards of Type DS units and, in addition, any electrical equipment is completely enclosed. They are equipped with temperature limitation features.

(f) *Type DX* units are diesel-powered units that differ from Type DS and DY units in that the diesel engine and the electrical fittings and equipment are so designed, constructed, and assembled that the units can be used in atmospheres containing specifically named flammable vapors, dusts, and, under certain conditions, fibers. Type DX units are specifically tested and classified for use in Class I, Group D locations or for Class II, Group F or G locations as defined in NFPA 70, *National Electrical Code*®□.

(g) *Type E* units are electrically powered units having minimum acceptable safeguards against inherent fire and electrical shock hazards.

(h) *Type ES* units are electrically powered units that, in addition to meeting all the requirements for Type E units, are provided with additional safeguards to the electrical system to prevent the emission of hazardous sparks and to limit surface temperatures.

(i) *Type EE* units are electrically powered units that, in addition to meeting all the requirements for Types E and ES units, have their electric motors and all other electrical equipment completely enclosed.

(j) *Type EX* units are electrically powered units that differ from a Type E, ES, or EE unit in that the electrical fittings and equipment are so designed, constructed, and assembled that the units can be used in atmospheres containing specifically named flammable vapors, dusts, and, under certain conditions, fibers. Type EX units are specifically tested and classified for use in Class I, Group D locations or for Class II, Group F or G locations as defined in NFPA 70, *National Electrical Code*.

(k) *Type G* units are gasoline-powered units having minimum acceptable safeguards against inherent fire hazards.

(l) *Type GS* units are gasoline-powered units that, in addition to meeting all the requirements for Type G units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

(m) *Type LP* units are liquefied petroleum gas-powered units having minimum acceptable safeguards against inherent fire hazards.

(n) *Type LPS* units are liquefied petroleum gas-powered units that, in addition to meeting the requirements for Type LP units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

(o) *Type G/CN* units operate on either gasoline or compressed natural gas having minimum acceptable safeguards against inherent fire hazards.

(p) *Type GS/CNS* units operate on either gasoline or compressed natural gas and, in addition to meeting all the requirements for Type G/CN units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

(q) *Type G/LP* units operate on either gasoline or liquefied petroleum gas having minimum acceptable safeguards against inherent fire hazards.

(r) *Type GS/LPS* units operate on either gasoline or liquefied petroleum gas and, in addition to meeting all the requirements for the Type G/LP units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

1-5 Hazard Classification.

1-5.1

The authority having jurisdiction shall determine the hazard classification of any specific location. The location shall have been classified prior to the consideration of the use of industrial trucks therein, and the type of industrial truck required shall be as provided in Section 1-6 for that location.

1-5.2

Several areas of any single plant or building could have different hazard classifications. The authority having jurisdiction shall limit the use of industrial trucks in classified areas in a plant or building in accordance with the hazard classification of such areas. The responsibility for the enforcement of restricted use in such areas shall be that of the management.

1-5.3

The industrial trucks specified in Section 1-6 are the minimum types required. Industrial trucks having greater safeguards shall be permitted to be used.

1-6 Specific Areas of Use.

Table 1-6 provides a summary of industrial truck types for specific areas of use and was developed from information contained in this section.

The references to class/group/division contained in parentheses in the subsection headings of this section correspond to classifications in accordance with NFPA 70, *National Electrical Code*, and are provided for the convenience of the user.

Key to Table Symbols

A = Type truck authorized for location described.

J = Type truck authorized for location described with approval of the authority having jurisdiction.

† = Where dust has resistivity of 10^5 ohm-cm, use J.

¹ = Where dust has resistivity of 10^5 ohm-cm or greater.

K = Type truck authorized to be determined by the authority having jurisdiction.

Type truck not authorized in location described.

1-6.1* Areas Containing Certain Flammable Gases or Vapors Where Power-Operated Industrial Trucks Shall Not Be Used (Class I, Groups A, B, and C, Division 1).

Power-operated industrial trucks shall not be used in these locations.

For examples of those chemicals for which mixtures of their vapors in air are classified as Class I, Group A, B, or C, see Section 500-3 of NFPA 70, *National Electrical Code*, and A-1-6.1 of this standard.

1-6.2 Areas Where Vapors of Flammable Liquids and Some Gases Exist under Normal Operating Conditions (Class I, Group D, Division 1).

1-6.2.1* Approved power-operated industrial trucks designated as Type DX or EX and classified for Class I, Group D chemicals shall be used in such locations containing gases or vapors.

1-6.2.2 Class I, Group D, Division 1 areas include locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another; interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used; locations containing open tanks or vats of volatile flammable liquids; drying rooms or compartments for the evaporation of flammable solvents; locations containing fat and oil extraction apparatus using volatile flammable solvents; portions of cleaning and dyeing plants where hazardous liquids are used; gas generator rooms and other portions of gas manufacturing plants where flammable gas could escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers; and all other locations where hazardous concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

1-6.3 Areas Where Volatile Flammable Liquids and Their Vapors or Flammable Gases Are Normally Confined (Class I, Group D, Division 2).

1-6.3.1 Approved power-operated industrial trucks designated as Type DX, DY, EE, or EX (classified for Class I, Group D locations) shall be used in locations where volatile flammable liquids or flammable gases are handled, processed, or used, but in which these liquids, vapors, or gases normally are confined within closed containers or closed systems from which they can escape only in the event of accidental rupture or breakdown of such containers or systems, or in the event of abnormal operation of equipment; in locations in which ignitible concentrations of gases or vapors are normally prevented by positive mechanical ventilation but that might become hazardous through failure or abnormal operation of the ventilating equipment; or in locations adjacent to Class I, Division 1 locations and to which ignitible concentrations of gases or vapors might occasionally be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

1-6.3.2 Class I, Group D, Division 2 areas include locations where volatile flammable liquids or flammable gases or vapors are used, but that, in the judgment of the authority having jurisdiction, would become hazardous only in the event of an accident or some unusual operating condition. The quantity of flammable material that might escape during an accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that should receive consideration in determining whether or not a particular type of truck possesses sufficient safeguards for the location.

1-6.4 Areas Containing Combustible Metal Dusts and Other Combustible Dusts Having Resistivity of Less than 10^2 ohm-cm (Class II, Groups E and F, Division 1).

1-6.4.1 Power-operated industrial trucks shall not be used in locations containing hazardous concentrations of metal dust, including aluminum and magnesium and their commercial alloys or other dusts of similarly hazardous characteristics having resistivity of less than 10^2 ohm-cm.

Exception: Approved power-operated industrial trucks designated as Type DX or EX shall be permitted to be used in such locations, subject to special investigation of both the truck and the *specific area of use by the authority having jurisdiction.*

1-6.4.2 In atmospheres where the dust of magnesium, aluminum, or aluminum bronze might be present, truck fuses, switches, motor controllers, and circuit breakers shall have enclosures specifically approved for such locations.

1-6.5 Areas Containing Combustible Dusts in Suspension Having Resistivity of 10^2 ohm-cm or Greater and Less than 10^8 ohm-cm (Class II, Group F, Division 1).

1-6.5.1 Power-operated industrial trucks shall not be used in locations containing hazardous concentrations of electrically conductive Group F dusts having a resistivity less than 10^5 ohm-cm.

Exception: Approved power-operated industrial trucks designated as Type DX or EX shall be permitted to be used in such locations, subject to special investigation of both the truck and the specific area of use by the authority having jurisdiction.

1-6.5.2 Approved power-operated industrial trucks designated as Type DX or EX (classified for Class II, Group F locations) shall be used in locations in which electrically nonconductive Group F dust having a resistivity of 10^5 ohm-cm or greater but less than 10^8 ohm-cm is or could be in suspension under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures or where mechanical failure or abnormal operation of machinery or equipment might cause such mixtures to be produced.

1-6.5.3* Class II, Group F, Division 1 areas include locations containing carbon black, charcoal, coal, and coke dusts that have more than 8 percent total volatile material (coal and coke dust in accordance with ASTM D 3175, *Standard Test Method for Volatile Matter in the Analysis Sample of Coal and Coke*) or atmospheres containing those dusts sensitized by other materials so that they present an explosion hazard.

1-6.6 Areas Containing Combustible Dusts in Suspension Having Resistivity of 10^8 ohm-cm or Greater (Class II, Group G, Division 1).

1-6.6.1 Approved power-operated industrial trucks designated as Type DX or EX (classified for Class II, Group G locations) shall be used in locations in which combustible dust having resistivity of 10^8 ohm-cm or greater is or could be in suspension under normal operating conditions in quantities sufficient to produce explosive or ignitible mixtures, or where mechanical failure or abnormal operation of machinery or equipment might cause such mixtures to be produced.

1-6.6.2 Class II, Group G, Division 1 areas include locations such as the working areas of grain-handling and storage plants; rooms containing grinders or pulverizers, cleaners, graders, scalpers, open conveyors or spouts, open bins or hoppers, mixers or blenders, automatic or hopper scales, packing machinery, elevator heads and boots, stock distributors, and dust and stock collectors (except all-metal collectors vented to the outside); and all similar dust-producing machinery and equipment in grain-processing plants, starch plants, sugar-pulverizing plants, malting plants, wood flour plants, hay-grinding plants, and other occupancies of similar nature where combustible dust having resistivity of 10^8 ohm-cm or greater might, under normal operating conditions, be present in the air in quantities sufficient to produce explosive or ignitible mixtures.

1-6.7 Areas Where Combustible Dusts Having Resistivity of 10^5 ohm-cm or Greater are Present but Not Normally in Suspension in the Atmosphere (Class II, Groups F and G, Division 2).

1-6.7.1 Approved power-operated industrial trucks designated as Type DX, DY, EE, or EX (classified for Class II, Group F or G locations, as appropriate) shall be used in locations in which combustible dust having resistivity of 10^5 ohm-cm or greater is not normally in suspension in the air or is not likely to be thrown into suspension by the normal operation of equipment or apparatus in quantities sufficient to produce explosive or ignitible mixtures but where deposits or accumulations of such dust might be ignited by arcs or sparks originating in the truck.

1-6.7.2 In locations where dangerous concentrations of suspended dust having resistivity of 10^5 ohm-cm or greater would not be likely, approved power-operated industrial trucks designated as Type CNS, DS, ES, GS, LPS, GS/CNS, or GS/LPS shall be permitted to be used if approved for such location by the authority having jurisdiction. These locations include rooms and areas containing only closed spouting and conveyors, closed bins or hoppers, or machines and equipment from which appreciable quantities of dust could escape only under abnormal operating conditions; rooms or areas into which explosive or ignitible concentrations of suspended dust might be communicated only under abnormal operating conditions; rooms or areas where the formation of explosive or ignitible concentrations of suspended dust is prevented by the operation of effective dust control equipment; warehouses and shipping rooms where dust-producing materials are stored or handled only in bags or containers; and other similar locations.

1-6.8 Areas Where Easily Ignitible Fibers or Materials Producing Combustible Flyings Are Handled, Manufactured, or Used (Class III, Division 1).

1-6.8.1* Approved power-operated industrial trucks designated as Type DX, DY, EE, or EX shall be used in locations that are classified because of the presence of easily ignitible fibers or materials producing combustible flyings but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures.

1-6.8.2 Locations where easily ignitible fibers or flyings are found usually include some portions of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cottonseed mills; flax-processing plants; clothing-manufacturing plants; woodworking plants (except wood flour plants); and establishments and industries involving similar processes or conditions.

A wood flour plant shall be considered to be a Class II, Group G, Division 1 location as defined in 1-6.6.2.

Easily ignitible fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, sawdust, wood chips, and other materials of similar nature.

1-6.9 Areas Where Easily Ignitible Fibers Are Stored or Handled (Class III, Division 2).

Exception: In process of manufacture.

1-6.9.1 Approved power-operated industrial trucks designated as Type CNS, DS, DX, DY, ES, EE, EX, GS, LPS, GS/CNS, or GS/LPS shall be used in locations where easily ignitible fibers are stored or handled, including outside storage, but are not being processed or manufactured. Industrial trucks designated as Type E that have been used previously in these locations shall be permitted to be continued in use with the approval of the authority having jurisdiction.

1-6.10 Hazardous Areas Not Otherwise Classified.

The authority having jurisdiction shall determine which types of approved power-operated industrial trucks, if any, shall be used following an engineering survey of the property and an evaluation of the fire and explosion hazards.

1-6.11 Piers and Wharves.

1-6.11.1 Where it is determined that the location on piers and wharves for handling general cargo is not hazardous, any approved power-operated industrial truck designated as Type CN, D, E, G, LP, G/CN, or G/LP shall be permitted to be used, or trucks that conform to the requirements for these types shall be permitted to be used.

1-6.11.2 Where an area of a pier or wharf is determined to be hazardous, only approved power-operated industrial trucks specified for such locations in the preceding subsections shall be permitted to be used.

1-6.12 General Inside and Outside Storage.

1-6.12.1 Where it is determined that the location for general storage in warehouses or general outside storage is not hazardous, any approved power-operated industrial truck designated as Type CN, D, E, G, LP, G/CN, or G/LP shall be permitted to be used, or trucks that conform to the requirements for these types shall be permitted to be used.

1-6.12.2 Where the location for general storage in warehouses or general outside storage is determined to be hazardous, only approved power-operated industrial trucks specified for such a location in the preceding subsections shall be permitted to be used.

1-6.13 General Industrial or Commercial Properties.

1-6.13.1 Where it is determined that the location on a general industrial or commercial property for handling or processing materials (with storage being incidental to handling and processing), or both, is not hazardous, any approved power-operated industrial truck designated as Type CN, D, E, G, LP, G/CN, or G/LP shall be permitted to be used, or trucks that conform to the requirements for these types shall be permitted to be used.

1-6.13.2 Where the location on a general industrial or commercial property for handling or processing materials, or both, is determined to be hazardous, only approved power-operated industrial trucks specified for such a location in the preceding subsections shall be permitted to be used.

1-6.14 Converted Industrial Trucks.

1-6.14.1 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G for the use of gasoline for fuel, where converted to the use of liquefied petroleum gas fuel in accordance with Chapter 3, shall be permitted to be used in those locations where a Type G or LP truck has been specified in the preceding subsections.

1-6.14.2 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G for the use of gasoline for fuel, where converted to the use of dual fuels (gasoline and LPG) in accordance with Chapter 3, shall be permitted to be used in those locations where a Type G or LP truck has been specified in the preceding subsections.

1-6.14.3 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type LP for the use of liquefied petroleum gas for fuel, where converted to the use of dual fuels (gasoline and LPG) in accordance with Chapter 3, shall be permitted to be used in those locations where a Type G or LP truck has been specified in the preceding subsections.

1-6.14.4 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type LP for the use of liquefied petroleum gas for fuel, where converted to the use of gasoline for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where Type G trucks have been specified in the preceding subsections.

1-6.14.5 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G/LP for the use of dual fuels, where converted to the sole use of gasoline for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where Type G trucks have been specified in the preceding subsections.

1-6.14.6 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G/LP for the use of dual fuels, where converted to the sole use of liquefied petroleum gas for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where Type LP trucks have been specified in the preceding subsections.

1-6.14.7 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G for the use of gasoline for fuel, where converted to the use of compressed natural gas fuel in accordance with Chapter 3, shall be permitted to be used in those locations where a Type G or CN truck has been specified in the preceding subsections.

1-6.14.8 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G for the use of gasoline for fuel, where converted to the use of dual fuels (gasoline and CNG) in accordance with Chapter 3, shall be permitted to be used in those locations where a Type G or CN truck has been specified in the preceding subsections.

1-6.14.9 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type CN for the use of compressed natural gas for fuel, where converted to the use of gasoline for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where a Type G or CN truck has been specified in the preceding subsections.

1-6.14.10 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type CN for the use of compressed natural gas for fuel, where converted to the use of gasoline for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where Type G trucks have been specified in the preceding subsections.

1-6.14.11 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G/CN for the use of dual fuels, where converted to the sole use of gasoline for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where Type G trucks have been specified in the preceding subsections.

1-6.14.12 Power-operated industrial trucks that previously have been approved for or that conform to the requirements for Type G/CN for the use of dual fuels, where converted to the sole use of compressed natural gas for fuel in accordance with Chapter 3, shall be permitted to be used in those locations where Type CN trucks have been specified in the preceding subsections.

1-6.14.13 Power-operated industrial trucks previously designated Type CNS, GS, LPS, GS/CNS, or GS/LPS shall not be converted to the use of other fuels.

1-6.14.14 Power-operated industrial trucks previously approved for or that conform to the requirements for Type CN, G, LP, G/CN, or G/LP shall not be converted to Type CNS, GS, LPS, GS/CNS, or GS/LPS.

Chapter 2 Dual-Fuel Trucks

2-1 General.

A dual-fuel truck shall be defined as a truck equipped to be operated on either gasoline or LPG or to be operated on either gasoline or CNG without further modification.

2-2 Requirements.

2-2.1

Those parts of the fuel system that come into contact with gasoline shall meet the requirements for liquid fuel in accordance with UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered*.

2-2.2

Those parts of the fuel system that come into contact with CNG fuel shall meet the requirements for CNG fuel in accordance with NFPA 52, *Standard for Compressed Natural Gas (CNG) Vehicular Fuel Systems*.

2-2.3

Those parts of the fuel system that come into contact with LPG fuel shall meet the requirements for LPG fuel in accordance with UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered*.

2-2.4

Those parts of the fuel system that come into contact with both gasoline and LPG fuel or with both gasoline and CNG fuel shall be compatible with both fuels.

2-2.5* Fuel Changeover.

Where switching from CNG or LPG to liquid fuel, care shall be taken to ensure that there is no spillage of liquid fuel.

2-3 Nameplate Visibility.

The truck type designation (*see definitions in Section 1-4*) as shown on the nameplate and the type marker (*see 5-4.2*) shall not be covered over with paint so that their information is obscured.

Chapter 3 Converted Trucks

3-1* Conversion of Trucks.

Industrial trucks previously approved and classified by type designation (*see 1-6.14*) shall be permitted to be converted to another type, provided that the conversion results in a truck that embodies the features specified for the particular fuel to be used in accordance with Table 3-1.

Table 3-1 Permissible Truck Fuel Conversions

Original Approval and Classification	New Approval and Classification
Gasoline	LP-Gas
Gasoline or LP-Gas	Dual fuels
LP-Gas or Dual fuels	Gasoline
Dual fuels	LP-Gas
Gasoline	CNG
G/CNG	Dual fuels
CNG or Dual fuels	Gasoline
Dual fuels	CNG
LP-Gas	CNG
CNG	LP-Gas

3-2 Conversion Requirements.

3-2.1

A truck designated as Type G, LP, or G/LP that is converted to another of these designations shall conform to the requirements for the new designation selected in accordance with UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered.*

3-2.2

Conversion kits for use on trucks designated as Type G, LP, or G/LP shall conform to the requirements for the type designation selected in accordance with UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered*, and can be approved by a testing laboratory.

3-2.3

Conversion kits for use on trucks designated as Type CN, G, LP, G/CN, or G/LP shall include the items specified in 3-2.4. The installation of the kit shall be in accordance with 3-2.4. Where a listed conversion kit is used, a copy of the report shall be supplied to the authority having jurisdiction upon request.

3-2.4

Kits for conversion of CN, G, LP, G/CN, and G/LP trucks shall include:

(a) Step-by-step installation instructions with pictorial illustration (if necessary) for clarity.

(b) All parts required to complete the installation, including:

1. Functional components;
2. Mounting brackets and hardware;
3. Connecting wires, hoses, and fittings; and
4. Sealants, if required.

(c) A durable, corrosion-resistant plate, indicating the converted type designation of the truck, for permanent mounting adjacent to the manufacturer's name plate on the truck.

(d) A metal nameplate attached to the LPG-tank mounting identifying the fuel container assembly to be used where the conversion is to LPG and a removable fuel tank is to be used.

(e) A gasoline fuel tank, along with necessary mounting and connection hardware and installation instructions, where the conversion is from CNG or LPG to gasoline or dual fuels.

(f) Instructions for removal or deactivation of the present components, including the gasoline tank(s), where the conversion is from gasoline or dual fuels to CNG or LPG.

(g) A tank or tanks, as appropriate, along with the necessary mounting and connection hardware and installation instructions where the conversion is from LPG to CNG or dual fuels, or where from gasoline to CNG or dual fuels and the truck is not equipped with a CNG or gasoline fuel tank, or both.

(h) Instructions covering checks and tests to be performed after the conversion and prior to putting the truck into service.

3-2.5

When a conversion kit is installed, all original identification of approval or listing and type designation shall be removed, and the plate specified in 3-2.4(c) shall be installed in lieu thereof.

Chapter 4 Maintenance of Industrial Trucks

4-1 General.

The fire safety built into power-operated industrial trucks shall be maintained in accordance with the instructional and training material provided by the manufacturer. Any power-operated industrial truck not in safe operating condition shall be removed from service.

4-2 Precautions.

4-2.1

Repairs shall not be made in Class I, Class II, and Class III locations.

4-2.2

Repairs to the fuel and ignition systems of industrial trucks that involve fire hazards shall be conducted only in locations designated for such repairs.

4-2.3

Repairs to the electrical system of battery-powered industrial trucks shall be performed only after the battery has been disconnected.

4-3 Replacement Parts.

All parts of any industrial truck, particularly trucks approved for use in classified hazardous locations, needing replacement shall be replaced only with parts providing the same degree of fire safety as those used in the original design.

4-4 Mufflers.

Water mufflers shall be filled daily or as frequently as is necessary to prevent depletion of the supply of water below 75 percent of the filled capacity. Vehicles with mufflers having screens or other parts that might become clogged shall not be operated while such screens or parts are clogged. Any vehicle that emits hazardous sparks or flames from the exhaust system shall be removed from service immediately and shall not be returned to service until the cause for the emission of such sparks and flames has been eliminated.

4-5 Operating Temperature.

Where the temperature of any part of any truck is found to be in excess of its normal operating temperature and creates a hazardous condition, the vehicle shall be removed from service and shall not be returned to service until the cause for such overheating has been eliminated.

4-6 Fire Prevention.

Industrial trucks shall be kept in a clean condition and reasonably free of lint, excess oil, and grease. Noncombustible agents are preferred for cleaning trucks. Flammable liquids [those having flash points below 100°F (37.8°C)] shall not be used. Combustible liquids [those having flash points at or above 100°F (37.8°C)] shall be permitted to be used. Precautions regarding toxicity, ventilation, and fire hazard shall be appropriate for the agent or solvent used.

4-7 Antifreeze.

Where antifreeze is used in the engine cooling system, only glycol-based material shall be used.

4-8 Nameplate Visibility.

The truck type designations (*see definitions in Section 1-4*) as shown on the nameplate and the type markers (*see 5-4.2*) shall not be covered over with paint so that their identification information is obscured.

Chapter 5 Fuel Recharging, Marking, and Operation of Industrial Trucks

5-1 Fuel Handling and Storage.

5-1.1 Liquid Fuels (e.g., Gasoline and Diesel Fuel).

5-1.1.1 The storage and handling of liquid fuels shall be in accordance with NFPA 30, *Flammable and Combustible Liquids Code*, or NFPA 30A, *Automotive and Marine Service Station Code*, as applicable.

5-1.1.2* Trucks using liquid fuels shall be refueled only at locations designated for that purpose and from approved dispensing pumps.

5-1.1.3 Engines shall be stopped and the operator shall not be on or inside the truck during refueling.

5-1.1.4 Emergency refueling shall be from approved safety cans. Safety cans shall be inspected regularly for leaks and for damage to closures; faulty cans shall be replaced.

5-1.1.5 Spillage of fuel or overfilling of the vehicle fuel tank shall be avoided.

5-1.1.6 Smoking or open flames shall be prohibited in the refueling area.

5-1.2 Liquefied Petroleum Gas Fuel.

5-1.2.1 The storage and handling of liquefied petroleum gas (LP-Gas) shall be in accordance with NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

5-1.2.2 Filling of fuel containers that are permanently mounted on trucks and filling of removable DOT-type LP-Gas containers shall be done at locations designated for that purpose and in accordance with NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

5-1.2.3 LP-Gas containers shall not be dropped, thrown, rolled, or dragged.

5-1.2.4 LP-Gas containers shall not be overfilled.

5-1.2.5 The engine shall be stopped and the operator shall not be on or inside the truck during refueling.

5-1.2.6 Trained and designated personnel shall refill or exchange LP-Gas containers.

5-1.2.7 A soap solution shall be used to check for leaks. A match or open flame shall not be used.

5-1.2.8 Removable LP-Gas containers shall not be exchanged near, and LP-Gas-powered vehicles shall not be parked near, sources of heat, open flames, or similar sources of ignition or near open pits, underground entrances, elevator shafts, or other similar areas.

Exception: Open pits, underground entrances, elevator shafts, or similar areas that are adequately ventilated to prevent accumulations of LP-Gas.

5-1.2.9 Trucks equipped with permanently mounted LP-Gas containers shall be refueled outdoors.

5-1.2.10* Means shall be provided in the fuel system to minimize the escape of fuel when the containers are exchanged. This shall be accomplished by:

(a) Closing the valve on the LP-Gas container; and

(b) Using an approved automatic quick-closing coupling (a type that closes in both directions when uncoupled) in the fuel line. Where such an automatic quick-closing coupling is not used, the fuel line shall be emptied by allowing the engine to run until the fuel in the line is consumed.

5-1.2.11 Removable LP-Gas containers shall be mounted securely to prevent them from jarring loose, slipping, or rotating and shall be positioned so that the safety pressure relief valve opening is always in contact with the vapor space (top) of the container. This shall be accomplished by means of a substantial positioning pin engaging the cylinder, or an equivalent means, and a container clamp(s) that, where the container is properly installed, positions the container. A container and its fittings shall not extend beyond the platform of the industrial truck.

5-1.2.12 All reserve LP-Gas containers shall be stored and transported with the service valve closed. Safety relief valves shall have direct communication with the vapor space of the container at all times.

5-1.2.13 All LP-Gas containers shall be examined before refilling for the following defects or damage:

(a) Dents, scrapes, and gouges of the pressure vessel;

(b) Damage to the various valves and liquid level gauge;

(c) Debris in the relief valve;

(d) Damage to or loss of the relief valve cap;

(e) Indications of leakage at the valves or threaded connections; and

(f) Deterioration, damage, or loss of flexible seals in the filling or servicing connections.

Where examination reveals physical damage such as dents, scrapes, or gouges [*see 5-1.2.13(a)*] that materially weaken the structure of the LP-Gas container and render it unsafe for use, it shall be removed from service.

Where examination reveals damages specified above other than physical damage [*see 5-1.2.13(b) through (f)*] to the container, appropriate repairs shall be made before the container is refilled.

5-1.2.14 Smoking shall be prohibited in the container refilling area for either portable or permanently mounted containers and in the exchange area during the exchange of LP-Gas containers.

5-1.2.15 The service valve of the fuel container shall be closed whenever vehicles are parked overnight or stored indoors for a protracted time.

5-1.3 Compressed Natural Gas Fuel.

5-1.3.1 The compression, storage, handling and dispensing of CNG shall be located and conducted in accordance with NFPA 52, *Standard for Compressed Natural Gas (CNG) Vehicular Fuel Systems*.

5-1.3.2 The engine shall be stopped and the operator shall not be on or inside the truck during refueling.

5-1.3.3 Smoking and open flames shall be prohibited in the refueling area.

5-1.3.4 Each fuel supply container shall be mounted in a location to minimize damage from collision. A container and its fittings shall not extend beyond the platform of the industrial truck. Containers, valves, and hoses and fittings shall be protected from physical damage using the vehicle structure, valve protectors, or suitable guards in accordance with NFPA 52, *Standard for Compressed Natural Gas (CNG) Vehicular Fuel Systems*.

5-1.3.5 The refueling receptacle on a truck shall be supported firmly and shall incorporate a means to prevent the entry of dust, water, and other foreign material. Where the means used is capable of sealing the system pressure, it shall be capable of being depressurized before removal.

5-1.3.6 A CNG cylinder shall not be charged in excess of its maximum allowable working pressure at the normal temperature for that cylinder.

5-1.3.7 The transfer of CNG into the fuel supply container of a truck shall be performed by a person who is qualified by virtue of having performed the transfer operation for at least three full cycles under supervision and who has competence in initiating emergency procedures. This person shall be responsible for verifying the working pressure and for ensuring that the container is retested according to the required schedule.

5-1.3.8 A match or open flame shall not be used to check for leaks in CNG fuel systems.

5-1.3.9 Containers.

5-1.3.9.1 Containers and their appurtenances, piping systems, compression equipment, controls, devices, and pressure relief valves shall be maintained in proper operating condition.

5-1.3.9.2 To keep pressure relief devices in reliable operating condition, care shall be taken in the handling and storing of compressed natural gas containers to avoid damage. Care also shall be exercised to avoid plugging caused by paint or other dirt accumulation in pressure relief device channels or other parts that could interfere with the functioning of the device. Only qualified personnel shall be permitted to service pressure relief devices.

5-1.3.9.3 Only assemblies or original manufacturer's parts shall be used in the repair of pressure relief devices.

Exception: Assemblies or parts that have been proved by suitable testing.

5-1.3.10 CNG-powered vehicles shall not be parked near sources of heat, open flames, or similar sources of ignition.

5-1.3.11 The service valve of the fuel container shall be closed whenever vehicles are parked overnight or stored indoors for a protracted time.

5-2 Dual Fuel.

5-2.1*

Where operating a dual-fuel truck on CNG or LP-Gas, the gasoline level in the liquid fuel tank shall be checked daily. The truck shall not be operated unless the gasoline fuel tank is at least $^{1}/_{4}$ full.

5-2.2

Where operating a dual-fuel truck on CNG fuel, the provisions of 5-1.3 shall apply.

5-2.3

Where operating a dual-fuel truck on LP-Gas, the provisions of 5-1.2 shall apply.

5-2.4

Where operating a dual-fuel truck on liquid fuel, the provisions of 5-1.1 shall apply.

5-3 Changing and Charging Storage Batteries.

5-3.1

This section shall apply to batteries used on electric trucks. The two types of batteries commonly used are lead and nickel-iron. They contain corrosive chemical solutions, either acid or alkali, and, therefore, present a chemical hazard. While being charged, they give off hydrogen and oxygen, which, in certain concentrations, are explosive.

5-3.2

Battery-charging installations shall be located in areas designated for that purpose; such areas shall be kept free of extraneous combustible materials. Facilities shall be provided for the following:

(a) Flushing spilled electrolyte;

(b) Fire protection;

(c) Protecting charging apparatus from damage by trucks; and

(d) Adequate ventilation for dispersal of fumes from gassing batteries.

Where on-board chargers are used, charging shall be accomplished at locations designated for that purpose, taking into account the electrical requirements of the charger and facilities for fire protection.

Exception: Flushing facilities shall not be required if charging is accomplished without removing the battery from the vehicle.

5-3.3

Where handling acid concentrates greater than 50 percent acid (above 1.400 specific gravity), an eye-wash fountain shall be provided.

5-3.4

A conveyor, overhead hoist, or equivalent material-handling equipment shall be provided for handling batteries.

5-3.5

Chain hoists shall be equipped with load-chain containers. Where a hand hoist is used, uncovered batteries shall be covered with a sheet of plywood or other nonconducting material to prevent the hand chain from shorting on cell connectors or terminals. A properly insulated spreader bar shall be used with any overhead hoist.

5-3.6

Reinstalled or new batteries shall meet or exceed the battery type marked on the truck. Reinstalled batteries shall be positioned properly and secured in the truck.

5-3.7

A carboy tilter or siphon shall be provided where acid in carboys is used. Where diluting concentrated sulfuric acid to make up electrolyte, the acid ALWAYS shall be added to the water — not the reverse. Battery maintenance personnel shall wear protective clothing such as eye protection, long sleeves, and gloves.

Exception: Removal and replacement of batteries shall not require the use of protective clothing.

5-3.8

Electrical installations shall be in accordance with NFPA 70, *National Electrical Code*, and any local ordinances.

5-3.9

Trained and authorized personnel shall change or charge batteries.

5-3.10

Trucks shall be positioned properly and brakes shall be applied before attempting to change or charge batteries.

5-3.11

Where charging batteries, the vent caps shall be kept in place to avoid electrolyte spray. Care shall be taken to ensure that vent caps are functioning. The battery (or compartment) cover(s) shall be open to dissipate heat and gas.

5-3.12

Smoking shall be prohibited in the charging area.

5-3.13

Precautions shall be taken to prevent open flames, sparks, or electric arcs in battery-charging areas.

5-3.14

Tools and other metallic objects shall be kept away from the tops of uncovered batteries.

5-4 Use of Trucks in Classified Areas.

5-4.1

Industrial trucks shall not be used in classified areas.

Exception: Where specified in Chapter 1.

5-4.2 Markings of Types CNS, DS, DY, DX, ES, EE, EX, GS, LPS, GS/CNS, and GS/LPS Industrial Trucks and Their Areas of Use.

5-4.2.1 Proper equipment shall be used in classified areas for the safety and protection of employees and property. Approved trucks, listed by a testing laboratory for use in such areas, shall be clearly identified. To facilitate identification by operators and supervisory personnel, a uniform system of marking has been developed and is described in 5-4.2.2 and 5-4.2.3.

5-4.2.2 Durable markers indicating the designation of the type of truck for use in classified areas shall be applied to each side of the vehicle in a visible but protected location. These markers shall be distinctive in shape as shown in Figure 5-4.2.2. The markers for LPS, GS, DS, ES, CNS, GS/LPS, and GS/CNS shall measure 4 in. (102 mm) square markers. The width of the other markers shall be 5 in. (127 mm). The signs shall have black borders and lettering on a yellow background.

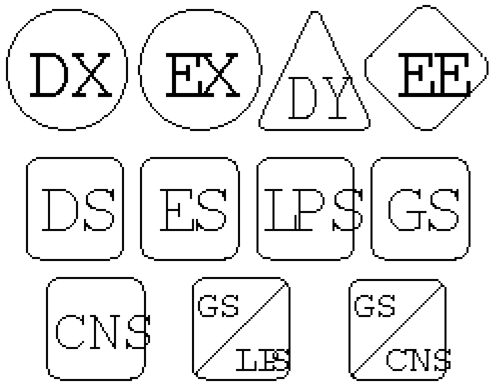

Figure 5-4.2.2. Markers used to identify type of industrial truck.

5-4.2.3 Entrances to classified areas where industrial trucks are to be used shall be posted with durable markers as shown in Figure 5-4.2.3. The minimum width of the sign shall be 11 in. (279 mm); the minimum height of the sign shall be 16 in. (406 mm). The sign shall have the word "caution" in yellow letters on a black background. The body of the sign shall have black letters on a yellow background. A marker(s) identical to that used on the side of the truck shall be installed on the sign as indicated. (*See Figure 5-4.2.2*.)

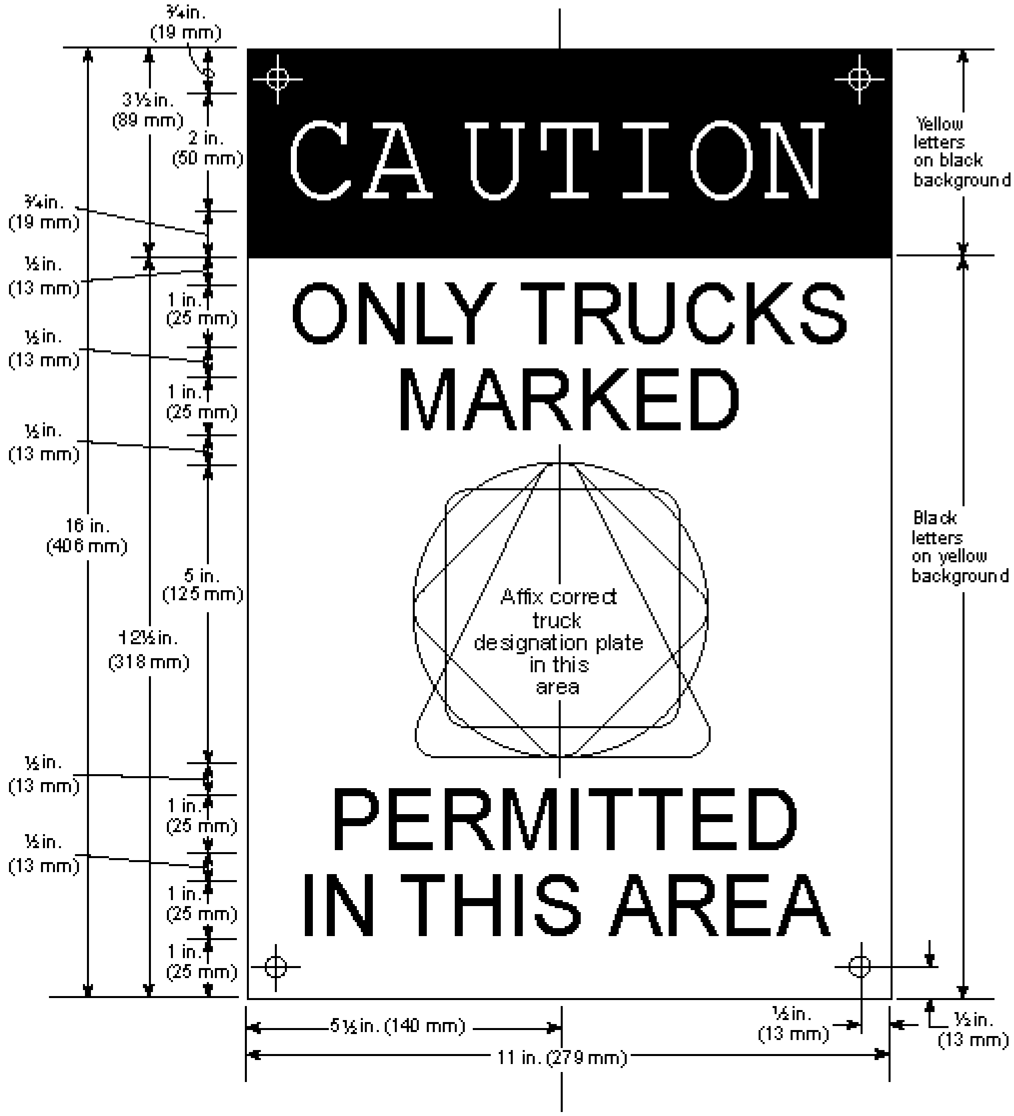

Figure 5-4.2.3. Building signs for posting at entrance to hazardous areas.

5-5 Safe Operating Rules.

Powered industrial truck operation shall be in accordance with ANSI B56.1, *Safety Standard for Low Lift and High Lift Trucks*.

5-6 Operating Procedures and Training.

5-6.1

There shall be a written operating procedure plan and operator training.

5-6.2

The procedure shall include, as a minimum, (a) through (e) as follows:

(a) Operation limited to trained personnel;

(b) Cautions where checking or filling tank;

(c) Action for suspected leak;

(d) Refueling instructions;

(e) Emergency items:

1. Shut off fuel valve;

2. Ensure battery correct type and position.

Chapter 6 Referenced Publications

6-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

6-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 30A, *Automotive and Marine Service Station Code*, 1996 edition.

NFPA 52, *Standard for Compressed Natural Gas (CNG) Vehicular Fuel Systems*, 1995 edition.

NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, 1995 edition.

NFPA 70, *National Electrical Code*, 1996 edition.

6-1.2 Other Publications.

6-1.2.1 ASME Publication. American Society of Mechanical Engineers, 345 East 47th Street, New York, NY 10017.

ANSI/ASME B56.1, *Safety Standard for Low Lift and High Lift Trucks*, 1993.

6-1.2.2 ASTM Publication. American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

ASTM D 3175, *Standard Test Method for Volatile Matter in the Analysis Sample of Coal and Coke*, 1989.

6-1.2.3 UL Publications. Underwriters Laboratories Inc., 333 Pfingsten Road, Northbrook, IL 60062.

UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered*, 1991.

UL 583, *Standard for Safety Electric-Battery-Powered Industrial Trucks*, 1991.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document but is included for informational purposes only.

A-1-4 Approved. The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

A-1-4 Authority Having Jurisdiction. The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A-1-4 Listed. The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A-1-4 Type Designation. Specific standards covering the types of industrial trucks detailed in Section 1-4 have been published by Underwriters Laboratories Inc., and are identified as UL 558, *Standard for Safety Industrial Trucks, Internal Combustion Engine-Powered*, and UL 583, *Standard for Safety Electric-Battery-Powered Industrial Trucks*. UL 558 covers Types D, DS, DY, G, GS, LP, LPS, G/LP and GS/LPS; UL 583 covers Types E, EE, ES, and EX.

Standards for Types CN, CNS, G/CN, and GS/CNS trucks are not in published form; however, information is available from Underwriters Laboratories Inc. regarding their requirements for these type designations.

The Underwriters Laboratories Inc. examination of powered industrial trucks relates to fire hazards only for Types D, DS, DY, G, GS, LP, LPS, G/LP, and GS/LPS internal-combustion-engine-powered industrial trucks; to fire and explosion hazard for Type DX trucks; to fire and electrical shock hazard only for Types E, ES, and EE battery-powered industrial trucks; and to the fire, electric shock, and explosion hazard for Type EX trucks suitable either for use in Class I, Group D, or Class II, Group G, hazardous locations. Trucks that have been examined and classified as meeting the respective Underwriters Laboratories standards for the particular area of use are found in the UL *Automotive Burglary Protection Mechanical Equipment Directory*, except for Type EX trucks, which can be found in the UL *Hazardous Locations Equipment Directory*.

A-1-6.1 For examples of those chemicals for which mixtures of their vapors in air are classified as Class I, Group A, B, or C, see Section 500-3 of NFPA 70, *National Electrical Code*. The following are some examples of Class I, Groups A, B, and C chemicals:

acetaldehyde	ethylene oxide
acetylene	ethylenimine
acrolein (inhibited)	hydrogen
allyl alcohol	hydrogen cyanide
arsine	hydrogen sulfide
butadiene	manufactured gases con-
n-butyraldehyde	taining more than 30%
carbon monoxide	hydrogen (by volume)
crotonaldehyde	morpholine
cyclopropane	2-nitropropane
diethyl ether	propylene oxide
diethylamine	propylnitrate
epichlorohydrin	tetrahydrofuran
ethyl mercaptan	unsymmetrical dimethyl
ethyl sulfide	hydrazine (UDMH 1,
ethylene	1-dimethyl hydrazine)

A-1-6.2.1 For examples of those chemicals for which mixtures of their vapors in air are classified as Class I, Group D, see Section 500-3 of NFPA 70, *National Electrical Code*. The following are some examples of Class I, Group D chemicals:

acetic acid (glacial)	ethanol (ethyl alcohol)
acetone	ethyl acetate
acrylonitrile	ethyl acrylate

ammonia	ethylene diamine
benzene	(anhydrous)
butane	ethylene dichloride
1-butanol	ethylene glycol mono-
2-butanol (secondary	methyl ether
utyl alcohol)	gasoline
n-butyl acetate	heptanes
isobutyl acetate	hexanes
sec-butyl alcohol	isoprene
di-isobutylene	isopropyl ether
ethane	mesityl oxide
methane (natural gas)	pentanes
methanol (methyl	1-pentanol (amyl
alcohol)	alcohol)
3-methyl-l-butanol	propane
(isoamyl alcohol)	1-propanol (propyl
methyl ethyl ketone	alcohol)
methyl isobutyl ketone	2-propanol (isopropyl
2-methyl-l-propanol	alcohol)
(isobutyl alcohol)	propylene
NFPA 702-methyl-2-propanol	styrene
(tertiary butyl alcohol)	toluene
petroleum naphtha	vinyl acetate
pyridine	vinyl chloride
octanes	xylenes

A-1-6.5.3 Most Group F dusts are electrically nonconductive and have resistivities in the range of 10^5 ohm-cm to 10^8 ohm-cm. However, some western (e.g., Wyoming) coals can have resistivities less than 10^5 ohm-cm.

A-1-6.8.1 Where these materials are either in enclosed systems or where flyings in air are minimized through use of ventilation controls, the use of Types CNS, DS, ES, GS, LPS, GS/CNS, or GS/LPS trucks may be considered.

A-2-2.5 The purpose of this requirement is to ensure the carburetor float system is functioning properly after a period of disuse.

A-3-1 Section 3-1 provides that acceptance of an industrial truck that has been converted rests entirely with the inspection authority having jurisdiction. The responsibility of determining whether or not a truck has been properly converted is placed with the authority having jurisdiction because it is impractical to ship each converted truck back to the testing laboratory to be reexamined or retested, and it is also impractical for the laboratory to send a representative into the field to examine or test every converted truck.

It is recognized that the various authorities having jurisdiction may not be expert in determining what constitutes a proper conversion. Installation directions furnished with conversion equipment, "Listed by Report," specify in detail how the conversion is to be made so that it will be in accordance with NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*. These detailed instructions supply the authority having jurisdiction with all the necessary information to determine whether or not a truck has been properly converted.

A-5-1.1.2 Safe outdoor locations are preferable to those indoors. NFPA 30, *Flammable and Combustible Liquids Code*, includes requirements for arranging indoor fueling facilities. NFPA 30A, *Automotive and Marine Service Station Code*, includes requirements for arranging outdoor fueling facilities.

A-5-1.2.10 The exchange of removable LP-Gas containers is preferably done outdoors, but may be done indoors.

A-5-2.1

The purpose in requiring that the liquid fuel tank always be filled with gasoline to at least the $^{1}/_{4}$-full level is to provide a sufficient amount of liquid fuel to maintain a vapor saturation in the tank above the normally explosive level. The amount of fuel in the tank can be determined using the fuel gauge provided on the vehicle.

NFPA 512

1994 Edition

Standard for Truck Fire Protection

1994 Edition

This edition of NFPA 512, *Standard for Truck Fire Protection*, was prepared by the Technical Committee on Motor Vehicle and Highway Fire Protection and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 15-18, 1993, in Phoenix, AZ. It was issued by the Standards Council on January 14, 1994, with an effective date of February 11, 1994, and supersedes all previous editions.

The 1994 edition of this document has been approved by the American National Standards Institute.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

Origin and Development of NFPA 512

The first edition of the Recommended Good Practices was drafted by the NFPA Committee on Truck Fire Protection and adopted by the Association in 1952. Amendments were adopted in 1955. In 1967 the Committee was reorganized as the Committee on Motor Vehicle and Highway Fire Protection. The scope of the Committee was greatly expanded at the time of the reorganization. The reorganized Committee undertook as its first order of business a thorough review of the 1955 edition of NFPA 512.

The 1970 edition was a complete revision and reorganization of the 1955 edition. The 1975 standard was a complete revision of the 1970 Recommended Good Practices. The 1975 edition was partially revised in 1978, and the 1984 edition represented further partial revision to that 1978 edition. Minor changes were made in the 1990 edition in emergency signals (fusees) and fire protection requirements to bring the standard into conformity with the Federal Motor Carrier Safety Regulations.

Minor changes in the 1994 edition were made to comply with the NFPA *Manual of Style*. Also, revised appendix notes were added addressing the scope and portable extinguishers.

Technical Committee on Motor Vehicle and Highway Fire Protection

Richard Ortisi-Best, NFPA Staff Liaison

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee has primary responsibility for documents on motor vehicle fire prevention and protection measures to reduce loss of life and property damage in the operation and maintenance (repair) of such vehicles (except as specified herein); fire prevention and protection recommendations for motor freight terminals; protection for tunnels, air-right structures, and bridges; and to recommend protection facilities on limited-access highways. Included as motor vehicles are trucks, buses, taxicabs, limousines, and passenger cars; excluded are the design, fire protection, and operational procedures for fire apparatus, mobile homes and travel trailers, tank vehicles of all kinds for handling flammable and combustible liquids and liquefied petroleum gases, and vehicles transporting explosives and other hazardous chemicals. The construction and protection of garages is handled by the NFPA Committee on Garages.

NFPA 512

Standard for Truck Fire Protection

1994 Edition

NOTE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 5 and Appendix B.

Chapter 1 Introduction

1-1* Scope.

This standard prescribes fire protection measures for property-carrying motor vehicles. The requirements given herein are minimum. They reflect the fact that motor vehicles are an indispensable major segment of the property-carrying transportation system, and, therefore, fires involving these vehicles can have a serious impact on public safety and the delivery and conservation of critical merchandise.

Exception No. 1: Aircraft fuel servicing vehicles; covered in NFPA 407, Standard for Aircraft Fuel Servicing.

Exception No. 2: Vehicles transporting explosives and blasting agents; covered in NFPA 495, Explosive Materials Code.

Exception No. 3: Tank vehicles for flammable and combustible liquids; covered in NFPA 385, Standard for Tank Vehicles for Flammable and Combustible Liquids.

Exception No. 4: LP-Gas tank vehicles and vehicles transporting portable LP-Gas containers; covered in NFPA 58, Standard for the Storage and Handling of Liquefied Petroleum Gases.

Exception No. 5: Motor vehicles subject to the regulations of the U.S. Department of Transportation.

1-2 Purpose.

This standard is for the use and guidance of persons charged with operating and maintaining property-carrying motor vehicles to provide that degree of public safety from fires involving such equipment that can be reasonably required. Consideration has been given to the fact that motor vehicles, by their very nature, can expose lives and property to unexpected fires, and that many roads, particularly limited-access highways, make it difficult for organized fire-fighting agencies to reach the scene of an emergency quickly.

1-3 Definitions.

Approved. Acceptable to the authority having jurisdiction.

NOTE: The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

NOTE: The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

Cargo Space. Includes the open, partially or fully enclosed, space of any motor vehicle used for carrying cargo.

General Cargo. Includes everything except materials specifically described and known as hazardous materials.

Hazardous Material. A substance or material that has been determined by the Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce, and that has been so designated in U.S. Department of Transportation Regulations 49 CFR, Parts 100-199.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of labeled equipment or materials and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Listed. Equipment or materials included in a list published by an organization acceptable to the authority having jurisdiction and concerned with product evaluation that maintains periodic inspection of production of listed equipment or materials and whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

NOTE: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

Motor Vehicle. Any self-propelled truck or truck tractor, or any semitrailer or full trailer drawn by another motor vehicle.

Shall. Indicates a mandatory requirement.

Chapter 2 Fire Prevention — Cargoes

2-1* General.

General cargo shall be loaded so that it does not constitute a fire hazard to other materials in transit or to the vehicle.

2-2 Hazardous.

Hazardous materials shall be packaged, loaded, and transported in accordance with U.S. Department of Transportation Regulations 49 CFR, Parts 100-199.

Chapter 3* Fire Prevention — Vehicle and Equipment

3-1 General.

The driver shall satisfy himself or herself before a trip that at least the following are in safe operating condition:

(a) Service brakes, including trailer brake connections,

(b) Parking (hand) brake,

(c) Steering mechanism,

(d) Lighting devices and reflectors,

(e) Horn,

(f) Coupling devices,

(g) Tires,

(h) Windshield wipers,

(i) Rear view mirrors,

(j) Emergency warning devices,

(k) Fire extinguishers.

3-2 Fueling.

3-2.1

All engines and motors shall be stopped during fueling operations, all open flames extinguished, and “no smoking” in the immediate area enforced. Fuel tanks shall not be overfilled, and allowance shall be made for expansion due to a rise in temperature to prevent spillage. The nozzle of the fueling hose shall be kept in continuous contact with the fuel tank intake pipe to prevent sparking from accumulated static electricity.

3-2.2

All fuel supplies for propulsion of the vehicle or any accessory equipment shall be carried in properly mounted tanks.

3-2.3

Where liquefied petroleum gases are used as fuel, NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*, shall be followed.

3-3* Tires.

The procedures of 3-3.1 through 3-3.4 shall be observed to minimize the occurrence of tire fires.

3-3.1

Tires shall be inflated to the proper pressure. Air pressure shall not be reduced ("bled") en route.

3-3.2

Dual tires shall be properly mated and properly spaced between pairs. Valve stems shall not be in contact with brake drums.

3-3.3

The driver shall examine the vehicle's tires at the beginning of each trip and each time the vehicle is parked. A driver transporting hazardous materials shall recheck the tires at least once every two hours or 100 miles of driving, whichever comes first.

3-3.4

In the event that a driver discovers an overheated tire, the driver shall stop immediately and cause it to be removed from the vehicle to a safe distance. The driver shall not drive the vehicle until the tire has been repaired or replaced. The tire that has been found overheated shall not be put in any location on the vehicle until cool to the touch.

3-4* Emergency Signals (Fusees).

3-4.1

Fusees shall be stored in open racks or metal boxes used for no other purpose in the cab or other readily accessible place on the vehicle.

3-4.2

Fusees shall not be attached to any part of the motor vehicle.

3-4.3

Fusees shall not be used in close proximity to leaking or spilled flammable liquid or leaking flammable gas.

3-4.4

The use of flame-producing warning signals shall be prohibited on vehicles transporting Class A or B explosives, on vehicles transporting flammable liquids or gases in cargo tanks, and on vehicles using compressed gas as a motor fuel.

3-5* Heaters.

3-5.1 Prohibited Types of Heaters.

The installation or use of the following types of heaters shall be prohibited:

3-5.1.1 Unenclosed Flame Heaters. Any type of heater employing a flame that is not fully enclosed (other than for small combustion air openings).

Exception: Open flame heaters shall be permitted for the heating of cargo tanks, but shall not be in operation while the vehicle is in motion.

3-5.1.2 Heaters Permitting Fuel Leakage. Any type of heater from the burner of which there could be spillage or leakage of fuel upon the tilting or overturning of the vehicle.

3-5.1.3 Solid Fuel Heaters. Any stove or other heater employing solid fuel, except wood charcoal.

3-5.2 Heater Specifications.

All heaters shall comply with the specifications of 3-5.2.1 through 3-5.2.10.

3-5.2.1 Protection of Heating Elements. Every heater shall be located or protected to prevent contact therewith by cargo or by occupants, unless the surface temperature of the protecting grilles or of any exposed portions of the heaters, inclusive of exhaust stacks, pipes, or conduits, is lower than would cause contact burns. Adequate protection shall be afforded against igniting parts of the vehicle or cargo, or against burning occupants by direct radiation. Wood charcoal heaters shall be enclosed within a metal barrel, drum, or similar protective enclosure with a securely fastened cover.

3-5.2.2 Securing of Heaters. Every heater and every heater enclosure shall be securely fastened to the vehicle in a substantial manner to provide against relative motion within the vehicle during normal usage or in the event the vehicle overturns. Every heater shall be designed, constructed, and mounted to minimize the likelihood of disassembly of any of its parts, including exhaust stack, pipes, or conduits, upon overturn of the vehicle in or on which it is mounted. Wood charcoal heaters shall be secured within the enclosure specified in 3-5.2.1, and the enclosure shall be securely fastened to the motor vehicle.

3-5.2.3 Fuel Lines. Where, either in normal operation or in the event of overturn or collision, there is likely to be relative motion between the fuel tank for a heater and the heater, or between either of such units and the fuel lines between them, a suitable means shall be provided to allow this motion without causing failure of the fuel lines.

3-5.2.4 Hot Water and Steam Hoses. Hoses for all hot water and steam heater systems shall be suitable for the purpose.

3-5.2.5 Electrical Apparatus. Every heater employing any electrical apparatus shall be equipped with electrical conductors, switches, connectors, and other electrical parts of ample rating to provide against overheating. Any electric motor employed in any heater shall be of adequate size and located so that it will not be overheated. Electrical circuits shall be provided with fuses or circuit breakers to prevent electrical overloading. All electrical conductors employed in or leading to any heater shall be secured against dangling, chafing, and rubbing, and shall have suitable protection against any other condition likely to produce short or open circuits. If a separate storage battery is located within the cargo space, such battery shall be securely mounted and equipped with nonspill filler caps.

Electrical equipment listed as suited for the foregoing use by a recognized laboratory shall be deemed to comply with the foregoing requirements, except as to security against dangling, etc.

3-5.2.6 Combustion Air. Heaters shall be constructed and installed to ensure sufficient outside air supply for normal combustion.

3-5.2.7 Combustion Heater Exhaust Construction. Every heater employing the combustion of fuel oil, gasoline, liquefied petroleum gas, or any other combustible materials shall be provided with substantial means of conducting the products of combustion to the outside of the vehicle.

Exception: This requirement shall not apply to heaters used solely to heat the cargo space. Such unvented heaters shall be removed during loading and unloading operations.

The exhaust pipe, stack, or conduit, if required, shall be sufficiently substantial and secured to provide assurance against leakage or discharge of products of combustion within the vehicle, and, if necessary, shall be insulated to make unlikely the burning or charring of parts of the vehicle by radiation or by direct contact. The place of discharge of the products of combustion to the atmosphere and the means of discharge of such products shall be such as to minimize the likelihood of their re-entry into the vehicle under all operating conditions.

3-5.2.8 Combustion Chamber Construction. The design and construction of any combustion-type heater shall provide against the leakage of products of combustion into air to be heated and circulated. The material employed in combustion chambers shall provide against leakage because of corrosion, oxidation, or other deterioration. Joints between combustion chambers and the air chambers with which they are in thermal and mechanical contact shall be designed and constructed to prevent leakage between the chambers; the materials employed in such joints shall have melting points substantially higher than the maximum temperatures likely to be attained at the joints.

Exception: Cargo space heaters permitted by 3-5.2.6 and unenclosed flame heaters used for heating the cargo of tank motor vehicles.

3-5.2.9 Automatic Fuel Control. Gravity or siphon feed shall not be used for heaters burning liquid fuels. Such heaters shall be equipped with automatic means for shutting off the fuel or for reducing such flow of fuel to the smallest practicable magnitude in the event of overturn of the vehicle. Heaters using liquefied petroleum gas or fuel shall have the fuel line equipped with automatic means at the source of supply for shutting off the fuel in the event of separation, breakage, or disconnection of any of the fuel lines between the supply source and the heater.

3-5.2.10 Shutoff Control. Automatic means, or manual means if the control is readily accessible to the driver without moving from the driver's seat, shall be provided to shut off the fuel and electrical supply in case of failure of the heater to function for any reason, or in case the heater should function improperly or overheat.

Exception: This requirement shall not apply to wood charcoal heaters or to heaters used solely to heat the contents of cargo tank motor vehicles, but wood charcoal heaters shall be provided with a controlled method of regulating the flow of combustion air.

3-5.2.11* The users of heaters in vehicles transporting hazardous materials shall comply with applicable regulations of the U.S. Department of Transportation, 49 CFR, Section 177.834 (1).

3-6 Lighting of Van Interiors.

If the interiors of closed vans are electrically lighted, the lights shall be protected by screens or grilles to prevent contact of the bulb by cargo.

3-7 Refrigeration Equipment.

3-7.1

Refrigeration machinery and equipment shall be installed so as not to constitute a fire hazard to cargo or vehicle.

3-7.2

The fuel supply for refrigeration equipment shall be adequate to permit operation between normal refueling points to avoid the need to refuel with makeshift devices while on the road. Extra fuel, if carried, shall be stored in approved-type storage tanks affixed to the vehicle. The transfer of fuel to the refrigeration units shall be by a safely arranged small hand pump unless the equipment's design permits direct suction from the fuel storage tank.

3-7.3

Refueling of refrigeration equipment shall be conducted at standard fueling stations utilizing approved-type facilities.

Chapter 4 Fire Protection

4-1 Emergency Procedures.

4-1.1*

The driver, on discovery of a fire, shall move the vehicle to the side of the road to a point where other equipment and property are not endangered. Where feasible, vehicles of a combination should be uncoupled and separated, if this can be done without endangering the safety of the driver.

4-1.2

An immediate notification shall be given by the fastest means practicable to the nearest fire emergency service. The driver shall advise fire fighters or other emergency responders of the nature of the cargo. If the cargo includes hazardous materials, the driver should have the shipping papers available immediately for examination by first-responders.

4-1.3

In case of danger that a fire might spread out of control, particularly with vehicles transporting hazardous materials, the driver shall take steps to warn the public away from the scene and inform the fire emergency service of the nature of the cargo.

4-2* Fire Extinguishers.

4-2.1*

Each power unit shall be equipped with at least one fire extinguisher, in accordance with NFPA 10, *Standard for Portable Fire Extinguishers*, that is properly filled and located so that it is readily accessible in case of a fire emergency. Every such extinguisher shall be designed, constructed, and maintained to permit visual determination of whether it is fully charged. Extinguishers shall be suitable for use at temperatures as low as –40°F (–40°C) without additional protection.

4-2.2* Type and Size.

4-2.2.1 A power unit used to transport hazardous materials shall be equipped with a fire extinguisher having a listed rating of 10B:C or higher.

4-2.2.2 A power unit used to transport general cargo shall be equipped with a fire extinguisher having a listed rating of 5B:C or higher, or two fire extinguishers, each of which has a listed rating of at least 4B:C.

4-2.2.3 The extinguisher rating appears on the extinguisher instruction plate. Extinguishers lacking such instruction plates shall be prohibited.

4-2.2.4 Carbon tetrachloride and methyl bromide agents shall not be used.

4-2.3 Mounting.

Extinguishers shall be securely mounted and readily accessible. If the extinguisher is in a location other than within the driver's compartment, its location should be indicated by appropriate markings on the exterior of the vehicle.

Chapter 5 Referenced Publications

5-1

The following documents or portions thereof are referenced within this standard and shall be considered part of the requirements of this document. The edition indicated for each reference is the current edition as of the date of the NFPA issuance of this document.

5-1.1 NFPA Publications.

National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

NFPA 10, *Standard for Portable Fire Extinguishers*, 1990 edition.

NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases,* 1992 edition.

5-1.2 Other Publication.

5-1.2.1 U.S. Department of Transportation, 400 7th Street, SW, Washington, DC 20590.

Code of Federal Regulations, 49 CFR, Parts 100-199, as amended.

Appendix A Explanatory Material

This Appendix is not a part of the requirements of this NFPA document, but is included for informational purposes only.

A-1-1 Scope.

Commercial vehicles operating in interstate or foreign commerce are subject to the fire protection provisions of the Federal Motor Carrier Safety Regulations (FMCSR) administered by the U.S. Department of Transportation, 49 CFR, Parts 383-399. These requirements are incorporated within this standard because they represent minimum fire safety requirements that must be met by all persons responsible for the operation of such vehicles.

The transportation of hazardous materials in both interstate, foreign, and intrastate commerce is subject to the Hazardous Materials Regulations (HMR) of the U.S. Department of Transportation, 49 CFR, Parts 100-199.

Through participation in the federally funded Motor Carrier Safety Assistance Program (MCSAP), virtually all states have now adopted by reference the federal regulations cited above. These regulations are being jointly enforced by authorized federal, state, and local enforcement personnel at roadside checks of vehicles and drivers, and through inspections at motor carrier facilities.

A-2-1 Fire Prevention — Cargoes.

Fiber materials, that is, excelsior, rags, cotton waste, waste paper, paper shreddings, etc., should be transported in an enclosed vehicle or with a fire-retardant tarpaulin covering on all sides to avoid accidental ignition from external sources during transportation.

A-3 Fire Prevention — Vehicle and Equipment.

Fire prevention starts with proper vehicle maintenance and servicing operations, with particular emphasis on fueling of the vehicle and accessory equipment.

A-3-3 Tires.

Tire fires are caused by high internal tire temperatures that may result from overloading, underinflation, high speed, high road temperatures, and rubbing of dual tires. They are difficult to extinguish and are likely to rekindle. Tire fires are best extinguished by applying large quantities of water, where available, until the tire and wheel are cool to the touch. Putting the flame out is not enough as there may be burning inside the carcass. If quantities of water are not available and flames cannot be put out with the fire extinguishers, use dirt or sand and remove tires as quickly as possible.

A driver discovering a tire that is underinflated may drive at a moderate speed to the nearest place at which necessary service or repairs can be performed to correct the condition.

When touching tires to determine whether they are hot, use the back of the hand; touching with the palm often causes the fingers to close and could result in serious burns.

A-3-4 Flame-Producing Warning Devices.

Carriers using flame-producing warning signals (other than fusees) should replace such warning signals at the earliest opportunity with reflective triangles marked as being in compliance with Federal Motor Vehicle Safety Standard 125, 49 CFR, 571.125. Fusees may be permitted to be used to supplement these reflective triangles, and they may be permitted to be used by the driver to aid in the control of traffic in an emergency, provided they are not used in a manner that will increase the danger of fire.

A-3-5 Heaters.

The installation of heating equipment for protection of commodities from cold requires particular attention to minimize fire and other hazards.

A-3-5.2.11 Specific reference is made to 49 CFR, Parts 100-199, Section 177.834 (1).

A-4-1.1 Emergency Procedures.

Most fires start small and, if attacked quickly with appropriate extinguishing measures, can be handled by the driver. Large fires require the attention of trained fire fighters with ample equipment; fire fighters are also needed in case the original fire reignites after first aid extinguishing equipment is exhausted, particularly if tire fires are involved.

Consideration should be given to providing additional information to the driver attempting to deal with a small fire. This information might include:

(a) A warning that the driver should not risk his or her personal safety.

(b) A warning that the typical truck fire extinguisher will discharge in 8 to 10 seconds.

(c) A warning to fight a fire with the wind at the driver's back.

(d) A warning to the driver not to get surrounded by fire.

(e) An instruction to aim at the base of the flames and use a sweeping motion.

(f) A warning that, if fire is suspected within a closed van, the driver should not open the doors until there is adequate help to deal with the flare-up that is likely to occur when the doors are opened and oxygen reaches the fire.

A-4-2 Fire Extinguishers.

A motor vehicle needs protection against its own fire hazards regardless of the cargo. In some instances, this protection may be sufficient for the cargo as well; in others, particularly where flammable or combustible hazardous materials are involved, supplemental protection may be needed or specified by law.

A-4-2.1

By interpretation, the U.S. Department of Transportation considers an extinguisher to meet the requirement of being capable of visual inspection if:

(a) Equipped with a gauge that indicates charge pressure, or

(b) Charge pressure is maintained by a metallic seal that is readily accessible for inspection without the use of tools.

The following have been deemed not to meet the regulatory requirement for an extinguisher capable of visual inspection to determine whether it is properly charged:

(a) The use of a wire seal on the operating mechanism, or other device indicating only that the operating mechanism has not been manipulated, or

(b) An extinguisher that must be checked by weighing to determine that it is properly charged.

A-4-2.2 Ratings on Fire Extinguisher Labels.

The various extinguishing agents are not uniformly effective on the different classes of fires. UL 711, *Standard for Rating and Fire Testing of Fire Extinguishers*, was developed in order to rate the relative effectiveness of extinguishers. The Underwriters Laboratories rating system is based on using experts to extinguish scaled reproducible fires with extinguishers being tested for Class A (wood, paper, cloth, insulation, etc.) and Class B (flammable liquids, grease, etc.) fire extinguishing capability. The numerical prefix indicates relative potential, so that an extinguisher rated 10-B has twice the potential on Class B fires as one rated 5-B. Similarly, an extinguisher displaying a UL rating of 2-A has twice the potential on Class A fires as one rated 1-A. The C rating indicates that the extinguishing agent is electrically nonconductive and can be applied safely to energized electrical equipment without the possibility of a shock hazard. (The C rating does not have a numerical designation associated with it.)

Example: An extinguisher is rated and classified 4-A:20-B.C. This indicates the following:

1. It should extinguish approximately twice as much Class A fire as a 2-A [$2^1/_2$-gal (9.46-L) water] rated extinguisher.

2. It should extinguish approximately 20 times as much Class B fire as a 1-B rated extinguisher.

3. It is suitable for use on energized electrical equipment.

Fire extinguishers are also required to have a decal with use code symbols positioned below the operating instructions. The use code symbols reflect the rating of the extinguisher and are intended for quick reference by the user. Table A-4-2.2 depicts the current pictorial marking system. The absence of the Class A symbol in the third row of the table indicates that these extinguishers did not achieve the A rating but could be used on Class A fires with less effectiveness than those with the A rating. (Older extinguishers have decals with a triangle, square, circle, and 5-point star containing the letters A, B, C, and D, respectively.)

Before selecting a fire extinguisher, identify and know the hazard on which it may be used.

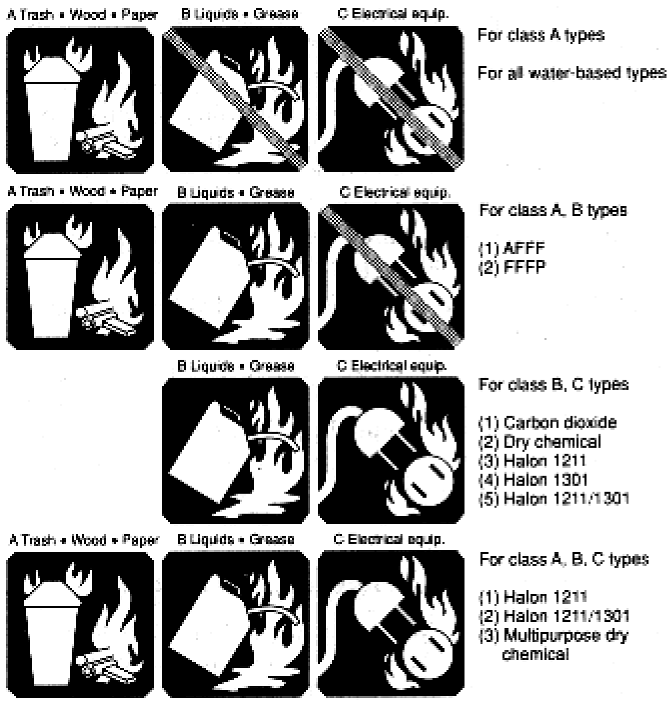
There are three ways to select a fire extinguisher:

(a) Select an extinguisher rated for Class A, B, and C fires.

(b) Select an extinguisher especially designed for a specific fire likely to occur.

(c) Select a combination of the two.

Table A-4-2.2 Typical Pictorial Extinguisher Marking Labels



Color Separation Identification (picture symbol objects are white; background borders are white)
- Blue — background for "YES" symbols
- Black — background for symbols with slash mark ("NO")
  — class of fire symbols and wording
- Red — slash mark for black background symbols

NOTE 1: A red slash through any symbol means the extinguisher should not be used on that class of fire.

NOTE 2: A missing symbol means that this extinguisher has not been rated for a given class of fire.

NFPA 513

1994 Edition

Standard for Motor Freight Terminals

1994 Edition

This edition of NFPA 513, *Standard for Motor Freight Terminals*, was prepared by the Technical Committee on Motor Vehicle and Highway Fire Protection and acted on by the National Fire Protection Association, Inc. at its Fall Meeting held November 15-18, 1993, in Phoenix, AZ. It was issued by the Standards Council on January 14, 1994, with an effective date of February 11, 1994, and supersedes all previous editions.

The 1994 edition of this document has been approved by the American National Standards Institute.

Changes other than editorial are indicated by a vertical rule in the margin of the pages on which they appear. These lines are included as an aid to the user in identifying changes from the previous edition.

Origin and Development of NFPA 513

The first edition of NFPA 513 was prepared by the NFPA Committee on Truck Transportation. It was tentatively adopted in 1958 and adopted by the Association as an official NFPA Standard in 1959. In 1967, the Committee was reorganized as the Committee on Motor Vehicle and Highway Fire Protection.

The 1973 edition was a complete revision and reorganization of the 1971 edition. The 1973 edition was partially revised in 1975, 1978, and 1984. The 1990 edition contained minor changes such as an update of Table 3-1.2, which is extracted from NFPA 30, *Flammable and Combustible Liquids Code*. Very minor changes were incorporated in Chapters 3 and 6 of this 1994 edition.

Technical Committee on Motor Vehicle and Highway Fire Protection

Enoch Lipson, *Chair*
The Port Authority of NY & NJ, NY

Neill Darmstadter, American Trucking Assn., Inc., VA

A. L. Elliott, Sacramento, CA

William A. Eppich, The Protectowire Co., Inc., MA

Clifford J. Harvison, Nat'l Tank Truck Carriers, Inc., VA

Marice M. Pilette, Mechanical Designs Ltd., MA

George E. Ralph, Southport, ME

(Alt. to A. L. Elliott)

Raymond D. Scanlon, The Port Authority of NY & NJ, NY
(Alt. to E. Lipson)

Richard Ortisi-Best, NFPA Staff Liaison

This list represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred.

NOTE: Membership on a Committee shall not in and of itself constitute an endorsement of the

Association or any document developed by the Committee on which the member serves.

Committee Scope: This Committee shall have primary responsibility for documents on motor vehicle fire prevention and protection measures to reduce loss of life and property damage in the operation and maintenance (repair) of such vehicles (except as specified herein); fire prevention and protection recommendations for motor freight terminals; protection for tunnels, air-right structures, and bridges; and to recommend protection facilities on limited-access highways. Included as motor vehicles are trucks, buses, taxicabs, limousines, and passenger cars; excluded are the design, fire protection, and operational procedures for fire apparatus, mobile homes and travel trailers, tank vehicles of all kinds for handling flammable and combustible liquids and liquefied petroleum gases, and vehicles transporting explosives and other hazardous chemicals. The construction and protection of garages is handled by the NFPA Committee on Garages.

NFPA 513

Standard for Motor Freight Terminals

1994 Edition

NOTE: An asterisk (*) following the number or letter designating a paragraph indicates explanatory material on that paragraph in Appendix A.
Information on referenced publications can be found in Chapter 7 and Appendix B.

Chapter 1 General Information

1-1 Application and Scope.

1-1.1

This standard contains requirements for the prevention of loss of life and property damage from fires in motor freight terminals.

1-1.2

This standard applies to freight transfer areas, offices, employee facilities, and to vehicle maintenance and service areas.

1-1.3

This standard applies to motor freight terminals handling freight of various types, including ordinary combustible materials and materials classified as hazardous by the U.S. Department of Transportation Regulations 49 CFR, Parts 100-199.

1-1.3.1 Terminals for truck transportation of explosives shall be in accordance with NFPA 495, *Explosive Materials Code*, and NFPA 498, *Standard for Explosives Motor Vehicle Terminals*.

1-1.3.2 Terminals for bulk shipments of flammable and combustible liquids shall comply with NFPA 30, *Flammable and Combustible Liquids Code*.

1-1.3.3 Terminals for bulk shipments of LP-Gas shall comply with NFPA 58, *Standard for the Storage and Handling of Liquefied Petroleum Gases*.

1-1.4

For general storage buildings, see NFPA 231, *Standard for General Storage*.

1-1.5

For fire protection for property-carrying motor vehicles, see NFPA 512, *Standard for Truck Fire Protection*.

1-1.6

Where existing buildings, structures, and installations meet the applicable requirements of the edition of this standard in effect at the time of construction or installation, they shall be permitted to be continued in use, provided they do not constitute a distinct hazard to life or adjoining property.

1-2 Definitions.

Approved. Acceptable to the authority having jurisdiction.

NOTE: The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials; nor does it approve or evaluate testing laboratories. In determining the acceptability of installations, procedures, equipment, or materials, the authority having jurisdiction may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The authority having jurisdiction may also refer to the listings or labeling practices of an organization concerned with product evaluations that is in a position to determine compliance with appropriate standards for the current production of listed items.

Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, an installation, or a procedure.

NOTE: The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.
